PART 1 GENERAL (GEN)

GEN 0

GEN 0.1 PREFACE

1 Publishing Authority

1.1 UK Aeronautical Information products are provided by authority of the UK Civil Aviation Authority (CAA) and UK Crown Dependencies - Isle of Man, Jersey and Guernsey.

The UK Civil Aviation Authority (CAA) is responsible for:

- Regulation of the UK AIS in accordance with CAP 779.
- The form and content of the UK AIP and ensuring that AIS is provided in accordance with ICAO Standards and Recommended Practices, UK legislation and any additional requirements the UK CAA may determine from time to time;
- Regulatory approval of specified aeronautical information and data submitted to the UK AISP in accordance with CAP 1054;
- Provision of data and information to AIS in accordance with the Formal Arrangement established between the CAA and UK AISP.

The Channel Islands Director of Civil Aviation (CI DCA) are responsible for:

- Regulating civil aviation in the Channel Islands, including Jersey (together with Channel Islands Airspace), Guernsey and Alderney airports;
- Ensuring the adoption of relevant UK CAA policy publications on AIS;
- Reviewing the Channel Islands compliance with UK regulatory requirements and standards for data originators and authorised sources providing aeronautical data to UK AIS;
- Provision of data and information to AIS in accordance with the Formal Arrangement established between the CI DCA and AISP.

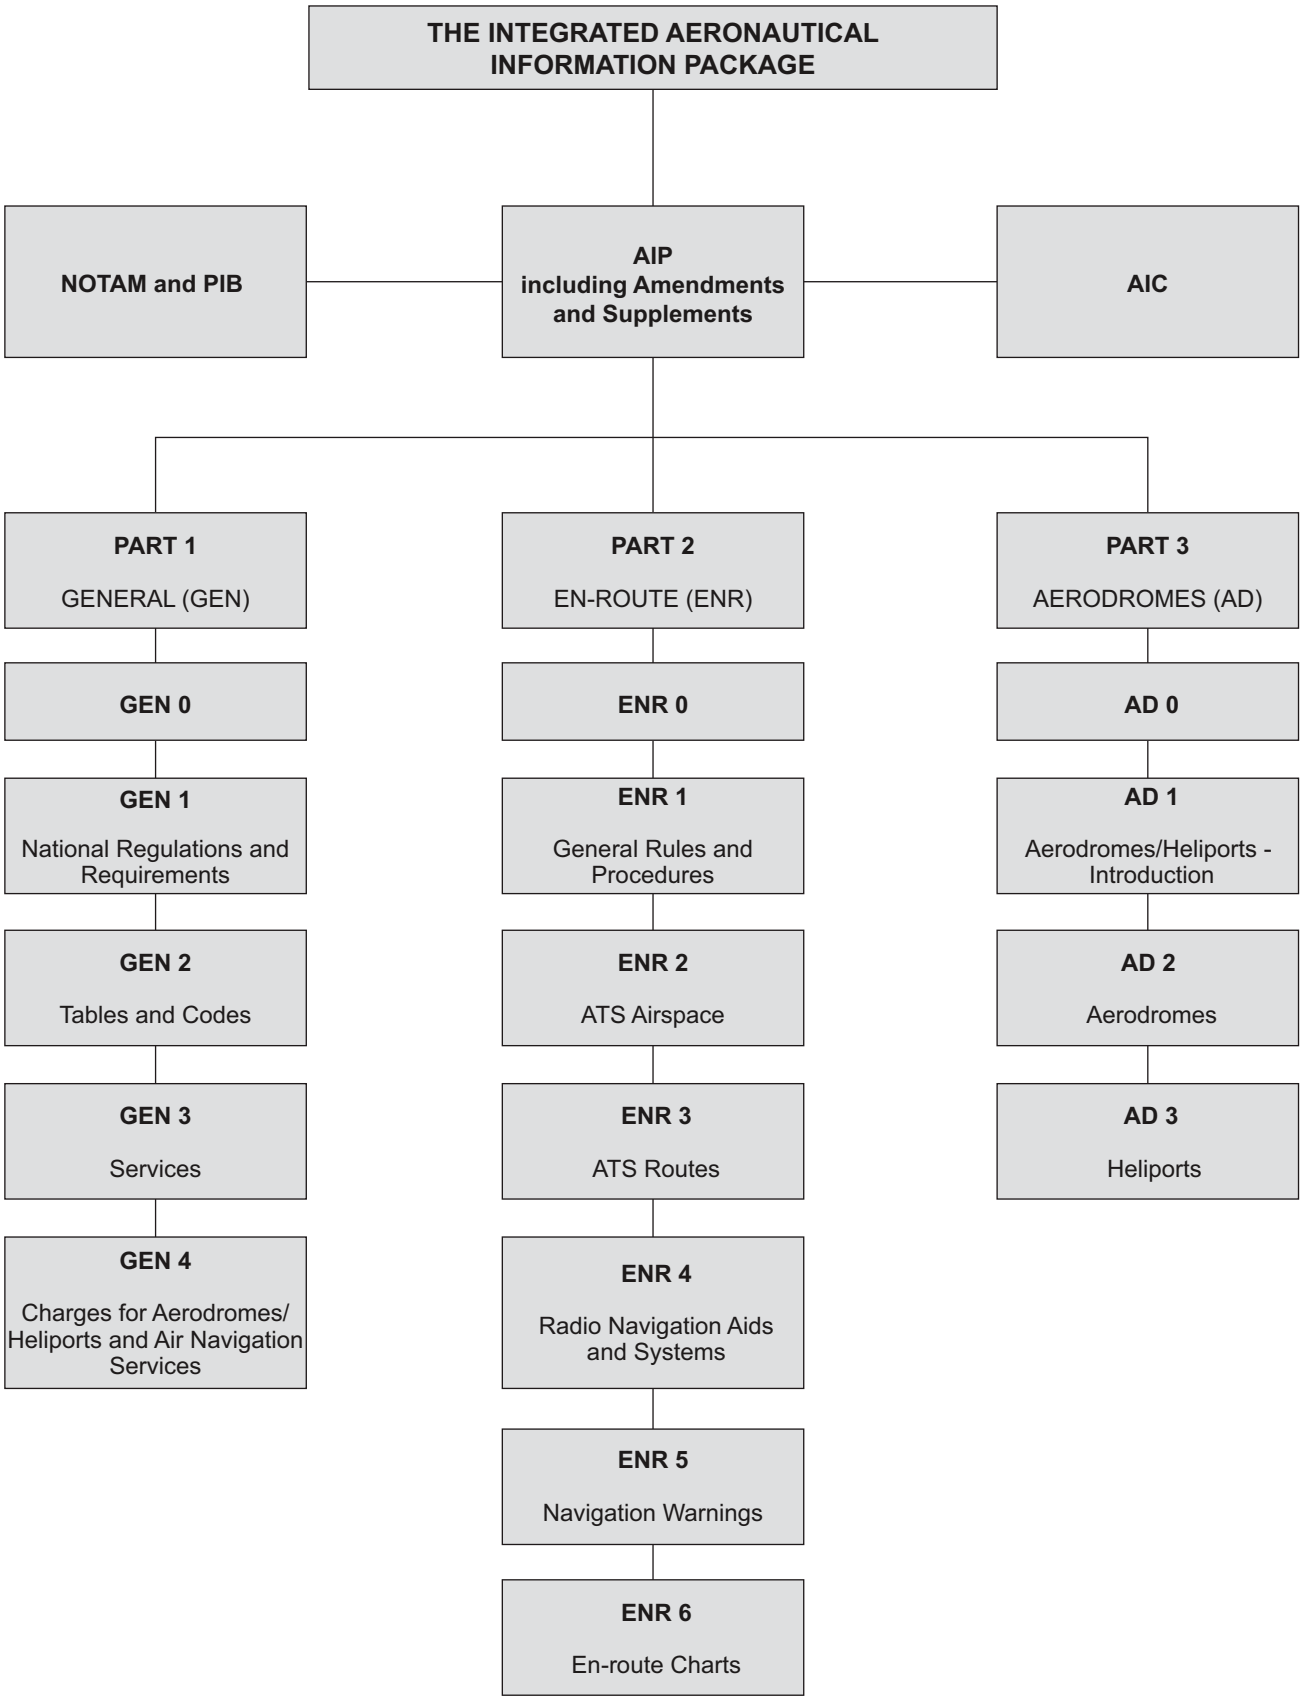
The Isle of Man Civil Aviation Administration (IOM CAA) is responsible for:

- Regulating civil aviation in the Isle of Man, including Isle of Man Airport;
- Ensuring the adoption of relevant UK CAA policy publications on AIS;
- Reviewing Isle of Man compliance with UK regulatory requirements and standards for data originators and authorised sources providing aeronautical data to UK AIS.

2 Applicable ICAO Documents

- ICAO Annex 15 – Aeronautical Information Service;
- ICAO Annex 4 – Aeronautical Charts;
- ICAO DOC 10066 – PANS AIM;
- ICAO Doc 8126 – AIS Manual;
- ICAO Doc 8697 – Aeronautical Chart Manual.

2.1 Differences to ICAO Standards and Recommended Practices are given at GEN 1.7.



3 Publication Media

3.1 AIS make Aeronautical Information Products (excl VFR Charts) freely available on the internet http://www.nats.aero/ais. The aeronautical information on the AIS website is a full and complete representation of all AIS products. VFR Charts can be purchased as described in the AIC entitled UK Integrated Aeronautical Information Package (IAIP).

4 The AIP Structure and Established Regular Amendment Interval

4.1 The AIP structure conforms to the template prescribed by ICAO, details of which are given at GEN 3.1.

GEN 0.1 PREFACE (continued)

GEN 0.1 PREFACE (continued)

Part 1 - General (GEN)

GEN consists of five sections containing information briefly described hereafter.

GEN 0	Preface; Record of AIP Amendments; Record of AIP Supplements; Checklist of AIP pages; List of hand amendments to the AIP; Table of Contents to Part 1.
GEN 1	National regulations and requirements - Designated authorities; Entry, transit and departure of aircraft; Entry, transit and departure of passengers and crew; Entry, transit and departure of cargo; Aircraft instruments, equipment and flight documents; Summary of national regulations and international agreements/conventions; Differences from ICAO Standards and Recommended Practices.
GEN 2	Tables and Codes - Measuring system, aircraft markings, holidays; Abbreviations used in Aeronautical Information Products; Chart symbols; Location indicators; List of radio navigation aids; Conversion of units of measurement; Sunrise/ Sunset Tables.
GEN 3	Services - Aeronautical Information Services; Aeronautical charts; Air Traffic Services; Communication and navigation services; Meteorological services; Search and Rescue.
GEN 4	Charges for aerodrome/heliport and air navigation services - Aerodrome/heliport charges; Air navigation service charges.

Part 2 - En-route (ENR)

ENR consists of seven sections containing information briefly described hereafter.

ENR 0	Table of Contents to Part 2.
ENR 1	General rules and procedures - General rules; Visual flight rules; Instrument flight rules; ATS airspace classification and description; Holding, approach and departure procedures; ATS Surveillance services and procedures; Altimeter setting procedures; Regional supplementary procedures; Air traffic flow management and Airspace Management; Flight planning; Addressing of flight plan messages; Interception of civil aircraft; Unlawful interference; Air traffic incidents.
ENR 2	Air traffic services airspace - Flight Information Regions (FIR); Upper Flight Information Regions (UIR); Terminal Control Areas (TMA) and Control Areas; Other regulated airspace.
ENR 3	ATS routes - Conventional Navigation Routes; Area navigation routes; Other routes; En-route holding.
ENR 4	Radio Navigation aids/systems - Radio navigation aids - en-route; Special navigation systems; Global Navigation Satellite System (GNSS); Name-code designators for significant points; Aeronautical ground lights - en-route.
ENR 5	Navigation warnings - Prohibited, restricted and danger areas; Military exercise and training areas and Air Defence Identification Zone (ADIZ); Other activities of a dangerous nature and other potential hazards; Air navigation obstacles; Aerial sporting and recreational activities; Bird migration and areas of sensitive fauna.
ENR 6	En-route charts.

Part 3 - Aerodromes (AD)

AD consists of four sections containing information as briefly described hereafter.

AD 0	Table of Contents to Part 3.
AD 1	Aerodromes/Heliports - Introduction - Aerodrome/heliport availability and conditions of use; Rescue and fire fighting services and snow plan; Index to aerodromes and heliports; Grouping of aerodromes/heliports; Status of certification of aerodromes.
AD 2	Aerodromes - Detailed information about aerodromes (including helicopter landing areas if located at the aerodromes) listed under 25 sub-sections. Aerodrome specific aeronautical charts and instrument flight procedures.
AD 3	Heliports - Detailed information about heliports (not located at aerodromes), listed under 23 sub-sections. Heliport specific aeronautical charts and procedures and instrument flight procedures. Unlicensed Heliports (Point-in Space procedures (PinS)) - Limited information about heliports, Instrument Approach Procedures.

4.2 The UK AIP is amended in accordance with the AIRAC schedule prescribed by ICAO. Information, containing all publication ‘cut off’ timetables, is available on the UK AIS website or by contacting AIS.

5 UK Aeronautical Information Product Terms and Conditions

5.1 NATS (En Route) PLC ('NATS') as the UK Aeronautical Information Service Provider (AISP) endeavours to make available aeronautical information and data in the UK 'Aeronautical Information Products' in compliance with relevant ICAO Standards and Recommended Practices, except where any differences are notified in the GEN 1.7 section of the UK AIP.

5.2 NATS will maintain the integrity of the information and data supplied to the AIS, from receipt through to the point of publication. However, because these products are compiled using information originated and supplied by numerous external parties, NATS cannot guarantee the accuracy or completeness of content.

GEN 0.1 PREFACE (continued)

5.3 To the fullest extent permitted by law, NATS accepts no liability for your use of UK Aeronautical Information Products.

Note: *'Aeronautical Information Products' means aeronautical data and aeronautical information provided either as digital data sets or as a standardised presentation in paper or electronic media. Aeronautical Information Products include:*

- Aeronautical Information Publication (AIP), including Amendments and Supplements;
- Aeronautical Information Circulars (AIC);
- Aeronautical Charts;
- VFR Charts;
- NOTAM;
- Digital Data Sets.

5.4 There are a number of commercial organisations and other third-parties that provide data services and/or process data using information sourced from official UK Aeronautical Information Products, and who then make this information available to users within their own products and services (with or without charge). Under current UK legislation there are no regulatory requirements in place for third-party providers other than DAT Providers in the scope of Regulation UK (EU) 2017/373 under Annex VII, Part-DAT.

5.5 Aeronautical data and aeronautical information are necessary for the safety of air navigation and it is highly recommended that all organisations or individuals that process aeronautical information sourced from UK Aeronautical Information Products should apply best practices to ensure that it maintains its integrity, is timely, complete and in a form suitable for users, as described in CAP 779 Regulation of Aeronautical Information Management Services. Every data user is liable for any damages caused by any modification made by it to the data made available by the UK AIS and all losses arising from any misuse of the data. Any identified errors should be reported to UK AIS. Where third-party providers process and re-package information which has been sourced from the UK Aeronautical Information Products and data quality issues are identified, the CAA may investigate and take measures to prevent the incorrect data from being made available to users.

6 Service to contact in case of detected Aeronautical Information Product errors or omissions

6.1 Email: aissupervisor@nats.co.uk

7 Document Referencing

7.1 The pagination and section referencing schemes applied to this document employ a very similar construction. User's attention is therefore drawn to the essential difference between the two types of reference.

a) Page numbering is defined by a combination of dots and dashes, whereby the dash represents the page number for information contained within the section, e.g. GEN 3.2-1 is page one of section 3.2.
b) Section and paragraph numbering is divided by dots, e.g. section AD 2.13 and paragraph 1.2.2.1.

7.2 As a general rule, cross references contained in this document will relate to sections or paragraphs. Reference to page numbers will normally be limited to those containing a chart or diagram.

8 Aerodrome Obstacle Data

8.1 From May 2026, AIP Obstacle Data tables (AD 2.10) will be withdrawn from an aerodrome's AIP entry after AIS receive the aerodrome's next Obstacle Survey. On an identified AIP amendment, the tables will be replaced by a link which shall direct users to the aerodrome's Obstacle dataset(s) published on the AIS website.

GEN 0.2 RECORD OF AIP AMENDMENTS

GEN 1 NATIONAL REGULATIONS AND REQUIREMENTS

GEN 1.1 DESIGNATED AUTHORITIES

1 The addresses of the designated authorities concerned with facilitation of international air navigation are:

a) **Civil Aviation**

Department for Transport

Post: Great Minster House, 76 Marsham Street, London. SW1P 4DR
Phone: 020-7944 8300 (Main Switchboard) (Office Hours: 0830-1730)
020-7944 5999 (Out of Office Hours)
Fax: 020-7944 9643
AFS: EGGCYAYX

Civil Aviation Authority

Post: Headquarters, Aviation House, Gatwick Airport South, West Sussex. RH6 0YR
Phone: 0330-022-1500
AFS: EGGAYAYX

Civil Aviation Authority

Post: Legal Department, 5th Floor, 11 Westferry Circus, London, E14 4HD

Civil Aviation Authority

Post: Safety Regulation Group, Aviation House, Gatwick Airport South, West Sussex. RH6 0YR
Phone: 01293-567171
Fax: 01293-573999
AFS: EGGRYAYX

Civil Aviation Authority (Scottish Office)

Post: 7 Melville Terrace, Stirling. FK8 2ND
Phone: 01786-431410
Fax: 01786-448030

b) **Meteorology**

The Civil Aviation Authority is the Met Authority for the United Kingdom. Met forecasting and climatological services for civil aviation are provided by the Met Office as the service provider for the Civil Aviation Authority.

See GEN Section 3.5

c) **Customs and Excise**

Post: HM Revenue and Customs, CITEX Written Enquiries team, Crownhill Court, Tailyour Road, Plymouth, PL6 5BZ
Phone: 0845-010 9000
Email: www.hmrc.gov.uk - see under ‘contact us’

d) **Immigration**

Post: Home Office, UK Border Agency, Lunar House, 40 Wellesley Road, Croydon, CR9 2BY.
Phone: 0870-606 7766 (Central Telephone Enquiry Bureau). Calls are held and answered in sequence, if not answered immediately please hold.

e) **Health**

Post: Department of Health, International Division. Area 326, 3rd Floor, 135-155 Wellington House, London. SE1 8UG
Phone: 020-7972 2000
Fax: 020-7210 4884/0
Email: dhmail@dh.gsi.gov.uk

f) **En Route and Aerodrome/Heliport Charges**

See GEN 4.

g) **Agricultural Quarantine**

Post: Department for Environment, Food and Rural Affairs. Nobel House, 17 Smith Square, London. SW1P 3JR
Phone: 020-7238 6000
Email: helpline@defra.gsi.gov.uk

Post: Department of Agriculture and Rural Development for Northern Ireland. Dundonald House, Upper Newtownards Road, Belfast. BT4 3SB

GEN 1.1 DESIGNATED AUTHORITIES (continued)

Phone: 028-9052 4999
Fax: 028-9052 5546
Email: dardhelpline@dardni.gov.uk

h) **Aircraft Accident Investigation**

Post: Department of Transport. Air Accidents Investigation Branch, Berkshire Copse Road, Aldershot, Hants. GU11 2HH

Phone: 01252-510300
01252-512299 (Accident Reports (H24))
Fax: 01252-376999
AFS: EGGCYLYX
Email: enquiries@aaib.gov.uk

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

1 National Regulations

1.1 General

1.1.1 **Crossing UK Boundaries**

1.1.1.1 Aircraft flying from or to places abroad may cross the coastline or the land frontier at any point, subject, however, to the requirements of regulations in force including those contained in the UK AIP ENR 1.1.3, paragraph 7.

1.2 Restrictions on Use

1.2.1 All operators are reminded of the need to comply with local flying restrictions, and noise characteristics and noise abatement procedures in respect of jet aircraft at United Kingdom airports, details of which are shown on the relevant pages of the AD Section. Care must be taken to ensure that advance arrangements have been made for the ground handling of the aircraft and that, unless special arrangements have been made with the airport authorities concerned, arrivals are scheduled during the airports normal hours of watch.

1.3 Aerodrome Operating Minima

1.3.1 The UK Air Navigation Order states that public transport aircraft registered in a country other than the United Kingdom, aerial work aircraft and private aircraft, when making a descent to an aerodrome must not descend from a height of 1000 FT or more above the aerodrome to a height of less than 1000 FT above the aerodrome if the relevant runway visual range at the aerodrome is at the time less than the specified minimum for landing.

In addition the aircraft referred to above when making a descent to an aerodrome must not:

a) Continue an approach to landing at any aerodrome by flying below the relevant specified decision height; or
b) descend below the relevant specified minimum descent height:

Unless, in either case, the specified visual reference for landing is established and maintained from such height.

1.4 Jet Aircraft

1.4.1 The Department for Transport's Aviation Environmental Division publishes a Notice giving effect to the night restrictions for jet aircraft to and from London Gatwick, London Heathrow and London Stansted. The Notice is published twice yearly as a supplement to the AIP in accordance with Civil Aviation (Notices) Regulations 1978 (SI 1978/1303). The night restrictions are set on a seasonal basis as the clocks change. They comprise a maximum number of movements which can be made each season with a quota which is related to an aircraft's noise classification on take-off or landing.

1.5 Arrival and Departure of Civil Aircraft on Flights between Great Britain, Republic of Ireland, Northern Ireland, Isle of Man or the Channel Islands

1.5.1 The Terrorism Act 2000 came into operation on 19 February 2001, replacing the Prevention of Terrorism Act 1989.

1.5.2 The owners or agents of aircraft employed to carry passengers for reward, coming to Great Britain from the Republic of Ireland, Northern Ireland or any of the Islands or going from Great Britain to any other of those places shall not, without the approval of an examining officer, arrange for the aircraft to call at an airport other than a designated airport for the purpose of disembarking or embarking passengers.

1.5.3 The captain of an aircraft not employed to carry passengers for reward and coming to Great Britain from the Republic of Ireland, Northern Ireland or any of the Islands or going from Great Britain to any other of those places shall not, without the approval of an examining officer, permit the aircraft to call or leave an airport in Great Britain other than a designated airport.

1.5.4 The purpose of these requirements is to enable the police to exercise their powers under the Act to carry out security checks and pilots must comply with the requirements of the examining officer in respect of any examination of the captain, crew or passengers where carried. Arrangements in respect of scheduled flights are well established.

1.5.5 If a pilot or an aircraft operator wishes to make a flight to or from a non-designated airport without an intermediate landing at a designated airport, he must seek prior permission from the Chief Officer of Police in whose area the non-designated airport is located. In practice this is usually via the force Special Branch and should be done as far in advance as possible of the flight being made. (Most Police forces require at least 24 hours notice either directly or via the airport operator).

1.5.6 The following Acts continue to remain in force: Prevention of Terrorism (Jersey) Law 1996. Terrorism and Crime (Bailiwick of Guernsey) Law, 2002. The Isle of Man Prevention of Terrorism 1990.

1.5.7 Airports now available and designated under the 2000 Act are listed at GEN 1.2, Appendix A.

1.5.8 Addresses of Chief Constables are given at GEN 1.2, Appendix B.

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

1.6 Notification of Civil Helicopter Flights to Northern Ireland

1.6.1 Under the present arrangements contained in the Terrorism Act 2000, the Secretary of State for Northern Ireland, requires pilots in command of civil helicopters flying into Northern Ireland to notify the Police Service of Northern Ireland - Belfast 02890-650222 Ext 33607, of the point and time of arrival in Northern Ireland. In addition the usual security arrangements for the destination should be followed.

1.6.2 An amendment to the arrival point/time must be advised to Belfast Aldergrove Radar Control on channel 133.130 who will advise the Police Service of Northern Ireland for the pilot.

1.7 Flights between the Isle of Man and Great Britain or Northern Ireland

1.7.1 All aircraft carrying from the Isle of Man any goods on which United Kingdom or European Union duties have not been paid must land at one of the airports designated by the Secretary of State for the purposes of customs and excise (hereafter referred as 'designated airports') designated airports are listed at Appendix C (paragraph 1.9.1 refers).

1.8 Forced Landings

1.8.1 If an aircraft while on a flight to which the restrictions as to place of landing set out at GEN 1.2. paragraph 1.11.1 apply, is required under or by virtue of any enactment relating to air navigation, or is compelled by accident, stress of weather or other unavoidable cause, to land at a place other than a designated airport, the commander of that aircraft must as soon as possible report the landing to an officer of the Border Force for customs and excise or immigration purposes or a police constable. The commander must comply with any directions given by a Border Force officer with respect to any passengers, crew or goods on board the aircraft. In all forced landing situations, any action taken by officers of the Border Force will take full account of the health and safety needs of passengers and crew.

1.9 Customs and Excise, Immigration and Health Airports

1.9.1 The aerodromes in the United Kingdom which have been designated for the purpose of customs and excise by the Secretary of State for the DfT and as designated ports of entry for the purposes of the Immigration Act 1971 are listed at Appendix C. The appendix also gives information on those aerodromes designated as Sanitary Airports under International Sanitary Regulations.

1.9.2 Only designated airports listed in Appendix C which are also ports of entry for immigration purposes may handle unlimited traffic to and from the UK (see GEN 1.2 paragraph 1.10.1 for details of EU countries) although certain non-designated aerodromes may handle a limited range of traffic to and from such places subject to the airports being covered by a Certificate of Agreement issued by the Border Force. For detailed arrangements at specific aerodromes contact the aerodrome manager.

1.9.3 Charges are payable for the attendance of Border Force staff, for customs and excise purposes, outside certain authorised hours for any duties other than the acceptance of inward report of the aircraft, and the clearance of passengers and their baggage. Details of such charges may be obtained from the HMRC's VAT General enquiries helpline. Tel: 0300-200 3700. A charge may also be levied if attendance by Border Force staff for immigration purposes is required; contact the local Border Force Office for further information.

1.9.4 For information about the International traffic authorised to be handled by individual aerodromes, and about the hours of attendance and arrangements for immigration clearance contact the aerodrome operator or the relevant Border Force office (see GEN 1.2 Appendix D).

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

1.10 Flights from/to Countries Outside the UK

1.10.1 **Arrival in the United Kingdom from outside the UK**

1.10.1.1 Place of arrival. Unless special permission has been obtained from the Border Force for both customs and excise and immigration purposes, the commander of an aircraft entering the United Kingdom from a place outside the UK may not land at any place other than one of the airports listed at Appendix C which is approved for both customs and excise and immigration purposes unless the airport is covered by a Certificate of Agreement issued by the Border Force. Non-scheduled flights need to give advance notice by completing the General Aviation report (GAR) with the timeframes specified on the report.

1.10.1.1.1 All aircraft have to report their expected arrival to the Border Force at least 24 hours (12 hours if arriving from the Channel Islands) prior to arrival. Aircraft commanders and operators should report their expected arrival by completing and submitting a General Aviation Report (GAR) form. The GAR can be submitted over the internet using an approved GAR submission portal. Details of approved GAR submission internet portals are available at: https://www.gov.uk/government/publications/general-aviation-operators-and-pilots-notification-of-flights
Aircraft commanders and operators are strongly advised to use an approved internet portal to submit the GAR. Internet portals are the most efficient method of submitting a GAR and provide users with a message and unique reference number confirming successful submission of the GAR. Alternatively the GAR can be emailed to NCU@hmrc.gov.uk. In addition the GAR should also be submitted to a local Border Force Office if local reporting arrangements are in place. The airfield operator will be able to inform you if this is necessary. If a GAR is submitted to a local Border Force office it must also be emailed to NCU@hmrc.gov.uk or submitted via an approved GAR internet portal. The title of the email should be titled:*'GAR, airfield registration, name of airfield, postcode of airfield (if known)'.* The GAR form and instructions are available at: https://www.gov.uk/government/publications/general-aviation-operators-and-pilots-notification-of-flights

1.10.1.2 Timely requests for the special permission referred to should be made by or on behalf of the commander of an aircraft through the operator of the aerodrome to the appropriate local offices of the Border Force for customs and excise and immigration services. It should be noted that the grant of such permission in no way affects the need for compliance with the relevant Article of the Air Navigation Order which requires particular aircraft to use a licensed aerodrome when engaged in the public transport of passengers.

1.10.1.3 When an aircraft lands at a designated airport the aircraft commander must bring it to the examination station and report its arrival to the Border Force for customs and excise purposes. The Border Force office for the airport of arrival should be contacted for advice on the procedure for making report there concerning customs and excise matters (including any documentary requirements), as such procedures may vary depending on local circumstances.

1.10.1.3.1 If the aircraft has stores on board, they must be declared to the Border Force in accordance with the procedure in operation at the airport concerned (generally using Form C209).

1.10.1.4 **Liability of Aircraft to Customs Duty and VAT**

1.10.1.4.1 **Civil aircraft may be eligible for Customs duty reduction or relief under the following regimes:**

a) Authorised Use Special Procedure can reduce the amount of duty an authorisation holder has to pay when they import aircraft or aircraft parts into Great Britain (England, Scotland and Wales). For more information on authorised use please visit: https://www.gov.uk/guidance/authorised-use-end-use
b) Imports into Northern Ireland (NI) are subject to the Union Customs Code. In NI, authorised use is referred to as end-use. Information on Special Procedures in NI can be found at: https://taxation-customs.ec.europa.eu/document/download/1bdaa892-93fe-4809-93e7-7ead3ea5ebb0_en
c) Temporary Admission Special Procedure can relieve Customs duty and import VAT on civil aircraft used as a Means of Transport (MOT) when temporarily imported into Great Britain (England, Scotland and Wales). This is for aircraft registered outside of GB or the Isle of Man, or if it is not registered, where it is owned by a person established outside of GB or the Isle of Man. For more information on temporary admission please visit:
    i. https://www.gov.uk/guidance/temporary-admission-customs-technical-handbook
    ii. https://www.gov.uk/government/publications/reference-document-for-temporary-admission-eligible-goods-and-conditions-for-relief
    iii. https://www.gov.uk/government/publications/list-of-goods-applicable-to-oral-and-by-conduct-declarations
d) Imports to Northern Ireland are subject to the Union Customs Code. Information on special procedures in Northern Ireland can be found at: https://taxation-customs.ec.europa.eu/document/download/1bdaa892-93fe-4809-93e7-7ead3ea5ebb0_en
e) Some supplies of an aircraft may qualify for the zero rate of VAT. For more information please visit: https://www.gov.uk/guidance/ships-aircraft-and-associated-services-notice-744c

1.10.1.5 **Departure from the United Kingdom**

1.10.1.5.1 Unless special permission has been obtained from the Border Force, the commander of an aircraft may not depart from the United Kingdom to any place or area outside the EU except from a designated airport. Timely requests for the special permission referred to should be made by or on behalf of the commander of an aircraft through the operator of the aerodrome to the appropriate Border Force local office. (Note: Special permission is not required for outward non-scheduled flights for non-EU destinations from Cer-

tificate of Agreement airports, just prior notification using the General Aviation Report (GAR)).

1.10.1.5.1.1 All aircraft have to report their expected departure to the Border Force at least 24 hours (12 hours if flying to the Channel Islands) prior to departure. Aircraft commanders and operators should report their expected arrival by completing and submitting a General Aviation Report (GAR) form. The GAR can be submitted over the internet using an approved GAR submission portal. Details of approved GAR submission internet portals are available at: https://www.gov.uk/government/publications/general-aviation-operators-and-pilots-notification-of-flights
Aircraft commanders and operators are strongly advised to use an approved internet portal to submit the GAR. Internet portals are the most efficient method of submitting a GAR and provide users with a message and unique reference number confirming successful submission of the GAR. Alternatively the GAR can be emailed to NCU@hmrc.gov.uk. In addition the GAR should also be submitted to a local Border Force Office if local reporting arrangements are in place. The airfield operator will be able to inform you if this is necessary. If a GAR is submitted to a local Border Force office it must also be emailed to NCU@hmrc.gov.uk or submitted via an approved GAR internet portal. The title of the email should be titled:*'GAR, airfield registration, name of airfield, postcode of airfield (if known)'.* The GAR form and instructions are available at: https://www.gov.uk/government/publications/general-aviation-operators-and-pilots-notification-of-flights

1.10.1.5.2 It should be noted that the grant of such permission in no way affects the need for compliance with the relevant Article of the Air Navigation Order which requires particular aircraft to use a licensed aerodrome when engaged in the public transport of passengers.

1.10.1.5.3 Any stores on board or loaded onto an aircraft, together with the stores list on form C208 must be made available for Border Force examination if required for customs and excise purposes. The Border Force will advise details of any other documentary requirements, relating to customs and excise matters, which may vary from place to place depending on local circumstances.

2 Scheduled Flights

2.1 Flights to and from the United Kingdom - Scheduled Flights - Commercial

2.1.1 Airlines are required to fulfil the following:

a) Confirmation to be made to the DfT whether dangerous goods, weapons or munitions of war are to be carried. If it is proposed to carry forbidden goods, as defined in ICAO Technical Instructions for the Safe Transport of Dangerous Goods by Air (Doc. 9284-AN/905), confirmation should be provided by the airline that an 'exemption' has been issued by the UK CAA. (The term 'Dangerous Goods' has the meaning assigned to it by the Air Navigation (Dangerous Goods) Regulation 2002). For more details contact: Dangerous Goods Office, CAA, Aviation House, Gatwick Airport, West Sussex RH6 0YR.Tel: 01293-573800, Fax: 01293-573991, Telex: 878753 CAA SRG, e-mail dgo@srg.caa.co.uk);
b) Air Travel Organisers Licence (ATOL), as set out at GEN 1.2. paragraph 3.7.

2.2 Flights to/from Countries Outside the European Economic Area (including services involving the Channel Islands, Isle of Man, Gibraltar and UK Overseas Territories)

2.2.1 DfT Operating permits for scheduled services are required under Article 138 of the Air Navigation Order 2005, Article 77 of the Air Navigation Order 1972 (for flights to Jersey), Article 77 of the Air Navigation Order 1976 (for flights to the Isle of Man), Article 80 of the Air Navigation Order 1980 (for flights to Guernsey) and Article 135 of the Air Navigation (Overseas Territories) Order 2007 and will be issued in accordance with the traffic rights available under the UK's bilateral air services agreements with the carrier's State. Permits are normally granted on a seasonal basis.

2.2.2 Designation

2.2.2.1 Formal designation of the carrier to operate agreed routes under the relevant bilateral Air Services Agreement will be required. If the airline is not already designated, DfT will require confirmation by the airline's aeronautical authority that it is prepared to designate the airline under the relevant air services agreement before permission will be granted.

2.2.3 Operators wishing to apply for the permission required must also provide the following information to DfT:

a) Schedule, including start date, of the proposed service;
b) Type of aircraft to be used;
c) In some cases airlines may be required to file tariffs for passenger services with the Foreign Carrier Permits Department, Civil Aviation Authority, foreigncarrierpermits@caa.co.uk, Fax 020-7453 6322, Tel 033-0138 3484.

2.2.4 Documentary Requirements

a) Certificate of Competency and/or Air Operators Certificate and an Operating Licence issued by the aeronautical authority of the airline's country of registration;
b) Certificate of Airworthiness and Certificate of Registration issued by the aeronautical authority of the country of registration for all aircraft to be used on services to the UK;
c) Certificate of liability insurance for passengers and third party risks in respect of each aircraft to be used on services to the UK. For cargo flights, certificate of third party liability. The level of insurance must meet the minimum levels of insurance for passenger and third party liability set out in Articles 6 and 7 of EC Regulation 785/2004;

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

d) Dangerous Goods confirmation as set out in paragraph 2.1.3 (a);
e) Air Travel Organisers Licence (ATOL) as set out at GEN 1.2. paragraph 3.7 (not for cargo services);
f) A statement that flight crews' Non-Precision and Category 1 Aerodrome Operating Minima complies with the UK Air Navigation Order;

Note: *The notified method for calculating UK minima is set out in the UK AIP Aerodrome (AD Volume 1);*

g) Statement that the aircraft operator is aware of the UK Approach Ban requirements set out in the UK Air Navigation Order, and that flight crews will be issued with written instructions with regard to the UK Air Navigation Order prior to operating the flights into the UK;

Note: *Statements about Aerodrome Minima and Approach Ban are to be made to the DfT but any enquiries should be made to the Flight Operations Policy Dept, Civil Aviation Authority, Aviation House, London Gatwick Airport, West Sussex RH6 0YR. Tel: 01293-573414, Fax: 01293-573991, Telex: 878753;*

h) Noise certificate of aircraft to be used (all aircraft must be Chapter 3 compliant);

i) Confirmation that Airborne Collision Avoidance System (ACAS II or TCAS Version 7.1) is fitted (if not, provide exemption statement by the airline's aeronautical authority).

2.2.5 Leased Aircraft

2.2.5.1 DfT will also require the above documents in regard to any foreign registered aircraft leased from another carrier which the applicant carrier proposes to use to the UK and additionally the following information:

a) Confirmation that the lease has been approved by the lessee’s aeronautical authorities;
b) confirmation of which airline’s operations and flight manuals will be used;
c) contact details of the lessor airline (name, address, telephone, fax, telex, e-mail);
d) copy of the lease agreement;

Note: *Documents should be provided in the English language. If they are submitted in a foreign language, DfT may request an English translation to be provided.*

2.3 Applications

2.3.1 Applications to be submitted at least two months prior the start of the operating season in question, or start date proposed for new services, to: DfT, International Aviation & Safety Division, First Floor, Great Minster House, 76 Marsham Street, London SW1P 4DR as follows:

Fax: 020-7944 2194, e-mail: airlineoperatingpermits@dft.gsi.gov.uk

For operators of aircraft registered in the CIS, Asia, Far East, Australasia, Central, North and South America, including the Caribbean

- IASD1: Tel: 020-7944-5804, 020-7944 5848; 020-7944-5849, 020-7944-5807;

For operators of aircraft registered in Africa, Middle East and Europe (including Baltic States, but excluding CIS)

- IASD2: Tel: 020-7944-5847, 020-7944-5806, 020-7944-5812;

Note: *Applications for seasonal permits will be considered only during normal office hours. Operating permits will be refused to any airlines, type or specific aircraft or aircraft registered in States where evidence suggests do not comply with international safety standards, including those banned within the European Union. The list of which can be found at http://ec.europa.eu/transport/air-ban/list_en.htm*

2.4 Overflight and Non Traffic Stops

2.4.1 Prior permission is not required for scheduled flights by aircraft registered in countries that are parties to the International Air Services Transit Agreement (IASTA) or where the relevant UK bilateral Air Services Agreement allows overflying the UK or making stops for non-traffic purposes. Prior permission is, however, required for such flights by aircraft registered in countries that are not party to IASTA or where the relevant bilateral Air Services Agreement does not provide for either first and second freedom rights and should be sought in accordance with the procedure set out in paragraph 2.2.

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

3 Non-Scheduled Commercial Flights

3.1 Procedures

3.1.1 **Overflying and Technical Stops**

3.1.1.1 Prior permission is not required for non-scheduled flights by aircraft registered in countries which are parties to the Chicago Convention (Contracting States) overflying the United Kingdom or making stops for non-traffic purposes. Prior permission is, however, required for such flights by aircraft registered in countries which are not parties to the Chicago Convention and should be sought in accordance with the procedure set out in paragraph 3.8.

3.2 Traffic Stops

3.2.1 Civil aircraft registered in Chicago Contracting States operating flights for valuable consideration, may not take on board or discharge passengers or goods in the United Kingdom, except with the prior permission of the Secretary of State for Transport (DfT), granted under the UK Air Navigation Order, to the operator or charterer of the aircraft or to the Government of the country in which the aircraft is registered. Applications for such permission should be made in accordance with the procedures set out in paragraphs 3.8 to 3.12 as appropriate.

3.2.2 Flights to/from countries within the European Economic Area (EEA)

3.2.2.1 Under EC Regulation 2408/92 on Market Access carriers registered in a European Economic Area (EEA) country may operate freely between those countries including cabotage. Permission is not required from the DfT for EEA airlines to operate on such routes which are available to them under EC Regulation 2408/92.

3.2.3 The European Economic Area consists of the following countries:

Austria	Belgium	Bulgaria†	Cyprus	Czech Republic	Denmark	Estonia
Finland	France	Germany	Greece	Hungary	Iceland	Republic of Ireland.
Italy	Latvia	Lichtenstein	Lithuania	Luxembourg	Malta	Netherlands
Norway	Poland	Portugal	Romania	Slovakia	Slovenia	Spain
Sweden	Switzerland	United Kingdom				

† Bulgaria is currently partially excluded from the internal aviation market. Bulgarian operators may therefore be required to apply to DfT for specific permissions.

Note: *The Channel Islands, Isle of Man and Gibraltar are currently outside the scope of the market access regulation.*

3.3 Charter Services Operated in Place of a Scheduled Service

3.3.1 A charter flight operated in place of a scheduled service and which does not comply with the terms of the operating permit originally issued becomes a non-scheduled flight. The United Kingdom does not recognise the concept of 'blocked-off' scheduled flight, which this sort of flight is sometimes termed, and the prior permission from the DfT must be obtained in accordance with the procedures set out in paragraphs 3.8 to 3.12 as appropriate, before such a flight is operated.

3.4 Cabotage

3.4.1 Other than flights under EC Regulation 2408/92 on Market Access, the DfT is prepared to consider applications only in accordance with its procedures for processing applications by foreign airlines wishing to operate fifth freedom charter flights to/from the UK (there are separate procedures for cargo and passenger flights). A copy of the procedures, which apply 'no-objections' and reciprocity of treatment by other governments towards similar flights by UK airlines, can be obtained from the DfT geographical desks given at paragraph 3.14 or at http://www.dft.gov.uk/stellent/groups/dft_control/documents/contentservertemplate/dft_index.hcst?n=14338&l=2. The procedures cover such applications for flights between one place in the United Kingdom and another place in either the United Kingdom or in a United Kingdom Overseas Territory or Associated State.

3.5 Fifth and Seventh Freedom Flights

3.5.1 The DfT is prepared to consider applications **only** in accordance with its procedures for processing applications by foreign airlines wishing to operate fifth freedom charter flights to/from the UK. A copy of the procedures, which apply 'no-objections' from UK airlines and reciprocity of treatment by other governments towards similar flights by UK airlines, can be obtained from the DfT geographical desks given at paragraph 3.14 or at http://www.dft.gov.uk/stellent/groups/dft_control/documents/contentservertemplate/dft_index.hcst?n=14338&l=2.

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

3.5.2 The DfT's 'no-objections' procedures do not apply to the following flights:

a) Flights by EEA carriers under EC Regulation 2408/92 on Market Access;
b) flights that are permitted under the 1956 Multilateral Agreement on Commercial Rights of Non-Scheduled Air Services in Europe; and
c) flights to which EC Council Directive 92/50 relating to the co-ordination of procedures for the award of public services contract applies.

3.6 1956 Multilateral Agreement on Commercial Rights of Non-Scheduled Air Services in Europe

3.6.1 The United Kingdom is a party to the Multilateral Agreement. To give effect to the provisions of this Agreement, permits covering the exercise of traffic rights in the United Kingdom for the categories of flight listed in paragraph 3.6.3 (a) to (e), have been issued to the Governments of the other States which have ratified, or adhered to, the Agreement. Prior permission for each flight operated under such permits is not necessary but should be notified, in advance, to the DfT (Fax: 020-7944 2194, e-mail: airlineoperatingpermits@dft.gsi.gov.uk), giving details as shown in paragraph 3.8.4.

3.6.2 The countries signatory to the 1956 Multilateral Agreement are:

Austria	Belgium	Croatia	Denmark	Estonia	Finland	France
Germany	Hungary	Iceland	Republic of Ireland	Luxembourg	Macedonia	Moldova
Netherlands	Norway	Portugal	Spain	Sweden	Switzerland	Turkey
United Kingdom						

3.6.3 Categories of flight:

a) All-Cargo charters;
b) flights for the purpose of meeting humanitarian or emergency needs;
c) taxi class passenger flights of occasional character on request, provided that the aircraft does not have a seating capacity of more than ten passengers and provided that the destination is chosen by the hirer or hirers and no part of the capacity of the flight is resold to the public;
d) flights on which the entire space is hired by a single person (individual, firm, corporation or institution) for the carriage of his or its staff or merchandise, provided that no part of such space is resold;
e) single flights, no operator or group of operators being entitled under this sub-paragraph to more than one flight per month between the same two traffic centres for all aircraft available to him.

3.6.4 Operators should note that although non-scheduled flights can be operated under the terms of the Multilateral Agreement as indicated above, they will nevertheless need to comply not only with the UK regulations for that category of traffic but also with the regulations of the country at the other end of the route.

3.6.5 The following details in respect of each flight operated in accordance with paragraph 3.6.3, but excluding taxi class flights as in paragraph 3.6.3 (c), for which no notification is required must be furnished to the DfT not less than two full working days before the operation:

a) Name of airline;
b) type of aircraft, nationality and registration marks;
c) date(s) and programmes of flight(s);
d) nature of flight, eg cargo, sole-use charter, etc;
e) name, address and business of charterer, the number of passengers and/or the nature and amount of cargo to be taken on or put down;
f) when applicable, the Air Travel Organiser's Licence Number for passenger charters. See paragraph 3.7.

3.7 Air Travel Organisers' Licences (ATOL)

3.7.1 Any person who makes available in the United Kingdom, or holds themselves out in the United Kingdom as a person who may make available, accommodation for carriage of persons on an aircraft is required, under the provisions of the Civil Aviation (Air Travel Organisers' Licensing) Regulations 1995 (SI 1995/1054) to hold an appropriate Air Travel Organiser's Licence, issued by the United Kingdom Civil Aviation Authority (CAA) authorising him to do so, unless:

a) He will be the operator or reasonably believes that he will be the operator of the relevant aircraft when the flight is made;
b) he is acting as agent on behalf and with the authority of a disclosed identified ATOL holder;
c) he is a person who is exempted by the CAA from the need to hold an ATOL;
d) before accepting any payment he supplies a valid ticket for travel in respect of any flight accommodation which he makes available.

3.7.2 Details of the conditions of, and applications for Air Travel Organisers' Licences can be found here https://www.caa.co.uk/ATOL-protection/Trade/About-ATOL-and-how-to-apply/

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

3.8 Other Charter Flights

3.8.1 General Procedures (types of charter).

3.8.2 Prior permission is required for all types of flights other than:

a) Private flights;
b) flights as listed in paragraph 3.1.1 (ie overflying/technical stops);
c) flights in Europe as listed in paragraph 3.2.2.1;
d) third and fourth freedom passenger and cargo charters by US 'charter designated' carriers who need to file in advance details of flights or flight programmes only, accompanied where necessary by passenger lists, etc.

3.8.3 Operators should make applications for permits, where required, or filings in the case of US designated carriers, to the DfT on the geographical desk basis detailed in paragraph 14. Operators should give as much notice of the proposed flights as possible and, except in cases of genuine urgency (see paragraph 3.8.4 Note 1) at least two full working days before the arrival in, or departure from, the United Kingdom. Applications for fifth or seventh freedom or cabotage flights must be made in accordance with the timescales in the DfT's procedures for processing applications by foreign airlines wishing to operate fifth freedom charter flights to/from the UK. It is recommended that requests for permission are made on the application forms available at http:// www.dft.gov.uk/stellent/groups/dft_aviation/documents/ page/dft_aviation_040026.hcsp.

3.8.4 All applications for permission must include the following details:

a) Name of airline and address to which permit should be sent;
b) type of aircraft, nationality or registration marks;
c) date and programme of flights;
d) place of embarkation or disembarkation abroad, as the case may be, of passengers and/or cargo;
e) nature of flight eg cargo, inclusive tour, sole-use charter etc (see conditions set out in paragraphs 3.8.5 to 3.8.9);
f) name, address and business of charterer, the number of passengers and/or the nature and amount of cargo to be taken on or put down;
g) when applicable, the Air Travel Organiser's Licence Number.

Note 1: *The reason for the urgency* ***must*** *be stated in any application submitted at less than the specified period of notice. Outside normal office hours (0900 to 1730 local, Monday to Friday), applications should be made to the DfT Duty Office either by fax or e-mail (Fax: 020-7944-5369, e-mail: duty.officers@dft.gsi.gov.uk). Tel: 020-7944 5999. All messages must contain all of the information about the flight set out at (a) to (g) above.*

Note 2: *In considering applications for permission to operate non-scheduled flights to and/or from the United Kingdom, the DfT will take into account the conditions imposed by foreign States on similar flights by United Kingdom operators.*

3.8.5 **Special Event Charters**

3.8.5.1 A special event charter flight is a flight for the carriage of persons all of whom have a bona fide intention of participating in a special event of a sporting, religious, cultural, or other nature who have, before their outward journey, been provided with a ticket for a round-trip entitling them to be carried on both their outward and return journeys by air.

Note: *The DfT will only consider applications for permission to operate fifth or seventh freedom special event charters in accordance with its procedures for processing applications by foreign airlines wishing to operate fifth freedom charter flights to or from the UK. Applications should include the details set out in paragraph 3.8.4, together with full details of the special event in question and of arrangements for surface transport between the event and the airport. The operator will normally be required to certify that each passenger has a bona fide intention of attending the event - eg has a valid ticket to the event.*

3.8.6 **Sole-use (Single Entity) Charters**

3.8.6.1 A sole-use charter flight is a flight solely for the carriage of cargo or passengers with or without their baggage, or both cargo and passengers, in consequence of a person's exclusive right to use the carrying capacity of the aircraft, being:

a) Cargo - all of which is consigned by that person and none of which is carried in pursuance of an agreement between that person and any other person made otherwise than as a term of the sale of the cargo (see also paragraph 3.9.5 for cargo only charter flights);
b) passengers - none of whom are carried for a separate fare: for the purposes of this provision:
    i. any reward wholly or partly in respect of or in connection with the carriage of a passenger (other than remuneration passing from the operator of the aircraft to a member of the crew thereof) shall be deemed to be a fare, irrespective of the person by or to whom it has been given: provided that reward for exclusive right to use the passenger capacity of the aircraft shall not be a fare; and
    ii. a fare shall be deemed to be separate although it is for several journeys, or for a journey by a group of passengers who are fewer in number than the number of seats occupied on the flight.

3.8.6.2 Applications for permission, or filings in the case of US charter designated carriers, to operate sole-use charter flights should be made as set out in paragraph 3.8.4 and must be submitted together with statements by both the operator and the charterer that the conditions set out above will be complied with.

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

3.8.7 **Cargo Charters**

3.8.7.1 Applications for permission to operate cargo charter flights should be made to the geographical desk at DfT detailed at paragraph 3.14, by country of registration of the aircraft involved. Filings by US charter designated carriers should be made to the address given at paragraph 3.14. The attention of operators is drawn to GEN 1.4. paragraph 1.2 and GEN 1.4 paragraphs 3.1 and 3.2.

3.8.7.2 Applications must contain confirmation whether dangerous goods, weapons or munitions of war are to be carried, if it is proposed to carry forbidden goods, as defined in ICAO Technical Instructions for the Safe Transport of Dangerous Goods by Air (Doc 9284-AN/905), confirmation should be provided by the airline that an 'exemption' has been issued by the UK CAA (The term 'Dangerous Goods' has the meaning assigned to it by the Air Navigation (Dangerous Goods) Regulations 2002). For more details contact: Dangerous Goods Office, CAA, Aviation House, Gatwick Airport, West Sussex RH6 0YR.(Tel: 01293-573800 Fax: 01293-573991, Telex: 878753 CAASRG, e-mail: dgo@srg.caa.co.uk).

3.8.7.3 Airlines are reminded that applications for fifth or seventh freedom cargo charters must be made in accordance with DfT procedures for such flights. These are available from the DfT geographical desks and at http://www.dft.gov.uk/stellent /groups/ dft_control/ documents/contentservertemplate/dft_index.hcst?n=14338&l=2.

3.9 Inclusive Tour Charters

3.9.1 Inclusive Tour Charter Services - Other Routes.

3.9.1.1 Operators of aircraft registered in a Chicago Convention Contracting State, wishing to apply to the DfT for the permission required under the Air Navigation Order, to operate inclusive tour charter services to/from the United Kingdom, are reminded that their applications must give the following information for each series of flights:

a) full name and address of operator;
b) nationality, registration marks of aircraft, and capacity to be provided during the whole period (on round trip basis) and showing, where there is more than one tour organiser, the number of seats allocated to each organiser;
c) programme of operations, including the itinerary of the aircraft;
d) name(s) and address(es) of the travel agency(ies) or tour organiser(s) and, where applicable, the number of the Air Travel Organiser's Licence (see paragraph 3.10.1.3 Note 1);
e) details of the conditions under which the inclusive tour is organised:
    i. minimum price payable by a passenger for the inclusive tour (see paragraph 3.10.1.3 Note 3);
    ii. complete routeing of the inclusive tour;
    iii. duration of inclusive tour (including stay at hotel).

3.9.1.2 Applications should be sent to the DfT geographical desk detailed in paragraph 3.14. Separate applications are required for flights to Jersey, Guernsey and the Isle of Man. In addition to operational requirements as set out in other parts of the United Kingdom AIP, operators must ensure that all documentary requirements specified in GEN 1.2.paragraph 3.15 are complied with.

Note: *Applications will not be considered without all the above information.*

3.10 In accordance with the recommendations of the European Civil Aviation Conference (ECAC), DfT requires application for seasonal inclusive tour charter flights to be made by the following dates:

a) For flights between 1 April and 31 October, by 15 January;
b) for flights between 1 November and 31 March, by 1 September.

3.10.1 These time limits shall not, however, apply to single flights or series of flights for which information is not available by the dates specified. In these cases DfT will require a minimum of two full working days notice for single flights and five full working days for series of flights. Any alterations in the condition of operational programmes already approved must be submitted for approval at the earliest possible date.

3.10.2 DfT will only consider applications from airlines of the country of origin or destination of the inclusive tour traffic by air, where the air portion of the holiday includes a single terminal point outside the United Kingdom. In the case of a 2-centre or circular tour holiday originating in or including a stop in the United Kingdom, the Department is prepared to consider applications from operators belonging to any of the Countries which appear in the proposed routeing of the tour, provided that the aircraft will be making a stopover (and not merely a fuelling or other technical stop) at the point or points in the territory of the country to which the operator belongs.

3.10.3 The attention of operators of foreign registered aircraft is drawn to the fact that permits issued to them by DfT for inclusive tour charter flights originating in the United Kingdom will contain the following conditions:

By means of the advertising, publicity or booking arrangements to an inclusive tour charter flight or flights to be performed under this permit, passengers shall be informed before entering into the contract of carriage:

a) That the holder of this permit is intended to be the operator of the aircraft performing the flight(s);
b) of the type of aircraft which the operator intends to use for the purpose of performing the flight(s); and
c) of the airport of destination at which it is intended to set down passengers.

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

Note 1: *Permits will only authorise the carriage of passengers paying an inclusive charge for air transport, surface transport, hotel accommodation and/or facilities in connection with a special event, booked by the tour organisers named in the application for it. It is therefore important that any travel agent(s) associated with the charterer of the aircraft should be named in the application.*

Note 2: *The information given should include a summary of the facilities (other than air transport) between the places named in paragraph 3.9.1.1(c) which are to be provided for the passenger, eg transport from…….. to…… by…… accommodation at…… for…… period, and indicate the nature of the tour, eg single or 2-centre holiday, coach tour, etc. The DfT may request a copy of the relevant tour brochures.*

Note 3: *Charges for inclusive tour charters must comply with regulations prescribed from time to time by the United Kingdom Government.*

3.11 Substitute Charters (Sub-service or Sub-charter Flights)

3.11.1 A substitute charter flight is a flight operated by one operator pursuant to an agreement between that operator and another operator on whose behalf the flight is to be operated, when that other operator holds a licence or permit for the flight.

3.11.2 When the operator of an aircraft registered in any foreign country wishes to exercise traffic rights in the United Kingdom with that aircraft on a substitute flight for another operator (whether that other operator is an operator of a United Kingdom registered aircraft or is the operator of a foreign registered aircraft) prior permission must be obtained from the DfT even though the original operator holds a licence or permit for that flight. Applications for such permission should be submitted by the operator who is to perform the flight, giving reasons for the substitution.

3.11.3 In the case of a substitute flight for other flights described in paragraphs 3.8.5 to 3.8.9 or 3.8.12, the application should be made as set out in paragraphs 3.8 or 3.12 as appropriate; it must include confirmation that the relevant conditions will be complied with, and state the serial number of the licence or permit granted to the operator on whose behalf the flight is to be operated.

Note 1: *In these paragraphs 'licence' means an air service licence granted by the UK CAA to the operator of a United Kingdom registered aircraft.*

Note 2: *In these paragraphs 'permit' means a permit for a flight issued by the DfT to the operator of an aircraft registered in a foreign country.*

3.12 Permits

3.12.1 When a flight has been approved as required by the DfT, a permit will be granted to the operator of the aircraft (see paragraphs 3.8 to 3.11). The airport concerned will be sent a copy of the permit by DfT. For passenger flights, His Majesty's Customs and Revenue will be notified for the purposes of Passenger Duty. Operators are responsible for making their own arrangements with the airport concerned for the reception and handling of the aircraft and should, if necessary, quote the DfT permit number when making these arrangements. Any changes in:

a) The date of operation of the flight into or from the United Kingdom;
b) the nationality or type of the aircraft to be used;
c) the route of the flight; or
d) the charterer or the nature and weight of goods to be taken on board or discharged from the aircraft in the United Kingdom,

must be notified by the operator to the DfT and a variation of the permit obtained before the flight may be operated into or from the United Kingdom. Failure to so notify the DfT may result in the permit for the flight being invalid. Any changes to the times of arrival at or departure from United Kingdom airports for fifth or seventh freedom operations must be notified to the DfT and may require a new application to be made in accordance with DfT's fifth freedom procedures.

3.13 Aerial Photography, Aerial Survey and any form of Aerial Work and Application

3.13.1 Operators of aircraft registered in any foreign country wishing to engage in aerial photography or aerial survey flights in the United Kingdom, whether or not hire or reward is given or for the purpose of any other form of aerial work for hire or reward, are required under the provisions of the UK Air Navigation Order to obtain a permit from DfT. For this purpose they must submit their application to DfT at least **20 full working days** in advance of the proposed operation giving the following information:

a) Name and address of operator;
b) type, nationality and registration mark(s) of aircraft to be used;
c) details of the employer of the crew and photographer (for aerial survey and photography);
d) complete details of proposed operations, including dates, location, height to be flown, etc;
e) documentary requirements:
    i. copy of a valid certificate of airworthiness (copy of annual maintenance log book entries as well, if the certificate of airworthiness is not time limited);
    ii. copy of the certificate of registration;
    iii. copy of the Trust documents if the registered owner is a Trustee;
    iv. copy of valid certificate of insurance; and
    v. radio station licence.

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

Note 1: *If the aircraft has been modified for the type of aerial work to be carried out, details of the modifications together with a copy of the approval of the modifications from the aeronautical authority of the state of registry will be required;*

Note 2: *all documents should be provided in the English language. If they are submitted in a foreign language DfT may request an English translation to be provided;*

Note 3: *DfT will consider all applications subject only to receiving advice from the UK CAA.*

3.13.2 Additionally, operators wishing to engage in low flying (whether for agricultural, horticultural or forestry purposes) in the United Kingdom are required under the UK Air Navigation Order to obtain an exemption from the UK CAA. For this purpose they must submit their application with details (a) to (e) above, through the DfT, at least 20 full working days in advance. Operators are advised to obtain a copy of the document entitled 'The Aerial Application Certificate (CAP 414)' published by and obtainable from Tangent Marketing Services Limited, 37 Windsor Street, Cheltenham, Glos. GL52 2DG.

3.14 Applications

3.14.1 Applications for any type of charter should be made to DfT, International Aviation & Safety Division, First Floor, Great Minster House, 76 Marsham Street, London SW1P 4DR as follows:

Fax: 020-7944 2194
Email: airlineoperatingpermits@dft.gsi.gov.uk

Note: Operators are advised to make applications electronically using the downloadable application forms from the DfT web site (www.dft.gov.uk/stellent/groups/dft_aviation/documents/page/dft aviation_040026.hcsp).

For operators of aircraft registered in the CIS, Asia, Far East, Australasia, Central, North and South America, including the Caribbean:

- IASD1: Tel: 020-7944-5804, 020-7944 5848;

For operators of aircraft registered in Africa, Middle East and Europe (including the Baltic States, but excluding CIS)

- IASD2: Tel: 020-7944-5847, 020-7944-5806,

Note: *Operating permits will be refused to any airline, type of or specific aircraft or aircraft registered in States with evidence suggests do not comply with international safety standards. These are listed on the DfT web site (**http://www.dft.gov.uk**).*

3.14.2 Requests for permission made **out-of-hours, public holidays or at weekends** must be made to the DfT out-of-hours Duty Office:

Phone: 020-7944 5999
Fax: 020-7944 5847
Email: duty.officers@dft.gsi.gov.uk

3.14.3 Applications for seasonal permits will be dealt with only during normal office hours.

3.14.4 In addition to operational requirements as set out in other parts of the United Kingdom AIP, operators must ensure that all documentary requirements specified in GEN 1.2 paragraph 3.15 are complied with.

3.15 Documentary Requirements

3.15.1 **Flights to and from the United Kingdom - Non-Scheduled Flights - Commercial**

3.15.1.1 Documentary Requirements

3.15.1.2 In addition to operational requirements as set out in other parts of the UK AIP operators are required to provide copies of the following:

a) Certificate of Competency and/or Air Operator's Certificate and/or an Operating Licence issued by the aeronautical authority of the country of origin;
b) Certificate of Airworthiness and Certificate of Registration issued by the aeronautical authority of the country of origin for each aircraft to be used on services to the UK;
c) Certificate of liability insurance for passengers and third party risks in respect of each aircraft to be used on services to the UK. For cargo flights, certificate of third party liability. The level of insurance must meet the minimum requirements of insurance for passengers and third party liability set out in Articles 6 and 7 of EC Regulation No785/2004;
d) Dangerous Goods confirmation as set out in GEN 1.2. paragraph 3.8.7.2;
e) Air Travel Organisers Licence (ATOL) as set out in GEN 1.2. paragraph 3.7 (not for cargo services);
f) A statement that flight crews Non Precision and Category 1 Aerodrome Operating Minima complies with the UK Air Navigation Order. (Note: The notified method for calculating UK minima is set out in the UK AIP Aerodrome (AD Volume 1);
g) Statement that the aircraft operator is aware of the UK Approach Ban requirements set out in the UK Air Navigation Order and that flight crews will be issued with written instructions with regard to the UK Air Navigation Order prior to operating the flights into the UK;

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

Note: *Statements about Aerodrome Minima and Approach Ban are to be made to the DfT, but any enquiries should be made to the Flight Operations Policy Dept. CAA, Aviation House, London Gatwick Airport, West Sussex, RH6 0YR. Tel: 01293 - 573414, Fax: 01293-573991, Telex: 878753.*

h) Noise certificate for each aircraft to be used (all aircraft must be Chapter 3 compliant);
i) Confirmation that Airborne Collision Avoidance System (ACAS II or TCAS Version 7.1) is fitted (if not, provide exemption statement by the airline's aeronautical authority).

3.15.2 **Leased Aircraft**

3.15.2.1 The Department will also require the above documents in regard to any foreign registered aircraft leased from another carrier which the applicant carrier proposes to use to the UK together with the following information:

a) Confirmation that the lease has been approved by the lessee's aeronautical authorities;
b) confirmation of which airline's operations and flight manuals will be used;
c) contact details of the lessor airline (name, address, telephone, fax, telex).

Note 1: *Where possible, documents should be provided in the English language. If they are submitted in a foreign language, DfT may request an English translation to be provided.*

Note 2: *DfT may request a copy of the lease agreement (confidentiality will be maintained).*

4 Private Flights

4.1 Advanced Notification - Non-Scheduled Flights - Non-Commercial

4.1.1 Advance Notice of Permit Requirements

4.1.1.1 Except for airport purposes (GEN 1.2. paragraph 1.1) prior permission is not required for private flights by aircraft registered in States which are parties to the Chicago Convention for overflying the United Kingdom or for making non-traffic stops in United Kingdom territory. Permission for such flights by aircraft registered in States not parties to the Chicago Convention should be sought in accordance with the procedure as set out in GEN 1.2. paragraph 3.8 for commercial flights.

4.1.1.2 Pilots of non-scheduled non-commercial flights, have the obligation in respect of passport-control requirements set out in GEN 1.3. paragraph 2.1 and are to present their passengers on arrival and departure to a UKBA Officer, in accordance with the arrangements approved by the Home Office and notified to the airport manager.

4.1.1.3 The exemption for aircrew detailed in GEN 1.3. paragraph 2.1.1 is not applicable to non-commercial crew and the provisions of GEN 1.3. paragraph 2.2.1 apply.

5 Public Health Measures

NOT APPLICABLE

6 Appendix A — Airports Designated Under Terrorism Act 2000 (GEN 1.2 paragraph 1.5 refers)

Designated Airports (Great Britain)	
Aberdeen	Liverpool
Biggin Hill	London City
Birmingham	London Gatwick
Blackpool	London Heathrow
Bournemouth	London Luton
Bristol	London Stansted
Cambridge	Lydd
Cardiff	Manchester
East Midlands	Newcastle
Edinburgh	Norwich
Exeter	Prestwick
Glasgow	Southampton
Gloucestershire	Southend
Humberside	Teesside International
Leeds Bradford	

Designated Airports (Northern Ireland)		
Belfast Aldergrove	Belfast City	Londonderry Eglinton (City of Derry)

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

Designated Airports (Isle of Man and Channel Islands)	
Alderney	Isle of Man
Guernsey	Jersey

8 Appendix C — Designated International Airports - Customs, Immigration and Health (GEN 1.2 paragraph 1.9.1 refers)

8.1 The Aerodromes listed below have been designated for the purpose of customs and excise by the DfT.

8.2 All are also designated points of entry for the purposes of the Immigration Act 1971 except those indicated by Note 1.

8.3 For those aerodromes which are also designated as Sanitary Airports are also identified under International Sanitary Regulations (see Note 2).

Aberdeen
Belfast Aldergrove(2)
Biggin Hill(1)
Birmingham
Blackpool(1)
Bournemouth
Bristol
Cambridge(1)
Cardiff
East Midlands
Edinburgh
Exeter(1)
Farnborough(1)
Glasgow(2)
Humberside(1)
Isle of Man(1)(Not designated by the DfT)
Leeds Bradford
Liverpool
London City(1)
London Gatwick(2)
London Heathrow(2)
London Luton
London Stansted
Lydd(1)

GEN 1.2 ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT (continued)

Manchester[2]
Newcastle
Newquay[1]
Norwich
Prestwick[2]
Shoreham[1]
Southampton
Southend
Sumburgh[1]
Teesside International

Note 1: *These aerodromes are NOT Ports of Entry under the Immigration Act 1971.*

Note 2: *These aerodromes are Sanitary Airports under International Sanitary Regulations.*

GEN 1.3 ENTRY, TRANSIT AND DEPARTURE OF PASSENGERS AND CREW

1 CUSTOMS REQUIREMENTS

1.1 **Aircrew**

1.1.1 **Arriving on Flights from other EU Countries**

1.1.1.1 The duty/tax free allowances do not apply to intra EU crew. No declaration is required to be made unless they are carrying goods which need to be declared such as prohibited or restricted goods. Also, there is no customs restriction on crew members' exit route from the airport (although in practice at most larger airports their movements are constrained by security measures).

1.1.2 **Arriving on Flights from Non-EU Countries**

1.1.2.1 The Border Force officer at the airport of arrival will be able to advise on the arrangements in operation there for clearance of aircrew. Normally, this will involve the crew members in either:

a) Making a declaration on Form C909; or
b) making an oral declaration in the Red Channel or at the Red Point, if they are carrying goods in excess of the customs allowances.

1.1.2.2 The terms of this paragraph apply not only to crew who have arrived on a direct flight from outside the EU, but also to crew whose aircraft has made a stopover at another EU airport.

1.1.3 **Departing on Flights to Non-EU Destinations**

1.1.3.1 It is not normally necessary for crews' effects to be made available for Border Force inspection, except when refund of VAT is being claimed under the Retail Export Scheme. VAT leaflet 704/1 explains the conditions under which aircrew are eligible for the Scheme, and the procedures to be followed.

1.2 **Passengers**

1.2.1 **Arriving on Domestic Flights**

1.2.1.1 The hold baggage of passengers who arrived in the United Kingdom from a non-EU Country and have transferred to a domestic flight will be subject to customs control at the destination airport, if it has not been cleared at the airport of arrival in the United Kingdom. The Border Force officer at the destination airport should be contacted for details of the arrangements.

1.2.2 **Arriving on Flights from other EU Countries**

1.2.2.1 Passengers on direct flights from other EU Countries are not normally required to make any declaration and at most airports proceed through a separate EU exit.

1.2.2.2 The only exception is for passengers who commenced their journey outside the EU and have transferred to a flight to the United Kingdom after arriving in another EU Country. After reclaiming their hold baggage, such passengers must make an oral declaration in the Red Channel or at the Red Point, if they are carrying goods in excess of Customs allowances or prohibited or restricted items. Passengers with nothing to declare should proceed through the Green Channel.

1.2.3 **Arriving on Flights from Non-EU Countries**

1.2.3.1 After disembarkation, passengers completing their journey at a United Kingdom airport reclaim any hold baggage, and if they are carrying goods in excess of Customs allowances, cash or equivalent of €10000 or more, prohibited or restricted items or commercial goods, they must make an oral declaration in the Red Channel or at the Red Point. Passengers with nothing to declare should proceed through the Green Channel. These procedures apply not only to passengers who have arrived on a direct flight from outside the EU, but also to passengers whose aircraft has made a stopover at another EU airport.

1.2.3.2 Passengers who are transferring to a flight to another EU Country do not reclaim their hold baggage, but must declare any goods in their cabin baggage which are in excess of customs allowances.

1.2.3.3 Passengers who are transferring to a flight to a non-EU Country are not required to make any declaration to customs.

1.2.3.4 The Border Force officer at the airport of arrival should be contacted for advice on the arrangements there for passengers transferring to a flight to another United Kingdom airport, as these may vary depending on local circumstances.

1.2.4 **Departing on Flights to Non-EU Destinations**

1.2.4.1 It is not normally necessary for passengers baggage to be made available to Border Force, except when refund of VAT is being claimed under the Retail Export Scheme. VAT leaflet 704/1 explains the conditions under which passengers are eligible for the Scheme and the procedures to be followed.

GEN 1.3 ENTRY, TRANSIT AND DEPARTURE OF PASSENGERS AND CREW

1.3 **Further Information**

1.3.1 Further information on the customs requirements for international travellers, including details of customs allowances, is in Notice 1-Travelling to the UK.

1.4 **Custom's forms and Notices**

1.4.1 Copies of all customs forms, notices and leaflets may be obtained free of charge from the HMRC website www.hmrc.gov.uk or from the HMRC, Customs, International Trade and Excise enquiries service tel: 0845-010 9000.

2 IMMIGRATION REQUIREMENTS

2.1 **Aircrew**

2.1.1 In the case of an aircrew member arriving or departing as such, a valid crew licence or crew member certificate which includes a certification that the holder may at all times re-enter the state of issuance, is acceptable as a document of identity. Aircrew travelling as passengers are required to comply with the provisions of paragraph 2.2.1.

2.1.2 When a person subject to immigration control arrives as a member of the crew of an aircraft and is under an engagement requiring him to leave within seven days as a member of the crew of that or another aircraft, he may enter the United Kingdom without leave and remain until the departure of the aircraft on which he is required by his engagement to leave unless either:

a) There is in force a deportation order against him; or
b) he has at any time been refused leave to enter the United Kingdom and has not since been given leave to enter or remain in the United Kingdom; or
c) a Border Force Officer requires him to submit to examination.

2.1.3 An aircrew member who lawfully enters the United Kingdom without leave by virtue of the foregoing provision, should seek the permission of the Border Force Officer if he wishes to stay longer than seven days.

2.2 **Passengers**

2.2.1 For immigration purposes the United Kingdom, the Channel Islands, the Isle of Man and the Republic of Ireland collectively form a common travel area. A person arriving in the United Kingdom direct from, or departing from the United Kingdom direct to, a place outside the common travel area, is liable to be examined by a Border Force Officer and must produce to him (if required to do so) a valid passport or some other acceptable document satisfactorily establishing identity and nationality or citizenship, endorsed when necessary with a current United Kingdom visa or entry clearance. He must furnish the Border Force Officer with such information as may be required for the purpose of deciding whether he requires leave to enter and, if so, whether and on what terms leave should be given. Information on visa or entry clearance requirements may be obtained from a British Government representative overseas, the Home Office, UKBA or the local Border Force Office.

2.2.2 For the purposes of these requirements the term European Economic Area (EEA) is used to refer to the group of countries listed at GEN 1.2.1.2 paragraph 1 but also includes Iceland, Norway and Liechtenstein.

2.2.3 **Powers and Obligations of Captains and Owners or Agents of Aircraft Under the Immigration Act 1971**

a) Except with the prior approval of the Secretary of State, to embark and disembark passengers only at an airport designated as a port of entry in the GEN 1.2.1.1 Appendix C unless there is reasonable cause to believe all of them to be British citizens;
b) to ensure that persons who have arrived in the United Kingdom do not disembark until examined by a Border Force Officer or other than in accordance with arrangements approved by a Border Force Officer;
c) to ensure that passengers are presented for examination in an orderly manner;
d) to provide a list of crew and passengers if required to do so;
e) to provide landing cards for all passengers who are not British citizens or other nationals of Member States of the EEA;
f) to remove or make arrangements for the removal from the United Kingdom of a passenger arriving in the United Kingdom who is refused leave to enter;
g) to detain in custody persons placed on board an aircraft under the authority of a Border Force Officer;
h) to pay the Secretary of State on demand any expenses incurred by the latter in respect of the custody, accommodation or maintenance of a person at any time after his arrival while he was detained or liable to be detained under the authority of a Border Force Officer unless on arrival that person held a certificate of entitlement, an entry clearance or work permit, or was subsequently given leave to enter before removal directions had been carried out;
i) to remove a person against whom a deportation order is in force, if so directed by the Secretary of State.

2.3 Immigration (Carriers' Liability) Act 1987

2.3.1 Under the Immigration (Carriers' Liability) Act a charge will be levied on carriers who bring to the United Kingdom passengers without proper documentation. The charge will be £2000 for each passenger. The charge will be enforceable by civil action and would arise where a person requiring leave to enter (ie not a British Citizen or other national of the EEA) arrives at the Immigration Control without:

a) A valid passport or document satisfactorily establishing identity and nationality or citizenship; and
b) a valid visa where one is required under the Immigration Rules.

GEN 1.3 ENTRY, TRANSIT AND DEPARTURE OF PASSENGERS AND CREW

2.3.2 Information on visas and documentation can be obtained from British Consulates abroad or from Border Force offices in the United Kingdom; the principal air travel information-systems also carry up-dated information on visas.

2.4 **Landing Cards**

2.4.1 In addition to the general requirements described in paragraph 2 passengers who are not British citizens or other nationals of the EEA will normally be required to produce completed landing cards to the Border Force Officer.

3 PUBLIC HEALTH

3.1 **Public Health Requirements**

3.1.1 The Public Health (Aircraft) Regulations 1979 (England and Wales) give authorised officers and medical officers at airports a number of powers to control the spread of infectious disease, both on arrival and departure. In Scotland and Northern Ireland, broadly similar provision is made in the Public Health (Aircraft) (Scotland) Regulations 1971 (as amended in 1974 and 1978) and the Public Health (Prevention of Infections and Epidemic Diseases - Aircraft) Regulations 1971 (Northern Ireland).

3.1.2 These include powers to inspect aircraft; to de-rat or disinfect the aircraft if necessary; and under certain conditions detain the aircraft on arrival. (Regulations 7, 13, 14 and 16).

3.1.3 Medical officers, under certain conditions, have a number of powers to examine passengers on arrival, to order their isolation, to prohibit their leaving the aircraft, to require a passenger leaving an aircraft to state in writing his name and intended destination address; to cause the removal of an infected passenger from an aircraft; to place passengers under surveillance; or apply a number of additional health protection measures. (Regulations 8, 9, 18, 20, 21 and 23).

3.1.4 In addition, the Regulations impose a number of duties on the commanders of aircraft in terms of notifying cases of infectious disease on board their aircraft prior to landing, as well as supplying information as to the health conditions on board the aircraft once the aircraft has landed (Regulations 11 and 12).

3.1.5 The regulations also give medical officers a number of powers to examine passengers proposing to embark on an aircraft, to prohibit their embarkation if necessary, and under certain conditions to apply any other public health measures required by the Secretary of State for Health (Regulations 27 and 28).

4 FLYING LICENCES AND RATINGS

4.1 **Definitions**

4.1.1 A UK Part-FCL pilot licence means a licence granted in accordance with UK Regulation (EU) No 1178/2011 (as retained and amended into United Kingdom (UK) domestic law under the European Union (Withdrawal) Act), the ‘Aircrew Regulation’.

4.1.2 ‘Part-21 aircraft’ means an aircraft that is subject to UK Regulation (EU) 2018/1139 (as retained and amended into UK domestic law under the European Union (Withdrawal) Act), the ‘Basic Regulation’. The majority of aircraft registered in the United Kingdom are ‘Part-21’ aircraft. A UK registered ‘Part-21 aircraft’ will have a Certificate of Airworthiness or Permit to Fly granted by the CAA.

4.1.3 ‘Non-Part-21 aircraft’ means an aircraft that is not subject to UK Regulation (EU) 2018/1139, the ‘Basic Regulation’. They are aircraft that fall within the categories set out in that Regulation at Annex I or are ‘State’ aircraft. A United Kingdom civil registered ‘non-Part-21 aircraft’ will have a UK national Certificate of Airworthiness or Permit to Fly granted by the CAA.

4.2 **Visiting Pilots holding Third Country ICAO licences**

4.2.1 Unless the CAA directs otherwise, the holder of a valid pilot's licence, granted under the law of a Contracting State to the ICAO Convention or a relevant Overseas Territory, may exercise the privileges of that licence in any UK registered aircraft for a period not exceeding 28 days in a calendar year. This does not apply to student pilot licences and is subject to the following conditions:

a) the licence has been issued in accordance with the relevant international standards as set out in Annex 1 (Personnel Licensing) to the ICAO Convention; and

b) the licence does not include any extraordinary operational or medical conditions, restrictions or limitations; and

c) no flights are made for the purpose of public transport, commercial air transport, or aerial work and the pilot does not receive remuneration; and

d) the holder of the licence does not act as pilot of any aircraft flying in controlled airspace in circumstances requiring compliance with the Instrument Flight Rules and does not give instruction in flying.

e) a declaration is to be made, using forms SRG2141 and SRG2142.

GEN 1.3 ENTRY, TRANSIT AND DEPARTURE OF PASSENGERS AND CREW

4.2.2 Except as may be provided for in UK Regulation (EU) 2020/723, there are no provisions for the validation of instructor or examiner privileges granted under the law of a Contracting State to the ICAO Convention or under the law of a relevant Overseas Territory. Any pilot who wishes to exercise instructor or examiner privileges in a UK registered aircraft to instruct or examine for UK Part-FCL or UK ANO Licence qualifications must hold appropriate UK instructor or examiner privileges issued by the UK.

4.2.3 It should be noted that a licence issued by a Member State of the European Union or the European Economic Area, is considered as a Third Country Licences.

4.3 **Pilots licences for persons residents within the United Kingdom**

4.3.1 UK Part-21 aircraft - pilots flying UK registered 'Part-21 aircraft' for any purpose must hold a UK Part-FCL licence by the UK in accordance with the Aircrew Regulation or validation issued in accordance with UK Regulation (EU) 2020/723 (as retained and amended into UK domestic law under the European Union (Withdrawal) Act).

4.3.2 UK Non-Part-21 aircraft - pilots flying UK registered non-Part-21 aircraft must hold a licence issued in accordance with the current UK Air Navigation Order or hold a validation in accordance with said Order, unless they are the holder of a UK Part-FCL licence.

4.3.3 All pilots who are resident within the UK, must hold a UK licence to operate UK and third country aircraft that are resident within the UK in accordance with Article 2 of UK Regulation (EU) 2018/1139.

4.4 **Pilots of aircraft registered in a third country flying within the territory of the United Kingdom**

4.4.1 Pilots wishing to fly aircraft registered in third countries must comply with the UK Air Navigation Order (UK ANO) Articles 148 and 151, as applicable. This requires the pilot to hold a valid pilot licence, granted or rendered valid under the law of the State of Registry of the aircraft, issued in accordance with the relevant international standards as set out in ICAO Convention Annex 1 (Personnel Licensing).

4.4.2 UK Regulation (EU) 2018/1139, applies to aircraft registered anywhere in the world if they are used by an 'operator established or residing in the United Kingdom'. UK Regulation (EU) 2018/1139 defines an operator as 'any legal or natural person, operating or proposing to operate one or more aircraft.....'.

4.4.3 UK Regulation (EU) 2018/1139 also requires pilots of UK aircraft registered anywhere in the world that are used by operators based in the UK to hold either a valid UK Part-FCL pilot licence or a validation issued in accordance UK Regulation (EU) 2020/723, except where there is an agreement between the UK and the third country of aircraft registry to the contrary.

4.4.4 Pilots of non-Part-21 (Annex I) aircraft registered in third countries and flying within the United Kingdom are unaffected by UK Regulation (EU) 2018/1139 but remain subject to the ANO Articles 148 and 151.

4.5 **Pilots holding licences other than UK Part-FCL or UK ANO licences that are not granted in accordance with the Standards of Annex 1 (Personnel Licensing) to the ICAO Convention**

4.5.1 Pilots whose licences are not ICAO-Annex 1 compliant or include extraordinary operational or medical conditions, restrictions or limitations, must contact the CAA for advice before flying aircraft either registered in the UK, wherever the aircraft based, or registered elsewhere, if the aircraft is based in the UK.

4.6 **Contacting the United Kingdom CAA on licensing matters**

Post: Civil Aviation Authority, Shared Services Centre (Flight Crew Licensing), Aviation House, Beehive Ring Road Crawley, West Sussex, RH6 0YR.
Phone: +44 (0)3300-221972
Email: fclweb@caa.co.uk

GEN 1.4 ENTRY, TRANSIT AND DEPARTURE OF CARGO

1 CUSTOMS AND EXCISE REQUIREMENTS

1.1 **Importation and Exportation of Cargo and Cargo in Transit**

1.1.1 **Movement of Community Goods**

1.1.1.1 With the completion of the Single Market, Community goods moving within the EC are considered to be in 'Free Circulation', and will for the most part, no longer require Community Transit documentation. Community/Free Circulation goods are those which:

a) Originate in the Community; or
b) are goods imported from a non-Community country and which have had all duties and charges paid and are said to be in Free Circulation;
c) goods which have been manufactured in the community wholly or partly from materials or parts which are in Free Circulation.

1.1.2 **Import of Non-Community Goods**

1.1.2.1 The importation of goods from a third country are subject to customs controls and require documentary evidence. Refer to HM Revenue and Customs Notice 199 – Imported goods: Customs procedures and customs debt.

1.1.3 **Transit of Non-Community Goods**

1.1.3.1 Goods which transit the UK and are not in Free Circulation are required to be under Customs control.

1.1.4 **Export of Non-Community Goods**

1.1.4.1 Goods which are to be exported either direct to a third country, or via the EU require an export declaration to be lodged at the Customs office of export. Further information can be found in HM Revenue and Customs Notice 275 – Export Procedures.

1.2 **Freight Charters - Consolidation and Consignment Size**

1.2.1 For outbound cargo charters between the United Kingdom and Europe* there is no minimum consignment size requirement. Consolidation is permitted.

1.2.2 For outbound cargo charters from the United Kingdom, other than to Europe* and the USA, no consignment shall be carried unless it exceeds 500 kg in weight, or 3.0 cubic metres in volume. Consolidation of consignments of less than 500 kg is permitted.

1.2.3 For inbound charters to the United Kingdom, other than from USA and Canada, there are no consignment size or consolidation restrictions.

1.2.4 For inbound charters from Canada, no consignment shall be carried unless it exceeds 500 kg in weight or 3.0 cubic metres in volume. Consolidation of consignments of less than 500 kg is permitted.

1.2.5 Special arrangements apply for both inbound and outbound charters to and from the USA and details can be obtained from IA 2A, Department of Transport.

Note: ** Europe means the area comprising the following countries:*

Albania	Algeria	Andorra
Austria	Belgium	Republic of Bosnia & Herzegovina
Bulgaria	CIS (West of Urals)	Croatia
Czech Republic	Denmark	Finland
France	Germany	Gibraltar
Greece	Hungary	Iceland
Republic of Ireland	Italy	Liechtenstein
Luxembourg	Macedonia	Malta
Monaco	Morocco	Netherlands
Norway	Poland	Portugal (including Azores & Madeira)
Romania	Slovenia	San Marino
Slovak Republic	Spain (including Balearics & Canaries)	Sweden
Switzerland	Tunisia	Turkey (Europe & Asia)
Fed Rep of Yugoslavia (Serbia & Montenegro)		

GEN 1.4 ENTRY, TRANSIT AND DEPARTURE OF CARGO (continued)

2 AGRICULTURAL QUARANTINE REQUIREMENTS

2.1 **TO BE DEVELOPED**

3 DANGEROUS GOODS AND MUNITIONS OF WAR REQUIREMENTS

3.1 **Carriage of Munitions of War**

3.1.1 For operators subject to EASA Ops, CAT.GEN.MPA.155 states that weapons of war or munitions of war may only be carried if approval to do so has been granted by all States whose airspace is intended to be used for the flight. As indicated in GM1 CAT.GEN.MPA.155, there is no internationally agreed definition of the terms 'weapons of war' and 'munitions of war'. For the purposes of flights using UK airspace, these terms are considered to include:

a) any weapon (with or without ammunition);
b) any ammunition;
c) any article containing an explosive or any noxious liquid, gas; or
d) any other thing, which is designed or made for use in warfare or against the person, including parts and accessories for such weapon, ammunition or article.

3.1.2 For all other aircraft (i.e. those not subject to EASA Ops), the UK Air Navigation Order states that munitions of war may only be carried if the Civil Aviation Authority (CAA) has granted permission to do so. The ANO contains the same definition of a munition of war as 3.1.1 above.

3.1.3 Therefore, weapons of war or munitions of war may only be carried by an aircraft within UK airspace if an approval or a permission has been granted by the CAA. Such documents are only granted on a long-term basis rather than for each flight. Application must be made at least 10 working days before the proposed date of the first flight on which weapons of war or munitions of war are to be carried. Applications may either request the approval/permission be granted for a period of one year, or non-expiring. Non-expiring approvals/permissions are subject to an annual fee which is charged by invoice.

3.1.4 If the weapons of war or munitions of war are also classified as dangerous goods, then see also paragraph 3.2 (Carriage of Dangerous Goods).

3.1.5 For details of how to apply for an approval or a permission to carry weapons of war or munitions of war, see paragraph 3.3 (Applications and Enquiries).

3.2 **Carriage of Dangerous Goods**

3.2.1 The requirements concerning dangerous goods vary depending upon which operating regulations apply to the aircraft, as follows:

a) UK commercial air transport aircraft operating under an EASA Ops Air Operators Certificate are subject to CAT.GEN.MPA.200 and require an approval granted by the CAA in order to carry dangerous goods;
b) all other UK registered aircraft are subject to Regulation 4(1)(a) of the Air Navigation (Dangerous Goods) Regulations 2002 and require an approval granted by the CAA in order to carry dangerous goods;
c) non-UK commercial air transport aircraft operating under an EASA Ops Air Operator Certificate are also subject to CAT.GEN.MPA.200 and require an approval granted by the National Aviation Authority of their own State in order to carry dangerous goods within UK airspace;
d) all other non-UK commercial air transport aircraft that are not operating under an EASA Ops Air Operator Certificate (i.e. Third Country Operators) will be subject to EASA Part-TCO once it comes into force and will require an authorisation granted by the European Aviation Safety Agency (EASA) in order to operate in any EASA member State. This authorisation will specify whether or not the operator is authorised to carry dangerous goods. Until such time as EASA Part-TCO becomes applicable to Third Country Operators, a general approval granted by the UK CAA approves the operator to carry dangerous goods within UK airspace provided it holds approval to carry dangerous goods granted by its own State in accordance with International Civil Aviation Organization (ICAO) Annex 18 and the Technical Instructions; and
e) all non-UK, non-commercial air transport aircraft are subject to Regulation 4(1)(a) of the Air Navigation (Dangerous Goods) Regulations 2002 and require an approval granted by the CAA in order to carry dangerous goods.

3.2.2 In addition to the approval described in paragraph 3.2.1, where the ICAO Technical Instructions indicates that a particular type of dangerous goods requires an additional exemption or approval in order to be carried, such approval or exemption must be obtained from the CAA.

3.2.3 Applications for approvals and/or exemptions must be made at least 10 working days before the proposed date of the flight. For details of how to apply for an approval or exemption to carry dangerous goods, see paragraph 3.3.

3.3 **Applications and Enquiries**

3.3.1 Application forms and further information about dangerous goods, weapons of war and munitions of war can be obtained from the following website address:

www.caa.co.uk/dangerousgoods

GEN 1.4 ENTRY, TRANSIT AND DEPARTURE OF CARGO (continued)

3.3.2 Completed application forms should be sent to the Civil Aviation Authority by e-mail, although they may also be sent by post. The applicable addresses and contact details are below:

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS

1 Introduction

1.1 The entry for RVSM is published in accordance with European RVSM implementation.

1.2 Details of other UK General and Special Equipment requirements may be added once determined.

2 RVSM

2.1 Introduction

2.1.1 Reduced Vertical Separation Minimum (RVSM) operations are mandated in part of the upper airspace of the United Kingdom, other European Civil Aviation Conference (ECAC) member states and some adjacent states (referred to as EUR RVSM airspace). In addition RVSM operations are in place in the majority of the world's continental and oceanic airspace. RVSM airspace in the North Atlantic (NAT) region covers the same flight levels as in the EUR RVSM area. RVSM is the generic term for a reduction in vertical separation from 2000 FT to 1000 FT that can be applied to approved operators of approved aeroplanes operating between FL 290 and FL 410 inclusive. With the exception of State aircraft, Non-RVSM Approved aircraft are not permitted to operate within the EUR RVSM airspace, including in the Scottish FIR/UIR and the London FIR/UIR, except for operators of Non-RVSM Approved aircraft wishing to transit the NAT region above RVSM airspace, that is at FL 430 or above.

2.1.2 The requirements for European RVSM are published in the ICAO documents **Regional Supplementary Procedures (Doc 7030 -EUR) and Procedures for Air Navigation Services Air traffic Management (PANS ATM Doc 4444) plus JAA Temporary Guidance Leaflet No. 6 Revision 1 (TGL 6).** Detailed information on the ATS routes, associated flight level allocation and RVSM entry/exit points in the London and Scottish UIRs are published in the UK AIP.

2.2 Means of Compliance

2.2.1 Except for State aircraft, operators intending to conduct flights within the EUR RVSM airspace require a RVSM approval from the State in which the operator is based or from the State in which the aircraft is registered. To obtain such an RVSM approval operators shall satisfy the said State that:

a) aircraft for which an approval is sought have the vertical navigation performance capability required for RVSM operations through compliance with the criteria of the RVSM minimum aviation system performance standards (MASPS);
b) they have instituted procedures in respect of continued airworthiness (maintenance and repair) practices and programmes; and
c) they have instituted operational procedures and a programme of flight crew training so that they have an in-depth knowledge of the criteria for operating in RVSM airspace and this should include both initial and recurrent training.

2.2.2 For UK based operators and the operators of civil aircraft registered in the UK the RVSM approval is to be obtained from the Civil Aviation Authority Safety and Airspace Regulation Group (SARG). Once obtained the RVSM approval is not restricted to a specific region. Instead it is valid globally, where RVSM procedures are applied, on the understanding that any operating procedures specific to a given region should be stated in the operations manual or appropriate crew guidance. Applications for approval should be made on Form CA4040 (RVSM Approval Application) which is available on the CAA website.

2.2.3 Aircraft that have received State approval for RVSM operations will be referred to as 'RVSM approved aircraft' while those aircraft that have not received such approval will be referred to as 'non-RVSM approved aircraft'. State aircraft that have not been granted RVSM approval should be granted access to RVSM airspace and ATC will apply a 2000 FT separation from other traffic.

2.3 Flight Crew Operating Practices and Procedures

2.3.1 All RVSM airspace is defined by ICAO as 'special qualification airspace'. Accordingly it is important that all operators provide their flight crews with a resume of any special procedures or phraseology applicable to a given RVSM operation. Holders of AOCs are required to have an 'operations manual' in which all pertinent details and procedures are specified. Non-AOC holders are required to submit to the CAA for approval RVSM operations instructions/procedures for use by flight crews.

2.3.2 Operations manuals should include sections on:

a) Equipment Requirements and Minima;
b) Flight Planning;
c) Pre-Flight, In-Flight and Post-Flight Procedures;
d) Contingencies;
e) TCAS/ACAS Alerts;
f) R/T Phraseology;
g) Height Monitoring Requirements.

2.4 Contingencies - Applicable to all RVSM Airspace

2.4.1 **General**

2.4.1.1 Flight crews are to report to ATC as soon as practicable any event that may affect their ability to comply with the ATC clearance,

examples being: severe turbulence, loss of thrust, loss of pressurisation, need to divert, uncertainty of present position, etc. If, at any time, it is not possible to notify ATC immediately that a problem has occurred and obtain a new clearance before departing from the old, comply as accurately as possible with any procedures that may be specified for the airspace, eg NAT contingency Procedures. In all cases a good lookout should be maintained and if the aeroplane is equipped with TCAS/ACAS the visual display should be used to assist in the sighting of proximate traffic.

2.4.1.2 The following equipment failures must be reported to ATC:

a) Loss of thrust on one or more engines necessitating descent;
b) Loss of one or more altimetry systems;
c) Failure of all automatic altitude control systems;
d) Failure of any other equipment that could affect the ability of the aeroplane to maintain flight as cleared.

2.4.2 **Contingencies - Applicable to Specified RVSM Airspace**

2.4.2.1 **UK and EUR RVSM Airspace -** In this RVSM airspace it is expected that all aeroplanes will be in continuous radio contact with ATC either on the assigned frequency or on the distress and emergency frequency (121.500 MHz). They will therefore be able to advise ATC of any abnormal circumstances where RVSM performance requirements cannot be met, including encounters with turbulence greater than 'moderate'. ATC will then respond and issue an appropriate revised clearance before the pilot initiates a deviation from the original clearance. It is recognised, however, that there may be some circumstances (such as emergency descent following the loss of cabin pressurisation) where deviations may have to occur with little or no prior notice to ATC. In such cases the pilot will need to obtain a revised clearance as soon as possible after the deviation.

2.4.2.2 **North Atlantic and other Oceanic or Remote RVSM Airspace (if applicable)** - For oceanic and remote area RVSM application, where continuous direct controller-pilot communication may not always be possible, a range of contingencies have been considered which allow independent action by flight crews. In general they permit crews, in exceptional circumstances, to deviate from assigned clearances by selecting flight levels and/or tracks where other aeroplanes are least likely to be encountered. During such deviations crews are required to make maximum use of aeroplane lighting and to transmit relevant information on all appropriate frequencies, including the distress and emergency frequency. Once contact with ATC has been re-established, the crew will be assisted and issued with new clearances as required. Offset track procedures may be permitted if an encounter with turbulence is considered to be due to wake vortex in accordance with PANS ATM (Section 15.2.4). Specific procedures for the NAT region are contained in Section ENR 2.2 of the UK AIP.

2.5 TCAS/ACAS Alerts and Warnings

2.5.1 Procedures for dealing with TCAS/ACAS Alerts and Warnings are contained in Procedures for Air Navigation Services Aircraft Operations (PANS OPS, ICAO Doc 8168), Part 3, Section 3, Chapter 3.

2.6 RT Phraseology

2.6.1 Phraseology associated with RVSM operations has been developed for European wide use. **All** flights must use this phraseology whilst operating, or intending to operate, between FL 290 and FL 410 inclusive in the London and Scottish UIRs.

2.6.2 Aircraft operators are reminded that, within UK airspace, when responding to ATC the pilot is to append the callsign at the end of the message and not at the beginning.

2.6.3 ATC are to use the controller-controller RVSM phraseology for co-ordination between Air Traffic Service Units (ATSUs). In the event of ATC being advised by the pilot that the aircraft is no longer capable of RVSM operations, it is particularly important that the first ATSU that is made aware of the failure generates the appropriate co-ordination, eg the pilot calls for start-up and declares 'unable RVSM due equipment' and the airport ATSU then passes this message on to the first Air Traffic Control Centre involved with the flight.

2.6.4 The detailed RVSM phraseology is contained in Section 2.10.

2.7 UK Specific RVSM Exemptions

2.7.1 This section details the procedure for operators of civil registered aircraft to obtain an RVSM Exemption for the flights listed in paragraph 2.7.2 below. It also details Flight Planning and ATC procedures for civil registered aircraft which have obtained an RVSM Exemption to carry out specific flights in UK RVSM airspace under the control of a military or civil ATS agency as appropriate. The Exemption procedures detailed are UK specific and applicable for flights where RVSM monitoring is required, flights for test purposes and flights in support of MOD requirements. **These procedures are not applicable for EUR RVSM in general or applicable over other HMUs in Europe.**

2.7.2 **Categories of Civil Registered Aircraft Eligible for RVSM Exemption:** The following categories of flights by civil registered Non-RVSM Approved aircraft may be granted RVSM Exemptions to enter UK RVSM airspace:

a) Flights for the purpose of overflying the Strumble HMU for RVSM monitoring;
b) Aircraft using GMU equipment to complete a RVSM monitoring flight;

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

c) Flight testing, whether for the purpose of prototype testing or in association with the approval of a modification to an existing type designed aircraft (eg Trailing Cone Flights for the purpose of gaining RVSM approval);
d) Air Tests (eg post maintenance);
e) Special flights on behalf of the MOD;
f) Calibration flights (eg Radio Navigation Aids).

2.7.3 Aircraft conducting an Airworthiness Flight Test for the CAA are considered RVSM exempt and no application is required. This includes CAA Continued Airworthiness Flight Tests and those flight tests associated with an initial issue of a Certificate of Airworthiness for a series of aircraft. However, operators of aircraft not holding an RVSM approval should take note of the Flight Planning requirements provided in paragraph 2.7.5.3 Note 1, and in all cases prior notification of such a flight test should be made with the appropriate ATC agency. Note: Definition of 'State' aircraft - For the purpose of EUR RVSM, only aircraft used in military, customs or police services shall qualify as 'State' aircraft and are eligible to apply 'M' in ITEM 8 of the Flight Plan.

Note: *Definition of 'State' aircraft - For the purpose of EUR RVSM, only aircraft used in military, customs or police services shall qualify as 'State' aircraft and are eligible to apply 'M' in ITEM 8 of the Flight Plan.*

2.7.4 **RVSM Exemptions - Application Procedure**

2.7.4.1 Manager Airspace Regulation, Safety and Airspace Regulation Group (SARG) is the UK Authority for issuing RVSM Exemptions to aircraft operators for flights conducting tasks detailed in paragraph 2.7.2. An application for an RVSM Exemption will be treated on an individual basis. RVSM Exemptions will only be issued for a specific period in respect of a specific aircraft, or a series of aircraft (eg in support of MOD tasks or aircraft undergoing a CAA Airworthiness Flight Check). Operators of civil registered aircraft requiring RVSM Exemptions should apply to Head of Airspace using a proforma that can be obtained from SARG Tel: 020-7453 6553. All applications (either by E-Mail, Fax or post) are to be sent to:

Post: Manager Airspace Regulation
1E,
Aviation House,
Gatwick Airport South,
West Sussex,
RH6 0YR
Phone: 020-7453 6553
Email: airspaceregulation@caa.co.uk

2.7.4.2 RVSM Exemptions will be returned to the operator by the quickest means and details copied to the relevant ACCs. It is essential that the Serial No. of the RVSM Exemption is quoted in the Remarks of the Flight Plan, otherwise entry to UK RVSM airspace will be refused.

2.7.5 **Completion of Flight Plans - Additional Flight Planning Requirements**

2.7.5.1 Normal flight planning requirements for RVSM operation are contained in Chapter 10 of the UK Flight Planning Guide (CAP 694). Flights operating under an exemption granted in accordance with the guidance above shall conform to the following additional flight planning requirements.

2.7.5.2 **For all Flights, in Item 15** file a maximum level of FL 280 to the point where the flight wishes to enter RVSM airspace (otherwise if GAT the FPL will be rejected by DNM). Do not enter RFL details at FL 290 or above anywhere in item 15. A verbal request to ATC for flight above FL 280 will ensure the FPL is not rejected by DNM.

2.7.5.3 For all flights, in Item 18 include the RVSM Status and Exemption Serial No. in the Remarks, ie: **'STS/UK RVSM EXEMPT.....Serial No.'**

Note 1: *Operators of Non-RVSM Approved aircraft* ***are not to enter 'W'*** *in item 10 even with this specific exemption.*

Note 2: *Having an RVSM Exemption does not confer any right to enter RVSM airspace as GAT unless specifically agreed by the appropriate ATC agency on the day. Any such penetration of RVSM airspace must be subject to the prevailing traffic conditions and controller workload.*

2.7.5.4 **Flight Testing or CAA Airworthiness Test Flights by Non-RVSM Approved Aircraft - In Item 15,** enter route details within the area in which the flight intends to operate, eg OAT, VLN, SMG, VLN and then the return joining point for the ATS route structure to destination at a level not above FL 280. If aerodrome of departure is outside the ATS route structure insert the appropriate routeing; if the final intention is to rejoin the ATS route structure, file to rejoin at the appropriate point not above FL 280. **In Item 18,** insert RVSM Status and Exemption Serial No. (if applicable) and 'RMK/Flight Testing' or 'RMK/CAA Airworthiness Flight Test' as appropriate with requested flight level in RVSM airspace.

2.7.5.5 **Overflight of the Strumble HMU by Non-RVSM Approved Aircraft** - Aircraft requiring RVSM monitoring over the Strumble HMU should flight plan via Strumble in accordance with standard routeing. If flying along the ATS route structure specifically to STU only, after STU insert the required routeing to destination. For flights intending to receive a service from London Radar (Military Control) for the purpose of conducting Air Tests or CAA Airworthiness Test Flights prior to overflying the Strumble HMU, or intending to fly OAT (off route) to facilitate flight over the Strumble HMU without flying along the ATS route structure, the appropriate routeing should be filed. **In Item 18 insert** 'RMK/HMU FLT' (this information will be presented to controllers on active flight progress strips).

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

2.7.6 **Notification to Air Traffic Control**

2.7.6.1 Pilots must pre-arrange handling in RVSM airspace by contacting the appropriate ACC Supervisor or Military Supervisor as appropriate on one of the following numbers:

- LACC Civil Supervisor. Tel: 01489-612420;
- Swanwick Military East Supervisor. Tel: 01489-612408;
- Swanwick Military West Supervisor. Tel: 01489-612417;
- Swanwick Military North Supervisor. Tel: 01489-612943;
- ScACC Civil Supervisor. Tel: 01292-692763.

2.7.6.2 In addition to filing the appropriate flight plan in order to ensure correct handling, pilots should also pass the relevant flight profile details to the appropriate ATC Supervisor.

2.7.6.3 Operators requiring flight over the Strumble HMU should avoid peak periods as ATC need to provide 2000 FT separation between RVSM approved and Non-RVSM approved aircraft above FL 290. If in doubt suitable timings can be arranged with the LACC Civil ATC Supervisor.

2.7.7 **Air Traffic Control (ATC) Procedures for all Flights**

2.7.7.1 When Non-RVSM aircraft are ready to enter RVSM airspace, the appropriate clearance is to be obtained from ATC. Note that, due to the need to provide 2000 FT separation, controllers need to co-ordinate the flight with other RVSM approved aircraft. These flights therefore create extra workload and a slight delay in receiving such clearances should be anticipated. It would therefore be helpful if pilots can provide as much notice as possible prior to requesting flight levels above FL 280.

2.7.7.2 Pilots must comply with any requirements stated in the RVSM Exemption unless otherwise instructed by ATC. Pilots are also reminded to include their Non-RVSM status (callsign: NEGATIVE RVSM) in the initial call on any frequency within RVSM airspace and subsequent frequency changes, when requesting level changes pertaining to flight levels in RVSM airspace and in all read backs to flight level clearances pertaining to flight levels in RVSM airspace.

2.7.8 **Air Traffic Control (ATC) Procedures for Strumble HMU Flights**

2.7.8.1 Pilots should request a suitable flight level above FL 280 from ATC well before reaching the Strumble HMU. For the best chance of successful monitoring, aircraft should fly straight and level at an ATC assigned level between FL 290 and FL 410 throughout the area depicted on the chart at Annex B. Mode A SSR code should not be changed within that area. A single pass over the HMU is sufficient for certification purposes, though some operators may request a second. Pilots of aircraft are to comply with ATC instructions at all times.

2.7.8.2 Overflight of the HMU may be delayed until the flight can be integrated with other traffic and 2000 FT separation applied. ATC will therefore issue instructions as appropriate. As a reminder to ATC that the aircraft is attempting height monitoring, the crew is to transmit 'for Strumble HMU flight' on first contact with London Control or London Radar as appropriate.

2.8 Height Monitoring Requirements

2.8.1 There is an ongoing requirement for height monitoring within the EUR and NAT RVSM airspace in order to monitor safety levels of RVSM operations. Aircraft operators are therefore required to continue participating in ongoing monitoring activities and this may involve the re-monitoring of aircraft that have previously gone through the process. Non-participation can result in the withdrawal of RVSM approval. This monitoring requirement is, in its current form, applicable for EUR RVSM operations specifically to fulfil the requirements for ongoing EUR RVSM Safety Assessments. However, activities are under way to harmonise the detailed monitoring requirements globally. **The CAA is obliged, by ICAO, to keep a database of all UK registered RVSM approved aircraft. Therefore, operators are to inform the CAA (RVSM Approvals) both when they add aircraft to their fleet and of any aircraft they intend to remove from their fleet of RVSM approved aircraft. The CAA will pass this information to the appropriate Regional Monitoring Agency (RMA). This is in addition to any requirements to comply with any Eurocontrol notification procedures.**

2.8.2 In order to have sufficient confidence in safety assessment results sufficient monitoring data is required. Due to the potential changes to altimetry performance over time, there is a limitation on the age of data that can be used for the assessments. Therefore there is a need to obtain new data and this may result in the re-monitoring of certain aircraft types and airframes. Data will be obtained through monitoring by the existing ground based Height Monitoring Units (HMUs). Since much of the data is obtained automatically, no specific action is required from operators unless they are approached by the RMA. Where such an approach is made, the operator is required to cooperate by arranging a special flight to over-fly an HMU. Lack of co-operation by an operator would be reported to the state issuing the approval and could result in the withdrawal of RVSM approval for the aircraft and/or operator in question.

2.8.3 For aircraft operator specific information, such as how many of his/her aircraft of a particular type need to be monitored and within what time frame, the operator may contact the RMA direct.

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

2.8.4 **Organisation of Monitoring Activities**

2.8.4.1 On behalf of ICAO the EUROCONTROL Agency acts as the RMA. The information which will be obtained through the monitoring programme on aircraft compliance status and measured height keeping performance will be combined with the information available from monitoring agencies in other regions.

2.8.4.2 The RMA will support operators and approval authorities on any issue related to RVSM approval and monitoring. The RMA will require information on the aircraft which are intended to operate in EUR RVSM airspace, and which will, therefore, need to be monitored on a periodic basis as part of the continuing safety assessment. To this end the RMA will also be in contact with State approval authorities. The RMA is based at the EUROCONTROL headquarters in Brussels, Belgium.

2.8.4.3 The RMA will ensure the continuous operation of the monitoring systems and will manage the measured height keeping performance data. The RMA will identify any height deviations that are outside the specifications of the ICAO RVSM performance requirements, and will follow-up as required.

2.8.5 **Global Long Term Monitoring Requirements**

2.8.5.1 ICAO has identified the need for ongoing monitoring to ensure the safety objectives continue to be met and to ensure the continued maintenance of height keeping performance of approved aircraft. This longer term monitoring is seen to be essential for the ongoing safety of RVSM operations.

2.8.5.2 The detailed global long term monitoring requirements are continuously evolving and the procedures in place in the EUR RVSM region are designed to conform with these.

2.9 Wake Vortex Issues

2.9.1 The purpose of this section is to present information in respect of wake vortex and to notify pilots and controllers of the relevant procedures in the event of a wake vortex encounter with specific regard to EUR RVSM operations.

2.9.2 The Eurocontrol scheme is recording those encounters that take place in RVSM airspace and does not in any way replace the UK reporting scheme which records all wake vortex encounters in UK airspace (including those at RVSM levels).

2.9.3 **Wake Vortices in EUR RVSM Airspace:** Prior to the implementation of RVSM in the EUR region an independent study concluded that the 'probability of hazardous encounters with wake vortices are not expected to increase but that nuisance encounters would increase'. Since August 2000 EUROCONTROL has been collating wake vortex encounters in the European airspace at FL 245 and above. These encounters have been subject to further independent analysis which has confirmed the findings of the above mentioned study. It is vital, however, that pilots continue to provide reports of wake vortex encounters in RVSM airspace. Any pilot who encounters a wake turbulence incident when flying in EUR RVSM airspace or within an adjacent RVSM transition area should ensure that a detailed report is provided to EUROCONTROL and State Regulation Authorities.

2.9.4 **Wake Vortices Encounters:** ICAO Document 7030 'Regional Supplementary Procedures' recognises wake turbulence as a factor in European and North Atlantic RVSM operations. In the North Atlantic, due to the special nature of the airspace and frequent poor communications, procedures have been developed which allow action by flight crews independent of ATC involvement. These procedures are **not** applicable to EUR RVSM airspace, where direct pilot/controller communication exists together with sufficient radar coverage to enable ATC to manage required flight deviations. In addition the vertical separation between aircraft can be increased tactically should this be necessary.

2.9.5 **Pilot Actions:**

2.9.5.1 When an aircraft is operating in the EUR RVSM airspace and encounters severe turbulence due to weather or wake vortex, and the Pilot-in-Command believes the vertical navigation performance requirements for EUR RVSM airspace cannot be maintained, the pilot shall:

a) inform ATC as soon as possible **('UNABLE RVSM DUE TURBULENCE') ;**
b) obtain a revised ATC clearance prior to initiating any deviation from cleared route or flight level;
c) where such revised ATC clearance could not be obtained prior to such a deviation, obtain a revised clearance as soon as possible thereafter.

2.9.5.2 These procedures should not be interpreted in any way that prejudices the final authority and responsibility of the Pilot-in-Command for the safe operation of the aircraft.

2.9.6 **Controller Actions:**

2.9.6.1 The ATC controller:

a) shall establish either an appropriate horizontal separation or an increased vertical separation of 600 M (2000 FT;
b) shall, to the extent possible, accommodate the pilot's request for flight level and/or route changes and pass traffic information as required;
c) confirm that the pilot is ready to resume RVSM operations **('REPORT READY TO RESUME RVSM')**.

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

2.10 Controller/Pilot RVSM Phraseology

Para	Message	Phraseology
1.	ATC ascertain the RVSM approval status of a flight	(callsign) **CONFIRM RVSM APPROVED**
2.	Pilot indication of non-RVSM approval Status: To be stated: a) in the initial call on any frequency within the RVSM airspace (ATC shall provide a readback with the same phrase); and b) in all requests for flight level changes pertaining to flight levels within the RVSM airspace; c) in all readbacks to flight level clearances pertaining to flight levels within the RVSM airspace. As well, pilots of aircraft, other than State aircraft, shall respond to level clearances involving the vertical transit through either FL 290 or FL 410 with this phrase. See examples shown below.	**NEGATIVE RVSM***
3.	Pilot indication of RVSM approval status:	**AFFIRM RVSM***
4.	State aircraft, non-RVSM approved, shall Indicate their status as being that of a State aircraft, in conjunction with a negative response to the RTF with the phrase:	**NEGATIVE RVSM STATE AIRCRAFT***
5.	ATC denial of clearance into the RVSM airspace:	(callsign) **UNABLE CLEARANCE INTO RVSM AIRSPACE, MAINTAIN** (or **DESCEND TO,** or **CLIMB TO) FLIGHT LEVEL** (number)
6.	For the case of an individual aircraft reporting severe turbulence or other severe weather related phenomenon, the pilot phraseology shall be:	**UNABLE RVSM DUE TURBULENCE***
7.	The phraseology required of a pilot to communicate those circumstances which would cause an aircraft's equipment to degrade to below altimetry MASPS compliance levels shall be: The phrase is to be used to convey both the initial indication of the non-altimetry MASPS compliance and, henceforth, on initial contact on all frequencies within the lateral limits of the RVSM airspace until such time as the problem ceases to exist.	**UNABLE RVSM DUE EQUIPMENT***
8.	The pilot shall communicate his/her ability to resume operation within the RVSM airspace after an equipment related contingency, or his/her ability to resume RVSM operations after a weather related contingency with the phrase:	**READY TO RESUME RVSM***
9.	To solicit this information ATC shall use the phrase:	(callsign) **REPORT ABLE TO RESUME RVSM**
Note: ** indicates a pilot transmission*		

Example 1: A non-RVSM approved aircraft, maintaining FL 260, subsequently requests a climb to FL 320

Pilot RTF:	(callsign) REQUEST FL 320, NEGATIVE RVSM
Controller RTF	(callsign) CLIMB FL 320
Pilot RTF	CLIMB FL 320, NEGATIVE RVSM (callsign)

Example 2: A non-RVSM approved aircraft, maintaining FL 260, subsequently requests a climb to FL 430.

Pilot RTF:	(callsign) REQUEST FL 430, NEGATIVE RVSM
Controller RTF	(callsign) CLIMB FL 430
Pilot RTF	CLIMB FL 430, NEGATIVE RVSM (callsign)

Example 3: A non-RVSM approved aircraft, maintaining FL 360, subsequently requests a climb to FL 380.

Pilot RTF:	(callsign) REQUEST FL 380, NEGATIVE RVSM
Controller RTF	(callsign) CLIMB FL 380
Pilot RTF	CLIMB FL 380, NEGATIVE RVSM (callsign)

Example 4: A non-RVSM approved civil aircraft, maintaining FL 280, subsequently requests a climb to FL 320.

Pilot RTF:	(callsign) REQUEST FL 320, NEGATIVE RVSM
Controller RTF	(callsign) UNABLE CLEARANCE INTO RVSM AIRSPACE, MAINTAIN FL 280

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

Controller-controller RVSM Phraseology		
Para	**Message**	**Phraseology**
1.	To verbally supplement an automated estimate message exchange which does not automatically transfer Item 18 information	**NEGATIVE RVSM or** **NEGATIVE RVSM STATE AIRCRAFT (as applicable)**
2.	To verbally supplement estimate messages of non-RVSM approved aircraft:	**NEGATIVE RVSM or** **NEGATIVE RVSM STATE AIRCRAFT (as applicable)**
3.	To communicate the cause of a single aircraft contingency:	**UNABLE RVSM DUE TURBULENCE (or EQUIPMENT, as applicable)**

3 Area Navigation - RNAV

3.1 Introduction

3.1.1 RNAV is a method of navigation which permits aircraft operation on any desired flight path within the coverage of referenced navigation aids or within the limits of the capability of self contained navigation systems, or a combination of the two. The introduction of RNAV has allowed greater flexibility in airspace design and potential user advantages such as direct tracks, fuel savings etc.

3.1.2 All aircraft that wish to fly in RNAV designated airspace are to be equipped with the appropriate navigation equipment as specified in EASA AMC 20-4 or the AMC-20 series document appropriate to the particular RNAV specification. Specific requirements for equipment to be carried by UK registered aircraft are contained in the table in GEN 1.5, paragraph 5.2.1.

3.2 RNAV 5 / Basic Area Navigation (B-RNAV) (RNAV 5 is PBN terminology for B-RNAV)

3.2.1 **General.** All aircraft, other than State Aircraft*, operating in en-route controlled airspace** within the London and Scottish FIRs/ UIRs shall be equipped with, as a minimum, RNAV equipment meeting RNAV 5 in accordance with the requirements set out in ICAO Doc 7030 Regional Supplementary Procedures (EUR).

Note 1: ** State aircraft are defined by ICAO Convention Article 3 as aircraft used in military, customs and police services.*

Note 2: *** Currently the mandate for the carriage of B-RNAV equipment applies only to the en-route portion of the UK ATS route structure and does not apply to designated feeder routes (SIDs and STARs) in/out of UK TMAs unless otherwise specified. However, consideration is being given to extend the mandate for the carriage of B-RNAV equipment for TMA and feeder route operations.*

3.2.2 **Flight Planning.** Operators of aircraft fitted with RNAV equipment having a navigation accuracy meeting RNAV 5 shall insert the designator letter 'R' in Item 10 of the Flight plan.

3.2.3 **Certification and Approval Requirements.** To be eligible for B-RNAV operations on-board navigation equipment will be required to provide en-route lateral track keeping accuracy of +/- 5 NM or better for 95% of the flight time (RNAV 5). For UK operators and UK registered aircraft the only approval required under the ANO is that B-RNAV equipment and its installation in the aircraft conform to the provisions outlined in the UK Air Navigation Order. No separate operational approvals are required.

Note: *Guidance material concerning navigation requirements associated with RNAV 5 (B-RNAV) operations is contained in EASA AMC 20-4, Airworthiness Approval And Operational Criteria For The Use Of Navigation Systems In European Airspace Designated For Basic RNAV Operations.*

3.2.4 **UK Exemption Policy.** There are no general exemptions issued from the requirement to carry RNAV equipment in the relevant airspace. Aircraft operators seeking to carry out a flight for the purpose of safety of life, maintenance or delivery should, in the first instance, contact the Safety and Airspace Regulation Group (SARG), Manager Airspace Regulation using the details below:

Post: Manager Airspace Regulation
Aviation House,
Gatwick Airport South,
West Sussex,
RH6 0YR,
Phone: 01293-573203
Email: airspaceregulation@caa.co.uk

3.2.5 **Contingency Procedures.** ICAO Doc 7030 Regional Supplementary Procedures detail the procedures for RNAV operations, including contingency procedures. These contingency procedures are summarised below:

a) Failure of RNAV Capability Whilst Airborne - If, as a result of failure of the RNAV system or degradation of it below RNP 5, an aircraft is unable either to enter mandated RNAV airspace or continue operations in accordance with the existing ATC clearance, a revised clearance shall, wherever possible be obtained by the pilot. Subsequent ATC action in respect of that

aircraft will be dependent upon the nature of the reported failure and the overall traffic situation. Continued operation with the current ATC clearance may be possible in many situations. When this cannot be achieved, a revised clearance may be required to revert to navigation using conventional aids. ATC may also provide the aircraft with radar vectors until the aircraft is capable of resuming its own navigation.

b) Failure of RNAV Capability before Departure - In case of failure or degradation of the RNAV system which is detected before departure from an aerodrome where it is not practicable to effect a repair, the aircraft concerned should be permitted to proceed to the nearest suitable aerodrome where repair can be made. When granting clearance to such aircraft, ATC should take unto account the existing or anticipated traffic situation and may have to modify the time of departure, flight level or route of the intended flight. Subsequent adjustments may become necessary during the course of the flight.

c) Flight Plan Procedures - Operators of such aircraft, where a failure or degradation is detected before departure, shall not insert the designators 'S' or 'R' in Item 10 of the Flight Plan. Since such flights require special handling by ATC, Item 18 of the Flight Plan shall contain STS/RNAVINOP. Subsequently, for a flight for which a flight plan has been submitted, a new plan should be filed and the old plan cancelled. For a flight operating on a Repetitive Flight Plan (RPL), the RPL should be cancelled and a new flight plan filed.

d) Phraseology - Whenever initial contact on an ATC frequency is established the pilot shall include the phrase 'UNABLE RNAV DUE EQUIPMENT' immediately after the aircraft callsign.

3.2.6 **UK ATS Routes.** Historically ATS routes have been delineated by ground-based navigation aids (today predominately VORs). Following the introduction of RNAV 5 to all UK en-route airspace, WGS 84 geographical points, which may not be coincident with a VOR, will define the ATS routes in the UK. This has the advantage that if a VOR is moved or withdrawn the alignment of the route can remain unchanged. All UK ATS routes are now RNAV routes at all flight levels. These routes are annotated accordingly in the En-Route section of the AIP.

3.2.7 **Responsibility of Operators.** The navigation system accuracy achievable by a RNAV system is dependent upon both the airspace infrastructure and the airborne equipment. It is the responsibility of the operator to ensure that the required system accuracy can be achieved when planning to operate in designated RNAV 5 airspace. Where position information derived from GPS is the only input to the RNAV system it is incumbent upon operators to confirm that the necessary coverage from GPS is provided for the intended flight.

3.3 Precision Area Navigation (P-RNAV)

3.3.1 AIP text to be developed.

4 RNP Instrument Approach Procedures

4.1 RNP Approach Procedures were previously published in AIP Supplement S11/2008. The supporting text and charts for those aerodrome procedures approved by the CAA have now been introduced into the AIP with effect from 31 July 2008 at which date, Supplement S11/2008 is withdrawn. The CAA approval for the use of RNP Approach Procedures in the UK is detailed below and includes guidance on the calculation of aerodrome operating minima supporting the introduction of APV Baro VNAV procedures.

4.2 RNP 2-Dimensional Non-Precision Approach (NPA) procedures and 3-Dimensional Barometric VNAV (APV Baro VNAV) Approach procedures are only authorised to suitable instrument runways, at appropriately equipped licensed aerodromes with Air Traffic Control (ATC) services as detailed below. However, exceptionally, the CAA may approve a procedure to a non-instrument runway, subject to a case by case assessment.

4.3 Procedures and charts for approved RNP Approaches are included in the appropriate AIP AD Section 8.

4.4 **General**

4.4.1 Notified RNP Instrument Approach Procedures will be available for use by all Instrument and IMC Rated pilots of UK and foreign registered aircraft. Aircraft must have suitably approved equipment.

4.5 **Aircraft Navigation System**

4.5.1 The aircraft navigation system shall include at least one GPS receiver. The navigation system must be approved to conduct :

a) RNP Approaches or;

b) Approaches with RNP 0.3 or RNP-RNAV 0.3.

Note: *The terminology used in Aircraft Flight Manuals may vary between aircraft types.*

4.5.2 All approved installations must have the appropriate approval for RNP Approach operations entered in the Aircraft Flight Manual (AFM), Pilot Operating Handbook (POH) or equivalent.

The navigation system can be as a minimum:

a) A system only based on GNSS having at least one GPS receiver qualified to TSO-C129a/ETSO-C129a Class A1 or TSO-C146()/ETSO-C146() Class Gamma and operational class 1, 2 or 3 or;

b) a multi-sensor system (eg, Flight Management System) having at least one GPS receiver qualified to TSO-C129()/ETSO-C129() Class B1, C1, B3 or C3 or TSO-C145()/ETSO-C145() class 1, 2 or 3 (with equivalent integration guidance).

Note: *() refers to any version of the equipment Technical Standard Order is acceptable eg. TSO-C129 or TSO-C129a.*

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

4.5.3 Any operating limitations mentioned in the AFM, concerning use of the navigation system on RNP Approach procedures must be observed.

4.5.4 Pilots must be able to determine that the on-board aeronautical database and software version in use for the navigation system is valid for the time of flight. The entire approach procedure must be loadable, by name, from the navigation database.

Manually entered and overlay procedures must not be used as the primary reference on any approach, at any time.

4.6 **Pilot Training and Licensing**

4.6.1 UK AOC holder's approval to fly these approaches will be administered under current CAA oversight arrangements. Flight Operations Division Communication 04/2008 directs the attention of AOC holders to guidance material for RNAV operations, including Instrument Approach Procedures. The document may be found on the CAA website at www.caa.co.uk/fodcom0408.

4.6.2 CAP 773 contains technical information on the function of GPS together with equipment requirements, human factors considerations, training and practical guidance for the use of GPS during RNP Approach operations. It also contains guidance for instructors, Flight Training Organisations (FTOs) and Registered Facilities on appropriate training for RNP Approaches. CAP 773 is available on the CAA website and then by following the links Publications; General Aviation.

4.6.3 A CAA Personnel Licensing Department policy statement entitled, 'Flight Training and Testing for RNAV (GNSS) Non-Precision Instrument Approaches' is available on the CAA website and then by following the links Safety Regulation; Personnel Licensing; What's New?

4.6.4 CAA Safety Sense Leaflet No.25 (Use of GPS) has been updated to include safety related guidance and information on the use of GPS in IMC and on Instrument Approaches. The leaflet may be found on the CAA website at www.caa.co.uk/safetysense.

4.7 **Aerodrome Licensing**

4.7.1 The CAA Safety Regulation Group (SRG) Aerodrome Standards Department has issued a Notice to Aerodrome Licence Holders (NOTAL) 4/2007 specifying the responsibilities and actions required of licence holders intending to introduce RNP approach operations. The NOTAL may be found on the CAA website and then by following the links, Publications; Aerodrome; NOTAL.

4.8 **Aerodrome Procedures**

4.8.1 Individual aerodromes wishing to introduce RNP Instrument Approach Procedures are to request the design of such procedures by completing the following form:

http://www.caa.co.uk/docs/7/dap_ta_ifprequestform.pdf

The request is to be made to the Head of Airspace Regulation at the Directorate of Airspace Policy (DAP).

4.8.2 To enable a design to be initiated, aerodromes must have an up-to-date obstacle survey that complies with CAP 232 Aerodrome Survey Information requirements. Where instrument flight procedures do not currently exist, or new procedures introduce markedly different flight profiles, aerodrome operators should be aware of the requirements of the Airspace Change Process published in CAP 725 Airspace Change Process Guidance Document. Both CAP 232 and 725 are available via the CAA website.

4.9 **Aerodrome Operating Minima**

4.9.1 See AD 1.1 subsection 4 for information on Aerodrome Operating Minima.

4.10 **ATS Providers - Information**

4.10.1 The CAA SRG Air Traffic Standards Division has issued an Air Traffic Services Information Notice (ATSIN) Number 108 outlining the responsibilities and actions required of ATS providers at aerodromes intending to introduce RNP Instrument Approach Procedures. The ATSIN is available on the CAA website and then by following the links, Publications; Air Traffic Services; ATS Information Notices.

4.11 **Pre-Flight Planning**

4.11.1 Aircraft operators shall ensure that the appropriate coverage from GNSS is provided for the intended flight. Receiver Autonomous Integrity Monitor (RAIM) availability prediction should take into account the GPS constellation predicted for the duration of the flight, NOTAM and avionics architecture eg, Baro aiding input. Software tools available on the Internet can be used for this purpose e.g. AUGUR or through the aircraft navigation system RAIM prediction capability, if provided. In the event of a predicted, continuous loss of appropriate level of fault detection of more than five (5) minutes for any part of the RNP Approach Procedure, the flight planning should be revised eg, delaying the departure or planning a different approach procedure.

Note: *AUGUR has been developed by EUROCONTROL and is available at http://augur.ecacnav.com/*

4.11.2 RAIM availability prediction software does not guarantee the service; they are tools to assess the expected capability to meet the required navigation performance. Because of failure of some GNSS elements, operators must be aware that RAIM, or GPS navigation altogether, may be lost while airborne which may require reversion to an alternative means of navigation. Therefore,

pilots should assess their capability to navigate (potentially to an alternate destination) in case of failure of GPS navigation.

4.12 **Method of Operation**

4.12.1 Standard Air Traffic Control procedures for sequencing and separating aircraft will apply at all times during RNP approaches.

4.12.2 Pilots shall request clearance to fly the procedure. Clearance to fly the procedure permits the pilot to fly in accordance with the published procedure, following the descent profile.

4.12.3 For APV Baro VNAV procedures, in order to minimise the potential for mis-setting of barometric reference Air Traffic Controllers must confirm QNH with flight crews prior to commencement of the approach.

4.12.4 The approach commences at the Initial Approach Fix (IAF).

Note: *At aerodromes where aircraft are vectored to the Intermediate Fix (IF), eg. London Gatwick and London Heathrow, the RNP Instrument Approach Procedure will commence at the IF.*

4.12.5 **RTF Phraseology:** Pilots should request clearance to fly the procedure using the phraseology:

'(Aircraft c/s), request RNP approach, via (Initial Approach Fix Designator), runway xx'.

Where traffic conditions permit, air traffic controllers shall clear the pilot to follow the procedure using the following phraseology:

'(Aircraft c/s), cleared RNP approach, runway xx, (report at (Initial Approach Fix designator))'.

For traffic sequencing and to aid situational awareness, air traffic controllers may request the pilot to report when established on final approach track or to report at any other relevant point in the procedure. For example:

'(Aircraft c/s), report established on final approach track';

'(Aircraft c/s), report 2 miles from final approach fix'.

Air Traffic Controllers will request that the pilot reports at the final approach fix, using the phraseology:

'(Aircraft c/s), report final approach fix'.

When Air Traffic Control is aware of problems with the GNSS system, the following phraseology should be used:

'(Aircraft c/s), GNSS reported unreliable (or GNSS may not be available (due to interference))';

In the vicinity of (location) (radius) (between (levels)).

or:

In the area of (description) (between (levels)):

'(Aircraft c/s), GNSS unavailable for (specify operation) (from (time) to (time) (or until further notice))'.

Following a RAIM indication, pilots should inform the controller of the event and subsequent intentions.

'(Aircraft c/s), GNSS unavailable (due to (reason eg Loss of RAIM or RAIM alert)) (intentions)';

'(Aircraft c/s), Loss of RAIM or RAIM alert (intentions)'.

4.12.6 After reaching the final approach fix, the pilot will continue to fly the procedure towards the next waypoint, normally the runway threshold. At the appropriate time, the pilot will either continue with the air traffic clearance received or will execute the Missed Approach Procedure (MAP).

4.12.7 **Missed Approach Procedure:** To expedite the introduction of RNP Approaches, the Missed Approach Procedures will be conventional, using ground-based navigational aids. These will be reviewed in due course and, after detailed discussions with the aerodromes to determine optimum hold locations and required tracks, will be converted to full RNP MAPs. Environmental consultation will need to be considered for any new tracks. Until then, all MAPs will be straight ahead to a designated altitude with track guidance. At the designated altitude, the pilot should revert to conventional navigation and route to the holding beacon, ie. by making a turn to the beacon or a turn with continued climb to holding altitude at the beacon.

4.12.8 **Loss of Communications:** In the event of communications failure, the pilot should continue with the RNP procedure in accordance with published loss of communication procedures.

4.13 **Point of Contact**

4.13.1 Pilots, ATS providers or aerodrome operators seeking further information on the establishment of RNP Instrument Approach Procedures should contact:

Post: Manager Airspace Regulation, CAA, 1 NE Aviation House, Beehive Ring Road, Crawley, West Sussex, RH6 0YR
Email: airspace@caa.co.uk

The CAA website may be found at: http://www.caa.co.uk

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

5 Carriage of Radio and Radio Navigation Equipment

5.1 Carriage of Communications Equipment

5.1.1 The requirements for the carriage of radio equipment are contained in the Air Operations Regulation (EU) No 965/2012 and the Air Navigation Order (2016). In the case of the Shanwick Oceanic Control Area, additional requirements are contained in the ANO and the Air Navigation (General) Regulations 2006, as amended.

5.1.2 When required by the applicable airspace requirements, type of aircraft and operations being flown, aircraft and helicopters must be equipped with VHF 8.33 kHz channel spacing radio communication equipment that is capable of conducting two-way communications with aeronautical stations on published channels, as follows:

Applicability	VFR	IFR (or CAT VFR with no visual landmarks)
CS-25 aircraft	2 independent radios	2 independent radios
CS-23 Class I aircraft	1 radio	1 radio
CS-29 / CS-27 / Other CS-23 aircraft	1 radio	2 independent radios
Other aircraft operations in controlled airspace class A (IFR only), B, C, D or RMZ	1 radio	1 radio
Other aircraft operations in controlled airspace Class E	No radio required	1 radio
Other cases	No radio required	

Note: *CS-23 Class 1 aircraft is a Single Reciprocating Engine aircraft with a MCTOW of less than 2721 KG.*

5.1.3 **Operation in the Shanwick Oceanic Control Area**

All aircraft operating within the Shanwick Oceanic Control Area must be equipped with at least one long range communication system, such as HF RTF.

5.1.4 **FM Immunity**

ICAO requirements for receiver FM immunity from the adjacent sound broadcast band are defined in ICAO Annex 10 Volume III Part 2.3.3. (VHF communications). Radio equipment not meeting the immunity standard shall not be used to comply with carriage requirements. UK-registered aircraft exceeding 5700 KG must also have appropriate placards on any non-immune communications set.

5.1.5 **Exemptions for 8.33 kHz Radio Equipment**

Provision for State aircraft exempted from the carriage of 8.33 kHz channel spacing communications equipment will be made on a tactical basis through the provision of an alternative UHF/25 kHz VHF channel. Exemptions from mandatory carriage of VHF 8.33 kHz aircraft radio equipment and procedures to be followed by pilots of non-8.33 kHz equipped State aircraft are described in ENR 1.8.

5.1.6 **Radio Mandatory Zones (RMZ)**

Radio Mandatory Zones (RMZs) refer to an airspace of defined dimensions wherein the carriage and operation of radio equipment is mandatory. (UK REG (EU) No 923/2012 Article 2(106)).

5.1.7 En-route RMZs are detailed at ENR 2.2, subsection 5, and aerodrome specific RMZs are detailed in the Aerodrome Index – Specific.

5.1.8 Temporary RMZs put in place to meet urgent operational requirements may not be incorporated in the AIP due to their limited duration. They will be notified through appropriate means including NOTAM and AIC.

5.2 Carriage of Navigation Equipment

5.2.1 Aircraft must be equipped with sufficient navigation equipment to ensure that, in the event of the failure of one item of equipment at any stage of the flight, the remaining equipment allows safe navigation in accordance with the flight plan.

5.2.2 Aircraft operating IFR or over routes with no visual landmarks as well as UK-registered multi-engined aircraft when flying for the purpose of public transport under VFR must be equipped with navigation equipment necessary to fly in accordance with the ATS flight plan, if applicable; and the applicable notified airspace requirements.

5.2.3 An acceptable means of compliance is:

- One VHF omnidirectional radio range (VOR) receiving system, one DME and one ADF system, except that an ADF system need not be installed provided that the use of ADF is not required in any phase of the planned flight;
- One ILS where ILS is required for approach navigation purposes;

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

- One marker beacon receiving system where a marker beacon is required for approach navigation purposes;
- Area navigation equipment when area navigation is required for the route being flown;
- An additional DME system on any route, or part thereof, where navigation is based only on DME signals;
- An additional VOR receiving system on any route, or part thereof, where navigation is based only on VOR signals; and
- An additional ADF system on any route, or part thereof, where navigation is based only on NDB signals.

5.2.4 Aircraft operators may operate without an additional VOR receiving system or additional ADF system as above provided they are equipped with alternative equipment that allows safe navigation for the intended route.

5.2.5 **Exemptions for Navigation Equipment**

State aircraft are exempt from the requirement for carriage of RNAV equipment. No other general exemption from these requirements will be granted, but, in very special circumstances, relaxation of the requirements, for a single flight, may be approved by the appropriate ATC Unit.

5.2.6 **Navigation equipment unserviceable**

Operators should consult their minimum equipment list and Master Minimum Equipment Lists, as applicable. Otherwise, where not more than one item of equipment is unserviceable when the aircraft is about to begin a flight, may nevertheless take off on that flight if:

1. It is not reasonably practicable for the repair or replacement of that item to be carried out before the beginning of the flight;
2. The aircraft has not made more than one flight since the item was last serviceable; and
3. The commander of the aircraft is satisfied that the flight can be made safely and in accordance with any relevant requirements of the appropriate air traffic control unit, taking into account the latest information available as to the route and aerodrome to be used (including any planned diversion) and the weather conditions likely to be encountered.

5.2.7 **FM Immunity**

All required radio navigation equipment must be FM immune. If the aircraft is UK-registered then any non-immune navigation set must be identified with an appropriately worded placard.

5.3 **Carriage of Surveillance Equipment**

5.3.1 Commission Regulation (EU) No. 1207/2011 and UK Air Navigation Order.

5.3.1.1 Commission Regulation (EU) No. 1207/2011 applies to all flights operating as general air traffic in accordance with instrument flight rules within UK airspace. In addition, requirements for the carriage of Secondary Surveillance Radar (SSR) transponder equipment are given in the Air Navigation Order and related airspace requirements are notified in this section.

5.3.1.2 Commission Regulation (EU) No. 1207/2011 also requires aircraft with a maximum certified take-off mass exceeding 5700 KG or having a maximum cruising true airspeed capability greater than 250 KTS, operating under IFR, to be equipped with ADS-B version 2 datalink, typically pairing of a 1090 MHz Mode S “extended squitter” transponder with an approved GNSS navigation source to provide the required position, vector, altitude and velocity data.

5.3.1.3 A summary of the surveillance equipage requirements is given below:

Sub - para	Applicability	Requirements
SSR Transponder Equipment for Aircraft Operating Under IFR		
(a)	All fixed-wing aeroplanes operating under IFR having a MTOM in excess of 5700 KG **or** having a maximum cruising true airspeed capability in excess of 250 KT with an individual certificate of airworthiness first issued on or after 7 June 1995.	Mode S Enhanced Surveillance, ADS-B version 2 and Mode S Enhanced Surveillance
(b)	Other aircraft operating in accordance with instrument flight rules within UK airspace.	Mode S Elementary Surveillance
SSR Transponder Equipment for Aircraft Operating Under VFR		
(c)	All aircraft operating under VFR within United Kingdom controlled airspace of Classification B and C.	Mode S Elementary Surveillance
(d)	All aircraft operating under VFR within United Kingdom airspace at and above FL 100.	Mode S Elementary Surveillance
(e)	All aircraft operating under VFR within United Kingdom airspace notified as a ‘Transponder Mandatory Zone’. ***Note:*** *Applies to Airspace Classes D, E, F and G as appropriate.*	Mode S Elementary Surveillance
(f)	All aircraft operating under VFR flying for the purpose of Public Transport.	Mode S Elementary Surveillance

5.3.2 **Transponder carriage and operation, Transponder Mandatory Zone Airspace**

5.3.2.1 In accordance with SERA.13001 (a), when an aircraft carries a serviceable SSR transponder, the pilot shall operate the transponder at all times during flight, regardless of whether the aircraft is within or outside airspace where SSR is used for ATS

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

purposes. Pilots are to operate the transponder if equipped and to the full extent of its capabilities. This includes Elementary and Enhanced Mode S and Mode A/C. Pilots of Mode A/C equipped aircraft should note that Mode C should NOT be deselected at any time. The pilot of an aircraft that wishes to operate in a Transponder Mandatory Zone (TMZ - see 5.3.2.2) without such serviceable transponder equipment may be granted access to the TMZ subject to specific ATC approval.

5.3.2.2 **Notified 'Transponder Mandatory Zone' Airspace**

For the purposes of the UK Air Navigation Order and SERA.6005, Transponder Mandatory Zones without an associated aerodrome are detailed at ENR 2.2 Paragraph 4, and aerodrome specific Transponder Mandatory Zones are detailed at the relevant section in AD 2/3.

5.3.2.3 Temporary Transponder Mandatory Zones put in place to meet urgent operational requirements may not be incorporated in the AIP due to their limited duration. They will be notified through appropriate means including NOTAM and AIC. →

5.3.3 **Mode S Capability**

5.3.3.1 **Enhanced Surveillance.** An aircraft is only considered to be compliant with the Mode S Enhanced Surveillance requirements when it can provide all the Downlinked Aircraft Parameters (DAPs) notified in Part 6 to the Air Navigation (General) Regulations 2006 and which have been certificated as compliant with the requirements of EASA AMC 20-13 or with equivalent national certification requirements.

5.3.3.2 **Elementary Surveillance.** An aircraft is only considered to be compliant with the Mode S Elementary Surveillance requirements when it meets the requirements notified in Part 6 to the Air Navigation (General) Regulations 2006 and has been certificated as compliant with the requirements of EASA CS-ACNS. In addition, provided that the differences listed in CS-ACNS Sub-part D, Appendix D have also been addressed, then previous compliance declarations with JAA TGL 13 Revision 1 (Certification of Mode S Transponder Systems for Elementary Surveillance) supplemented with the additional assessments is another Acceptable Means of Compliance.

Note 1: *The minimum capability for the secondary surveillance transponder shall be Mode S Level 2 meeting the performance and functionality objectives of Annex 10 to the Chicago Convention, Volume IV, Third Edition including all amendments up to No 77.*

Note 2: *In accordance with ICAO Annex 10 Volume IV paragraph 3.1.2.10.4, Mode S transponders installed on aircraft with maximum certified take-off mass exceeding 5700 KG or a maximum cruising true airspeed capability in excess of 250 KTS, shall operate the Mode S transponders above with antenna diversity operation i.e. two RF ports for operation with two antennas, one antenna on the top and the other on the bottom of the aircraft's fuselage.*

5.3.4 **Exceptions**

5.3.4.1 The requirements at sub-paragraphs 5.3.1.3 (c) to 5.3.1.3 (e) shall not apply to:

a) Gliders, including self-sustaining gliders and self-propelled hang gliders, and self-launching motor gliders;
   i. Where operating above FL 195 inside airspace notified as TRA(G), or
   ii. Where operating below FL 195 inside notified Non-SSR Transponder Glider Areas.
b) Aircraft below FL 100 in Controlled Airspace outside of the London Terminal Manoeuvring Area when receiving an approved crossing service;
c) Aircraft operating in accordance with a clearance from an appropriate ATC unit for a particular flight, whilst complying with the appropriate Rules of the Air that apply to the airspace concerned and any specific instructions that the ATC unit may give;
d) Aircraft operating in accordance with a general permission given by the appropriate ATC unit, whilst complying with the appropriate Rules of the Air that apply to the airspace concerned and any specific instructions that the ATC unit may give in relation to that particular flight operating under the general permission.

5.3.4.2 The requirements at sub-paragraph 5.3.1.3 (f) shall not apply to:

a) Gliders, including self-sustaining gliders and self-propelled hang gliders, and self-launching motor gliders except when flying above FL 195 outside of airspace notified as TRA(G);
b) Balloons except when flying in the circumstances prescribed at paragraphs 5.3.1.3 (c) to 5.3.1.3 (e).

5.3.4.3 The exception at paragraph 5.3.4.1 (a)(ii) applies in accordance with any specific permission issued by the CAA and published on its website.

5.3.4.4 In accordance with 5.3.4.1 (a) (ii), in order to inform other airspace users of intended flights in Non-SSR Transponder Glider Area 1 (essentially covering much of the Scottish mainland away from the TMAs), glider operators will notify planned areas of operation by NOTAM, typically issued not later than 1400 hours on the day before the planned flight(s).

5.3.5 **Exemptions**

5.3.5.1 **Non Mode S Enhanced Surveillance Capable Aircraft**

5.3.5.1.1 Fixed-wing aircraft operating under IFR having a maximum take-off mass in excess of 5700 KG or having a maximum cruising true airspeed capability in excess of 250 KT, with an individual certificate of airworthiness first issued before 7 June 1995, which are

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

not Mode S Enhanced Surveillance and ADS-B v2 compliant, do not have to comply with these requirements. The aircraft must be Mode S Elementary Surveillance compliant, as a minimum.

5.3.5.1.2 Exemptions from the Mode S Enhanced Surveillance and ADS-B v2 requirements will not be granted for fixed-wing aircraft operating IFR in UK airspace with a first certificate of airworthiness issued on or after 7 June 1995 except for aircraft:

- That are being flown in or out of UK airspace, for the purpose of maintenance and engineering at approved facilities.
- That are being flown out of UK airspace for export purposes;
- That will be taken out of service from UK airspace no later than 31 October 2025.

5.3.5.1.3 Operators of aircraft, with a first certificate of airworthiness issued before 7 December 2020 that is not Mode S Enhanced Surveillance and ADS-B v2 compliant do not have to comply with the requirements until 6 June 2023 inclusive at the latest, subject to having established a retrofit programme before 7 December 2020 demonstrating how they will establish compliance.

5.3.5.2 **Exceptional Circumstance Exemptions from Mode S Elementary Surveillance.** Exemptions from the SSR transponder carriage for ELS requirements will not normally be issued. However, if it is considered that exceptional circumstances exist, an application should be made to:

Post: CNS Policy, Safety and Airspace Regulation Group
Aviation House
Gatwick Airport South
West Sussex
RH6 0YR

Phone: +44 (0)330-138 3373
Email: mode.s@caa.co.uk

Applications shall state details of the inability to meet the requirement, including aircraft type, registration and, where applicable, the forecast date by which installation of equipment will be complete. Due to the significant coordination and planning required with ATS providers, such applications must be made at least 5 days in advance of the flight.

5.3.5.2.1 Where a non-compliant aircraft does not have an exemption as prescribed above the ATS provider is likely to refuse to provide a service within UK airspace.

5.3.5.3 **Transponder Failure.** Cases in respect of transponder failure are to be dealt with in accordance with the SSR Operating Procedures as promulgated in ENR 1.6.2, paragraph 4.

5.3.5.4 **Emergencies.** An aircraft in an emergency situation will be afforded the appropriate level of priority, which shall include implicit exemptions from the appropriate legislation for the purpose of saving life.

5.3.6 **Channel Islands Control Zone**

5.3.6.1 Requirements for the Channel Islands Control Zone are given at EGJJ AD 2.22, paragraph 1.

5.3.7 **State Aircraft**

5.3.7.1 All visiting non-compliant state aircraft require a dispensation against the AIP not to carry the required equipment as detailed at paragraph 5.3.1. All applications for dispensations to be made to:

Post: CNS Policy, Safety and Airspace Regulation Group
Aviation House
Gatwick Airport South
West Sussex
RH6 0YR

Phone: +44 (0)330-138 3373
Email: mode.s@caa.co.uk

Dispensations are only issued up to a maximum length of 3 months, after which time a new application will need to be submitted.

5.3.8 **Flight Plans**

5.3.8.1 Operators of non-equipped State aircraft communicated as per Article 8(3) and operators of aircraft not equipped in accordance with Article 5(5) of the Commission Regulation (EU) 1207/2011, or hold a valid exemption from the UK CAA, operating wholly or partially within the UK airspace shall include the indicators SUR/EUADSBX or SUR/EUEHSX or SUR/EUELSX or a combination thereof, in Item 18 of the flight plan.

5.4 **Carriage of Airborne Collision Avoidance Systems (ACAS) in the Scottish FIR/UIR and the London FIR/UIR**

5.4.1 The requirements for the carriage of Airborne Collision Avoidance Systems (ACAS) are contained in the UK Air Navigation Order. Traffic Alert and Collision Avoidance System (TCAS) II is accepted as a suitable ACAS system provided its installation is

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

certificated by the State of Registry, and that its operation by flight crew is in accordance with instructions for the use of this equipment specified in their company's operations manual.

5.4.2 With the exception of those circumstances at paragraph 5.4.3, all turbine-powered aeroplanes with a maximum certificated take-off mass exceeding 5700 KG or authorised to carry more than 19 passengers, and all other aircraft equipped on a voluntary basis with ACAS II are to be fitted with, and operate, TCAS II software Version 7.1 with a Mode S transponder compliant with Annex 10 Mode S SARPs within UK Airspace.

General flight procedures relating to the operation of ACAS II equipment are detailed at ENR 1.1, paragraph 3, General Flight Procedures. This includes operation of aircraft when ACAS II is unserviceable.

5.4.3 **Exemptions**

5.4.3.1 A General Exemption from the requirements of the UK Air Navigation Order concerning the carriage of ACAS II has been granted for aeroplanes operating under certain conditions. Two classes of flights are affected:

a) **Delivery Flights.** Aeroplanes newly manufactured within European Civil Aviation Conference (ECAC) member states, which are not fitted with ACAS II. These will be permitted to transit on direct flights only, out of the airspace of ECAC member states to regions where the carriage and operation of ACAS II is not required.
b) **Maintenance Flights.** Direct flights by aeroplanes, which are not fitted with ACAS II, from outside ECAC member states, for the purpose of maintenance and engineering at facilities located within the ECAC member states.

5.4.3.2 Following notification approval of an ACAS II exemption for the flight, the aircraft operator should indicate on the Flight Plan that the flight is being operated under the provisions of the ACAS II Delivery and Maintenance Flight Exemption provisions, by inserting, in Field 18, the information:

'RMK / Delivery flight - ACAS II exemption approved', or 'RMK / Maintenance flight - ACAS II exemption approved'.

5.4.3.3 Flights operated under the provisions of these exemptions must be non-revenue flights. An ACAS II delivery or maintenance flight exemption is not available for those flights seeking only to transit through the airspace of ECAC member states.

5.4.3.4 The following conditions apply:

a) Where agreed Regulations and Procedures exist, these shall be maintained.
b) An ICAO compliant altitude reporting transponder must be fitted and serviceable **before** departure.
c) An ACAS II exemption approval will be valid for a 3-day period from estimated departure date, and solely for the purpose for which it has been issued. If the flight is subsequently delayed beyond the maximum 3-day exemption period a fresh application must be submitted; this may take a further 3 working days to process.
d) An ACAS II Exemption Letter issued by the ASU, must be carried on-board the aircraft.
e) Conditions may be imposed by one or more ECAC Member States: such as operating within certain restrictive hours, or via specific routes, or at stated flight levels (for safety reasons or otherwise).
f) The flight must be conducted along the most direct (or permissible) route to the delivery or maintenance destination airport.

Aircraft operators are to ensure compliance with the above conditions and that the exempted flight is in accordance with the operator's originally stated intentions, and that it must comply with any conditions laid down by the CAA and subsequently by the ATC authorities.

5.4.3.5 In addition, test flights are to be subject to established national regulations, procedures and authorisation. Carriage of ACAS II equipment will be addressed under the current provisions for avionics equipment required for these flights.

5.4.3.6 Operators of aeroplanes intended to be operated under the provisions of these exemptions must apply for an exemption on an individual, case-by-case basis, to the CAA at least 5 working days before a flight is due to depart for or from, or transit through, the Scottish FIR/UIR and the London FIR/UIR.

5.4.3.7 A General Exemption from the requirements of the UK Air Navigation Order concerning the carriage of ACAS II in has been granted for turbine-powered historical and ex-military aeroplanes into which it is recognized as being technically unfeasible to incorporate ACAS II. The exemption applies to aeroplanes which fall within the provisions of Annex II to the EC Regulation (EC) No. 216/2008 namely:

a) historic non-complex aircraft for which:

   i. initial design was established before 1 January 1955, and
   ii. production has been stopped before 1 January 1975;

b) aircraft having a clear historical relevance, related to:

   i. participation in a noteworthy historic event; or
   ii. a major step in the development of aviation; or
   iii. a major role played in the armed forces of a Member State;

c) aircraft that have been in the service of military forces, unless the aircraft is of a type for which a design standard has been adopted by the Agency;
d) replicas of (a), (b) or (c).

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

5.4.3.8 This exemption is automatically invoked by the inclusion of **'RMK / Historic Aircraft - ACAS II exemption approved'** in Field 18 of the ICAO Flight Plan Form (CA48). No further exemption application action is required.

5.4.3.9 Owners and operators of historical and ex-military aeroplanes intended to be operated under the provisions of this exemption must seek approval for flights through the airspace of other ECAC member states from the appropriate State authorities.

5.4.3.10 Operators of aeroplanes that meet the carriage requirements at paragraph 5.4.2 but are not equipped and cannot be operated under the provisions of the General Exemptions described at paragraphs 5.4.3.1 and 5.4.3.7 must apply for exemptions on an individual, case-by-case basis to the CAA at least 5 working days before a flight is due to depart for or from, or transit through, the Scottish FIR/UIR and the London FIR/UIR.

5.4.3.11 Owners and operators of aeroplanes intended to be operated under the provisions of these exemptions must seek approval for flights through the airspace of other ECAC member states from the appropriate State authorities.

5.4.4 **Departure from Air Traffic Control Clearances**

5.4.4.1 The legal aspects of departure from an air traffic control clearance in compliance with a TCAS Resolution Advisory are clarified in AIC P 079/2011.

5.4.5 **TCAS I**

5.4.5.1 TCAS I is an airborne collision avoidance system that utilises interrogations of, and replies from, airborne radar transponders to alert pilots to close proximity traffic. Unlike TCAS II it does not generate ‘Resolution Advisory' (RA) warnings. TCAS I is not intended for ICAO International implementation and standardisation and is not mandated for equipage.

5.4.6 **ACAS Systems Approvals**

5.4.6.1 Any ACAS system that operates by interrogating transponders using the 1030 and 1090 MHz frequencies must be approved to transmit by the National IFF/SSR Committee (NISC).

5.4.6.2 All TCAS II interrogators and certain TCAS I interrogators are covered by a series of generic NISC approvals to transmit. Operators of other TCAS I interrogators must apply to the NISC for approval on an individual basis.

5.4.6.3 A list of interrogators holding generic approvals, as well as the approval process for other TCAS interrogators is available in CAP 761.

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

5.4.7 **Further Information, Advice and Exemptions**

5.4.7.1 Further information and advice concerning the carriage and operation of ACAS II equipment (and exemptions from these) can be obtained from:

Post: Head of Airspace Regulation
Safety and Airspace Regulation Group
Aviation House
Gatwick Airport South
West Sussex
RH6 0YR
Phone: +(0)20-7453 6510
Fax: +(0)20-7453 6565
Email: airspaceregulation@caa.co.uk

5.5 **8.33 kHz Channel Spacing in the VHF Radio Communications Band**

5.5.1 Non-equipped flights which are flight planned to enter any FIR/UIR in the EUR region where no exemptions have been published, except for those applicable to UHF equipped State flights (refer to AIP/Supplement of the State covering the FIR/UIR concerned), must flight plan outside of converted airspace. Non-equipped IFR flights will be rejected from specific sectors or states. Within the Scottish FIR/UIR and the London FIR/UIR, flights must equip in accordance with GEN 1.5, paragraph 5.2.

5.6 **Use of GPS for North Sea Operations**

5.6.1 UK AOC Holders intending to use GPS for en-route navigation for North Sea flight operations are to use GPS equipment that meets or exceeds CAA Specification 22. AOC holders requiring further information should contact their assigned flight operations Inspector. Non UK AOC holders are recommended to operate to at least the CAA Specification 22 standard.

5.7 **Controller-Pilot Data Link Communication Service in UK Domestic Airspace**

5.7.1 **Introduction**

5.7.1.1 Controller-pilot data link communication (CPDLC) provides a means of communication between the controller and pilot, using data link for ATC communication. This application includes a set of clearance/information/request message elements which corresponds to the phraseologies used in the radiotelephony environment. Standard voice radiotelephony will remain the primary means of ATC communications at all times. Any failure event concerning CPDLC will lead to a reversion to voice operation.

5.7.1.2 CPDLC services are available in the Scottish FIR/UIR and the London FIR/UIR, and these are distinct from Oceanic CPDLC procedures.

5.7.1.3 CPDLC services are available from FL 285 and above and will be provided at FL 195 and above where possible within the Scottish FIR/UIR and the London FIR/UIR. The following CPDLC services are provided in this airspace:

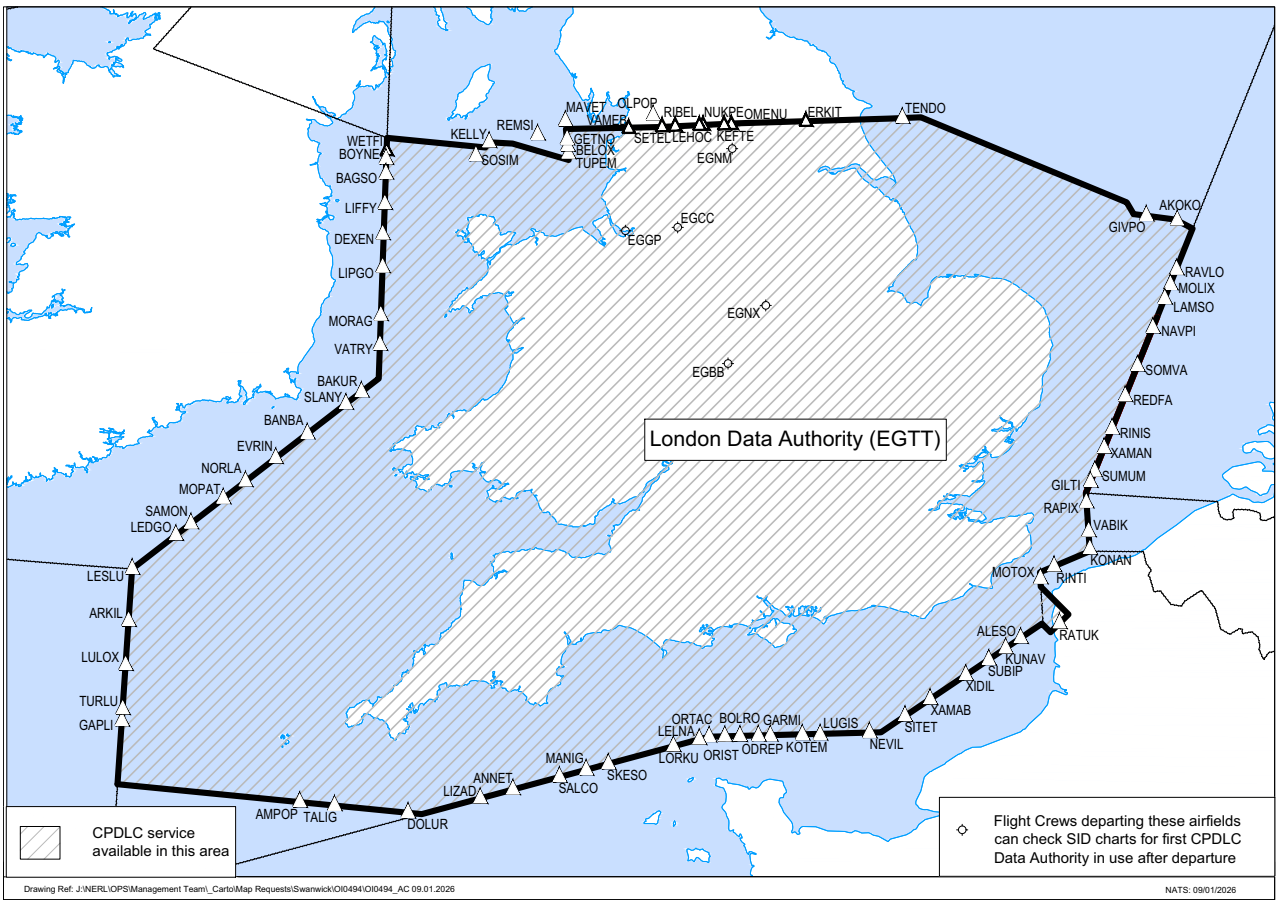
- DLIC (data link initiation capability)
- ACL (ATC clearances and instructions)
- ACM (ATC communications management)
- AMC (ATC microphone check)

5.7.1.4 Provision of CPDLC services is based on the requirements of the Commission Regulation (EC) No. 29/2009, as amended, on data link services. The rule applies to all flights operating as general air traffic in accordance with instrument flight rules within the airspace above FL 285. A CPDLC service is provided to ATN VDL 2, FANS1/A and FANS1/A+ equipped aircraft.

5.7.1.5 Aircraft meeting the conditions as specified in Article 3(3) of Commission Regulation (EC) No. 29/2009, as amended, or as defined in Commission Implementing decision 2019/2012 are not required to be equipped with CPDLC Aeronautical Telecommunications Network (ATN) Very High Frequency Data Link Mode 2 (VDL Mode 2) capable data link systems. In order to ensure that ATS providers have information on such aircraft, this should be indicated on the filed flight plan.

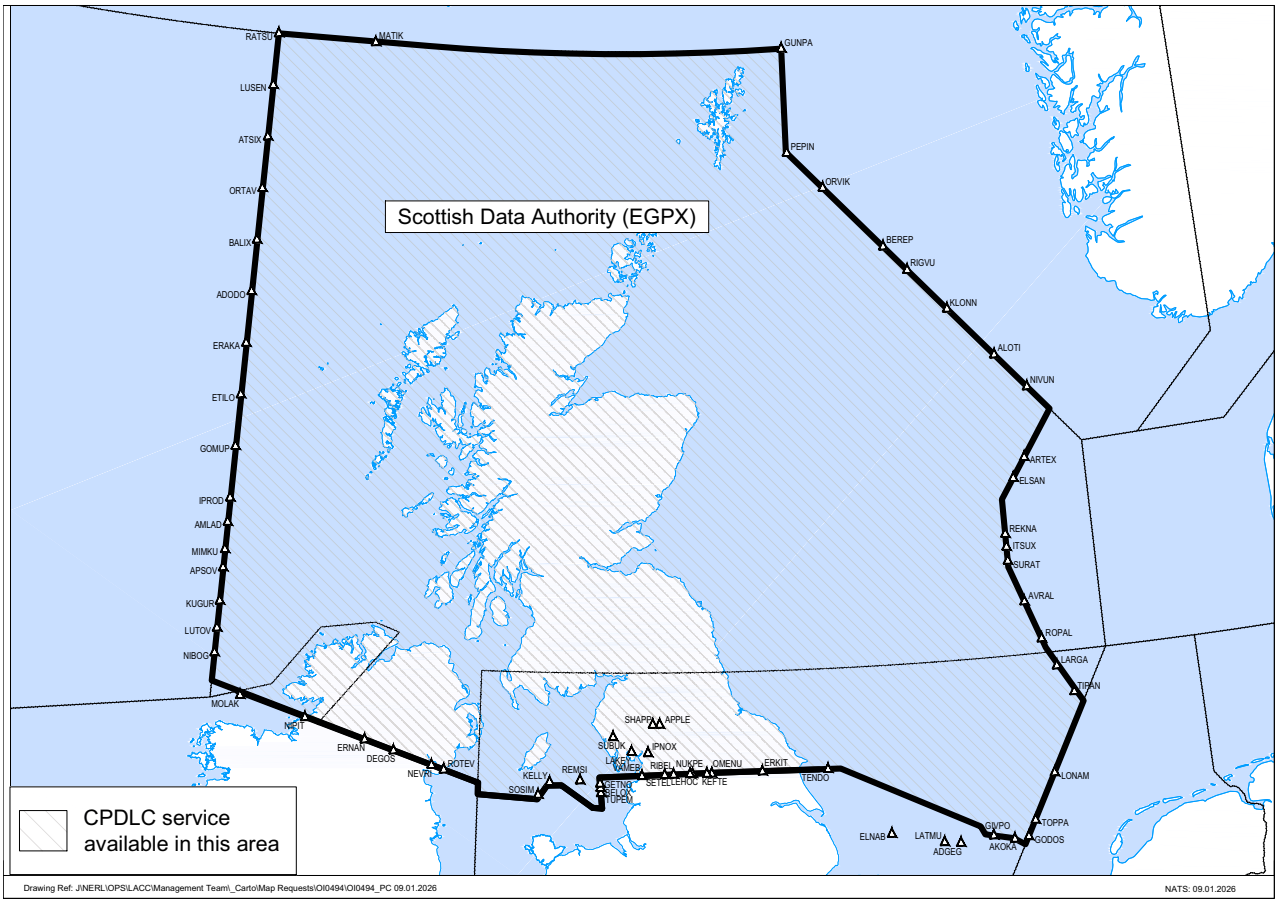
5.7.1.6 Operators conducting flights wholly or partly in airspace where ATN B1 CPDLC is required but for which Commission Regulation (EC) No. 29/2009, as amended, is not applicable in accordance with Article 3(3), or which aircraft types/models are exempted by Commission Implementing Decision 2019/2012, should include the letter "Z" in item 10 and the indicator "DAT/CPDLCX" in item 18 of each flight plan. Operators that voluntarily equip their aircraft in compliance with Commission Regulation (EC) No. 29/2009, as amended, and intend to use the CPDLC capability do not need to indicate in their flight plans the status as exempted.

5.7.2 **Area of Applicability**



Flight Crews should refer to the map of NATS CPDLC Data Authorities (see figures below).

5.7.2.1 **Aircraft Transiting Airspace Where a CPDLC Service is Not Available**



5.7.2.1.1 Aircraft transiting airspace below FL 285 where a CPDLC service is not available will maintain a logon, but will not receive a CPDLC service. Upon entering airspace where a logon is maintained but CPDLC is not available, the flight will be notified via CPDLC. The

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

specific messages are detailed in the current AIC.

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

5.7.3 **Requirements**

In all CPDLC communications, the highest standard of discipline shall be observed at all times (Ref. ICAO Annex 10, Vol. II).

The use of CPDLC is not mandatory and is conducted at the discretion of ATC and the pilots concerned. Where urgent or time critical communications are required voice shall be used. Voice read-back is not required for any CPDLC instruction. In cases were uncertainty arises as a result of a data link message, communication shall revert to voice.

5.7.3.1 **Flight Plan**

5.7.3.1.1 In order to use the CPDLC services, pilots shall file the respective equipage in their flight plan in accordance with Flight Plan 2012 J codes.

5.7.3.1.2 For flights granted a CPDLC exemption, the indicator DAT/CPDLCX shall be included in Item 18 of the flight plan.

5.7.3.2 **Establishing a CPDLC connection**

5.7.3.2.1 Establishment of a CPDLC connection through the initiation of a logon is a pre requisite for receiving CPDLC service. Prior to initiating the logon, the flight crew should verify the correctness of the logon information associated with the flight plan.

5.7.3.2.2 A CPDLC service is only established when all the required logon parameters match those contained in the ICAO flight plan:

For an ATN LOGON:

- Mode-S Aircraft-ID i.e. ICAO [Flight plan item 7] callsign
- Aircraft ID – 24bit address
- ICAO Flight plan Departure and destination airfields (not IATA codes)

For a FANS LOGON:

- Mode-S Aircraft-ID i.e. ICAO [Flight plan item 7] callsign
- Aircraft registration
- ICAO Flight plan Departure and destination airfields (not IATA codes)

5.7.3.2.3 To resolve any discrepancies, airlines will need to contact the relevant ATC data authority using the email address specified in the

current AIC.

5.7.3.2.4 For Dual Stacked operators equipped with both FANS 1/A or FANS 1/A + and ATN VDL 2 as separate systems the preferred mode of operation is ATN VDL 2.

5.7.3.2.5 If there is an indication that the logon procedure was unsuccessful, the flight crew should confirm that the logon information above is correct and retry a logon. If on a second attempt connection is still not successful, revert to voice.

5.7.3.3 **Current Data Authority (CDA) / Next data Authority (NDA) Confirmation**

5.7.3.3.1 Aircraft entering the Scottish or London Data Authority for the first time will receive a welcome message to establish CDA. The welcome message will be an uplink UM183 (with ATSU facility designator) to all CPDLC equipped aircraft. Aircraft must respond to this message for CDA to be established.

5.7.3.3.2 For more information on this process, refer to PANS ATM section 14, the ICAO GOLD version 2.0, or Eurocontrol guidance material for ATC and Flight Crews V6.0.

5.7.4 **Procedures**

5.7.4.1 **Logon for transiting aircraft**

5.7.4.1.1 The Data Authority address for London ACC is EGTT. The Data Authority address for Scottish ACC is EGPX.

5.7.4.1.2 CPDLC log on shall be established in sufficient time to ensure that the aircraft is communicating with the appropriate Data Authority. The following guidance criteria provided by GOLD is applicable to UK airspace.

Logon Timing Condition(s)	When	Logon Address of Data Authority
15 minutes or more prior to boundary estimate	When operating above FL 100	Current Data Authority for the airspace in which the aircraft is operating
Less than 15 minutes prior to boundary estimate	When operating above FL 100	Next Data Authority that provides CPDLC and/or ADS C services on that flight
Following an unsuccessful data link transfer to another ATSU	When detected by the flight crew or upon receipt of instruction from ATC	As instructed or per above

5.7.4.1.3 For flights departing aerodromes in the United Kingdom logon may also be conducted by aircraft on the ground where coverage exists.

5.7.4.1.4 Standard Instrument Departure plates for aerodromes close to the boundary of EGTT/EGPX data authorities (see London Data Authority map) will advise flight crews of the appropriate CPDLC Data Authority to select prior to departure.

5.7.4.1.5 Flights transiting both London and Scottish ACC using CPDLC, the change of CDA to NDA will be initiated by the controller and will be automatically transferred seamlessly to the operator. The flight crew should not need to reinitiate a logon. The current and next data authority is notified to the aircrew by viewing the ACTIVE CENTRE and NEXT.

5.7.4.1.6 When entering the next ATSU's airspace, the flight crew should confirm the successful transfer from the Current Data Authority to the Next Data Authority by observing the change in the active centre indication provided by the aircraft system. Crews should be aware that they need to keep the CDA and the frequency aligned. THEY MUST NOT RESPOND TO UPLINK MESSAGES FROM A UNIT THAT THEY ARE NOT IN VOICE COMMUNICATION WITH.

5.7.4.2 **Log-off**

5.7.4.2.1 Flights leaving London or Scottish CDA to a non-CPDLC capable airspace will receive an 'End of Service' message and will be logged off automatically.

5.7.4.3 **Data link failure**

5.7.4.3.1 When the CDA detects a CPDLC failure, the controller will contact the aircraft using voice, inform the crew 'Disregard CPDLC [message type] message, break, [correct clearance or instruction]'. CREWS ARE REQUESTED TO RESPOND UNABLE IF THE MESSAGE REMAINS UNANSWERED. This closes the message dialogue and ensures that messages do not trigger time out alerts.

5.7.4.3.2 Due to safety concerns, there is a requirement for all FANS aircraft, following an uplink message timeout alert to disconnect from the CPDLC ground system. Controllers may instruct crews to disconnect via CPDLC using phraseology described in the current AIC.

'Disconnect CPDLC and revert to voice'

GEN 1.5 AIRCRAFT INSTRUMENTS, EQUIPMENT AND FLIGHT DOCUMENTS (continued)

5.7.5 **CPDLC message sets**

5.7.5.1 Currently there are two sets of messages being used:

- to support FANS 1/A equipped aircraft:
  Safety and Performance Standard for Air Traffic Data Link Services in Oceanic and Remote Airspace (Oceanic SPR Standard, RTCA DO-306/EUROCAE ED-122).
- and to support ATN VDL 2 equipped aircraft:
  Safety and Performance Standard for Air Traffic Data Link Services in Continental Airspace (Continental SPR Standard, RTCA DO-290/EUROCAE ED-120).

5.7.5.2 Messages supported by CPDLC in the UK are published in the corresponding AIC.

INTENTIONALLY BLANK

GEN 1.6 SUMMARY OF NATIONAL REGULATIONS AND INTERNATIONAL AGREEMENTS/CONVENTIONS

1 The following list of titles and references of regulations affecting air navigation in the United Kingdom, Channel Islands and the Isle of Man, together with International Agreements/Conventions ratified by the United Kingdom. It is essential that anyone engaged in air operations be acquainted with the relevant regulations. The UK applies EU aviation safety legislation. Copies of these documents may be obtained from:

The Stationery Office UK.

Phone: 0870-600 5522
Http: http://www.tso.co.uk

European Union Aviation Safety Agency (EASA) regulation website.

Http: https://www.easa.europa.eu/regulations

A reference to a legal instrument, such as the Air Navigation Order 2009, is a reference to that instrument as amended. The various amending instruments are not shown separately.

Title	Main Subjects (where not self evident)
Aeroplane Noise Regulations 1999 (1999/1452)	
Air Navigation Order 2016 (2016/765) as amended	Registration, Airworthiness and Operation of Aircraft, Air Traffic Control, Aircrew and Aerodrome Licensing.
Air Navigation (General) Regulations 2006 (2006/601)	Load Sheets, Weight and performance of Public Transport Aircraft, Noise and vibration caused by aircraft, Maintenance, Landing facilities at aerodromes, Mandatory Reporting and Radio Navigation appliances to be carried on aircraft.
Air Navigation Aircraft (Wreck and Salvage) Order 1938 (1938/136)	
Air Navigation (Dangerous Goods) Regulations 2002 (2002/2786)	
Air Navigation (Environmental Standards) Order 2002 (2002/798)	
Air Navigation (Overseas Territories) Order 2013 (2013/2870) Air Navigation (Overseas Territories) (Environmental Standards) Order 2019	These Orders apply to Territories listed in the relevant schedule.
Air Navigation (Restriction of Flying) (City of London) Regulations 2004 (2004/2092) (Highgrove House) Regulations 1991 (1991/44) (Hyde Park) Regulations 2004 (2004/2090) (Isle of Dogs) Regulations 2004 (2004/2091) (Nuclear Installations) Regulations 2007 (2007/1929) (Prisons) Regulations 2001 (2001/1657) (Scampton Airfield) Regulations 2000 (2000/3390) (Scottish Highlands) Regulations 2008 (2008/1239) (Specified Area) Regulations 2005 (2005/964)	
Airports Slot Allocation Regulation 2006 (2006/2665)	
Aviation Security Act 1982	
Aviation Security (Air Cargo Agents) Regulations 1993 (1993/1073)	
Aviation and Maritime Security Act 1990 (c. 31)	
Carriage by Air Act 1961 (c. 27)	Gives effect to the Warsaw Convention as amended at The Hague, 1955.
Carriage by Air Acts (Application of Provisions) Order 1967 (1967/480)	Applies the principles of the Warsaw Convention as amended, and the Guadalajara Convention to carriage of mail and to non-international carriage within the meaning of those conventions to which those conventions do not themselves apply.
Carriage by Air Acts (Application of Provisions) (Overseas Territories) Order 1967 (1967/810)	
Carriage by Air (Convention) Order 1967 (c. 8) (1967/479)	
Carriage by Air Acts (Implementation of Protocol No 4 of Montreal 1975) Order 1999 (1999/1312)	
Carriage by Air (Parties to Convention) Order 1999 (1999/1313)	
Carriage by Air (Sterling Equivalents) Order 1999 (1999/2881)	Specifies the sterling equivalents of amounts, expressed in gold francs, in the Warsaw Convention and in the provisions relating to other carriage by air.
Carriage by Air (Supplementary Provisions) Act 1962 (c. 43)	To give effect to the Guadalajara Convention, supplementary to the Warsaw Convention, for the unification of certain rules relating to carriage by air by a person other than the contracting carrier; for the connected purposes.

GEN 1.6 SUMMARY OF NATIONAL REGULATIONS AND INTERNATIONAL AGREEMENTS/CONVENTIONS (continued)

Title	Main Subjects (where not self evident)
Carriage by Air and Road Act 1979 (c. 28) (Commencement No 1) Order 1980 (1980/1966) (Commencement No 2) Order 1997 (1997/2565) (Commencement No 3) Order 1998 (1998/2562)	
Civil Aviation Act 1982 (c. 16)	Establishment and functions of CAA. Power to make Air Navigation Order
Civil Aviation Act 2006 (c. 34) (Commencement No.1) Order 2007 (2007/598)	
Civil Aviation Act 2012 (c. 19)	
Civil Aviation (Air Carrier Liability) Order 1998 (1998/1751)	
Civil Aviation (Air Travel Organisers' Licensing) Regulations 2012 (2012/1017)	
Civil Aviation (Contributions to the Air Travel Trust) Regulations 2007 (2007/2999)	
Civil Aviation (Customs and Excise Airports) Order 1985 (1985/ 1643)	This Order designates aerodromes to be places for the landing and departure of aircraft for the purpose of the enactments for the time being in force relating to Customs.
Civil Aviation (Designation of Aerodromes) Order 1981 (1981/651)	
Civil Aviation (Documentary Evidence) Regulations 1972 (1972/ 187)	These regulations designate the authorities and persons who may certify the documents referred to in Section 6 of the Tokyo Convention Act 1967,
Civil Aviation (Eurocontrol) Act 1983 (c. 11) Civil Aviation (Eurocontrol) Act 1983 (Commencement No. 1) Order 1983 (1983/1886) (c. 50) Civil Aviation (Eurocontrol) Act 1983 (Commencement No. 2) Order 1985 (1985/1915) (c. 46)	The Convention, the organiser and status of Eurocontrol.
Civil Aviation (Insurance) Regulations 2005 (2005/1089)	
Civil Aviation (Investigation of Accidents) Regulations 1996 (1996/ 76)	
Civil Aviation (Investigation of Air Accidents and Incidents) Regulations 1996 (1996/2798)	
Civil Aviation (Investigation of Military Air Accidents at Civil Aerodromes) Regulations 2005 (2005/2693)	
Civil Aviation (Notices) Regulations 1978 (1978/1303)	
Civil Aviation (Personnel Licences) Order 1992 (1992/2673)	
Civil Aviation (Safety of Third-Country Aircraft) Regulations 2006 (2006/1384)	
Commission Regulation (EU) No 73/2010 (ADQ)	Requirements for the quality of aeronautical data and aeronautical information for the Single European Sky (see GEN 1.6 paragraph 5).
Commission Implementing Regulation (EU) No 923/2012 (Standardised European Rules of the Air (SERA)) as amended	Flight over the high seas; protection of persons and property; avoidance of collisions; signals; time; flight plans; visual meteorological conditions, visual flight rules, special VFR and instrument flight rules; airspace classification and air traffic services.
Commission Regulation (EU) 1178/2011 as amended	EASA Aircrew Regulation (Aircrew Licensing)
Immigration Act 1971 (c. 77)	
Military Lands Act 1892 (c. 43)	Bye Laws which prohibit entry to Danger Areas.
Rules of the Air Regulations 2015 (2015/840)	Lights and other Signals; General and Special Flight Rules; Aerodrome Traffic Rules; Aerodrome Markings; Air Traffic Control; Miscellaneous Special Rules.
Summer Time Act 1972 (c. 6) Summer Time Order 1997 (1997/2982)	
Terrorism Act 2000	See GEN 1.2.1.1 Paragraph 5
Tokyo Convention Act 1967 (c. 52)	To give effect to the provisions of the Tokyo Convention, 1963, relating to offences etc. committed on board aircraft.
Tokyo Convention (Certification of Countries) Order 1977 (1977/ 1258) (Supplementary) Order 1978 (1978/1534)	This order certifies in which countries the Convention on Offences and certain other acts committed on board aircraft, is for the time being in force.

Title	Main Subjects (where not self evident)
CHANNEL ISLANDS	
Civil Aviation Act (Channel Islands) Order 1953 (1953/393)	
Civil Aviation Act (Channel Islands) Order 1966 (1966/688)	Extension to the Channel Islands to certain provisions of the Civil Aviation Act
Civil Aviation Act 1971 (Channel Islands) Order 1972 (1972/450)	Enables His Majesty to confer power on certain authorities in the Channel islands to make regulations.
ALDERNEY	
Air Transport Licensing (Alderney) Law 1996	Notifies the requirements for application to be made to the States of Alderney for a licence to operate Scheduled or Charter Flights between Alderney and the UK, Isle of Man and other Channel Islands
Airport Ordinance 1950	General Regulations for the use of Alderney Airport
Airports Fees Ordinance 1987	Regulations under which fees and charges are determined for the use of Alderney Airport.
GUERNSEY	
Air Navigation (Guernsey) Order 1981 (1981/1805)	This Order extends the provisions of the ANO, subject to modifications set out in the Schedule, to Guernsey.
Air Navigation (General) (Guernsey) Regulations 1972 (1972/486)	These Regulations apply to the UK Air Navigation (General) Regulations as amended, to Guernsey.
Air Navigation (Restriction of Flying) (Guernsey) Regulations 1985 (Guernsey 1985/21)	Notifies the Sark Restricted Area (R 095).
Air Transport Licensing (Guernsey) Law 1995	
Airport Ordinance 1950	General Regulations for the use of Guernsey Airport
Airport Fees Ordinance 1987	Regulations under which fees and charges are determined for the use of Guernsey Airport.
Aviation Security (Guernsey) Order 1997 (1997/2989)	Extension to Guernsey of certain provisions of the UK Aviation Security Act 1982, and the Aviation and Maritime Security Act 1990.
Carriage by Air (Guernsey) Order 1967 (1967/804) Carriage by Air (Application of Provisions) (Guernsey) Order 1967 (1967/807)	
Civil Aviation Act 1980 (Guernsey) Order 1984 (1984/130)	
Civil Aviation Act 1982 (Guernsey) Order 1986 (1986/1162)	Extension to Guernsey of certain provisions of the Civil Aviation Act.
Civil Aviation (Investigation of Air Accidents and Incidents) (Guernsey) Order 1998 (1998/1503)	The Order extends the provision of the UK Order, subject to modifications set out in the schedule, to Guernsey
Detention of Aircraft (Guernsey and Alderney) Law 1994	
Firearms Ordinance 1987	Notifies Fort Le Marchant Small Arms range
Terrorism and Crime (Bailiwick of Guernsey) Law 2002	
Public Health (Aircraft) (Guernsey) Order 1974 (Guernsey 1974/47)	
Rules of the Air and Air Traffic Control (Guernsey) Regulations 1985 (1985/23)	Regulations as UK Legislation, but made under the Air Navigation (Guernsey) Order 1981 and applying to the Bailiwick of Guernsey.
JERSEY	
Aerodromes Administration (Jersey) Law 1952	
Aerodromes (Jersey) Regulations 1965	
Air Navigation (Jersey) Law 2014	
Airport Dues (Jersey) Law 1956	
Aviation Security (Jersey) Order 1993	
Carriage by Air (Jersey) Order 1967	
Carriage by Air (Application of Provisions) (Jersey) Order 1967	
Civil Aviation Act 1982 (Jersey) Order 1990	Extension to Jersey of certain provisions of the Civil Aviation Act.
Terrorism (Jersey) Law 2002	
Public Health (Aircraft) (Jersey) Order 1971	
Air Navigation (Rules of the Air) (Jersey) Regulations 2017	Regulations as per Standardised European Rules of the Air (SERA), but made under the Air Navigation (Jersey) Law 2014.
Civil Aviation (Jersey) Law 2008	
Note: *Copies of the Legislation listed for Channel Islands, Alderney and Guernsey can be obtained from: The Greffe Office, St Peter Port, Guernsey.*

GEN 1.6 SUMMARY OF NATIONAL REGULATIONS AND INTERNATIONAL AGREEMENTS/CONVENTIONS (continued)

2 Landing and Taking Off Near Open Air Assemblies

2.1 When an event involving an organised open-air assembly of more than 1000 people takes place within 1000 metres of an unlicensed aerodrome or helicopter landing site, compliance with the following procedures is required under Standardised European Rules of the Air SERA.3105 Minimum Heights.

2.2 **Procedures applicable at a pre-existing unlicensed aerodrome:**

a) Landing and take-off shall only be performed with the permission of the person in charge of the aerodrome;
b) Aircraft shall not fly over any area occupied by spectators or car parks below a height of 1000 FT AGL unless at such a height as will permit, in the event of an emergency arising, a landing to be made without undue hazard to persons or property on the surface; and
c) The person in charge of the aerodrome shall ensure that on the ground, aircraft and members of the public are segregated from each other.

2.3 **Procedures applicable at a temporary helicopter landing site:**

a) The helicopter commander or operator shall obtain the written permission of the person in charge of the event prior to using the landing site;
b) The person in charge of the event should convey to helicopter commanders written details pertaining to the location and layout of the landing site and the procedures to be employed;
c) The person in charge of the event should inform the local police authority a minimum of 24 hours in advance of the commencement of operations;
d) The person in charge of the event shall ensure that on the ground, aircraft and members of the public are segregated from each other;
e) Landing and take-off shall only be performed:

i. During daylight hours;
ii. When the cloud ceiling is higher than 600 FT AGL and the flight visibility is more than 3 KM;

f) Helicopters shall not fly over any area occupied by spectators or car parks below a height of 1000 FT AGL or such height as will permit the helicopter, in the event of a power unit failure, to alight clear of the assembly, whichever is the higher;
g) Landing and take-off shall be made in an area which has been set aside for the purpose and helicopters which are landing and taking off shall maintain a safe distance from persons located outside the area, of at least 30 metres; and
h) Approach and departure shall be made over clear areas so that a safe forced landing can be achieved in the event of engine failure.

2.4 **Procedures applicable to aeroplane operations at a temporary aerodrome:**

a) Operations should be conducted in accordance with the guidance contained in CAP 793;
b) The aircraft commander or operator shall obtain the written permission of the person in charge of the event prior to using the aerodrome;
c) The person in charge of the event should convey to aircraft commanders written details pertaining to the location and layout of the aerodrome and the procedures to be employed;
d) Aircraft shall not fly over any area occupied by spectators or car parks below a height of 1000 FT AGL or such height as will permit the aircraft, in the event of a power unit failure, to alight clear of the assembly, whichever is the higher.

2.5 CAP 793 contains guidance on safety standards at unlicensed aerodromes and CAP 789 contains guidance to operators who hold AOCs (both available at www.caa.co.uk). Further advice concerning operations at unlicensed aerodromes (for non-public transport operations) may be obtained from the Flight Operations Inspectorate (General Aviation) of the Civil Aviation Authority, Tel: 01293-573525. Further advice concerning operations at heliports or landing sites (for helicopter public transport operations) may be obtained from the Flight Operations Inspectorate (Helicopters) of the Civil Aviation Authority, Tel: 01293-573443.

3 Designation of Hostile Environment for Helicopter Operations, including Offshore Operations, in accordance with Commission Regulation (EU) No 965/2012 – Air Operations

3.1 Annex 1 to Commission Regulation (EU) 965/2012 (EASA Air Operations Regulation) contains the definition of Hostile Environment with regards to helicopter operations. (See also Air Navigation Order).

3.2 This designation and/or interpretation of a hostile environment applies only in relation to the EASA Air Operations Regulation and has no bearing on the circumstances in which the equipment requirements of the ANO apply.

3.3 Hostile environment means:

a) an area in which:

i. a safe forced landing cannot be accomplished because the surface is inadequate; or
ii. the helicopter occupants cannot be adequately protected from the elements;
iii. search and rescue response/capability is not provided consistent with anticipated exposure; or
iv. there is an unacceptable risk of endangering persons or property on the ground;

b) in any case, the following areas shall be considered hostile:

GEN 1.6 SUMMARY OF NATIONAL REGULATIONS AND INTERNATIONAL AGREEMENTS/CONVENTIONS (continued)

i. for over-water operations, the open sea areas North of 45N and South of 45S unless any part is designated as non-hostile by the responsible authority of the State' in which the operations take place; and
ii. those parts of a congested area without adequate safe forced landing areas.

3.4 For the purposes of operations under 3.3(b)(i) above, the UK does not designate any of the open sea areas North of 45N and South of 45S as a non-hostile environment.

3.5 For the purposes of operations in Performance Class 3 under CAT.POL.H.420 and in accordance with ARO.OPS.215, the UK has not designated any area where helicopter operations may be conducted without a safe forced landing capability.

3.6 When conducting offshore operations under an Offshore Specific Approval (SPA.HOFO), flights shall only be planned and commenced when the significant wave height of the sea over which the flight is intended to be conducted to or from an offshore location:

a) is 6 metres or less; and
b) does not exceed the certificated ditching performance of the helicopter.

Once the flight has been commenced and a deterioration in sea conditions beyond the limits in (a) or (b) above is experienced, the flight may be continued in accordance with procedures detailed in the operator's operations manual.

3.7 Interpretation of terms for use with paragraphs 3.3, 3.4 and 3.6:

a) 'Open Sea Area': The area of water to seaward of the seaward edge of the Coastal Corridor, where one exists, or the coastline where a Coastal Corridor does not exist.
b) 'Coastline' is deemed to include stretches of water such as river mouths and estuaries where the over water distance between the contiguous land mass does not exceed 8 NM.

Where used to define to airspace boundaries, 'Coastline' is defined as a generalisation of the geographic feature; operators must not use this as a definitive boundary and are responsible for applying appropriate measures to ensure they operate within or outside of the airspace structure.

c) 'Offshore operation' means a helicopter operation that has a substantial proportion of any flight conducted over open sea areas to or from an offshore location.
d) 'Offshore location' means a facility intended to be used for helicopter operations on either a fixed or floating offshore structure or vessel including an offshore installation or a renewable energy installation as defined in the **Civil Aviation Act 1982.**
e) 'Significant wave height' means the average value of the height (vertical distance between trough and crest) of the largest one-third of the waves present.
f) 'Coastal Corridor' from GM1 CAT.OP.MPA.137(b) is used for helicopters operating as Commercial Air Transport in Performance Class 3 and means:

'A variable distance from the coastline to a maximum distance corresponding to three minutes flying at normal cruising speed.'

For the United Kingdom (including Northern Ireland), and from the coastline of islands surrounding it, the maximum distance from the coastline corresponds to three minutes flying at normal cruising speed, but to no greater than 6 NM, where conditions are suitable for coastal transit.

g) 'Coastal Transit' from GM1 CAT.OP.MPA.137(b) in relation to helicopters operating as Commercial Air Transport in Performance Class 3 means:

'The conduct of operations over-water within the Coastal Corridor in conditions where there is a reasonable expectation that:

i. the flight can be conducted safely in the conditions prevailing;
ii. following an engine failure, a safe forced landing and successful evacuation can be achieved; and
iii. survival of the crew and passengers can be assured until rescue is effected.'

4 Designation of the London and Scottish Flight Information Regions as the area within which certain documents may be retained at the aerodrome or operating site in accordance with UK Regulation 965/2012 – Air Operations and UK Regulation 2018/1976 - Sailplane Regulations

4.1 Annexes VII (Part-NCO) and VII (Part-SPO) to UK Regulation 965/2012 (UK Air Ops) and UK Regulation 2018/1976 (Sailplane Regulations) contain the option for the CAA to designate an area within which certain documents may be retained at the aerodrome or operating site.

4.2 The CAA, in accordance with NCO.GEN.135(b)(2) and SPO.GEN.140(b)(2), ARO.OPS.210, SAO.GEN.155(d) and SFCL.GEN.045(d)(2) has determined that the London and Scottish Flight Information Regions (FIR) are the designated areas for the purpose of these regulations.

4.3 For details of the documents which shall be carried on all flights reference should be made to the relevant Annex of the UK Air Operations Regulations and Sailplane Regulations.

5 Data quality requirements - Commission Regulation (EU) 73/2010

5.1 Commission Regulation (EU) No 73/2010 lays down 'requirements for the quality of aeronautical data and aeronautical information

GEN 1.6 SUMMARY OF NATIONAL REGULATIONS AND INTERNATIONAL AGREEMENTS/CONVENTIONS (continued)

for the Single European Sky'. The purpose of this regulation is to strengthen and enhance the Standards for Aeronautical Information Services described in (ICAO) Annex 15.

5.2 Aeronautical Data and Information in the UK IAIP is not currently compliant with this regulation.

5.3 CAA is working to ensure that the requirements of this regulation will be met. As the UK IAIP transitions towards full compliance, data not meeting the requirements of Commission Regulation (EU) No 73/2010, will be suitably identified as such.

INTENTIONALLY BLANK

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES

1 In CAA publications, where a term is used, which is defined by ICAO in a relevant Annex or PANS document, that definition will apply unless:

a) the contrary is indicated; or
b) there is a different definition in the Air Navigation Order or European Union Regulations.

2 Differences to ICAO definitions and SARPS are identified in the tables below.

Annex 1: Personnel Licensing (AMDT 179)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
1.1.18	Definition	More exacting or exceeds	The UK uses the term certificate of release to service (CRS), in relationship to the complete aircraft and CAA Form 1 for the release.	
2.3.2.1	Standard	Different in character or other means of compliance	In the UK, the holder of a Private Pilot License (PPL) providing flight instruction may receive remuneration.	This aligns with EU rules.
2.3.4.2.1	Standard	More exacting or exceeds	The UK requires 25 hours total for dual flight instruction.	The equivalent ICAO requirement for aeroplanes, does not specify the amount of hours needed.
2.3.5	Standard	Different in character or other means of compliance	For powered lift, the UK requires a Commercial Pilot License (CPL) (A) or (H) Part - Flight Crew License (FCL), and depending on which of these a pilot has, the requirements are listed in FCL.720.PL.	
2.4.4.1.1	Standard	More exacting or exceeds	The UK requires a total flight time of 185 hours.	
2.4.5.1.1 2.4.5.1.2	Recommend ation	Different in character or other means of compliance	The UK requires a CPL(A) or (H) Part-FCL license, and depending on which of these a pilot has , the requirements are listed in provision FCL.720.PL. In addition, a type rating course as defined within the certified aircraft Operational Suitability Data (OSD) document would need to be complied with, including type rating skill test.	
2.9.1.3.1	Standard	More exacting or exceeds	The UK requires a total flight time of 15 hours and 45 launches.	
2.10.1.3.1	Standard	More exacting or exceeds	The UK requires 10 inflations and 20 take-offs and landings.	
2.10.1.3.4	Recommend ation	More exacting or exceeds	In case of remuneration requires 50 hours of flight time and 50 take-offs and landings as Pilot in Command (PIC) on balloons.	
2.11	Standard	Less protective or partially implemented or not implemented	The UK is currently developing legislation for the grant of a Remote Pilot Licence, to be effective 2026.	Subject to rulemaking.
2.12	Standard	Less protective or partially implemented or not implemented	The UK is currently developing legislation for the grant of a Student Remote Pilot Licence, to be effective 2026.	Subject to rulemaking.
2.14	Standard	Less protective or partially implemented or not implemented	The UK is currently developing legislation for the grant of a Remotely Piloted Aircraft System (RPAS) Instructor Rating, to be effective 2026.	Subject to rulemaking.
4.2.3.1 4.2.3.2	Standard	Less protective or partially implemented or not implemented	The UK is currently developing legislation for the grant of a Remotely Piloted Aircraft System (RPAS) Instructor Rating, to be effective 2026.	Subject to rulemaking.
4.4.1.1	Standard	Less protective or partially implemented or not implemented	For the initial issue of an Air Traffic Controllers (ATCO) licence an individual must be not less than 20 years old on the date of issue.	
4.5.3.3	Standard	More exacting	Holders of an instructor endorsement shall be authorised to provide on-the-job training and supervision at a working position for areas covered by a valid unit endorsement.	
4.6	Standard	Less protective or partially implemented or not implemented	The UK does not issue Flight Operations Officer / Flight Dispatcher licences.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 1: Personnel Licensing (AMDT 179)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
4.7	Standard	Less protective or partially implemented or not implemented	The UK does not issue Aeronautical Station Operator licences.	
6.2.4.2	Standard	More exacting or exceeds	For ATCO the current regulatory requirements are more restrictive as applicants shall be normal trichromates.	
6.2.4.3	Standard	More exacting or exceeds	The aircrew regulations state that applicants shall pass the Ishihara test. For ATCO, the current requirements are more restrictive: pseudoisochromatic plate testing alone is not sufficient. Colour vision should be assessed using means to demonstrate normal trichromacy.	
6.2.4.4	Standard	Different in character or other means of compliance	The UK issues class 1 medical certificates to colour vision deficiency (CVD) pilots but restricted to non-commercial air transport activities by day only.	
6.3.4.1.2	Standard	More exacting or exceeds	Practical hearing test not acceptable for initial Class 1 assessment.	
6.4.1.1	Standard	More exacting or exceeds	For a Commercial Pilot licence for airships, a Class 2 medical certificate is required. For a Flight Engineer Licence, a Class 1 medical certificate is required.	
6.5.3.2	Standard	More exacting or exceeds	Applicants with hypermetropia exceeding +5.0 dioptres, myopia exceeding -6 dioptres, anastigmatic component exceeding 3 dioptres, or oranisometropia exceeding 3 dioptres shall have a corrected visual acuity of 6/6 or better in each eye.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 2: Rules of the Air (Amendment 48)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C1 1.0.1	Definition: Acrobatic Flight	More exacting or exceeds	Air Navigation Order 2016 definition is more aligned to specific aerobatic manoeuvres. UK Reg (EU) No 923/2012 definition includes Annex 2 definition but expands upon it to highlight that it is not associated with "normal" flight.	The UK uses the terms aerobatic manoeuvres (ANO 2016) and aerobatic flight (UK Reg (EU) No 923/2012.
C1 1.0.81	Definition: Operator	Different in character or other means of compliance	The UK Air Navigation Order definition refers to the person who has responsibility for the management of the aircraft.	
C1 1.0.89	Definition: Remote Pilot Station	Different in character or other means of compliance	The UK has not adopted the term 'remote pilot station' and has instead adopted the term 'command unit (CU)' meaning "the equipment or system of equipment to control unmanned aircraft remotely as defined in point 32 of Article 3 of Regulation (EU) 2018/1139 which supports the control or the monitoring of the unmanned aircraft during any phase of flight, with the exception of any infrastructure supporting the command and control (C2) link service".	
C1 1.0.95	Definition: RPA Observer	More exacting or exceeds	The UK has not adopted the term 'RPA observer' and has instead adopted the terms 'unmanned aircraft observer' and 'airspace observer' as defined in Article 2(24) and Article 2(25) (respectively) of Regulation (EU) 2019/947. These definitions differentiate between an individual that monitors the RPA to ensure that it remains within VLOS, and an individual that visually scans the airspace to identify airborne hazards. The definitions do not describe the trained or competent status of the individual.	
C1 1.0.113	Visual line-of-sight (VLOS) operation	Different in character or other means of compliance	The UK definition includes the context of VLOS operation, highlighting that it allows "the remote pilot to control the flight path of the unmanned aircraft in relation to other aircraft, people and obstacles for the purpose of avoiding collisions".	
C3 3.2.2	Standard	Different in character or other means of compliance	UK SERA.3210(b) states that an aircraft that is aware that the manoeuvrability of another aircraft is impaired shall give way to that aircraft. It further requires priority for aircraft with impaired manoeuvrability.	
C3 3.2.2.4	Standard	Less protective or partially implemented or not implemented	UK SERA.3210(c)(3)(i) states that a sailplane overtaking another sailplane may alter its course to the right or to the left.	This allows sailplanes to overtake each other on the left as well.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 2: Rules of the Air (Amendment 48)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C3 3.2.3.2	Standard	Less protective or partially implemented or not implemented	UK regulations specify in point b) to act as far as practicable and in point c) the operation is specified as taxiing or being towed. Rules of the Air Regulations 2015 Rule 14 and Rule 15 permit the following: **Rule 14 Stationary helicopters on offshore or renewable energy installations.** Notwithstanding SERA.3215 a helicopter may, when stationary on an offshore or renewable energy installation, switch off the red anti-collision light as long as that is done in accordance with a procedure contained in the operations manual of the helicopter operator as a signal to ground personnel that it is safe to approach the helicopter for the purpose of embarkation or disembarkation of passengers or the loading or unloading of cargo. **Rule 15 Failure of anti-collision and navigation lights** (1) If any light required to be displayed by SERA.3215 fails during flight at night and cannot be immediately repaired or replaced, the aircraft must land as soon as it can safely do so, unless authorised by the appropriate air traffic control unit to continue its flight.(2) An aircraft may continue to fly during the day in the event of a failure of an anti-collision light provided the light is repaired at the earliest practicable opportunity.	The period for the requirement is defined as "at night" as defined in UK SERA Art 2(97).
C3 3.2.5	Standard	Less protective or partially implemented or not implemented	UK SERA. 3225 (c) & (d) specify that points c) & d) do not apply to balloons. UK SERA.3225 (c) specifies that point c) applies unless otherwise "indicated or instructed by ATC".	UK SERA. 3225 does not specify that these provisions apply "whether or not within an aerodrome traffic zone".
C3 3.3.1.2	Standard	Different in character or other means of compliance	(e) UK Reg. (EU) No. 923/2012, SERA.4001(b)(5) requires a flight plan to be submitted for any flight across international borders, unless otherwise prescribed by the States concerned. In addition, UK Reg. (EU) No. 923/2012, SERA.4001(b)(6) requires a flight plan to be submitted for any flight planned to operate at night, if leaving the vicinity of an aerodrome.	
C3 3.9 Table3-1	Standard	Different in character or other means of compliance	In the UK, in addition to the minima specified, VFR flight is permitted by aircraft in class D airspace at or below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher, if the aircraft is flown in accordance with the following conditions: a) during day; b) at an indicated airspeed of 140 KT or less to give adequate opportunity to observe other traffic or any obstacles in time to avoid a collision; and, c) remaining clear of cloud, with the surface in sight and: i. for aircraft other than helicopters, with a flight visibility of at least 5KM; ii. ii) for helicopters, with a flight visibility of at least 1500 M. In addition to the minima specified against footnote **(a)(1), the UK specifies that flight visibilities in airspace classes F and G may be reduced, during day only, to not less than 1500 M for flights operating at an indicated airspeed of 140 KT or less to give adequate opportunity to observe other traffic or any obstacles in time to avoid a collision.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 2: Rules of the Air (Amendment 48)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C4 4.6	Standard	More exacting or exceeds	SERA.5005(f)(2) differs from 4.6(b) in placing an additional requirement upon VFR flights to operate at a height less than 150 M (500 FT) above the ground or water, or 150 M (500 FT) above the highest obstacle within a radius of 150 M (500 FT) from the aircraft.	

Annex 3: Meteorological Services For International Air Navigation (Amendment 82)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.2.10	Recommend ation	Different in character or other means of compliance	The UK supplies meteorological information (OPMET) to users as specified in ICAO Annex 3 through the ICAO Secure Aviation Data Information Service (SADIS) in accordance with System Wide Information Management (SWIM) protocols. The UK does not supply meteorological information directly to users through national information services.	The supply of meteorological information directly to users through national information services is dependent on the implementation of a UK national SWIM infrastructure applicable to all domains (not just MET). A UK national SWIM implementation framework is being developed in accordance with ICAO Doc 10199 (PANS-Information Management, ICAO Doc 10039 (Manual on the SWIM Concept) and ICAO Doc 10203 (Manual on SWIM Implementation). Timescales for the implementation of a UK national SWIM infrastructure have not been established at this stage.
4.1.6	Recommend ation	Less protective or partially implemented or not implemented	Automated equipment for the measurement of visibility and runway visual range is not mandatory at aerodromes with runways intended for Category I instrument approach and landing operations. At these aerodromes human observed visibility and runway visual range are reported. Such aerodromes will not have fully integrated automatic systems for acquisition, processing, dissemination, and display in real time of the meteorological parameters affecting landing and take-off operations.	Installation and use of equipment for measuring height of cloud base is mandatory at licensed aerodromes with precision approach runways
4.6.5.1	Standard	Different in character or other means of compliance	Vertical visibility is not measured in the UK.	In the UK when the sky is obscured 'VV///' is reported in lieu of cloud information.
5.3.1, 5.8.1, 5.9.4, 5.9.5, 5.9.6	Recommend ation	Less protective or partially implemented or not implemented	Secondary Surveillance Radar (SSR) Mode S within Europe does not support the downlinking of automated routine observations sent via ADS in the Shanwick Oceanic Area are made every 30 minutes.	Current European Mode S Downlink Aircraft Parameters do not include the meteorological data block. WMO AMDAR data provides automated en-route meteorological observations.
5.3.4	Standard	Less protective or partially implemented or not implemented	Secondary Surveillance Radar (SSR) Mode S within Europe does not support the downlinking of automated routine observations.	Aircraft reports in the climb-out phase are obtained via AMDAR.
6.2.1.6	Recommend ation	Less protective or partially implemented or not implemented	UK issues TAFs of 2-5 hour validity to aerodromes that are due to close.	TAFs with validity periods of less than 6 hours are issued to aerodromes that are due to close in order to reduce the number of TAF cancellations.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 3: Meteorological Services For International Air Navigation (Amendment 82)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
6.3.2.2, 6.3.2.3	Standard	Less protective or partially implemented or not implemented	AIRMET information is not issued in the UK. GAMET area forecasts in plain language are issued.	AIRMET information is not issued as the specified phenomena are covered by SIGMET where applicable and appropriate warnings in low-level area forecasts.
7.5.1.1, 7.5.1.2, 7.5.1.3, 7.5.2.1, 7.5.2.2	Standard	Less protective or partially implemented or not implemented	AIRMET information is not issued in the UK.	AIRMET information is not issued as the specified phenomena are covered by SIGMET where applicable and appropriate warnings in low-level area forecasts.
7.6.1.3	Recommend ation	Less protective or partially implemented or not implemented	Aerodrome warnings in the UK are issued at specified times and are not cancelled or amended between issue times, except at certain aerodromes.	For operational reasons at certain aerodromes warnings will be issued, cancelled or amended 24/7 as required.
11.4	Standard	Less protective or partially implemented or not implemented	UK D-VOLMET reflects the content of UK VHF VOLMET broadcasts and does not provide TAF, SIGMET, special air-reports or AIRMET.	The D-VOLMET service is provided using the same equipment as VHF VOLMET.
11.5.1	Standard	Less protective or partially implemented or not implemented	UK VOLMET provides current aerodrome routine meteorological reports (METAR) only.	System designed to give rapid refresh of current conditions at key aerodromes in high density air traffic airspace.
11.5.2	Standard	Less protective or partially implemented or not implemented	UK does not broadcast VOLMET on high frequencies (HF).	The UK only broadcasts VOLMET on VHF broadcasts.

Annex 4: Aeronautical Charts (AMDT 62)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C1 1.1.4	Definition Aerodrome reference point	More exacting or exceeds	In the UK the aerodrome reference point is the geographical location of the aerodrome and the centre of its traffic zone where an ATZ is established.	
C1 1.1.9	Definition Air transit route	Less Protective or partially implemented or not implemented	Heli Route' or Helicopter Main Route' (HMR) are used in place of Air transit route.	
C1 1.1.62	Definition Instrument approach procedure	More exacting or exceeds	The UK definition includes instrument approach procedure classifications.	
C2 2.1.8	Recommendation	Different in character or other means of compliance	In the UK the basic sheet size of the charts is 297 MM x 210 MM (A4).	Reduction in sheet size would reduce the area of coverage and the amount of data published.
C4 4.1 - 4.10.4	Standard	Less protective or partially implemented or not implemented	The UK does not produce an Aerodrome Obstacle Chart ICAO Type B.	A demand for this chart has not been identified in the UK. User requirement is satisfied by the current content of the AIP. There are no current plans to produce this chart.
C5 5.1 - 5.8.8	Standard	Less protective or partially implemented or not implemented	The UK does not produce an Aerodrome Terrain and Obstacle Chart - ICAO (Electronic).	A demand for this chart has not been identified in the UK.
C7 7.1 – 7.9.4.2	Standard	Less protective or partially implemented or not implemented	The UK does not produce the En-route Chart - ICAO.	Information is published in tabular format in UK AIP ENR 3. Similar charts produced by industry are more appropriate for use by aircraft operators.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 4: Aeronautical Charts (AMDT 62)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C8 8.1 - 8.9.4.1.1	Standard	Less protective or partially implemented or not implemented	The UK does not produce the Area Chart - ICAO.	Requirement fulfilled by other means - SID and STAR charts, Approach charts and 1:500000 charts.
C9 9.9.3.1	Standard	Different in character or other means of compliance	Only Area Minimum Altitude (AMA) are shown.	The extent of the Minimum Sector Altitude (MSA) does not sufficiently take account of the complete route.
C9 9.9.4.2	Recommendation	Different in character or other means of compliance	The communication failure procedure is not shown on SID Charts. Communication failure procedures are shown on ATC Surveillance Minimum Altitude Charts.	UK will review its administrative arrangements and make amendments as applicable.
C10 10.9.3.1	Standard	Different in character or other means of compliance	Only Area Minimum Altitude (AMA) are shown.	The extent of the Minimum Sector Altitude (MSA) does not sufficiently take account of the complete route.
C10 10.9.4.2	Recommendation	Different in character or other means of compliance	The communication failure procedure is not shown on STAR Charts. Communication failure procedures are shown on ATC Surveillance Minimum Altitude Charts.	UK will review its administrative arrangements and make amendments as applicable.
C11 11.4	Recommendation	More exacting or exceeds	In the UK the basic sheet size of the charts is 297 MM x 210 MM (A4).	Reduction in sheet size would reduce the area of coverage and the amount of data published.
C11 11.8.2	Standard	Different in character or other means of compliance	The magnetic variation shown only agrees with non-VOR procedures.	The set value of the VOR is used in the design of a VOR procedure and this could be different from the local magnetic variation value.
C11 11.10.2.2	Recommendation	Less protective or partially implemented or not implemented	Only a generic set of obstacles for the area are shown, which does not always include the controlling obstacles.	For chart clarity purposes.
C11 11.10.4.3	Recommendation	Less protective or partially implemented or not implemented	The Final Approach Fix or Point (FAF/FAP) geographical co-ordinates are not shown.	A requirement for publication of these co-ordinates has not been identified in the UK.
C11 11.10.6.3	Standard	Different in character or other means of compliance	f) Transition altitude information is not shown within the profile area.	
C11 11.10.7.1	Standard	Less protective or partially implemented or not implemented	Aerodrome operating minima is not shown on UK Instrument Approach Charts.	UK publishes the Obstacle Clearance Altitude and Obstacle Clearance Height (OCA/H), and instructions on how to calculate the Aerodrome Operating Minima in the UK AIP AD 1.1 subsection 4.
C11 11.10.7.2	Standard	Less protective or partially implemented or not implemented	Only basic CAT D OCA(H) are shown.	Work is currently underway to identify the measures required to achieve compliance with this standard.
C11 11.10.8.5	Standard	Less protective or partially implemented or not implemented	In accordance with PANS-OPS (Doc 8168), only the approach descent gradient is shown on UK AIP non-precision instrument approach charts.	Fully compliant for RNAV IAPs when BaroVNAV and/or SBAS elements have been provided on the chart.
C11 11.10.8.9	Standard	Less protective or partially implemented or not implemented	This Standard has not been implemented in the UK as there are no approach procedures authorised in the UK for simultaneous operations.	Implementation of the provision will be reviewed should simultaneous operations be introduced in the UK.
C11 11.10.9	Standard	Less protective or partially implemented or not implemented	Only RNAV coding data is shown.	Non RNAV procedures were designed pre RNAV standards and/or will not conform to coding standards. Therefore the UK has taken the position to not supply appropriate data for non RNAV procedures.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 4: Aeronautical Charts (AMDT 62)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C12 12.1 to 12.10.6.2	Standard	Less protective or partially implemented or not implemented	The UK does not produce the Visual Approach Chart - ICAO.	Established Visual Approach Procedures do not exist in UK.
C13 13.6.2	Recommendation	Less protective or partially implemented or not implemented	The areas where aircraft with folding wing tips may be safely operated with wingtips extended is not yet shown on charts.	The change process for the required changes to the UK Aeronautical Chart Specification (SPC_AIM006_01) is in progress and will be implemented before aeroplanes with folding wing tips will be operating to/from UK aerodromes.
C14 14.6.2	Recommendation	Less protective or partially implemented or not implemented	The areas where aircraft with folding wing tips may be safely operated with wingtips extended is not yet shown on charts.	The change process for the required changes to the UK Aeronautical Chart Specification (SPC_AIM006_01) is in progress and will be implemented before aeroplanes with folding wing tips will be operating to/from UK aerodromes.
C16 16.1 to 16.9.7.2	Standard	Less protective or partially implemented or not implemented	The UK does not produce the World Aeronautical Chart ICAO 1:1 000 000.	There is no operational requirement for this chart. ICAO Chart 1:500 000 is produced instead.
C17 17.4.3	Recommendation	Different in character or other means of compliance	Chart is sold flat.	Chart user folds at own discretion.
C17 17.7.11.1	Recommendation	Less Protective or partially implemented or not implemented	Only hypsometric tints and contours shown.	Not applicable to UK topography.
C17 17.7.12.2	Standard	Less Protective or partially implemented or not implemented	Limits of tree growth not shown.	Not applicable to UK topography.
C18 18.1 to 18.8.5	Standard	Less Protective or partially implemented or not implemented	The UK does not produce the Aeronautical Navigation Chart - ICAO Small scale.	This Chart is not produced in the UK as there is either no operational requirement for the chart, or equivalent charts which are more appropriate for the required use are made available by commercial organisations.
C19 19.1 to 19.9.2	Standard	Less Protective or partially implemented or not implemented	The UK does not produce the Plotting Chart - ICAO.	There is no operational requirement for the chart in the UK. Aircraft Operators use large format or Electronic En-Route charts provided by commercial organizations. These are more appropriate for the required use.
C20 20.1 to 20.6	Standard	Less Protective or partially implemented or not implemented	The UK does not produce the Electronic Aeronautical Chart Display - ICAO.	Products provided by commercial service providers are more suitable for use by aircraft operators.

Annex 5: Units of Measurement to be Used in Air and Ground Operations (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
NIL				

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 1: Operation of Aircraft (International Commercial Air Transport - Aeroplanes) (AMDT 49)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C3 3.1.4	Standard	Different in character or other means of compliance	The UK does not give any formal status to flight operations officers/flight dispatchers.	The UK requires an operator to ensure that the operations manual contains instructions and information necessary for operations personnel to perform their duty including training for those other than crew members.
C3 3.1.5	Standard	Less protective or partially implemented or not implemented	The UK does not give any formal status to flight operations officers/flight dispatchers.	The UK requires an operator to ensure that the operations manual contains instructions and information necessary for operations personnel to perform their duty including training for those other than crew members.
C3 3.3.1	Recommend ation	Less protective or partially implemented or not implemented	The UK only requires operators of aeroplanes in excess of 27,000 KG to establish FDM programmes.	The term Flight Data Monitoring is used instead of Flight Data Analysis.
C3 3.3.2	Standard	Less protective or partially implemented or not implemented	ORO.AOC.130 only requires a flight data monitoring programme for aeroplanes with a Maximum Certified Take-Off Mass (MCTOM) above 27,000 KG.	Alignment will be considered within future rule making activities.
C3 3.3.2	Standard	Less protective or partially implemented or not implemented	ORO.AOC.130 does not require a flight data monitoring programme for aeroplanes with a MCTOM equal to or less than 27,000 KG. Therefore, Annex 6 Part I, 3.3.3 is not implemented for aeroplanes with MCTOM between 15,000 KG and 27,000 KG.	Alignment will be considered within future rule making activities.
C3 3.5.1	Standard	Less protective or partially implemented or not implemented	The scope of CAT.GEN.MPA.205 – aircraft tracking - is essentially restricted to aeroplanes in excess of 27,000 KG.	Requiring an aircraft tracking capability for lighter aeroplanes is considered to be disproportionate with regards to the cost and expected safety benefit.
C3 3.5.2, 3.5.3	Standard & Recommend ation	Less protective or partially implemented or not implemented	The UK only requires tracking of such aeroplanes with a first individual CofA on or after 16 December 2018.	
C4 4.2.1.3.1	Standard	Different in character or other means of compliance	The operator remains responsible that the contracted services comply with the applicable requirements and that the aviation safety hazards associated with contracted services or products are considered by the operator's management system. However, it is not specified that the operator shall develop policies and procedures for third parties.	
C4 4.2.1.5	Standard	Different in character or other means of compliance	UK AOCs do not have an expiry date but are dependent on continued validity.	Alignment will be considered within future rule making activities.
C4 4.2.1.6	Standard	Different in character or other means of compliance	The UK has not yet implemented requirements for Extended Diversion Time Operations (EDTO). Extended-range Twin-engine Operations Performance Standards (ETOPs) is still used.	Alignment will be considered with RMT 0179.
C4 4.2.8.6	Recommendation	Less protective or partially implemented or not implemented	The UK allows Met Visibility to be converted to RVR. No limiting visibility is prescribed.	Alignment will be considered within future rule making activities.
C4 4.3.3.1	Standard	Less protective or partially implemented or not implemented	In the UK, the commander is not required to sign the Operational Flight Plan (OFP). An OFP is not required for operations under VFR of other-than-complex motor-powered aeroplane taking off and landing at the same aerodrome or operating site.	Alignment will be considered within future rule making activities.
C4 4.3.4.1.2	Standard	Different in character or other means of compliance	UK rules allow 2 hours for ETOPS (EDTO not yet implemented).	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 1: Operation of Aircraft (International Commercial Air Transport - Aeroplanes) (AMDT 49)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C4 4.3.4.1.3	Standard	More exacting or exceeds	CAT.OP.MPA.185 (a) requires a period commencing one hour before and ending one hour after the estimated time of arrival at the aerodrome.	
C4 4.3.4.3.1	Standard	More exacting or exceeds	UK ANO rules require a period commencing two hours before and ending two hours after the estimated time of arrival at the aerodrome.	
C4 4.3.6.4	Recommendation	Less protective or partially implemented or not implemented	The UK has not adopted this Recommendation.	Alignment will be addressed with RMT 0179.
C4 4.3.10.1	Recommendation	Less protective or partially implemented or not implemented	The recommendation will be considered in the scope of rule making for the implementation of the EDTO standards.	
C4 4.5.5	Standard	Different in character or other means of compliance	The operator specifies the procedure in the OM which the Pilot in Command is obliged to comply with in accordance with CAT.GEN.MPA.105 (a)(8).	
C4 4.6.1, 4.6.2	Standard	Different in character or other means of compliance	The UK does not give any formal status to flight operations officers/flight dispatchers.	The UK requires an operator to ensure that the operations manual contains instructions and information necessary for operations personnel to perform their duty included training for those other than crew members.
C4 4.7.1.1, 4.7.1.2, 4.7.2.1 to 4.7.2.3.1 and 4.7.2.4 to 4.7.2.6	Standard	Less protective or partially implemented or not implemented	The UK has not yet adopted the Standard for EDTO which will be the subject of future rule making and implementation.	The UK uses ETOPS procedures.
C4 4.7.2.7	Recommendation	Less protective or partially implemented or not implemented	The UK has not adopted this Recommendation.	The UK uses ETOPS procedures.
C4 4.9.2	Standard	Less protective or partially implemented or not implemented	Under UK Reg.(EU) 965/2012, the maximum certificated take-off mass (MCTOM) is not stipulated.	
C6 6.1.5	Standard	Less protective or partially implemented or not implemented	The UK has not ratified Article 83 bis but would follow this Standard if required.	
C6 6.2.2.1	Standard	Less protective or partially implemented or not implemented	Only applied to large aeroplanes with a first individual CofA on or after 18 February 2020 for lavatory waste receptacles, and 18 May 2019 for portable fire extinguishers.	
C6 6.3.1.1.1	Standard	Different in character or other means of compliance	CAT.IDE.A.190 (a)(3) applies to multi-engine turbine-powered aeroplanes with an MCTOM of 5700 KG or less with a MOPSC of more than 9. CAT.IDE.A.190 (b)(5) is applicable to aeroplanes with an individual first CofA on or after 1 January 2016. CAT.IDE.A.191 (light weight FDR) applies to turbine-engine aeroplanes with MCTOM of 2250 KG or more, or aeroplanes with a MOPSC of more than 9 not covered under CAT.IDE.A.190, and first issued with an individual CofA on or after 5 September 2022.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 1: Operation of Aircraft (International Commercial Air Transport - Aeroplanes) (AMDT 49)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C6 6.3.1.1.2	Recommendation	Different in character or other means of compliance	ANO 2016 and CAT.IDE.A.190 (a)(3) applies to multi-engine turbine-powered aeroplanes with an MCTOM of 5700 KG or less with a MOPSC of more than 9. CAT.IDE.A.190 (b)(5) is applicable to aeroplanes with an individual first CofA on or after 1 January 2016. CAT.IDE.A.191 (light weight FDR) applies to turbine-engine aeroplanes with MCTOM of 2250 KG or more, or aeroplanes with a MOPSC of more than 9 not covered under CAT.IDE.A.190, and first issued with an individual CofA on or after 5 September 2022 not covered under CAT.IDE.A.190, and first issued with an individual CofA on or after 5 September 2022.	
C6 6.3.1.1.3	Standard	More exacting or exceeds	CAT.IDE.A.190 (a)(1) applies to aeroplanes with an individual CofA after 1 June 1990 and MCTOM of more than 5700 KG. CAT.IDE.A.190 (a)(2) applies to turbine-engined aeroplanes with an individual CofA before 1 June 1990 and MCTOM of more than 5700 KG.	
C6 6.3.1.1.4	Standard	Different in character or other means of compliance	ANO 2016 and CAT.IDE.A.190 (a)(1) applies to aeroplanes with an individual CofA after 1 June 1990 and MCTOM of more than 5700 KG. CAT.IDE.A.190 (a)(2) applies to turbine-engined aeroplanes with an individual CofA before 1 June 1990 and MCTOM of more than 5700 KG.	
C6 6.3.1.1.5	Recommendation	Different in character or other means of compliance	ANO 2016 applies to aeroplanes with an individual CofA on or after 1 June 1990 and CAT.IDE.A.190 (a)(3) applies to aeroplanes with an individual CofA on or after 1 April 1998.	
C6 6.3.1.1.7	Recommendation	More exacting or exceeds	CAT.IDE.A.190 (a) captures all turbine-engined aeroplanes with an individual CofA before 1 June 1990 and MCTOM of more than 5700 KG.	
C6 6.3.1.1.8, 6.3.1.1.9	Standard & Recommendation	More exacting or exceeds	CAT.IDE.A.190 (a)(2) applies to all turbine-engined aeroplanes with a MCTOM of over 5700 KG and first issued with an individual CofA before 1 June 1990 whatever the date of prototype certification.	
C6 6.3.1.1.10	Standard	Less protective or partially implemented or not implemented	CAT.IDE.A.190 (a)(1) applies to all aeroplanes with a MCTOM of over 5700 KG with an individual CofA issued on or after 1 June 1990. However, in the case where the aeroplane was first issued an individual CofA between 1 January 2005 and 1 January 2016, AMC2 CAT.IDE.A.190 is applicable but does not specify all of the first 78 parameters listed in table A8-1.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 1: Operation of Aircraft (International Commercial Air Transport - Aeroplanes) (AMDT 49)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C6 6.3.1.1.11 6.3.1.1.12	Standard & Recommendation	More exacting or exceeds	CAT.IDE.A.190 (a)(1) applies to all aeroplanes with a MCTOM of over 5700 KG and first issued with an individual CofA on or after 1 June 1990. AMC1.2 CAT.IDE.A.190 is applicable to aeroplanes first issued with an individual CofA on or after 1 January 2023.	AMC1.2 CAT.IDE.A.190 specifies the 82 parameters listed in table A8-1.
C6 6.3.1.2	Standard	Less protective or partially implemented or not implemented	Not specifically stated but CAT.IDE.A.190 requires that the FDR uses a digital method of recording and storing the data, hence CAT.IDE.A.190 excludes de facto engraving metal foil and photographic film.	
C6 6.3.1.3	Standard	More exacting or exceeds	The minimum recording duration for the FDR is 25 hours for aeroplanes other than those referenced in 6.3.1.1.5. For aeroplanes referenced in 6.3.1.1.5, the minimum recording duration is 10 hours.	
C6 6.3.2.1.1, 6.3.2.1.2, and 6.3.2.3.3	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Standard/ Recommendation.	Alignment will be considered within future rule making activities.
C6 6.3.2.4.2	Standard	More exacting or exceeds	The requirement is for aeroplanes with an individual first CofA from 5 September 2022.	
C6 6.3.2.4.3	Recommendation	Less protective or partially implemented or not implemented	The requirement is for aeroplanes with an individual first CofA from 5 September 2022.	
C6 6.3.3.1.1	Standard	More exacting or exceeds	The requirement is for aeroplanes with an individual first CofA from 8 April 2014.	
C6 6.3.3.1.2, 6.3.3.1.3	Standard & Recommendation	Less protective or partially implemented or not implemented	The requirement is for aeroplanes with an individual first CofA from 8 April 2014 but no retrofit or update is required.	
C6 6.3.4.1.1, 6.3.4.1.2, 6.3.4.2, 6.3.4.3, 6.3.5.4	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Standard/ Recommendation.	Alignment will be considered within future rule making activities.
C6 6.3.5.5.1	Recommendation	Different in character or other means of compliance	Aeroplanes required to be fitted with a FDR and CVR may instead be fitted with combination recorders.	
C6 6.3.5.5.2	Standard	Less protective or partially implemented or not implemented	The UK has not yet adopted this Standard but aeroplanes required to be fitted with a FDR and CVR may instead be fitted with combination recorders.	Alignment will be considered within future rule making activities.
C6 6.3.6.1	Standard	Different in character or other means of compliance	CAT.GEN.MPA.210 is applicable to aeroplanes with MCTOM of over 27,000 KG with a MOPSC of more than 19 and all aeroplanes with a MCTOM of more than 45,500 KG. CAT.GEN.MPA.210 is applicable to such aeroplanes with a CofA first issued on or after 1 January 2023.	The means for accurately locating the point of end of flight after an accident required by CAT.GEN.MPA.210 will, as a secondary benefit, also allow quick retrieval of flight recorder data.
C6 6.3.6.2	Standard	Different in character or other means of compliance	CAT.GEN.MPA.210 is also applicable to aeroplanes with MCTOM of over 45,500 KG and less than 19 pax. CAT.GEN.MPA.210 is applicable to every aeroplane with a CofA first issued on or after 1 January 2023.	The means for accurately locating the point of end of flight after an accident required by CAT.GEN.MPA.210 will, as a secondary benefit, also allow quick retrieval of flight recorder data.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 1: Operation of Aircraft (International Commercial Air Transport - Aeroplanes) (AMDT 49)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C6 6.5.2.1	Standard	Less protective or partially implemented or not implemented	For aeroplanes under CAT.IDE.A.285, carriage of life jackets when flying en route over water beyond gliding distance from the shore, in the case of all other land planes (not operated in accordance with 5.2.9 or 5.2.10) not implemented.	
C6 6.5.3.1	Standard	Less protective or partially implemented or not implemented	For aeroplanes under CAT.IDE.A.285, the ULD at (c) might not be fitted if the aeroplane is equipped with robust and automatic means to accurately determine, following an accident where the aeroplane is severely damaged, the location of the point of end of flight.	
C6 6.12	Standard	Different in character or other means of compliance	Management of cosmic radiation is conducted in accordance with the Air Navigation (Cosmic Radiation: protection of Air Crew and Space Crew and Consequential Amendments) Order 2019 and equipment is not necessarily carried on board the aircraft.	
C6 6.18.1	Standard	Less protective or partially implemented or not implemented	Partially implemented. CAT.GEN.MPA.210 is not applicable to aeroplanes with MCTOM of less than 45,500 KG and Maximum Operational Passenger Seating Configuration (MOPSC) of less than 19.	CAT.GEN.MPA.210 meets the same objective as 6.18.1 which is according to Annex 6 Pat 1 Appendix 9 'to establish the accident site within 6 NM radius'. Transmitting a position every minute is just one solution to achieve this objective.
C6 6.18.2	Recommendation	Different in character or other means of compliance	The UK has not yet adopted this Recommendation.	Alignment will be considered within future rule making activities.
C6 6.18.3	Standard	Different in character or other means of compliance	The provision of position information will be dependent on how that information is derived.	
C6 6.19.2	Recommendation	Less protective or partially implemented or not implemented	The UK has not adopted this Recommendation.	
C6 6.20.2, 6.20.3, 6.22.1, 6.22.2, 6.24	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Standard/ Recommendation.	Alignment will be considered within future rule making activities.
C6 6.26.1	Standard	Less protective or partially implemented or not implemented	The UK has not yet adopted this Standard.	Alignment will be considered within future rule making activities.
C8 8.2.1	Standard	Less protective or partially implemented or not implemented	UK requirements do not address the human factors principles in Part M sub part G and Part CAMO.	The CAMO must have a Continuing Airworthiness Maintenance Exposition which is equivalent to a Maintenance Control Manual.
C8 8.3.1	Standard	Less protective or partially implemented or not implemented	Part M Sub part G, Part CAMO and Part CAO do not observe Human Factors principles in the design of the Maintenance Programme.	
C8 8.3.2	Standard	Less protective or partially implemented or not implemented	The requirements do not explicitly state that 'Copies of all amendments shall be furnished promptly to all organizations or persons to whom the manual has been issued".	
C8 8.4.2	Standard	More exacting or exceeds	The UK requires the records to be retained for 2 years.	
C8 8.8.2, 8.8.3	Standard	Less protective or partially implemented or not implemented	For CAT operations maintenance release must be completed by an approved maintenance organisation.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 1: Operation of Aircraft (International Commercial Air Transport - Aeroplanes) (AMDT 49)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C10 10.1, 10.2, 10.3, 10.4, 10.5	Standard	Less protective or partially implemented or not implemented	The UK does not give any formal status to flight operations officers/flight dispatchers.	The UK requires an operator to ensure that the operations manual contains instructions and information necessary for operations personnel to perform their duty including training for those other than crew members.
C11 11.4.3	Recommend ation	Less protective or partially implemented or not implemented	The UK only requires the Journey Log Book to be retained for three months.	
C12 12.4	Standard	More exacting or exceeds	For CAT operations, Cabin Crew are required to hold a CC Attestation following the successful completion of the Initial training required by UK Reg.(EU) 1178/2011.	
C13 13.2.4	Recommend ation	Less protective or partially implemented or not implemented	The UK has not mandated this Recommendation.	It is not considered practical to implement this Recommendation on some smaller aircraft.
C13 13.6.1	Recommend ation	Less protective or partially implemented or not implemented	The UK does not currently prescribe that specialised means of attenuating and directing the blast should be provided for use in the least-risk bomb location.	
C15 15.2.1	Standard	More exacting or exceeds	Any provision of flight manual information will be provided through aeroplane certification.	

Annex 6 Part 2: Operation of Aircraft (International General Aviation - Aeroplanes) (AMDT 41)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.2.1.2	Recommen-dation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Recommendation.	Alignment will be considered within future rule making activity.
2.2.3.4.2 & 2.2.3.4.3	Standard	More exacting or exceeds	UK ANO rules require a period commencing two hours before and ending two hours after the estimated time of arrival at the aerodrome.	
2.4.2.2	Standard	More exacting or exceeds	In order to operate within UK airspace, Operators are also required to carry a functioning active Carbon Monoxide detector, capable of alerting flight crew by aural and/or visual warnings in affected piston engine aircraft, when operating with passengers onboard who do not hold a recognised flight crew qualification.	Carbon Monoxide poisoning has been a factor in multiple General Aviation accidents in the UK. To address this the CAA has published a Safety Directive (SD 2024/001 V2), which establishes the mandatory carriage of a functioning active CO detector, applicable to both UK registered and non-UK registered aircraft operating in UK airspace, Operators must review the Safety Directive to determine if it is applicable to their operation. It is the intention of the CAA to incorporate this Safety Directive into legislation at an appropriate time in the future.
2.4.2.3	Standard	Less protective or partially implemented or not implemented	Only applied to large aeroplanes with a first individual CofA on or after 18 February 2020 for lavatory waste receptacles, and 18 May 2019 for portable fire extinguishers.	Alignment will be considered within future rule making activity.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 2: Operation of Aircraft (International General Aviation - Aeroplanes) (AMDT 41)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.4.3.2	Recommendation	Different in character or other means of compliance	The UK rules do not distinguish between VFR flights and VFR controlled flights.	
2.4.11.2, 2.4.11.3	Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Recommendation.	Alignment will be considered within future rule making activity.
2.4.15	Standard	Less protective or partially implemented or not implemented	The UK has not yet fully adopted this Standard.	The UK intends to develop appropriate regulations through a rule making activity.
2.4.16.1.1.1	Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Recommendation.	Alignment will be considered within future rule making activity.
2.4.16.1.1.2, 2.4.16.1.1.3	Standard & Recommendation	More exacting or exceeds	NCC.IDE.A.165 is applicable to aeroplanes with an individual first Cof A issued on or after 1 January 2016.	
2.4.16.2.1	Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Recommendation.	Alignment will be considered within future rule making activity.
2.4.16.2.3.1	Standard	More exacting or exceeds	The UK requires aeroplanes with a MCTOM of over 27,000 KG and a first individual CofA issued on or after 1 January 2021 to retain the information for the preceding 25 hours.	
2.4.16.2.3.2, 2.4.16.3.1.2 & 2.4.16.3.1.3	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Standard/Recommendation.	Alignment will be considered within future rule making activity.
2.4.17.2.2 & 2.4.17.3	Standard	Less protective or partially implemented or not implemented	The UK does not require a specific approval for use of EFB in non-commercial operations.	Alignment will be considered within future rule making activity.
2.4.18	Standard	Less protective or partially implemented or not implemented	The UK has not ratified Article 83 bis but would follow these Standards if required.	Alignment will be considered within future rule making activity.
2.6.2.2	Standard	More exacting or exceeds	The UK requires records to be retained for 2 years.	
3.1.2	Recommendation	Less protective or partially implemented or not implemented	The UK has not yet adopted this Recommendation.	Alignment will be considered within future rule making activity.
3.4.1.2	Standard	Less protective or partially implemented or not implemented	The UK has not yet adopted this Standard.	Alignment will be considered within future rule making activity.
3.4.2.8	Standard	Less protective or partially implemented or not implemented	The UK has not yet fully adopted this Standard but relies on individual crew management of fatigue.	Alignment will be considered within future rule making activity.
3.4.3.7.1	Recommendation	Less protective or partially implemented or not	The UK has not implemented this Recommendation.	Alignment will be considered within future rule making activity.
3.6.3.1.1.1, 3.6.3.1.1.2, 3.6.3.1.1.3, 3.6.3.2.1.2	Standard & Recommendation	Less protective or partially implemented or not implemented	NCC.IDE.A.165 is applicable to aeroplanes with an individual first Cof A issued on or after 1 January 2016.	Alignment will be considered within future rule making activity.
3.6.3.2.1.1	Standard	More Exacting or Exceeds	This Standard is applied to turbine aeroplanes with a MCTOM of more than 2250 KG.	Alignment will be considered within future rule making activity.
3.6.3.2.1.3	Recommendation	Less protective or partially implemented or not implemented	The UK has not implemented this Recommendation.	Alignment will be considered within future rule making activity.
3.6.8.2.1	Recommendation	Less protective or partially implemented or not implemented	The UK has not implemented this Recommendation.	Alignment will be considered within future rule making activity.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 2: Operation of Aircraft (International General Aviation - Aeroplanes) (AMDT 41)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.6.9.1	Recommendation	More exacting or exceeds	The UK requires all turbine-engined aeroplanes of more than 5700 KG or a MOPSC of more than 19 to be fitted with ACAS.	Alignment will be considered within future rule making activity.
3.8.5.2, 3.8.5.3	Standard	More exacting or exceeds	In the UK an AME can only release a Non Part 21 aircraft on their license.	UK AME cannot release a large turbojet aircraft. Alignment will be considered within future rule making activity.
3.10	Recommendation	Less protective or partially implemented or not implemented	The UK does not give any formal status to flight operations officers/flight dispatchers. The UK does not specify the duties and training associated with the employment of flight operations officers / flight dispatchers.	Alignment will be considered within future rule making activity.

Annex 6 Part 3: Operation of Aircraft (International Operations - Helicopters) (AMDT 25)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Section 2				
1.1.4	Standard	Different in character or other means of compliance	The UK does not give any formal status to flight operations officers/flight dispatchers.	The UK requires an operator to ensure that the operations manual contains instructions and information necessary for operations personnel to perform their duty including training for those other than crew members.
1.1.5, 2.6.1, 2.6.2	Standard	Less protective or partially implemented or not implemented	The UK does not give any formal status to flight operations officers/flight dispatchers.	The UK requires an operator to ensure that the operations manual contains instructions and information necessary for operations personnel to perform their duty including training for those other than crew members.
1.3.1	Recommendation	Less protective or partially implemented or not implemented	The UK only requires operators of helicopters conducting CAT operations under a Helicopter Offshore Operations Specific Approval to establish FDM programmes.	
1.4.1	Standard	Less protective or partially implemented or not implemented	UK Reg (EU) No 923/2012 Article 2 (73) but does not have or eFPL.	Alignment will be considered within future rule making activities.
2.2.8.3	Standard	Less protective or partially implemented or not implemented	The new approach classifications have not yet been transposed into UK regulations.	Alignment will be considered within future rule making activities.
2.2.8.6	Recommendation	Less protective or partially implemented or not implemented	The UK allows Met Visibility to be converted to RVR. No limiting visibility is prescribed.	
2.3.3.1	Standard	Less protective or partially implemented or not implemented	UK regulations do not require the commander to sign the Operational Flight Plan. An OFP is not required for operations under VFR of helicopters with an MCTOM of 3175 KG or less, by day and over routes navigated by reference to visual landmarks in a local area as specified in the operations manual.	Alignment will be considered within future rule making activities.
2.3.4.1.2	Standard	More exacting or exceeds	The UK requires in CAT.OP.MPA.186 (a) a period commencing one hour before and ending one hour after the estimated time of arrival at the aerodrome.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 3: Operation of Aircraft (International Operations - Helicopters) (AMDT 25)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.3.4.2.1	Standard	More exacting or exceeds	The UK ANO regulations require a period commencing two hours before and ending two hours after the estimated time of arrival at the aerodrome.	
2.3.4.3.10	Recommendation	Different in character or other means of compliance	Operator's procedures for the use of offshore destination alternate heliports are required to be approved under SPA.HOFO.	
2.3.4.3.15	Recommendation	Less protective or partially implemented or not implemented	No minimum distance between destination and offshore destination heliport is specified.	
2.3.6.2, 2.3.6.3, 2.3.6.3.1, 2.3.6.3.2, 2.3.6.4	Standard	Less protective or partially implemented or not implemented	The UK does not specify duration of fuel/oil reserves for non-Part-21 flights. It only states sufficient fuel, oil and engine coolant (if required) are carried for the intended flight, and that a safe margin has been allowed for contingencies.	
2.3.7.1 & 2.3.7.6	Standard	Less protective or partially implemented or not implemented	(a) passenger embarking/disembarking is permitted with appropriate precautions. (b) oxygen replenishment is allowed.	
2.3.7.2	Standard	Less protective or partially implemented or not implemented	Alternative means of compliance is given in AMC1 CAT.OP.MPA.195 SPA.HEMS.155	
2.3.7.4	Standard	Less protective or partially implemented or not implemented	(f) and (g) not implemented in the UK.	
2.3.8.2, 4.8.2, 4.8.3, 4.8.4	Standard & Recommendation	Less protective or partially implemented or not implemented	Not implemented for CAT aircraft. There are no pressurised helicopters operated in the UK.	
2.8.1, 2.8.2	Standard	Less protective or partially implemented or not implemented	The UK does not currently permit the use of a FRMS for CAT operations with helicopters.	In the future, UK foresees the development of Part-FTL for CAT operations with helicopters permitting the use of a Fatigue Risk Management Systems (FRMS).
3.1.4, 3.4.1, 3.4.2, 3.4.3, 3.4.4	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK does not permit IMC operations in Performance Class 3.	
4.1.5.1, 4.1.5.2, 4.1.5.3, 4.1.5.4	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK has not ratified Article 83 bis but would follow these Standards and Recommended Practice if required.	
4.2.2	Standard	Less protective or partially implemented or not implemented	UK Reg (EU) 965/2012 does not require the carriage of spare electrical fuses in helicopters.	
4.2.2.1	Standard	Less protective or partially implemented or not implemented	The UK only requires this for Large Helicopters with Initial CofA after 18 February 2020 (lavatory) and 18 May 2019 (portable).	
4.3.1.1.2	Standard	More exacting or exceeds	The passenger capacity threshold in CAT.IDE.H.190 (a)(1) is 9 not 19.	
4.3.1.1.3	Recommendation	More exacting or exceeds	The UK requires this as a standard for Public Transport helicopters between 2730 and 7000 KG. Required for CAT helicopters first issued with an individual CofA on or after 1 August 1999.	
4.3.1.1.4	Standard	Less protective or partially implemented or not implemented	Only required for CAT and the scope of CAT.IDE.H.191 covers those helicopters with an individual CofA first issued on or after 5 September 2022.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 3: Operation of Aircraft (International Operations - Helicopters) (AMDT 25)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
4.3.1.1.5	Recommendation	Less protective or partially implemented or not implemented	Only required for CAT Turbine helicopters and the scope of CAT.IDE.H.191 covers those helicopters with an individual CofA first issued on or after 5 September 2022.	
4.3.1.3	Standard	Less protective or partially implemented or not implemented	The UK only requires recorders capable of retaining the information recorded during at least the last 8 hours of their operation for Public Transport operations. For CAT operations only in the case of helicopters first issued with an individual CofA on or after 1 January 2016 is the FDR required to record data for at least the preceding 10 hours.	
4.3.2.3	Standard	Less protective or partially implemented or not implemented	Fully implemented for CAT helicopters with initial CofA after 1 Jan 2016. Other helicopters are required to be equipped with a CVR capable of retaining the information of a duration of only 1 hour or 0.5 hours.	
4.3.3.1.1	Standard	More exacting or exceeds	The data link recording capability is required for CAT helicopters first issued with an individual CofA on or after 8 April 2014.	
4.3.3.1.2, 4.3.3.1.3	Standard & Recommendation	Less protective or partially implemented or not implemented	The data link recording capability is only required for CAT helicopters first issued with an individual CofA on or after 8 April 2014.	
4.3.4.4	Recommendation	Less protective or partially implemented or not implemented	Partially implemented. FDR documentation is not currently required to be in electronic format.	
4.4.4	Recommendation	Less protective or partially implemented or not implemented	The UK has not implemented this Recommendation for Non-Part-21 aircraft and has partially implemented only for CAT HOFO operations for Part-21 aircraft.	
4.5.2.6, 4.5.2.8	Recommendation	Less protective or partially implemented or not implemented	The UK has not implemented this Recommendation for Public Transport aircraft but the AMC for CAT aircraft is applicable to all helicopters regardless of the date of issuance of the CofA.	
4.5.2.7	Recommendation	Less protective or partially implemented or not implemented	The UK has not implemented this Recommendation for Public Transport aircraft but the AMC for CAT aircraft ensures that all life rafts of more than 40 KG should have remote control deployment.	
4.10.1	Recommendation	Less protective or partially implemented or not implemented	Not required for Public Transport aircraft and only for CAT helicopters with pax seating capability of more than 9.	
4.15.1	Recommendation	More Exacting or Exceeding	The UK has mandated this Recommendation for operations in hostile environment.	
6.3.1	Standard	Less protective or partially implemented or not implemented	The UK does not require operators to observe Human Factors principles in the design and application of the maintenance manual.	
6.3.2	Standard	Less protective or partially implemented or not implemented	Partially implemented. UK requirements do not explicitly describe that 'Copies of all amendments shall be furnished promptly to all organizations or persons to whom the manual has been issued'.	
6.4.2, 6.8.2	Standard	More Exacting or Exceeding	Retaining periods vary but exceed the ICAO requirement.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 3: Operation of Aircraft (International Operations - Helicopters) (AMDT 25)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
8.1, 8.2, 8.3, 8.4, 8.5	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK does not give any formal status to flight operations officers/flight dispatchers. The UK does not specify the duties and training associated with the employment of flight operations officers / flight dispatchers.	The UK requires an operator to ensure that the operations manuals contains instructions and information necessary for operations personnel to perform their duty including training for those other than crew members.
9.4.3	Recommendation	Less protective or partially implemented or not implemented	The UK only requires the Journey Log Book to be retained for 3 months.	
12.4.3.3	Standard	Less protective or partially implemented or not implemented	Not Implemented.	
Section 3				
1.1.5	Recommendation	Less protective or partially implemented or not implemented	Fully implemented for NCC but not explicitly implemented for NCO.	
2.2.1.1	Standard	Less protective or partially implemented or not implemented	UK regulations currently only provide operational credits for HUDs and EVS. For non-commercial operators, the State of Operator approves the operational credits instead of the State of Registry.	The approval for additional operational credits will be introduced through AWO rule changes.
2.6.2.1	Standard	Less protective or partially implemented or not implemented	Weather conditions, at the heliport of intended landing OR at least one alternate heliport will, at the estimated time of arrival, be at or above the heliport operating minima.	
2.7.1	Standard	More exacting or exceeds	For isolated heliports the minimum weather conditions defined in 2.6.2.2 have to prevail and all the other conditions must be met.	
2.7.2	Standard	Less protective or partially implemented or not implemented	Fully implemented for NCC. Not implemented for NCO flights.	
2.7.3	Standard	Less protective or partially implemented or not implemented	Fully implemented for NCC. Not implemented for NCO flights. Offshore alternatives in a hostile environment may be used.	
2.8.2, 2.8.3.1, 2.8.3.2, 2.8.3.3	Standard	Less protective or partially implemented or not implemented	The UK does not specify duration of fuel/oil reserves for non-Part-21 flights. It requires sufficient fuel, oil and engine coolant (if required) are carried for the intended flight, and that a safe margin has been allowed for contingencies.	
2.8.4	Standard	Less protective or partially implemented or not implemented	The UK does not specify potential contingencies for non Part-21 flights.It requires sufficient fuel, oil and engine coolant (if required) are carried for the intended flight, and that a safe margin has been allowed for contingencies.	
2.10.1, 2.11, 4.5.1	Standard	Less protective or partially implemented or not implemented	NCO.OP.190 contains an alleviation to the availability of oxygen on board. The pilot in command can decide to fly at any altitude without oxygen being available if he is able to determine that this can be done safely without impairment.	
2.10.2, 4.5.2.1	Standard & Recommendation	Less protective or partially implemented or not implemented	Not implemented for NCC & NCO operations.	There are no pressurised helicopters operated in the UK.
2.20	Standard	Less protective or partially implemented or not implemented	Not implemented for NCC flights at a distance from land corresponding to 10 minutes of flight or less or NCO flights within 50 NM from land.	Emergency floatation equipment can be used as another means of compliance.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 3: Operation of Aircraft (International Operations - Helicopters) (AMDT 25)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
4.1.3.1	Standard	Less protective or partially implemented or not implemented	The State of Operator is the competent authority for NCC operators and for NCO operators operating aircraft registered in a third country. The UK does not require the carriage of spare electrical fuses in helicopters.	"Certificate of airworthiness" includes any flight manual, performance schedule or other document, whatever its title, incorporated by reference in that certificate relating to the certificate of airworthiness.
4.1.3.2	Standard	Less protective or partially implemented or not implemented	Partially implemented: Only for Large Helicopters with an Initial CofA after 18 Feb 2020 (lavatory) and 18 May 2019 (portable).	
4.1.3.3	Recommendation	Less protective or partially implemented or not implemented	Not specifically required for non Part-21 operators. Specifically implemented only on flights where additional survival equipment is required for NCC & NCO operators.	
4.2.2.1, 4.2.3	Standard & Recommendation	Less protective or partially implemented or not implemented	Trainable Landing Lamp not required for non-Part-21 aircraft. NCC & NCO aircraft may optionally be fitted with an additional fixed light or lights positioned to give a wide spread of illumination instead.	
4.3.1	Standard	Less protective or partially implemented or not implemented	The floatation equipment requirement for non-Part-21 helicopters on all over water flights is not mandated.	Specified conditions and distances are: For NCC - required beyond 10 minutes flying time from land over a hostile sea area. For NCO - required beyond 50 NM from land over a hostile sea area.
4.3.2.1	Standard	Less protective or partially implemented or not implemented	UK does not mandate the carriage of life-saving rafts and equipment for making Pyrotechnical distress signals for non-Part-21 aircraft but relies on the provision of guidance material on their carriage and use. For NCC & NCO aircraft there are additional provisions for crew survival suits, life-saving equipment and survival equipment.	
4.3.2.4, 4.3.2.5, 4.3.2.6	Recommendation	Less protective or partially implemented or not implemented	The UK has not implemented this Recommendation for non-Part-21 and NCO aircraft. Implemented for all NCC aircraft regardless of the date of issue of the CofA.	
4.7.1.1.1	Standard	Less protective or partially implemented or not implemented	The UK does not mandate carriage of this type of recorder for non-Part-21 and NCO aircraft. The parameters recorded may be reduced for some NCC aircraft.	
4.7.1.1.2, 4.7.1.1.3, 4.7.2.1.2	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK does not mandate carriage of this type of recorder in these circumstances.	
4.7.2.1.1	Standard	Less protective or partially implemented or not implemented	The UK does not mandate carriage of this type of recorder for non-Part-21 and NCO aircraft. It is mandated for NCC aircraft with a first CofA on or after 1 January 2016.	
4.7.3.1.2, 4.7.3.1.3	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK does not mandate carriage of this type of recorder for any aircraft with a first CofA before 1 January 2016.	
4.8.1, 4.8.2	Standard	Less protective or partially implemented or not implemented	The UK does not mandate carriage of an ELT for non Part-21 aircraft. For NCC/NCO, one ELT(S) is required in each life raft. In addition, 1 ELT(AD) is required for NCC offshore over hostile waters.	
4.9.1, 4.9.2	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK requires Pressure-altitude reporting (Mode S) transponders for NCC aircraft at all times and for flights in notified airspace for non-Part-21 and NCO aircraft.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 6 Part 3: Operation of Aircraft (International Operations - Helicopters) (AMDT 25)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
4.11	Standard	Less protective or partially implemented or not implemented	Not implemented for non-Part-21 aircraft.	The State of Operator is the competent authority instead of State of Registry for NCC operators and for NCO operators using third country registered aircraft.
4.12.2.1	Standard	Less protective or partially implemented or not implemented	Not mandated for non-Part-21 operations.	The UK rules for NCO have been adapted to the characteristics of NCO operators. The level of protection is equivalent and consistent with the guidelines of ICAO Doc 10020 Chap 8.
4.12.2.2, 4.12.3	Standard	Less protective or partially implemented or not implemented	A specific approval from the competent authority is not required for NCC, NCO or non-Part-21 operations.	
4.13.1, 4.13.2, 4.13.3, 4.13.4	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK has not ratified Article 83 bis but would follow these Standards and Recommended Practice if required.	
5.1.1	Standard	Less protective or partially implemented or not implemented	For non-Part-21 and NCO aircraft the UK requires radio communication equipment when required by the applicable airspace requirements for the airspace being flown.	
5.1.3, 5.1.4	Standard	Less protective or partially implemented or not implemented	The UK requires radio communication equipment when required by the applicable airspace requirements for the airspace being flown.	
5.1.7, 5.1.8	Standard	Different in character or other means of compliance	For non-Part-21 and NCC operators the State of Operator shall establish those criteria.	Not applicable to NCO because such operations are not performed with aircraft used for NCO.
5.1.9, 5.2.3, 5.2.4, 5.2.5, 5.3.3, 5.3.4, 5.3.5	Standard	Different in character or other means of compliance	For NCC operators and for NCO operators using third country registered aircraft, the State of Operator shall establish those criteria.	
7.1	Standard	Different in character or other means of compliance	For NCC and NCO operators using third country registered aircraft, the State of Operator is the competent authority issuing or validating the licences.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 7: Aircraft Nationality and Registration Marks (AMDT 7)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C2 2.2 2.3	Standard	Less protective or partially implemented or not implemented.	The UK does not register unmanned aircraft unless they require certification.	
C4 4.2.5	Standard	Less protective or partially implemented or not implemented.	Balloons of not more than 2 M in any linear dimension at any stage of its flight, including any basket or other equipment attached to the balloon are exempt from registration and from the need to carry a fireproof identification plate.	To exclude toy balloons from Registration. All such balloons do not carry a payload and are therefore excluded from Annex 7 section 10.
C7 7.0	Standard	Less protective or partially implemented or not implemented.	There is no distinct Register of unmanned free balloons. Unmanned free balloons over 2 M in any linear dimension are entered on the UK Register of Civil Aircraft.	Unmanned free balloon launches that affect other airspace users are recorded but do not include all the detail specified. All such balloons do not carry a payload and are therefore excluded from Annex 7 section 10.
C8 8.1	Standard	Less protective or partially implemented or not implemented.	From 26 November 2026 the Air Navigation Order 2016 Articles 27 (2) and (4) require amendment to allow owners of aircraft registered in the names(s) of a charterer by demise to be included on the Certificate of Registration.	A legislative change is yet to be initiated.
C9 9.1	Standard	Less protective or partially implemented or not implemented.	By virtue of Air Navigation Order 2016 Article 27 (2) and (4) if an aircraft is registered in the name of a charterer(s) by demise the name of the owner is not included on the Certificate of De-registration.	A legislative change is yet to be initiated.
C9 9.2	Standard	Less protective or partially implemented or not implemented.	a) Not required. Balloons of not more than 2 M in any linear dimension at any stage of its flight, including any basket or other equipment attached to the balloon are exempt from registration and from the need to carry a fireproof identification plate.	All such balloons do not carry a payload and are therefore excluded from Annex 7 section 10.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 8: Airworthiness of Aircraft (AMDT 108)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Part II 1.3.2	Recom-mendation	Less protective or partially implemented or not implemented	Non-Part-21: Not implemented.	
Part II 1.5.4	Standard	Less protective or partially implement-ed or not imple-mented	Not fully implemented. Process is not estab-lished.	
Part II 1.6.2	Standard	Less protective or partially implement-ed or not imple-mented	Not fully implemented. Process is not estab-lished.	
Part II 1.6.3	Standard	Less protective or partially implement-ed or not imple-mented	Not fully implemented. Process is not estab-lished.	
Part II 3.2.4	Standard	Less protective or partially implement-ed or not imple-mented	No consideration is given in UK law for CofA is-sued by another state. Export CoA required for import.	
Part II 3.3.1	Standard	Less protective or partially implement-ed or not imple-mented	The United Kingdom CAA format of Certificate of Airworthiness describes categories, but not permitted operations.	It is not considered a loss of performance by this omission.
Part II 3.6.1	Standard	Different in charac-ter or other means of compliance	Assessment is also permitted by DOA under the UK Part-21 regulation.	Safety is assured through the DOA com-pliance and regulatory oversight.
Part II 4.2.1.5	Standard	Less protective or partially implement-ed or not imple-mented	Not fully implemented. Process is not estab-lished.	
Part II 4.2.1.6	Standard	Less protective or partially implement-ed or not imple-mented	Not fully implemented. Process is not estab-lished.	
Part II 4.2.3.3	Standard	Less protective or partially implement-ed or not imple-mented	Not implemented.	
Part II 4.2.3.4	Standard	Less protective or partially implement-ed or not imple-mented	Not fully implemented. Process is not estab-lished.	
Part II 5	Standard	Less protective or partially implement-ed or not imple-mented	SMS not yet implemented for maintenance or-ganisations.	There is a rulemaking action to include SMS in Part 145 organisations. Subpart F and CAO, BCAR: no SMS requirements.
Part II 6.2.2	Standard	Less protective or partially implement-ed or not imple-mented	SMS not yet implemented for maintenance or-ganisations.	There is a rulemaking action to include SMS in Part 145 organisations. Subpart F and CAO, BCAR: no SMS requirements.
Part II 6.2.4	Standard	Less protective or partially implement-ed or not imple-mented	SMS not yet implemented for maintenance or-ganisations.	There is a rulemaking action to include SMS in Part 145 organisations. Subpart F and CAO, BCAR: no SMS requirements Non-Part-21 aircraft: CAP553 BCAR Sec-tion A – no requirements.
Part II 6.6.5	Standard	Less protective or partially implement-ed or not imple-mented	Human Performance not specified.	Human performance not covered in Sub-part F, CAO, or Non-Part-21 aircraft: CAP553 BCAR Section A.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 8: Airworthiness of Aircraft (AMDT 108)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Part IIIA 2.2.3	Standard	Less protective or partially implemented or not implemented	The United Kingdom complies except that it does not require the scheduling of landing distance with runway slope. Performance is not scheduled for variations in water surface conditions, density of water and strength of current.	The UK requires that the allowable water surface conditions and any necessary water handling procedures for seaplanes be established. However, factors on landing distance are applied by operational rules where appropriate.
Part IIIA 4.1	Standard	Less protective or partially implemented or not implemented	The UK is not yet fully compliant with the text "They shall also consider Human Factors principles"	UK CS-25 Amendment 3 (July 2012) introduced 25.1302 relating to Flight Crew Error/Flight Crew Performance considerations in the Flight Deck Certification process. For the design of other parts of the aeroplane, the European Human Factors Advisory Group is tasked with producing a HF strategy and action plan which will guide the necessary rule making to achieve the goals of that strategy.
Part IIIA 4.1.6	Standard	Less protective or partially implemented or not implemented	For paragraphs (b), (g), (h) and (i): Part of these provisions implement ICAO's initiative to incorporate security into aircraft design. Protection against explosive and incendiary devices was not requested in the applicable airworthiness codes (JAR 25, CS 25) effective within the time span of the applicability of Part IIIA (up to 2 March 2004).	The differences related to security standards have been removed by the amendment of CS 25.795 introduced by Amendment 9 to CS 25 effective 12 August 2010. After this date the new security provisions are applicable to new applications for type certification as well as already certificated types subjected to certification of significant changes to TC (changed product rule Part 21A.101).
Part IIIA 9.2.4	Standard	Less protective or partially implemented or not implemented	The UK does not specify that limitations on equipment and systems shall include all those established for the various equipment and systems as installed in the aeroplane.	Paragraph 25X1524 was deleted from JAR-25 in order to harmonise with FAR 25, and therefore is not present in UK CS-25.
Part IIIA 11.1.1	Recommendation	Less protective or partially implemented or not implemented	Not specified (except for pilots compartment doors) by the applicable airworthiness codes (JAR 25, CS 25) effective within the time span of applicability of this provision of Part IIIA (up to 2 March 2004).	The differences related to security standards have been removed by the amendment of CS 25.795 introduced by Amendment 9 to CS 25 effective 12 August 2010.
Part IIIA 11.2	Standard	Less protective or partially implemented or not implemented	Not specified (except for pilots compartment doors) by the applicable airworthiness codes (JAR 25, CS 25) effective within the time span of applicability of this provision of Part IIIA (up to 2 March 2004).	The differences related to security standards have been removed by the amendment of CS 25.795 introduced by Amendment 9 to CS 25 effective 12 August 2010.
Part IIIB 2.2.7	Standard	Less protective or partially implemented or not implemented	The United Kingdom complies except that it does not require the scheduling of landing distance with runway slope. Performance is not scheduled for variations in water surface conditions, density of water and strength of current	The UK requires that the allowable water surface conditions and any necessary water handling procedures for seaplanes be established. However, factors on landing distance are applied by operational rules where appropriate.
Part IIIB 3.7	Standard	Less protective or partially implemented or not implemented	The UK only requires bird impact to be taken into account for CS 25 Large Aeroplanes and CS 23 Commuter Category aeroplanes. In the UK, certification with ditching provisions has to be requested by the applicant, as CS 23 and CS 25 do not require certification for ditching. However, CS 25.807(e) requires provision of ditching emergency exits for passengers, whether or not certification for ditching provisions is requested.	Compliance with the ditching requirements are at the discretion of the applicant. In practice, the operational restrictions which would result from a lack of ditching certification, means that most applicants seek to comply.
Part IIIB 4.1.1	Standard	Less protective or partially implemented or not implemented	The UK is not yet fully compliant with the text "They shall also consider Human Factors principles".	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 8: Airworthiness of Aircraft (AMDT 108)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Part IIIB 4.1.3	Standard	Different in character or other means of compliance	The UK does not require that the effects of materials during emergency situations be taken into account, with regard to persons on the ground and the environment in general.	
Part IIIB 6.1.1	Standard	Less protective or partially implemented or not implemented	The UK is not yet fully compliant with the text "They shall also consider Human Factors principles".	
Part IIIB 7.2.5	Standard	Less protective or partially implemented or not implemented	The UK does not specify that limitations on equipment and systems shall include all those established for the various equipment and systems as installed in the aeroplane.	Paragraph 25X1524 was deleted from JAR-25 in order to harmonise with FAR 25, and therefore is not present in CS 25.
Part IIIB 8.6	Standard	Less protective or partially implemented or not implemented	The United Kingdom only requires account to be taken of the installation of survival equipment in the Certification Specifications.	
Part IV 2.2.3.2	Standard	Less protective or partially implemented or not implemented	In the United Kingdom en-route performance is based on climb performance both for all engines operating and one engine inoperative situations. The case of the two critical power units inoperative for helicopters having three or more engines is not addressed.	
Part IV 4.1.6	Standard	Less protective or partially implemented or not implemented	There are no requirements in the United Kingdom for design precautions to be taken to protect against instances of cabin depressurisation. Unpressurised cabins and compliance with CS 27/29.831 ensures compliance with the standard relating to incapacitation from smoke or other toxic gases.	The UK does not have any pressurised helicopters at this time.
Part IV 4.1.8	Standard	Different in character or other means of compliance	In the UK, ground handling is not directly addressed.	The instructions for continued airworthiness in Appendices A29.3 & A27.3(a)(4) require information regarding towing & jacking to be supplied by the Type Certificate Holder. For Annex II aircraft there is no difference.
Part IVB 4.7	Standard	Different in character or other means of compliance	In the UK, ground handling is not directly addressed.	The instructions for continued airworthiness in Appendices A29.3 & A27.3(a)(4) require information regarding towing & jacking to be supplied by the Type Certificate Holder. For Annex II aircraft there is no difference.
Part IVB 5.2.7	Standard	More exacting or exceeds	The UK requires a restart capability for small rotorcraft up to 3175 KG.	CS 27 is more exacting or exceeds Part IVB which only requires restart capability for helicopters greater than 3175 KG or which are certificated to category A.
Part IVB 6.1.1	Standard	Different in character or other means of compliance	The United Kingdom does not comply with the Human Factors element.	
Part V 1.1.2	Recommendation	Different in character or other means of compliance	The United Kingdom applies EASA Certification Specification 22 to powered sailplanes. The upper weight limit of CS 22 is 850 KG. This means that powered sailplanes between 750 and 850 KG, certified in accordance with CS-22, may not be fully compliant.	
Part V 6.1.1	Standard	Different in character or other means of compliance	The United Kingdom does not comply with the Human Factors element.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 9: Facilitation (AMDT 30)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.71	Standard	Different in character or other means of compliance	The UK accepts CMCs (and crew ID) providing they are accompanied by a valid passport. UK visa requirements are waived in respect of visa nationals who arrive as operational aircrew and, within seven days, leave as operational aircrew.	
3.71.2	Recommenda-tion	Less protective or partially implemented or not implemented	The UK requires arriving individuals who are not operating aircrew to be in possession of a valid passport and where applicable, a valid visa.	
3.72	Standard	Less protective or partially implemented or not implemented	The United Kingdom requires technical personnel of foreign aircraft operators who arrive to undertake maintenance duties to be in possession of a valid passport or other satisfactory document establishing identity and nationality and, where applicable, a valid visa.	
3.73	Recommenda-tion	Less protective or partially implemented or not implemented	The United Kingdom requires civil aviation inspectors who arrive to conduct inspection duties to be in possession of a valid passport or other satisfactory document establishing identity and nationality and, where applicable, a valid visa.	
3.76	Recommenda-tion	Less protective or partially implemented or not implemented	Where required UK visas and entry clearances should be obtained prior to travel and a person will normally be refused entry in the absence of the necessary clearance.	
3.77	Recommenda-tion	Different in character or other means of compliance	The UK permits transit without visas for passengers who normally require visas, provided that the passenger has: (a) entry facilities for the countries en route and for the final destination; (b) a firm booking to travel by air within 24 hours; (c) no purpose in entering the UK other than to pass through in transit. NB This information is regularly updated in the Travel Information Manual.	
4.24	Standard	More Exacting or Exceeds	This Standard, and in particular the words "at any customs office", does not conform with Article 161 § 5 of the European Union's Customs Code which provides that the export declaration must be lodged where the goods are packed or where the exporter is established.	
4.25	Standard	Less protective or partially implemented or not implemented	Goods for export are declared and presented to customs before being given permission to progress.	
4.26	Recommenda-tion	More Exacting or Exceeds	The return of certain goods after their departure would not be guaranteed despite the lodging of a security.	
4.36	Standard	Less protective or partially implemented or not implemented	UK and European Union provisions concerning export and transit licences remain applicable, in certain cases, when the goods are redirected to another destination (for example weapons, dual use goods, precursors, etc).	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 9: Facilitation (AMDT 30)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
5.4	Standard	Less protective or partially implemented or not implemented	An operator is required to remove an inadmissible person in accordance with the directions given by the Immigration Officer.	
5.6	Standard	More Exacting or Exceeds	The UK Home Office will generally try to ensure inadmissible persons are correctly documented for removal.	
5.9.1	Standard	Less protective or partially implemented or not implemented	Under UK legislation, where a passenger is refused entry, the operator will normally be liable for any detention costs up to a maximum of 14 days unless the passenger is in possession of a current entry clearance/visa.	
5.11	Standard	More Exacting or Exceeds	UK legislation requires an operator to remove an inadmissible person to a country of which he is a national or citizen, a country or territory in which he has obtained a passport or other document of identity, a country or territory in which he embarked for the United Kingdom or a country or territory to which there is reason to believe that he will be admitted.	
5.26	Standard	Different in character or other means of compliance	The UK will co-operate fully with the requesting State to investigate and validate the persons claim to be a British citizen and to resolve the claim quickly, within 30 days if possible.	
5.27	Standard	Different in character or other means of compliance	This provision only applies where the person concerned is admissible or is to be expelled by the authorities.	HMPO requires a declaration of consent for all fully valid passports. This is a matter of policy and we cannot proceed with a passport application without this. If the applicant needs an ETD, this can be issued without consent but only in the situation that all other legal avenues have been exhausted.
8.8	Standard	Less protective or partially implemented or not implemented	The UK has limited discretion to waive entry requirements. Where possible, the UK Border Force will expedite clearance subject to the relevant checks being carried out.	Border Force carries out risk-based and intelligence-led customs checks on goods and people entering, transiting through, and leaving the UK. The completion time of those checks is proportionate to the circumstances of those goods and people.
8.33	Recommenda-tion	Different in character or other means of compliance	The UK and EU only recognise assistance dogs that have been trained by specific bodies.	While assistance dogs are carried free of charge, they have to comply with health and training standards.
8.38	Standard	Different in character or other means of compliance	The UK has little discretion to waive entry requirements but where possible arrangements may be made, when necessary, to facilitate entry.	
8.39	Standard	Different in character or other means of compliance	The UK has little discretion to waive entry requirements but where possible arrangements may be made, when necessary, to facilitate entry.	
9.1.1	Recommenda-tion	Different in character or other means of compliance	The UK has a single window for scheduled operators and different single windows for GA.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 9: Facilitation (AMDT 30)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
9.15	Standard	Different in character or other means of compliance	The UK does not normally require a passenger manifest in paper form when API data has been provided electronically but retains the right to do so in exceptional circumstances.	
10.20	Recommendation	Different in character or other means of compliance	A passenger locator form has been developed digitally and can be tailored to particular routes/countries. However, observations on passenger health by crew is still via the GENDEC in paper form.	

Annex 10: Aeronautical Telecommunications Vol I (Radio Navigation Aids) (AMDT 91)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Chapter 2: General Provisions For Radio Navigation Aids				
2.1.6	Recommendation	Less protective or partially implemented or not implemented	Not specified in UK requirements.	Approach design incorporates supplemental aids as available and appropriate.
2.2.1	Standard	Less protective or partially implemented or not implemented	The UK does not currently require periodic flight testing of DME not associated with a published procedure.	
Chapter 3: Specifications For Radio Navigation Aids				
3.1.3.3.2	Standard	Less protective or partially implemented or not implemented	Some localisers are promulgated in AIP as having specific areas where signals do not meet specifications.	This is world-wide standard practice where topography restricts or influences the signals.
3.1.3.3.2.1, 3.1.3.3.2.2 and 3.1.3.3.2.3	Standard	Different in character or other means of compliance	UK requirements written in terms of usable signal.	
3.1.3.5.3.6	Standard	Less protective or partially implemented or not implemented	Several old CAT I systems do not meet this recommendation.	This is a function of aerial design and cannot be changed by simple adjustment. Airports are advised at flight inspection if their system could give false capture on certain types of receiver.
3.1.5.1.5	Recommendation	Less protective or partially implemented or not implemented	Some CAT I systems have reference datum heights between 40 and 50 FT.	Requiring 40 feet at certain airports would reduce the useable runway length too much.
3.1.5.1.6	Recommendation	Less protective or partially implemented or not implemented	Some CAT 1 systems have a reference datum lower than 40 FT. These facilities are exclusive to particular aircraft types.	Requiring 40 feet at certain airports would reduce the useable runway length too much.
3.1.5.3.1	Standard	Less protective or partially implemented or not implemented	The UK accepts that some G/P have restricted coverage - this is published in AIPs for each specific system.	This is world-wide standard practice where topography restricts or influences the signals.
3.4.6.4	Recommendation	Less protective or partially implemented or not implemented	The UK allows a fall of up to 0.5 dB.	To achieve no fall in carrier when modulating is almost impossible. The UK requirement is practical and has no discernable effect on aircraft equipment.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol I (Radio Navigation Aids) (AMDT 91)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.5.3.4.1	Standard	More exacting or exceeds	Requirements limit average PRF to 16ppps, or 30 ppps for interrogators of 100w or less peak pulse power.	
3.5.3.4.3	Recommendation	More exacting or exceeds	Requirements limit PRF to 16 ppps after 30 seconds in search mode and 30ppps for interrogators of less than 100 watts.	
3.5.3.4.4	Standard	More exacting or exceeds	Requirements limit PRF to 16 ppps after 30 seconds in search mode and 30ppps for interrogators of less than 100 watts.	
3.5.5.1.5.2	Standard	Less protective or partially implemented or not implemented	UK requirements only explicitly specify this requirement for DME/P.	
3.5.5.4.4	Standard	More exacting or exceeds	ED-54 (MOPS for aircraft DME interrogator) specifies a reply efficiency of 60% or more.	
3.11.6.1.3.1	Standard	Different in character or other means of compliance	In the UK, angle filter characteristics are expressed in terms of limits on degrees of pase lag per rate of angle change needed for autopilot.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol II (Communications Procedures including those with PANS status) (AMDT 92)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Chapter 3: General Procedures for the International Aeronautical Telecommunication Service				
3.5.1.1 and 3.5.1.1.1	Standard	Less protective or partially implemented or not implemented	UK complies only at ATC units and recommends compliance at certain AFIS units.	
Chapter 5: Aeronautical Mobile Service - Voice Communications				
5.1.7	Standard	Less protective or partially implemented or not implemented	Not specifically defined in UK legislation.	The ICAO requirement to be referenced in the relevant CAA publication or the requirement to be promulgated.
5.2.1.4.1.1	Standard	Yes	On safety grounds in order to reduce level busts, Flight Levels ending in hundreds are transmitted as HUNDRED eg, FLIGHT LEVEL ONE HUNDRED in order to differentiate from Flight Level one one zero.	
5.2.1.5.8	Standard	More Exacting or Exceeds	CONTACT shall have the meaning "Establish communications with...(your details have been passed)". Additional word - FREECALL shall have the meaning "Call (unit)..(your details have not been passed)". Mainly used by military ATC. In the UK the additional term PASS YOUR MESSAGE is used. RECLEARED (ICAO) is only used in the UK for route clearances and not for vertical clearances.	Shortens a pilot's first call on the next ATS unit/frequency as he/she knows he/she does not have to pass full details. Informs the pilot he/she will have to pass full details to the next ATS unit/frequency on first contact. In the case of RECLEARED, the direction of vertical movement, provided by CLIMB and DESCEND, acts as a check in some circumstances when a pilot misinterprets a call not directed at him/her.
5.2.1.7.1.2	Standard	Less protective or partially implemented or not implemented	Approach control radar arrivals = DIRECTOR/ARRIVAL (when approved). Precision approach radar = TALKDOWN.HOMER not used in UK.	
5.2.1.7.2.1.1	Standard	More Exacting or Exceeds	Type (b) in UK is the telephony designator of the aircraft operating agency, followed by the full registration marking of the aircraft	
5.2.1.7.2.2.1	Standard	More Exacting or Exceeds	In the UK, the name of either the aircraft manufacturer, or name of the aircraft model, or name of the aircraft category (e.g. helicopter or gyrocopter) may be used as a prefix to the callsign.	To aid recognition by the ground station and/or other aircraft that the aircraft transmitting is of a particular category and may manoeuvre differently or require special handling.
5.2.1.7.3.2.3	Standard	More Exacting or Exceeds	Whereas the calling aeronautical station's call sign followed by the answering station's call sign shall be considered an invitation to proceed with a transmission, the UK additionally uses the phrase Pass Your Message Under certain circumstances the answering ground station may omit its callsign.	It has been shown that omitting the ground station call sign may improve safety standards at busy ATC units.
5.2.1.9.2.3	Standard	Less protective or partially implemented or not implemented	The following method of acknowledging receipt is not used in UK: The callsign of the aircraft followed if necessary by callsign of the aeronautical station' (ICAO). (CALLSIGN) ROGER is used in the UK.	UK procedures in accordance with the examples in ICAO Doc 9432, para 2.8.1.6 and 3.3.2.
5.2.2.1.1.3	Recommendation	Less protective or partially implemented or not implemented	Not specifically defined in UK legislation.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol II (Communications Procedures including those with PANS status) (AMDT 92)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
5.2.2.1.3	Standard	Different in character or other means of compliance	VHF emergency channel 121.5 MHz not routinely monitored at civil aerodromes in the UK, however, it is monitored 24 HR at Area Control Centres and covers most of UK above 3000 FT AMSL.	121.5 MHz is to be monitored at international aerodromes if D&D are unable to monitor to circuit altitude.
5.2.2.3.3	Recommendation	Less protective or partially implemented or not implemented	Not specifically defined in UK legislation.	The ICAO requirement to be referenced in the relevant CAA publication or the requirement to be promulgated.
6.2.1	Recommendation	Less protective or partially implemented or not implemented	Para (2) true heading to be steered by the aircraft, with no wind, to head for the direction-finding station not usually provided in UK.	

Annex 10: Aeronautical Telecommunications Vol III Part 1 (Digital Data Communication Systems) and Part 2 (Voice Communication Systems) (AMDT 93)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Part I				
C4	Standard	Less Protective or partially implemented or not implemented	AMS(R)S is not currently in use in the UK.	
C6.8	Standard	Less Protective or partially implemented or not implemented	VDL mode 3 is not in use in the UK.	
C6.9	Standard	Less Protective or partially implemented or not implemented	VDL mode 4 is not in use in the UK.	
C10	Standard	Less Protective or partially implemented or not implemented	Point-to-Multi-point Communications not used in the UK.	
C11	Standard	Less Protective or partially implemented or not implemented	The UK does not use HF Data Link.	
C12	Standard	Less Protective or partially implemented or not implemented	Universal Access Transceiver is not used in the UK.	
Part II				
2.2.1.2	Recommendation	Different in character or other means of compliance	The UK interprets 'On a high percentage of occasions' to be the 95th percentile value and thus requires the effective radiated power to be such as to provide a field strength of at least 188 microvolts per metre (minus 101 dBW/m2).	
2.2.2.2	Standard	Different in character or other means of compliance	The UK specifies receiver sensitivity in terms of the minimum level of input signal (dBm), modulated 30% by a sinewave of 1 kHz, applied to the receiver which is required to produce a SINAD ratio of 12dB at the audio output measured with a psophometric filter.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol III Part 1 (Digital Data Communication Systems) and Part 2 (Voice Communication Systems) (AMDT 93)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.2.2.3	Standard	Less Protective or partially implemented or not implemented	The UK requirement includes both 25 kHz and 8.33 kHz channels spacing specified in values of kHz and not percentage of the assigned frequency.	
2.3.1.2	Standard	Less Protective or partially implemented or not implemented	The UK does not specify the effective radiated power but provides for classes of transmitter grouped into two classifications of 16 Watts and 4 Watts Minimum Output Power, having estimated radio-line-of-sight distances of 200 NM and 100 NM respectively. A recommendation that the output power be limited to 25 Watts to reduce interference is also made.	
2.3.1.3	Standard	Less Protective or partially implemented or not implemented	The UK does not specify the adjacent channel power but defines a spectral mask for the transmitter occupied spectrum.	
2.3.1.4	Standard	Less Protective or partially implemented or not implemented	The UK specifies the modulation as 'not less than 70%' when modulated by a 1000 Hz audio frequency signal.	
2.3.2.1	Standard	Less Protective or partially implemented or not implemented	The UK does not define the frequency stability of receiver.	
2.3.2.2.1	Recommendation	Less Protective or partially implemented or not implemented	The UK specifies the sensitivity in terms of a radio frequency input signal not exceeding 10 microvolts (-93 dBm), with 30% modulation at 1000 Hz to produce a signal plus noise to noise ratio of 6 dBm with an audio output power not less than 10 dB below the declared output power.	
2.3.2.3	Standard	Less Protective or partially implemented or not implemented	The UK does not state the effective acceptance bandwidth but defines the effective bandwidth relative to the selected channel frequency of the receiver at the 6 dB and 60 dB points.	
2.3.2.4	Standard	Less Protective or partially implemented or not implemented	The UK does not state the effective acceptance bandwidth but defines the effective bandwidth relative to the selected channel frequency of the receiver at the 6 dB and 60 dB points.	
2.3.2.5	Standard	Less Protective or partially implemented or not implemented	The specification the UK applies only states the adjacent channel rejection for 8.33 kHz channel spacing. For 8.33 kHz channel spacing an adjacent channel rejection of 45 dB is specified at the first upper and lower adjacent channels for defined desired and interfering signals.	
2.3.2.6	Recommendation	Less Protective or partially implemented or not implemented	The UK does not specify the adjacent channel rejection for 25 kHz, 50 kHz or 100 kHz channel spacing.	
2.3.2.8.1	Standard	Less Protective or partially implemented or not implemented	Interference from adjacent channel VDL is not specified in UK requirements.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol III Part 1 (Digital Data Communication Systems) and Part 2 (Voice Communication Systems) (AMDT 93)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.3.2.8.2, 2.3.2.8.3, 2.3.2.8.4 & 2.3.2.8.4.1	Standard	Less Protective or partially implemented or not implemented	Not yet implemented.	
2.3.3.1, 2.3.3.2 & 2.3.3.3	Standard	Less Protective or partially implemented or not implemented	For aircraft (including helicopters) of 5700 KG MTWA or less, non-immune VHF Comm receivers may be permitted and the aircraft permitted to operate under IFR provided that crews are alerted to potential sources of interference.	This reflects the reduced risk posed to comm. receivers as compared to ILS and VOR receivers. No evidence notified to date to justify a reconsideration of this relaxation.
2.3.3.4	Recommendation	Less Protective or partially implemented or not implemented	For aircraft (including helicopters) of 5700 KG MTWA or less, non-immune VHF Comm receivers may be permitted and the aircraft permitted to operate under IFR provided that crews are alerted to potential sources of interference.	This reflects the reduced risk posed to comm. receivers as compared to ILS and VOR receivers. No evidence notified to date to justify a reconsideration of this relaxation
5.1.9	Standard	More exacting or exceeds	Provision of an e-mail address is not required. The manufacturer assigned serial number is required to relate to a unique beacon identification when it is used with a COSPAS SARSAT type approval certificate and so the COSPAS SARSAT approval number may be obtained indirectly. Information regarding aircraft colour is not required, however, information relating to max POB is required.	
5.2.1.3	Standard	More exacting or exceeds	The UK requires that the PERP is not less than 100mW	

Annex 10: Aeronautical Telecommunications Vol IV (Surveillance Radar and Collision Avoidance Systems) (AMDT 83)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Chapter 2: General				
2.1.3.2.1	Standard		The UK does not comply with this paragraph as it currently mandates the carriage and operation in designated airspace only. Non-Mode C transponders are still used outside of this airspace.	
Chapter 4: Airborne Collision Avoidance System (ACAS)				
			ACAS systems certified in accordance with DO-185A which does not address all ICAO parameters.	DO-185B being produced which will match current ICAO standards.

Annex 10: Aeronautical Telecommunications Vol V (Aeronautical Radio Frequency Spectrum Utilization) (AMDT 91)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.1.1	Standard	Less protective or partially implemented or not implemented	Not implemented in the UK	
3.1.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol V (Aeronautical Radio Frequency Spectrum Utilization) (AMDT 91)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.1.2.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
3.1.2.2	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
3.1.2.3	Recommendation	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
3.1.2.4	Recommendation	Less protective or partially implemented or not implemented	The UK has not assigned any HFfrequencies.	
3.1.2.5	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
3.1.3.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
3.2.2	Recommendation	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1	Standard	Different in character or other means of compliance	Communications frequencies are planned in accordance with planning agreements reached within Europe and contained in ICAO EUR DOC 011. The utilization table is based on Annex 10 Vol IV Para 4.1.1 but incorporates regional agreements on specific uses of individual frequencies or sub-bands.	To maximise the number of frequency assignments and planning efficiency that can be achieved.
4.1.1.1	Standard	Different in character or other means of compliance	VHF communications frequencies are planned in accordance with planning agreements reached within Europe and contained in ICAO EUR DOC 011. The utilization table is based on Annex 10 Vol IV Para 4.1.1 but incorporates regional agreements on specific uses of individual frequencies or sub-bands.	To maximise the number of frequency assignments and planning efficiency that can be achieved.
4.1.2.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.2.3	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.2.4	Standard	Less protective or partially implemented or not implemented	Compliant for VDL Mode 2 however there are currently no mandatory carriage requirements for VDL Mode 3 or Mode 4 in Europe.	Provision has been made regionally for two VDL Mode 4 signalling channels.
4.1.2.4.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.2.5	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.3.1.1	Standard	Different in character or other means of compliance	The UK encourages the use of practice PAN calls on 121.500 MHz in contradiction with the Annex 10 requirement for the frequency to only be used in genuine emergencies.	To ensure pilot familiarity with the process.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol V (Aeronautical Radio Frequency Spectrum Utilization) (AMDT 91)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
4.1.3.1.2	Standard	Different in character or other means of compliance	The UK operates a distress and diversion cell which provides 121.500 MHz for the whole of theUK, therefore not all International aerodromes provide 121.500 MHz Facilities. Those that do are published in UK AIP GEN 3.6.6, Para 5.	To provide the most efficient and coherent response to 121.500 MHz calls.
4.1.3.1.3	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.3.1.5	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.3.2.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.3.2.2	Standard	Different in character or other means of compliance	This requirement is not specified in UK regulations but is a prerequisite for aeronautical communications equipment approvals.	
4.1.3.3.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.3.3.2	Standard	Less protective or partially implemented or not implemented	The UK has not implemented VDL Mode 4.	
4.1.3.4.2	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations but is a prerequisite for ground station and aeronautical communications equipment approvals.	
4.1.4.6	Recommendation	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.4.9	Recommendation	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.5.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.5.2	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.1.6.1.1	Standard	Different in character or other means of compliance	Within Europe the bands 131.400 - 132.000 and 136.800 - 136.875 MHz inclusive are designated for operational control communications. This has been agreed at a European regional level and hence frequencies to meet aircraft operating obligations under Annex 6 may not be assigned in the band 128.825 - 132.025 MHz.	To maximise the number of frequency assignments and planning efficiency that can be achieved.
4.1.6.1.2	Standard	Different in character or other means of compliance	Within Europe the bands 131.400 - 132.000 and 136.800 - 136.875 MHz inclusive are designated for operational control communications. This has been agreed at a European regional level and hence frequencies to meet aircraft operating obligations under Annex 6 may not be assigned in the band 128.825 - 132.025 MHz.	To maximise the number of frequency assignments and planning efficiency that can be achieved.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 10: Aeronautical Telecommunications Vol V (Aeronautical Radio Frequency Spectrum Utilization) (AMDT 91)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
4.1.6.2	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations but all assigned frequencies are published in ICAO Table COM 2 published by the EUR regional office.	
4.2.4	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.3.2	Standard	Less protective or partially implemented or not implemented	No operational W and Z channels assigned in UK.	
4.4.1	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.4.2	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	
4.4.3	Standard	Less protective or partially implemented or not implemented	This requirement is not specified in UK regulations.	

Annex 11: Air Traffic Services (AMDT 52)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C2 2.5.2.3	Standard	Less protective or partially implemented or not implemented	Whilst the UK has adopted the term "controlled aerodrome", aerodromes where it is determined that air traffic control service will be provided are not designated as controlled aerodromes.	
C2 2.6.1	Standard	Different in character or other means of compliance	Subject to availability, VFR flights within class E airspace and all flights within class G airspace may receive UK Flight Information Services.	The UK does not designate airspace classes B and F.
C2 2.6.3	Standard	Less protective or partially implemented or not implemented	With regards to Class G, the UK does not require continuous two-way communications under IFR.	
C2 2.8.1	Standard	Less protective or partially implemented or not implemented	Not yet implemented in the UK. No EUR Region requirements specified in Doc 7030.	
C2 2.8.2	Standard	Less protective or partially implemented or not implemented	Not yet implemented in the UK. No EUR Region requirements specified in Doc 7030.	
C2 2.9.1	Standard	Less protective or partially implemented or not implemented	Not yet implemented in the UK. No EUR Region requirements specified in Doc 7030.	
C2 2.9.2	Standard	Less protective or partially implemented or not implemented	Not yet implemented in the UK. There are no EUR Region requirements specified in Doc 7030.	
C2 2.9.3	Standard	Less protective or partially implemented or not implemented	Not yet implemented in the UK. There are no EUR Region requirements specified in Doc 7030.	
C2 2.11.2.3	Standard	Less protective or partially implemented or not implemented	With the exception that the UK does not apply VFR cruising levels, the UK complies with the intent of the Standard but has not adopted it into the UK's rule set.	Limits of UK airspace structures are determined on the basis of justified operational requirements.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 11: Air Traffic Services (AMDT 52)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C2 2.11.3.2.2	Recommendation	Less protective or partially implemented or not implemented	UK does not apply VFR cruising levels as the lower limit.	Limits of UK airspace structures are determined on the basis of justified operational requirements.
C2 2.11.3.3	Standard	Less protective or partially implemented or not implemented	With the exception that the UK does not apply VFR cruising levels, the UK complies with the intent of the Standard but has not adopted it into the UK's rule set.	Limits of UK airspace structures are determined on the basis of justified operational requirements.
C2 2.11.5.5	Recommendation	Less protective or partially implemented or not implemented	With the exception that the UK does not apply VFR cruising levels, the UK complies with the intent of the Recommendation but has not adopted it into the UK's rule set.	Limits of UK airspace structures are determined on the basis of justified operational requirements.
C2 2.13.4	Standard	Less protective or partially implemented or not implemented	ATS route designators are being modified to comply with Appendix 1 requirements in accordance with the EUROCONTROL Route Network Development plan.	Changes to route designators in dense/complex airspace are timed to coincide with major structural airspace changes.
C2 2.26.5	Standard	Less protective or partially implemented or not implemented	Time checks are available on request to the nearest minute.	Normal practice is for pilots to use other sources.
C3 3.4.2	Standard	Less protective or partially implemented or not implemented	Not implemented with regards to b). Pilots and operators are not notified though the AIP.	
C6 6.2.2.3.7	Standard	Less protective or partially implemented or not implemented	Automatic Recording is not available in each and every case in the UK.	FIS units remain a recommendation.
C7 7.1.3.5	Recommendation	Less protective or partially implemented or not implemented	The UK has not adopted this recommendation.	
C7 7.1.4.5	Recommendation	Less protective or partially implemented or not implemented	The UK has not adopted this recommendation.	

Annex 12: Search and Rescue (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Chapter 1: Definitions				
			Pilot-in-Command. In United Kingdom legislation, 'Pilot-in-command' in relation to an aircraft means a person who for the time being is in charge of the piloting of the aircraft without being under the direction of any other pilot in the aircraft.	

Annex 13: Aircraft Accident and Incident Investigation (AMDT 19)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C5 5.9.1	Recommendation		Assimilated Regulation (EU) No 996/2010 (as amended), Article 11.2 (e) gives powers to request medical examination and tests and have immediate access to results.	The AAIB can only request, it has no powers to insist but it does have full access to results.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 13: Aircraft Accident and Incident Investigation (AMDT 19)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C6 6.3	Standard		Civil Aviation (Investigation of Air Accidents & Incidents) Regulations 2018 Regulation 16 requires that comments on draft final reports be received within 28 days unless an extension of that time is granted.	To expedite report publication. Regulations allow for extenstion to 30 days and to 60 days and beyond to be granted by the Chief Inspector. The intention is to align to 30 days at the next revision to the regulations.

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
1.1.56	Definition	Different in character other means of compliance	Instead of Intermediate holding position, the UK commonly uses the terms Taxiway Holding Position, Runway-taxi holding position and Intermediate-taxi holding position.	
1.2.2	Standard	Less protective or partially implemented or not implemented	The UK requires most types of aircraft operations for the purpose of Public Transport of Passengers and flying training to use an aerodrome licensed by the CAA or a Government aerodrome. However, neither cargo-only nor maintenance flights are required to use a licensed aerodrome and there is no requirement for Annex 14 to apply to Government aerodromes.	Government aerodrome means any aerodrome in the UK which is in the occupation of any Government Department or visiting force.
1.3.2	Standard	Less protective or partially implemented or not implemented	The UK does not specifically refer to a vertical reference system.	Orthometric height used as detailed in AIP GEN 2.1 Para 4.
1.4	Standard	Different in character other means of compliance	UK uses the term Public Transport of Passengers or flying training as the trigger for certifying. There is no requirement to certify Government aerodromes (see 1.2.2). In addition, the UK uses the term "licensing" as meaning the same as the ICAO term "certification".	
1.6.1	Standard	Different in character other means of compliance	UK determines code number in accordance with characteristics of the aerodrome. UK uses the greater of TODA/ASDA to determine the reference code number. Column (2) ARFL is replaced by "greater of TODA/ASDA".	UK considers the use of TODA/ASDA to be more relevant.
1.6.3	Standard	Different in character other means of compliance	The UK uses the greater of TODA/ASDA instead of aeroplane reference field lengths.	UK considers the use of TODA/ASDA to be more relevant.
2.2.2	Standard	Different in character other means of compliance	The UK does not include "and shall normally remain where first established".	The UK requires the ARP to be located at the centre of the ATZ, therefore, any change in location would require changes to the ATZ. This would require a safety case to be approved by the CAA.
2.2.3	Standard	Different in character other means of compliance	The UK requires the aerodrome reference point to be specified in WGS 84 format.	WGS84 adopted by ICAO as the geodetic reference system for all aeronautical data in 1998.
2.3.1 & 2.3.3	Standard	More exacting or exceeds	The UK requires a vertical accuracy of 0.3 M.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.6.1 - 2.6.8	Standard & Recommendation	Less protective or partially implemented or not implemented	UK delaying the applicability date for the change to PCR for pavement bearing strength in order to allow airports adequate time to plan and prepare and undertake pavement strength evaluation.	
2.7.1 - 2.7.3	Standard & Recommendation	Less protective or partially implemented or not implemented	The UK does not require pre-flight altimeter check locations to be established.	Flight Operational procedures require the pre-flight checks to involve setting the QNH on all the barometric altimeters (usually 3) and checking that the height displayed is approximately correct and there is no major discrepancy between them.
2.9.5	Standard	Different in character other means of compliance	The UK does not use the terms loose sand or chemically treated.	
3.1.1	Standard	Less protective or partially implemented or not implemented	UK does not utilise the useability factor.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.1.2	Recommendation	Less protective or partially implemented or not implemented	The UK does not regulate aerodromes on this issue, although it is applied in practice through instrument flight procedures and airspace design procedures.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.1.3.1	Recommendation	Different in character other means of compliance	The UK does not consider cross-wind limitations to be associated with runway licensing criteria.	This is considered an aircraft performance issue handled by the aircraft operator and the pilot.
3.1.4.1	Recommendation	Less protective or partially implemented or not implemented	The UK does not utilise the usability factor.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.1.11	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify these requirements. They are implemented through ATC operations in accordance with PANS Docs and Air Traffic operations design.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.1.12	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify these requirements. They are implemented through ATC operations in accordance PANS Docs, Doc 9643 (SOIR) and Instrument flight procedure design.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.4.8	Recommendation	More exacting or exceeds	Exceeds by 30 M code 3 and 4 and by 5 M code 1 and 2. The runway strip which encloses an instrument runway should be graded for a distance of 105 M either side of the centreline where the code number is 3 or 4, and 45 M where the code number is 1 or 2.	
3.4.17	Recommendation	More exacting or exceeds	For runways code 3 and 4, the UK requires this portion to extend out to 105 M.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.5.2	Recommendation	Less protective or partially implemented or not implemented	CAP 168 states that for national aerodromes, RESAs should be considered for non-instrument runways where the code number is 1 or 2, particularly where there are movements by jet aircraft not using public transport performance factors, or a high proportion of runway-limited movements at the higher weights.	RESA requirements for non-instrument code 1 and 2 runways will be re-assessed.
3.6.3	Recommendation	More exacting or exceeds	The UK allows for the width to be not less than that of the visual strip width where that is the limiting width.	
3.6.4	Recommendation	Less protective or partially implemented or not implemented	The UK allows 2% up slope where the codes are 1 and 2.	Only permitted after aeronautical study determines acceptability.
3.7.4	Standard	Different in character other means of compliance	The UK specifies that Stopways should have friction characteristics not substantially less than those of the associated runway and above the minimum friction level specified in CAP 683.	
3.8.1	Recommendation	Less protective or partially implemented or not implemented	The UK does not specifically require radio altimeter operating areas to be established. The UK requires information out to 900 M before the threshold for PATC generation In operation at CAT II/III PACTC would refer.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.8.2	Recommendation	Less protective or partially implemented or not implemented	The UK does not specifically require radio altimeter operating areas to be established. The UK requires information out to 900 M before the threshold for PATC generation.	Survey information required to 60 M either side of extended runway.
3.8.3 & 3.8.4	Recommendation	Less protective or partially implemented or not implemented	The UK does not require radio altimeter operating areas to be established.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.9.2	Recommendation	Less protective or partially implemented or not implemented	The UK does not regulate this aspect as it is considered to be a commercial issue.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
3.10.1	Recommendation	Different in character other means of compliance	The UK requirements refer to strip rather than taxiway shoulder.	
3.12.1	Recommendation	Less protective or partially implemented or not implemented	The UK does not use traffic density as a trigger for the requirement of a holding bay.	The UK does not consider this to be an aerodrome certification issue. When required, holding bays are constructed in accordance with requirements.
3.12.3 & 3.12.9	Standard	Different in character other means of compliance	The UK permits the location of a runway-holding position that will cause an infringement of the OLS, but not the OFZ, by a manoeuvring aircraft.	Permissible only if no interference occurs and the impact of the infringement is addressed in the calculation of the OCA/H.
3.12.6	Standard	More exacting or exceeds	UK applies 137 M precision approach 2/3 runway.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.15	Recommendation	Less protective or partially implemented or not implemented	The UK requires only that the aerodrome operator ensures that aircraft de-icing/anti-icing is available where icing conditions are expected to occur. Specific de-icing/anti-icing facilities are not required in the UK. Difference also applies to the marking and lighting of de-icing/anti-icing facilities.	De-icing of aircraft is not an aerodrome regulation issue. Individual aerodrome's provisions for de/anti-icing are assessed in view of local conditions.
4.1.8	Standard	Less protective or partially implemented or not implemented	d) not implemented.	The UK addresses requirements for curved and other shaped approach surfaces on an individual basis.
4.1.11	Standard	Different in character other means of compliance	CAP 168, for national aerodromes, does not use the term "inner approach surface", although it is applied as part of the OFZ.	
4.1.17	Standard	Different in character other means of compliance	The UK does not use the term "Inner Transitional Surface".	
4.2.10 & 4.2.11	Standard & Recommendation	Different in character other means of compliance	The UK does not divide the APPS for the purposes of obstacle penetration.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
4.2.12	Recommendation	Different in character other means of compliance	The UK applies this but does not specify the need for aeronautical study.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
4.2.20	Recommendation	Different in character other means of compliance	The UK applies this but does not specify the need for aeronautical study.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.1.1.4	Recommendation	Different in character other means of compliance	The UK recommends that only aerodromes that accept non-radio aircraft have a wind indicator that should be marked by a white, circular band that is 7.5 M in diameter and 0.6 M wide.	
5.1.1.5	Recommendation	Less protective or partially implemented or not implemented	Illuminated wind direction indicators are required only at aerodromes serving scheduled public transport operations at night.	UK require at least one illuminated wind sleeve for night OPS.
5.1.4.1	Standard	Less protective or partially implemented or not implemented	The UK does not specify 10° or height of 300 M for licensed aerodromes.	
5.2.1.2	Recommendation	More exacting or exceeds	At runway intersections the marking of the major runway should be continued and that of the subsidiary runway should be interrupted.	The UK permits aerodromes to determine their primary runways.
5.2.1.7	Recommendation	Less protective or partially implemented or not implemented	The UK does not require pavement markings to be made with reflective materials.	The UK requires sufficient illumination across the apron and for markings to contrast with the surface on which they are installed.
5.2.8.3	Standard	Less protective or partially implemented or not implemented	UK does not require or specify taxiway markings on runways used as a taxiway.	Runway markings are considered adequate.
5.2.10.8	Recommendation	More exacting or exceeds	The UK does not specify this requirement.	To prevent runway incursion, as far as possible the UK requires the aerodrome to limit the width of taxiways at holding points.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
5.2.12 - 5.2.12.6	Standard	Less protective or partially implemented or not implemented	UK does not require or specify VOR aerodrome checkpoints, nor therefore VOR aerodrome checkpoint signs (5.4.4).	VOR equipment is checked electronically.
5.2.13.7	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify the radii of markings.	The UK leaves this to aerodrome designers.
5.2.16.2	Recommendation	More exacting or exceeds	To prevent runway incursion, as far as possible the UK requires the aerodrome to limit the width of taxiways at holding points.	
5.3.1.2	Recommendation	Less protective or partially implemented or not implemented	The UK has not established protected laser emission zones around aerodromes.	
5.3.2.3	Recommendation	More exacting or exceeds	The UK requires the colour to be maintained throughout the range.	
5.3.4.34 & 5.3.4.35	Recommendation & Standard	Less protective or partially implemented or not implemented	The UK does not specify this.	Although capacitor discharge lights are allowed in the UK, no aerodrome has yet installed them - not used in the UK.
5.3.5.2	Standard	Less protective or partially implemented or not implemented	The UK does not use T-VASIS or AT-VASIS.	UK considers T-VASIS and AT-VASIS are not acceptable for public transport operations.
5.3.5.3	Standard	Less protective or partially implemented or not implemented	The UK only requires APAPI or PAPI.	T-VASIS and AT-VASIS are not considered acceptable for public transport operations.
5.3.5.43	Standard	More exacting or exceeds	The UK uses a plane 1 degree below the lower boundary of an on slope signal originating 90 M from units where the LDA is 1200 M or greater, 60 M where the LDA is 800 M - 1199 M and 30 M where the LDA is less than 800 M, diverging at 15 degrees from the runway edge at the threshold out to 15 NM.	This practice has been in existence since PAPI was originally designed.
5.3.7.1 - 5.3.7.6	Recommendation	Less protective or partially implemented or not implemented	The UK has not implemented such systems but permits variations to simple approach systems. If necessary, Annex 14 would apply.	
5.3.9.4 & 5.3.11.2	Standard	More exacting or exceeds	UK does not give 3 M discretion. The lights are located along the edges of the area declared for use as the runway.	Does not promote the use of non-load bearing or unsuitable surface.
5.3.12.5	Standard	More exacting or exceeds	No discretion is given for offset of runway centreline lights. The UK specifies 30 M spacing except for CAT III operations or departures in RVR <400 M when 15 M spacing is required.	The UK has never specified 15 M spacing on runways intended to be used in RVR greater than 400 M regardless of maintenance serviceability. The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.3.16.2	Standard	More exacting or exceeds	The UK does not give 3 M discretion. The lights are located along the edges of the area declared for use as the stopway.	The UK does not promote the use of non-load bearing or unsuitable surface.
5.3.17.1	Standard	Less protective or partially implemented or not implemented	Centre line lights are not required between the taxiway centre line and the stop position on the stand.	The UK requires conspicuous centreline markings and stand lead-in arrows which provide adequate guidance.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
5.3.17.2, 5.3.17.4 & 5.3.17.9	Recommendation	More exacting or exceeds	The UK requires Taxi Centre Line Lights to be provided in RVR <400 M.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.3.17.5	Recommendation	Less protective or partially implemented or not implemented	The UK requirements refer to runway lighting and marking. If aircraft taxi routes utilise part of a runway, guidance is supplied by the runway marking and lighting.	
5.3.17.12	Recommendation	More exacting or exceeds	The UK does not permit offset.	
5.3.17.15	Recommendation	Different in character other means of compliance	The UK bases spacing on RVR not radius of curve.	Tests & practical experience confirm that the spacing is sufficient.
5.3.18.6	Recommendation	Different in character other means of compliance	The UK does not permit 3 M offset.	The UK does not promote the use of non-load bearing or unsuitable surface.
5.3.20.1	Standard	More exacting or exceeds	The UK requires stop bars for operations in RVR <800 M.	The UK considers 800 M to be more suitable for the weather conditions experienced in the UK.
5.3.20.10	Recommendation	More exacting or exceeds	The UK specifies High Intensity lighting to be used as a component of an A-SMGCS.	
5.3.21.1 & 5.3.21.2	Standard & Recommendation	Different in character other means of compliance	Stop bar specifications apply. Stop bars are provided at those aerodromes operating in RVR <800 M.	The UK does not make any distinction between stop bars and Intermediate holding position lights.
5.3.21.3	Recommendation	Different in character other means of compliance	They should be positioned co-incident with any associated taxiway holding position marking so as not to obscure or interfere with the integrity of the marking.	The UK does not make any distinction between stop bars and Intermediate holding position lights.
5.3.21.4	Standard	Different in character other means of compliance	The stop bar light fittings shall be spaced equally across the taxiway in a line at right angles to the taxiway centreline at intervals of no greater than 3 M.	The UK does not make any distinction between stop bars and Intermediate holding position lights.
5.3.22.1	Standard	More exacting or exceeds	Instead of de/anti-icing facility exit lights, taxiways are protected by stop bars irrespective of the type of facility e.g. apron, hangar, de-icing facility etc.	
5.3.22.2 & 5.3.22.3	Standard	Less protective or partially implemented or not implemented	The UK does not specify de-icing facility specifications.	De-icing is carried out on apron areas.
5.3.27.1	Standard	Less protective or partially implemented or not implemented	The UK does not specify requirements for aircraft stand manoeuvring guidance lights.	A visual docking guidance system or marshaller is normally used, and the UK requires adequate illumination to be provided across the apron area.
5.3.28.1 & 5.3.28.2	Standard & Recommendation	More exacting or exceeds	The UK requires this for RVR <1200 M to be consistent with requirements for runway guard lights.	The UK believes that the application of road holding position lights should be consistent with those for runway guard lights, to provide commonality for airside drivers.
5.3.28.4	Standard	Different in character other means of compliance	b) an amber light system meeting the characteristics of Runway Guard Lights is used.	The UK requires lights meeting the configuration of runway guard lights are installed to provide consistency for airside drivers at all locations when entering a runway.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
5.4.1.2	Recommendation	Less protective or partially implemented or not implemented	The UK does not currently permit variable message signs.	The UK does not regard the technology, suitability and safety of such signs to be sufficiently mature.
5.4.3.4	Standard	Different in character other means of compliance	Not used in the UK. The UK uses a location sign reversed onto the runway holding position sign.	The UK believes that the location sign format and location is understood and applied across aerodromes. The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.4.3.5	Recommendation	Different in character other means of compliance	TORAs for intersection take offs are promulgated in the UK AIP.	Providing a sign for intersections is not consistent with full length take-off procedures.
5.4.3.17	Standard	Less protective or partially implemented or not implemented	The UK does not specify the requirement for a runway exit sign. The UK uses a destination sign or a taxiway location sign to indicate the runway exit where required.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.4.3.19	Standard	Less protective or partially implemented or not implemented	The UK does not specify the positioning of a runway vacated sign.	
5.4.3.20	Standard	Less protective or partially implemented or not implemented	The UK requires intersection take-off distances to be promulgated in the AIP.	
5.4.3.24	Recommendation	Different in character other means of compliance	The UK permits the sign to be beside the taxiway.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.4.3.26	Standard	More exacting or exceeds	The UK requires location signs to be provided with a yellow border at all times.	This provides a consistent format for all location signs.
5.4.3.28	Standard	Less protective or partially implemented or not implemented	The UK does not specify runway vacated signs.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.4.3.29	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify intersection take-off signs.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.4.4.1	Standard	Less protective or partially implemented or not implemented	The UK does not require or specify VOR aerodrome checkpoints.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.4.5.1	Standard	Less protective or partially implemented or not implemented	The UK does not require aerodrome identification signs.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
5.5.7.2	Standard	Different in character other means of compliance	The UK does not require markers to be within the light fitting.	The UK does not perceive a safety benefit is achieved by doing so. Markers located next to lights have proved effective.
5.5.8.2	Standard	More exacting or exceeds	Spacing of boundary markers is every 45 M not 90 M.	
6.2.3.9	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify the colour of overhead cable markers.	Provision of cable markers rests with power transmission undertakings. The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
6.2.5.4	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify the size of cable markers.	Provision of cable markers rests with power transmission undertakings. The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
6.2.5.5	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify the spacing of cable markers.	Provision of cable markers rests with power transmission undertakings.
6.2.5.6	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify the colour of cable markers.	Provision of cable markers rests with power transmission undertakings.
7.2.2	Recommendation	More exacting or exceeds	Inner edge of the taxi side stripe marking indicates the outer edge of the load bearing surface.	The UK does not promote the use of non-load bearing or unsuitable surface.
8.1.10	Recommendation	Different in character other means of compliance	The UK requires all except for e), g) & h), as it is not considered that standby power requirements are essential for these lights.	Existing power supply and standby arrangements are adequate. The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
8.3.3	Recommendation	Less protective or partially implemented or not implemented	The UK does not specify these time minima.	The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
9.1.13	Standard	Less protective or partially implemented or not implemented	b) The UK requires full-scale aerodrome emergency exercises at intervals not exceeding four years.	The UK considers four years provides more flexibility to aerodrome operators to engage the necessary support of externally based agencies in support of these exercises. This improves the quality of the exercise.
9.2.1	Standard	More exacting or exceeds	The provision of RFFS at a level appropriate to the longest aircraft normally using the aerodrome and its fuselage width, is a requirement of the aerodrome licence/certificate.	
9.5.1 - 9.5.3	Recommendation	Less protective or partially implemented or not implemented	The UK delaying the applicability of Apron Management Services therefore does not currently require aerodrome operators to implement apron management services through a dedicated unit. Instead, several organisations have responsibilities for apron management and the safe movement of both aircraft and vehicles. Coordination between them is required.	Subject to future rule making.
9.8.7	Recommendation	Less protective or partially implemented or not implemented	The UK does not require surface movement radar to be provided for use in RVR conditions less than 350 M.	If SMR is not provided, operational limitations apply to ensure separation. SMR may be used in normal visibilities (e.g. at night) and is not limited only to poor visibility conditions.
9.12.2	Standard	Less protective or partially implemented or not implemented	The UK does not specify the requirement for ARIWS characteristics and status to be promulgated in the AIP.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 14: Aerodromes Vol I (Aerodrome Design and Operations) (AMDT 17)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
10.4.4	Standard	Different in character other means of compliance	UK permits 1.2 M wide transverse strip.	This has proven to be sufficient. The long-term use of this practice in the UK has not adversely affected or reduced safety or impacted upon interoperability.
10.5.8 & 10.5.9	Standard	More exacting or exceeds	The UK starts this requirement at RVR <400 M.	400 M provides consistency with MATS Part 1 procedures for the implementation of LVOs.
10.5.11 & 10.5.12	Standard	More exacting or exceeds	The UK starts this requirement at RVR <800 M.	

	Annex 14 Volume II: Heliports (AMDT 9)			
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.2.4	Standard	Less protective or partially implemented or not implemented	Where, subject to appropriate risk assessment, new helicopter types or type variants seek use of helideck designs which are less than 1D, 3.2.4 b) may be applied even to helicopters having a MTOM > 3175 KG.	New helicopter types have been introduced to the UK sector which in some cases, have exceeded the D-value of helidecks on existing assets (commonly known as a sub-1D operation). Provided a CAP 437 Appendix H risk assesment for sub-1D operations can be satisfied on a case-by-case basis, it is acceptable for the dimensions of the TLOF to drop below 1D, even when serviced by a helicopter type with a MTOM which is > 3175 KG, as long as the FATO is no less than 1D.
3.2.10	Standard	Less protective or partially implemented or not implemented	Fully implemented with the exception of the requirement for object frangibility.	The UK does not accept that objects can be frangible to all parts of a helicopter – particularly vulnerable is the tail section (rotor, stinger).
3.2.13	Standard	Less protective or partially implemented or not implemented	The Standard is applied to new builds completed on or after 14 November 2013.	For existing installations with a D-value of 16.00 M or less, a review of essential objects in the OFS has been instigated with a view to limiting obstruction heights to as low as reasonably practicable.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

	Annex 14 Volume II: Heliports (AMDT 9)			
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.2.14	Standard	Different in Character or Other means of compliance	2.5 CM height limit based on max permitted height of the circle-H lighting components or helideck landing net each prior to installation. Where an operational need exists to install both systems a 2.5 CM height limit may be assumed for each component in isolation. Acceptance is applied only for helidecks used exclusively by wheeled helicopters where the threat of dynamic rollover is not an issue.	The safety issue addressed by 3.2.14, as confirmed by the accompanying Note, is to mitigate the incidence of dynamic rollover for helicopters equipped with skids due to the presence of nets or raised light fittings above the surface of the TLOF. For the installed height of lighting the UK allows some small leeway for the installed height of components (segments, subsections, lighting elements and associated cabling) to marginally exceed 2.5 CM where a TLOF is serviced exclusively by helicopters with wheeled undercarriages. Helideck nets are acceptable where knots do not exceed 2.5 CM prior to installation.
3.3.12	Standard	Less protective or partially implemented or not implemented	Fully implemented with the exception of the requirement for object frangibility.	The UK does not accept that objects can be frangible to all parts of a helicopter – particularly vulnerable is the tail section (rotor, stinger).
3.3.15	Standard	Less protective or partially implemented or not implemented	This Standard is being applied to new builds completed on or after 14 November 2013.	For existing installations with a D-value of 16.00 M or less, a review of essential objects in the OFS has been instigated with a view to limiting obstruction heights to as low as reasonably practicable.
3.3.16	Standard	Different in Character	2.5 CM height limit based on max permitted height of the circle-H lighting components or landing net each prior to installation. Where an operational need exists to install both systems a 2.5 CM height limit may be assumed for each component in isolation. Acceptance is applied only for shipboard heliports used exclusively by wheeled helicopters where the threat of dynamic rollover is not an issue.	The safety issue addressed by 3.3.16 is to mitigate the incidence of dynamic rollover for helicopters equipped with skids due to the presence of nets or raised light fittings above the surface of the TLOF. For the installed height of lighting, the UK allows some small leeway for the installed height of components (segments, subsections, lighting elements and associated cabling) to marginally exceed 2.5 CM where a TLOF is serviced exclusively by helicopters with wheeled undercarriages. Helideck nets are acceptable where knots do not exceed 2.5 CM prior to installation.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

	Annex 14 Volume II: Heliports (AMDT 9)			
ICAO Ref.	Category (Standard, Rec'd Practice, etc.)	Difference	Details of Difference	Comments/Status
4.1.24	Standard	Less protective or partially implemented or not implemented	The requirement for a 210° obstacle free sector is upheld for all new build helidecks. For legacy helidecks the obstacle free sector may be reduced to no less than 180°.	All new helidecks must comply with the requirement for a 210° OFS. As regards legacy helidecks, it is agreed that an absolute minimum of a 180° OFS be provided. For helidecks with an OFS between 180° and 210°, there is insufficient evidence of a safety issue to impose any restrictions or demand corrective action. In order to regularise the situation, for those legacy helidecks which are unable to comply, the 210° Obstacle Limitation Surface (OLS) may be regarded as an Obstacle Identification Surface (OIS).
4.2.7, 4.2.10	Standard	More exacting or exceeds	The UK does not permit heliport designs with only a single approach and take-off climb surface.	Most helicopters require to operate into wind approach and take-offs.
4.2.19	Standard	More exacting or exceeds	For new build amidships shipboard heliports and refurbishments over 16.0 M completed on or after 10 November 2018, objects are restricted to no greater than 15 CM. For amidships shipboard heliports of 16.0 M or less, objects are restricted to no greater than 5 CM.	There is a potential incompatibility between 3.3.14 and 3.3.15 and 4.2.19 which will be raised with ICAO.
4.2.23	Standard	More exacting or exceeds	For non-purpose built ship side landing areas of 16.0 M or less objects are restricted to no greater than 5 CM.	There is a potential incompatibility between 3.3.15 and 4.2.23 which will be raised with ICAO.
5.3.7.3	Standard	Different in character or other means of compliance	Where the TLOF is not located within the FATO at a surface level heliport, the lighting of the FATO may consist of green perimeter lights (in lieu of white lights).	For surface level heliports located in a light rich environment of a city, town or settlement, research has indicated more effective acquisition of the heliport by use of green perimeter lighting.
5.3.7.4	Recommendation	Different in character or other means of compliance	Where the TLOF is not located within the FATO at a surface level heliport, the lighting of the FATO may consist of green perimeter lights meeting Illustration 5.	The distribution of light for illustration 4 is contrary to the established position of the helicopter on approach to a heliport as confirmed by UK research data i.e. the specification for the light in the vertical elevation is incompatible with typical approach path angles.
5.3.9.11	Recommendation	More exacting or exceeds	The UK requires that both the TD/PM circle and heliport identification marking be illuminated.	As of 1 April 2018, the lit TD/PM circle and lit heliport identification 'H' marking is mandated for offshore helidecks by a Safety Directive.
5.3.9.16	Standard	Different in character or other means of compliance	For the TD/PM circle, the UK allows a minimum width of 40 MM.	This specification is now recognised in the Heliport Manual (onshore) Doc 9261 as being an acceptable means of compliance.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

	Annex 14 Volume II: Heliports (AMDT 9)			
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
5.3.9.22	Recommendation	More exacting or exceeds	UK specification is more demanding at lowest elevations but less demanding at higher level (where UK research confirms the lowest light outputs are required).	UK has published its own version of Illustration 5 based on real data for helicopter approach path angles. This specification is now recognised in the Heliport Manual (onshore) Doc 9261 as being an acceptable means of compliance.
5.3.11.4	Recommendation	Less protective or partially implemented or not implemented	The UK does not require a heliport to demonstrate compliance with this recommendation.	It is very difficult to achieve or verify this recommendation and UK accepts that if the objective of standard 5.3.11.3 for the spectral distribution of floodlighting across the surface is met, this will provide adequate visual cues to allow for safe winching area operations.
5.3.14.3	Recommendation	Less protective or partially implemented or not implemented	The UK does not require a lit obstacle to demonstrate compliance with this recommendation.	It is very difficult to achieve or verify this recommendation and UK accepts that if the objective of standard 5.3.14.2 for the illumination of the entire obstacle is met, this will provide adequate warning to pilots to facilitate safe operations/ clearance from the object.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Annex 15 Aeronautical Information Services (AMDT 44)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
C1 1.1.106	Definition VOLMET	Less protective or partially implemented or not implemented	UK VOLMET and D-VOLMET provides current aerodrome routine meteorological reports only.	System designed to give rapid refresh of current conditions at key aerodromes in high density air traffic airspace.
C1 1.2.2.2	Standard	More exacting or exceeds	In the UK, OSGM15 (which includes data from EGM-96) is the geoid model used for determining heights above MSL to the required level of accuracy.	EGM-96 does not meet accuracy requirements for elevation and geoid undulation specified in Annex 14, Volumes I and II.
C1 1.2.2.3	Standard	Less protective or partially implemented or not implemented	Parameters for height transformation between OSGM15 and EGM-96 are not published.	There is no perceived requirement in the UK for a description of the parameters required for height transformation between OSGM15 and EGM-96.
C3 3.2.2	Standard	More exacting or exceeds	Publication resolution is more exacting.	Where the data appears in more than one section of the AIP with different resolution requirements, the higher resolution will be applied, to avoid 'rounding'.
C5 5.3.1.1, 5.3.4.1 to 5.3.5.2	Standard	Less protective or partially implemented or not implemented	The UK AIS provides the AIP dataset and obstacle datasets. Terrain datasets are provided when available by the originators directly. UK regulation requires the AIS provider to ensure that digital data is in the form of the specified data sets only when available.	IFP datasets are currently provided for evaluation purposes only, pending changes due to AIXM 5.2 format. Aerodrome mapping datasets are included in the UK AIS roadmap for provision in future.
C5 5.3.3.1; 5.3.3.3.4; 5.3.3.3.7; 5.3.3.4.5 and 5.3.3.4.6	Standard	More exacting or exceeds	UK policy is more demanding in certain cases.	UK requirements for data collection surfaces and coverage areas are intended to ensure that one aerodrome survey will deliver all data necessary to generate Obstacle Limitation Surfaces, design Instrument Flight Procedures and produce the required charts.
C5 5.4.3	Standard	Less protective or partially implemented or not implemented.	The UK does not provide data sets through information services.	The UK has included its plans for provision of SWIM services in its Airspace Modernisation Strategy Deployment Plan (CAP 1711b)
C6 6.3.2.3 and 6.3.2.4	Standard	More exacting or exceeds	The UK requires that unavailability of a runway due to runway marking works or, if the equipment used for those works can be removed, a time lag required for making the runway available shall be notified by NOTAM.	UK Reg (EU) 2017/373 also includes the requirement to raise NOTAMs regarding space weather, which has been removed from Annex 15. This will be removed from the regulation at the next opportunity.

Doc 4444: Procedures for Air Navigation Services — Air Traffic Management (Amdt 12)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Chapter 4: General Provisions for Air Traffic Services				
4.5.7.2.1			The phraseology 'Cleared via flight plan route' is not used in the UK.	
4.5.7.5.1			In addition, the following items are to be read back in full: taxi/ towing instructions, approach clearances, altimeter settings, VDF information, type of ATS Surveillance Service being received and frequency changes. See GEN 3.3.3.	
4.6.1.5			At or above FL 280, speeds shall be expressed in multiples of 0.01 Mach; below FL 280, multiples of 10 KT shall be used.	
4.9			UK wake turbulence categories are different to ICAO. Pilots should refer to and be familiar with UK AIC P083/2020 Wake Turbulence.	
Chapter 5: Separation Methods and Minima				
5.3.3.2			Cruise climbs are not authorised by ATC in the UK.	
Chapter 6: Separation in the vicinity of aerodromes				
6.3.2.4			Revised SID/STAR phraseology not yet implemented.	Work is under way to effect UK implementation of PANS-ATM Amendment 7 provisions (date to be confirmed).
6.5.2.4			Descent clearance on a STAR is as directed by ATC. Revised STAR phraseology not yet implemented.	Work is under way to effect UK implementation of PANS-ATM Amendment 7 provisions (date to be confirmed).
Chapter 7: Procedures for Aerodrome Control Service				
7.2			The procedure for selection of runway in use for noise preferential reasons is currently not implemented in the UK.	
7.6.3.1.1.3			Standard taxi routes are not published in the UK. Taxi instructions will be issued individually by ATC.	
7.6.3.2.3.3			In the UK, the use of flashing runway or taxiway lights has no meaning and is not used.	
7.15			Aerodrome lighting shall be displayed from 15 minutes before any ETA and until 15 minutes after any ATD as follows: 1. **By day:** High intensity systems, where installed on the runway to be used, whenever the visibility is less than 5 KM and/or the cloud base is less than 700 FT; 2. **By night:** Irrespective of weather conditions.	
Chapter 8: ATS Surveillance Services				

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 4444: Procedures for Air Navigation Services — Air Traffic Management (Amdt 12)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
8.6.5.1 (b)			Except in the approach phase, the purpose and extent of initial vectors will not be given by controllers. Aircraft in receipt of vectors and subsequently experiencing radio failure must follow the radio failure procedure notified at ENR 1.1.3.	
8.6.5.1 (c)			Controllers will endeavour to keep aircraft in receipt of vectors not less than 2 NM from the boundary of controlled airspace.	
8.7.3.2 (b)			Unless wake turbulence spacing is required, 2.5 NM spacing on final approach may be used between successive aircraft arriving at London Heathrow. Pilots should be aware that this spacing may be applied up to 20 NM from the threshold. Further details are notified in AIP EGLL-AD-2.20.	
8.7.3.4			UK wake turbulence categories are different to ICAO. Pilots should refer to and be familiar with UK AIC P083/2020 Wake Turblence.	
8.9.6.1.3			Obstacle clearance criteria applicable to each runway are detailed on UK AIP aerodrome approach charts and will not be routinely given by controllers over the RTF.	
			Chapter 12: Phraseologies	
12.2.4			Pilots are not required to report non-approved RVSM status in all requests for level changes and their read-backs.	
12.3.1.2 (a) 1			For level changes and reports: 'TO' shall only be used to describe altitude or height, eg 'DESCEND TO ALTITUDE 3000 FT'. It is **not** used when describing Flight Levels, eg 'CLIMB FL 250'.	
12.3.1.2 (z) to (kk)			Revised SID/STAR phraseology not yet implemented.	Work is under way to effect UK implementation of the PANS-ATM Amendment 7 phraseology (date to be confirmed but not before late 2017).
12.3.2.1 (c) & (d)			RECLEARED is to be used only when it relates to an ATC route clearance, airways, reporting points and waypoints, but NOT for instructions to climb and descend. The phrase 'CONTINUE AS CLEARED' is not to be used in the UK.	
12.3.2.4 (c)			'CRUISE CLIMB' is not used in the UK.	
12.3.3.1 (f) to (h)			Revised departure instructions phraseology not yet implemented.	Work is under way to effect UK implementation of the revised PANS-ATM Amendment 7 phraseology (date to be confirmed but not before late 2017).
12.3.3.2 (a) to (f)			Revised approach instructions phraseology not yet implemented.	Work is under way to effect UK implementation of the revised PANS-ATM Amendment 7 phraseology (date to be confirmed but not before late 2017).

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 4444: Procedures for Air Navigation Services — Air Traffic Management (Amdt 12)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
12.4.1.8 (e) & (f)			For avoiding action the following phraseology will be used: AVOIDING ACTION. Turn left (or right) immediately heading (three digits). Traffic (bearing by clock reference and distance).	
			OTHER UK PHRASEOLOGY **Student Pilots:** In the UK, pilots may hear the use of 'STUDENT' as part of the RTF callsign. The use of this term has been introduced to increase the awareness of controllers and other airspace users to the presence of student pilots flying solo. **Reduced runway separations:** When using ICAO reduced runway separation procedures, the phraseology 'LAND AFTER THE (aircraft type)' will be used. Full details of these procedures are notified in GEN 3.3.3. **Unlawful interference:** Pilots of aircraft subject to unlawful interference may hear one or more of the following phraseologies: 1. 'I am instructed by His Majesty's Government to refuse entry into United Kingdom airspace/ to inform you that landing clearance has been refused for any airfield within the United Kingdom. What are your intentions?' 2. 'I am instructed by His Majesty's Government that you are to hold at (fix or GPS position) at (level). Acknowledge'. **Approach delays:** If, for reasons other than weather, eg an obstruction on the runway, the extent of approach delays are not known, aircraft will be advised 'DELAY NOT DETERMINED'. As soon as it is possible for aircraft to re- commence approach procedures, EATs will be issued. **Helicopter phraseology** The UK has developed specific phraseology for use in helicopter operations. Helicopter pilots should be familiar with the relevant content of CAP 413 Radiotelephony Manual.**http://www.caa.co.uk/cap413**	
Chapter 13: Automatic dependent surveillance - contact (ADS-C) services				
			ADS-C systems are currently not used in the UK.	
Chapter 15: Procedures related to emergencies, communication failure and contingencies				

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 4444: Procedures for Air Navigation Services — Air Traffic Management (Amdt 12)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
15.1.4			UK controlled airspace is complex and congested; traffic is often orientated on the airway in certain directions or flows. Therefore, if able, aircraft executing an emergency descent should remain on the assigned route or track whilst carrying out the descent; unless doing so would endanger the aircraft.	
15.1.4.2			Upon hearing an emergency descent broadcast on the ATC frequency, pilots should: maintain radio silence, listen for instructions from ATC, maintain a good visual lookout and respond to TCAS advisories.	
15.3.3			UK Radio Failure procedures for IFR/IMC flights provide pilots with instructions more comprehensive than ICAO procedures. Pilots should read and be familiar with UK Radio Failure procedures notified at ENR 1.1.3 paragraph 3.	
Chapter 16: Miscellaneous Procedures				
16.2			For the rules, regulations, responsibilities and restrictions regarding unmanned free balloons in UK airspace, users should contact the UK CAA's Airspace Utilisation Section.	
16.4			For UK repetitive flight planning requirements see ENR 1.10.	

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Vol I (Flight Procedures) (Amdt 11)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Part I: Departure Procedures Section 2; Chapter 1: Use of FMS/RNAV equipment to follow conventional departure procedures				
1.4			**Additional requirements:** 1. the conventional procedure must have been inserted into the FMS from a recognised database and cannot be manually loaded or modified by the crew other than to follow ATC instructions; 2. after the procedure has been loaded into the FMS as above, it must be cross-checked against the published conventional procedure before any attempt is made to follow the procedure using the FMS.	
Part I: Noise Abatement Procedures Section 7; Chapter 2: Noise Preferential Runways and Routes				

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Vol I (Flight Procedures) (Amdt 11)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
2.2.3.			In general, where turns are required shortly after take-off for noise abatement or other operational purposes, the nominal track has not been designed in accordance with the criteria in Volume II Part 2 Chapter 3 para 3.3. However, no turns are to be commenced below a height of 500 FT AAL. Airport Operators may specify the criteria used to determine individual Noise Preferential Routes. These criteria are for guidance only and aircraft operators should adhere to the routes to the maximum extent practicable commensurate with the safe operation of the aircraft.	
Part I: Aeroplane Operating Procedures				
Section 7; Chapter 3				
3.8.			Unless otherwise stated, the upper limit for noise abatement procedures is 3000 FT ALT. However, aircraft operators are expected to operate their aircraft at all times in a manner calculated to cause the least noise disturbance on the ground.	

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Volume II (Construction of Visual and Instrument Flight Procedures) (Amdt 9)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
Part I: Procedure Construction and Obstacle Clearance Criteria for Departure Procedures Section 3; Chapter 3: Turning Departure				
3.3			In general, when turns are required shortly after take-off for noise abatement or other operational purposes, the nominal track has not been designed in accordance with these criteria. However, no turns are to be commenced below a height of 500 FT AAL Primary and Secondary areas for obstacle clearance on Standard Instrument Departure Procedures, where published, are determined along the nominal ground track of the Noise Preferential Route as specified by the Airport Operator. Obstacle clearance is not assessed for any routes other than published Standard Instrument Departures Procedures.	
Part I: Initial Approach Segment Section 4; Chapter 3: Requirements for separate instrument approach charts				

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Volume II (Construction of Visual and Instrument Flight Procedures) (Amdt 9)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
3.4.5.2 3.5.4.4			In certain procedures different outbound tracks and/or timings may be specified for Category A/B and Category C/D aircraft. These tracks/ timings will normally bepublished on a common instrument approach chart. Separate charts will normally be published whenever Category A/B and Category C/D aircraft have different procedure altitudes or different missed approach points.	
Part I: Length Section; Chapter 4				
4.3.1.1			The length of the intermediate segment should conform to the standard given in paragraph 4.3.1.1 whenever possible. However, when an operational advantage may be gained, the minimum length of the intermediate segment may be reduced to 5.5 KM (3 NM).	
Part I: Turn as soon as practicable Section 4; Chapter 6				
UK Addition 6.4.5.7			Paragraph 6.4.5.7 UK addition to PANS-OPS.	
Part I: General				
UK Addition 6.4.5.7.1			A turn as soon as practicable is prescribed in non-precision procedures when it is essential to locate the TP before the SOC associated with the normal turn at an altitude or at a fix, and when it is not convenient to move the MAPt. When specified, the missed approach procedures shall be annotated 'turn left (or right) as soon as practicable'. The criteria are the same as those for a turn at a designated altitude, modified in accordance with the paragraphs UK Addition 6.4.5.7.2 to 6.4.5.7.4.	
Part I: Turn altitude/height				
UK Addition 6.4.5.7.2			The turn altitude/height is also the OCA/H for the procedure. The TP is plotted at distance c after the latest limit of the MAPt tolerance area.	
Part I: Areas				
UK Addition 6.4.5.7.3			Turn initiation area. The turn initiation area is bounded by the edges of the MAPt tolerance area, starting at the earliest MAPt and extended beyond the latest MAPt to the TP.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Volume II (Construction of Visual and Instrument Flight Procedures) (Amdt 9)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
UK Addition 6.4.5.7.3.1			Turn area. The inner and outer boundaries of the turn area are constructed as specified in paragraph Part I Sect 4 Chapter 6 paragraph 6.4.5.2.2 with the following exceptions: a. The boundaries are based on the intermediate missed approach speed of the appropriate aircraft category; b. The outer boundary starts at the range of the TP (distance c has already been included in the turn initiation area).	
Part I: Obstacle clearance				
UK Addition 6.4.5.7.4			The obstacle clearance in the turn initiation and turn areas is adjusted to preserve the normal MOC associated with the transitional tolerance X into the turn area as follows: a. Obstacle clearance in the turn initiation area. Obstacle elevation/height in the turn initiation area shall be less than: OCA/H - MOC approach segment b. Obstacle clearance in the turn area. Obstacle elevation/ height in the turn area and subsequently shall be less than: OCA/H - MOC missed approach + (d0 - X) tan Z with the additional provision that obstacle height need not be less than (OCH - MOC approach segment). Where d0 is measured from the obstacle to the nearest point on the turn initiation area boundary. MOC approach is the primary area MOC associated with the final approach segment. MOC missed approach is the MOC applicable to the missed approach; 50 M (164 FT) for turns exceeding 15° and 30 M (98 FT) for turns of 15° or less, reduced if appropriate for obstacles within any secondary areas.	
Part I: Minimum Sector Altitudes (MSA) Section 4; Chapter 8				

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Volume II (Construction of Visual and Instrument Flight Procedures) (Amdt 9)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
8.4			Combining sectors for adjacent facilities: Where more than one facility provides arrival segment tracking to an instrument approach procedure, and unless otherwise specified, the minimum sector altitude for each sector is the highest of those calculated for that specific sector for every facility serving the procedure, regardless of the distance between the facilities. The Instrument Approach chart will state the facilities used in the calculation of MSA. eg 'MSA 25NM VOR XXX or NDB(L) YYY'.	
Part II: Surveillance Radar Section 2; Chapter 6				
UK Addition 6.1.1 6.2.3			**General.** See paragraph UK Addition 6.6 below for separate criteria for approved 'high resolution' equipment with a termination range of 0.5 NM or less. Additionally, within a specified area aligned with an Instrument Runway, when an aircraft is being vectored to an Instrument Approach, minimum obstacle clearance may be reduced to 150 M (500 FT). The specified area is shown on the ATC Surveillance Minimum Altitude Chart and is of the following dimensions: A line 2.5 NM long, centred on the runway centreline, 1.5 NM from the threshold in the approach and a line 5 NM long, centred on the runway centreline, 9.5 NM from the threshold in the approach, joined at the ends to form a quadrangle.	
6.4.3			**Area.** The area to be considered for obstacle clearance begins at the FAF and ends at the MAPt.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Volume II (Construction of Visual and Instrument Flight Procedures) (Amdt 9)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
6.5			**Termination Range.** A Surveillance Radar Approach shall be terminated 2 NM before touchdown except where a termination range of 1 NM has been specifically approved. See paragraph 6.6 below for separate criteria for approved 'high resolution' equipment with a termination range of 0.5 NM or less. The Missed Approach Point (MAPt) is located at the point where the radar approach terminates. However, where operationally advantageous, the MAPt for 2 NM SRAs may be designated as 1 NM before touchdown.	
Surveillance Radar (high resolution) - UK addition to PANS-OPS				
UK Addition 6.6			**General.** Certain approved Surveillance Radar equipments can provide final approach guidance of better quality than that provided for in paragraph 6.1. The criteria for procedures using these radars are the same as those contained in paragraphs 6.2 and 6.3 except for the final approach and missed approach areas and obstacle clearance described below: Note: Approval of 'high resolution' SRE procedures is based on an operational and technical evaluation of the equipment. In all cases: a. There is a continuous talk-down, on a discrete frequency, from 4 NM with ranges and advisory heights being given every 0.5 NM; b. The approach controller providing final approach guidance is allocated full time to the task; c. The display system incorporates a centreline with associated reflectors to confirm centreline accuracy; d. The accuracy, resolution, antenna rotation rate. Low- level cover, and extent of permanent echoes are assessed as capable of giving a high probability of a successful approach with a termination range of 0.5 NM or less.	

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Doc 8168: Procedures for Air Navigation Services — Aircraft Operations Volume II (Construction of Visual and Instrument Flight Procedures) (Amdt 9)				
ICAO Ref.	**Category (Standard, Rec'd Practice, etc.)**	**Difference**	**Details of Difference**	**Comments/Status**
UK Addition 6.6.1			**Area.** The area to be considered for obstacle clearance begins at the FAF and ends at the MAPt and is centred on the Final Approach Track. The minimum length of the Final Approach Track shall be 3 NM. The length shall be established by taking account of the permissible descent gradient (see paragraph 6.4.5). The maximum length should not exceed 6 NM. Where a turn is required over the FAF, Table I-4-5-1 in Part 1, Section 4, Chapter 5 applies. The width of the area is proportional to the distance from the radar antenna, according to the following formulae: W/2 = 1.9 + 0.1 D KM, for D greater than 10 KM. W/2 = 0.3 + 0.26 D KM, for D equal or less than 10 KM. Where: W = total area width in KM. D = distance from antenna to track in KM The maximum value for D is 37 KM (20 NM) subject to the accuracy of the radar equipment as determined by the Authority. A secondary area comprising 25% of the total width lies on each side of the primary area, which comprises 50% of the total width.	
UK Addition 6.6.2			**Obstacle Clearance.** The MOC is 75 M (246 FT) in the primary area, reducing to zero at the outer edges of the secondary areas.	
UK Addition 6.6.3			**Missed Approach Secondary Areas.** Secondary areas are established on each side of the primary area, with width equal to 25% of the total area width at the MAPt, reducing to zero width at the SOC.	

3 Data not fully compliant with data quality requirements (ADQ)

Numerical data and information with ICAO integrity classification 'critical', 'essential' or 'routine' made available via UK AIS, shall be provided in accordance with the requirements on the quality of aeronautical data and aeronautical information specified in relevant ICAO Annexes and UK Regulations (EU) 2017/373 and 139/2014.

Requirements on the quality of aeronautical data and aeronautical information apply to aeronautical data and aeronautical information with an ICAO integrity level and/or intended for use in IFR traffic and which are included in the following products made available by or through the UK AISP:

- Aeronautical Information Publication (AIP), including Amendments and Supplements;
- Aeronautical charts;
- NOTAM; and
- Digital data sets.

GEN 1.7 DIFFERENCES FROM ICAO STANDARDS, RECOMMENDED PRACTICES AND PROCEDURES (continued)

Requirements on the quality of aeronautical data and aeronautical information apply to all parties involved in the upstream data chain from the point of origination to the point of publication by AIS. This includes aerodrome operators, air navigation service providers, entities providing services for the origination and provision of survey data, airspace structure design and flight procedure design services and entities providing electronic terrain and obstacle data and any other parties originating, processing, or providing data in the scope of the data quality requirements.

More information regarding the applicability of 'ADQ' requirements can be found in CAP 1054 Chapter 2.

All data items that are in the scope of the ADQ but do not meet the data quality requirements are listed here:

www.nats.aero/ais/dataquality

Additionally, all **Area 1 Obstacles** (the height of which is 100 M or more AGL) included in ENR 5.4 and all **Instrument Flight Procedures** published in relevant AD sections should be considered non-compliant with ADQ. Aeronautical data published for aerodromes outside of the scope of ADQ (as per paragraph 1.5 in AD 1.4) will **not** be annotated to indicate their data quality compliance.

Aeronautical data published in the Remarks column of an AIP Table shall be considered as non-compliant to the ADQ.

INTENTIONALLY BLANK

GEN 2 TABLES AND CODES

GEN 2.1 MEASURING SYSTEM, AIRCRAFT MARKINGS, HOLIDAYS

1 Units of Measurement

1.1 The table of units of measurement used in the United Kingdom is that which is published in ICAO Annex 5 (Fifth Edition) Chapter 3 including permitted non-SI alternative units.

Measurement of	Units
Distance used in navigation, position report etc – generally in excess of 2 or 3 nautical miles	*Nautical miles and tenths
Relatively short distances such as those relating to aerodromes (eg runway lengths)	Metres
Altitudes, elevations and heights	Feet and Flight Levels
Horizontal speed including wind speed	Knots
Vertical speed	Feet per minute
Wind direction for landing and taking off	Degrees Magnetic
Wind direction except for landing and taking off	Degrees True
Visibility < 5000 metres (including RVR)	Metres
Visibility > 5000 metres	Kilometres
Distance from cloud	Metres
Depth of runway deposit	Centimetres or millimetres
Altimeter setting	Hectopascals
Temperature	Degrees Celsius (Centigrade)
Weight/mass	Metric tonnes or kilogrammes
Date/Time	Year, Month, Day, Hour and Minute, the day of 24 hours beginning at midnight Co-ordinated Universal Time
* International nautical miles, for which conversion into metres is given by 1 international nautical mile = 1852 M.	

1.2 There is no sharp dividing line between the usage of nautical miles or metres for the two types of horizontal distances referred to in the table above. There is no hard and fast rule, but distances having a navigational or position reporting aspect are given in nautical miles even if they are less than 2 nautical miles (eg ranges from touchdown during a precision approach). These are given in nautical miles and fractions. Distances on the aerodrome (eg runway lengths, etc.) are given in metres. Distances from obstacles in the vicinity of aerodromes and ILS marker distances are generally shown in nautical miles and tenths, except when it is necessary for greater accuracy for some middle markers to be shown in metres.

1.3 Nautical miles or feet, as appropriate, will be used in designating horizontal distances at military aerodromes, joint-user aerodromes controlled by Service personnel and in RAF Sections at Air Traffic Control Centres. Horizontal distances will, however, be given to civil pilots in metric units, on request. Similarly, at civil aerodromes, joint-user aerodromes under civil control and in civil sections at Air Traffic Control Centres, Service pilots will be given distances in nautical miles or feet, as appropriate, on request.

2 Temporal Reference System

2.1 The Gregorian calendar and Coordinated Universal Time (UTC) shall be used as the temporal reference system for air navigation.

2.2 Daylight saving time is UTC plus 1 hour. The expression “summer period” indicates that part of the year in which “daylight saving time” is in force. The other part of the year is named the “winter period”. Times applicable during the “summer period” are given in brackets.

2.3 The “summer period” is introduced every year on the last Sunday in MAR at 01:00 UTC and ceases on the last Sunday in OCT at 01:00 UTC.

2.4 Guidance material for expressing time periods in AIS Products is available on the NATS AIS website www.nats.aero/ais.

3 Horizontal Reference System

3.1 The geographical co-ordinates indicating Latitude and Longitude are expressed in terms of the World Geodetic System of 1984 (WGS84) geodetic reference datum.

3.2 Surveyed co-ordinates WGS84 are realised in the UK using the National GPS Network, a 3-D TRF (Terrestrial Reference Frame), using the ETRS89 (European Terrain Reference System 89) datum or by direct connection to the IGS system.

3.3 Area of Application

3.3.1 The area of application for the published geographical co-ordinates coincides with the Area of Responsibility for UK Air Traffic Services, ie London and Scottish Flight Information Regions; Scottish and Shanwick Oceanic Control Areas. In particular the airspace types shown below:

GEN 2.1 MEASURING SYSTEM, AIRCRAFT MARKINGS, HOLIDAYS (continued)

Area/en-route co-ordinates	Aerodrome co-ordinates
FIR Boundaries and Crossing points	Reference Points
ATS, RNAV and Conditional Routes	Thresholds
Holding Points	Radio Nav Aids – Precision and Non-Precision
Radio Nav Aids (Off Aerodrome)	Runway centre-line
CTA, TMA, CTR	Extended Runway centre-line FAFs
Restricted, Prohibited and Danger Areas	Stands and Nav Checkpoints
Obstacles – En-route	
Other significant points and areas	

3.4 Aerodromes with coordinates which have been transformed into WGS84 coordinates but whose accuracy of original field work does not meet the requirements in Annex 11, Chapter 2, and Annex 14, Volumes I and II, Chapter 2, are listed below:

Cheltenham
Derby

4 Vertical Reference System

4.1 The Ordnance Datum Newlyn (ODN) can be considered the source of Mean Sea Level (MSL) in the UK.

4.2 OSGM15 is the National Geoid Model used in the UK for determining elevations Above Mean Sea Level (AMSL) datum.

4.3 Primary term expressed in UK AIP.

a) Elevation (ELEV) - The vertical distance measured from Mean Sea Level (MSL). (FT/M)

4.4 Other terms expressed in AIP:

a) Above Aerodrome Level (AAL) - The vertical distance measured from a specified aerodrome. (FT/M)
b) Above Ground Level (AGL) - The vertical distance measured from the surface of the earth. (FT/M)
c) Above Mean Sea Level (AMSL) - The vertical distance measured from Mean Sea Level (MSL). (FT/M)
d) Altitude (ALT) - The vertical distance measured from Mean Sea Level (MSL). (FT/M)
e) Flight Level (FL) - A surface of constant atmosphere pressure which is related to a specific pressure datum, 1013.2 hPa, and is separated from other such surfaces by specific pressure intervals. Altitude above sea level in 100 FT units measured according to a standard atmosphere. Only above the transition level are flight levels used to indicate altitude; below the transition level feet (FT) are used.
e.g. FL250 = 25,000 FT AMSL when the pressure at sea level is 1013.2 hPa.
f) Height (HGT) - The vertical distance measured from a specified point or datum. e.g. An aerodrome.
g) Surface (SFC) - The distance measured from the surface of the earth. (FT/M)

5 Aircraft Nationality and Registration Marks

5.1 The nationality mark for British Civil aircraft is the letter 'G'. This nationality mark is followed by a hyphen and a registration mark consisting of four letters. Example: G-BAAA.

6 Public Holidays

6.1 The following link provides access to the government website announcing public holidays for the UK:

https://www.gov.uk/bank-holidays

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS

The abbreviations used in this AIP and in the general dissemination of information are extracted from ICAO DOC 8400. Abbreviations shown in italics are either different from or not contained in ICAO DOC 8400.

† When radiotelephony is used, the abbreviations and terms are transmitted as spoken words.

‡ When radiotelephony is used, the abbreviations and terms are transmitted using the individual letters in non-phonetic form.

Symbols	
-	*No information stored/provided for publication. The absence of information has not been confirmed by the Sponsor/ Authorised Source. (See also "NIL")*
A	
A/A	Air-to-air
A/G	Air-to-Ground
AAA	(or AAB, AAC....etc, in sequence) Amended meteorological message (message type designator)
AAL	Above Aerodrome Level
AAR	Air to Air Refuelling
AARA	*Air to Air Refuelling Areas*
ABM	Abeam
ABN	Aerodrome Beacon
ABV	Above
AC	Altocumulus
AC	*Area Control*
ACARS	Aircraft Communications Addressing And Reporting System
ACAS	†Airborne Collision Avoidance Systems
ACC	‡Area Control Centre OR Area Control
ACCID	Notification of an Aircraft Accident
ACFT	Aircraft
ACK	Acknowledge
ACL	Altimeter Check Location
ACN	Aircraft Classification Number
ACN	*Airspace Co-ordination Notice*
ACT	Active OR Activated OR Activity
AD	Aerodrome
ADA	Advisory Area
ADF	‡Automatic Direction-Finding Equipment
ADIZ	†(to be pronounced 'AY-DIZ') Air Defence Identification Code
ADS-B	‡Automatic Dependent Surveillance - Broadcast
ADS-C	‡Automatic Dependent Surveillance - Contract
ADSU	Automatic Dependent Surveillance Unit
ADVS	Advisory Service
AEW	*Airborne Early Warning*
AFIL	Flight Plan Filed in the Air
AFIS	Aerodrome Flight Information Service
AFPEx	*Assisted Flight Plan Exchange*
AFS	Aeronautical Fixed Service
AFTN	‡Aeronautical Fixed Telecommunication Network
AGCS	*Air Ground Communication Service*
AGL	Above Ground Level
AGNIS	*Azimuth Guidance for Nose-In Stand*
AIAA	*Area of Intense Air Activity*
AIC	Aeronautical Information Circular
AIM	Aeronautical Information Management
AIP	Aeronautical Information Publication
AIRAC	Aeronautical Information Regulation and Control
AIREP	†Air-Report
AIREX	*Air Exercise*
AIS	Aeronautical Information Services
ALA	Alighting Area
ALERFA	†Alert Phase
ALR	Alerting (message type designator)
ALRS	Alerting Service
ALS	Approach Lighting System
ALT	Altitude
ALTN	Alternate (Aerodrome)
AMA	Area Minimum Altitude
AMC	*Airspace Management Cell*
AMD	Amend OR Amended (used to indicate amended meteorological message; message type designator)
AMDT	Amendment (AIP Amendment)
AMS	Aeronautical Mobile Service
AMSL	Above Mean Sea Level
AMSS	Aeronautical Mobile Satellite Service
ANM	*ATFM Notification Message*
ANO	*Air Navigation Order*
AO	Aircraft Operators
AOC...	Aerodrome Obstacle Chart (followed by type and name/title)
AOC	*Air Operator Certificate*
AOM	*Aerodrome Operating Minima*
AP	Airport
APAPI	Abbreviated Precision Approach Path Indicator
APCH	Approach
APIS	*Aircraft Positioning and Information System*
APP	Approach Control Office OR Approach Control OR Approach Control Service
APRX	Approximate OR Approximately
ARA	*Advisory Radio Area*
ARO	Air Traffic Services Reporting Office
ARP	Air-Report (message type designator)
ARR	Arrival (message type designator)
ARST	Arresting (Specify (part of) Aircraft Arresting Equipment)
ASC	Ascent to OR Ascending to
ASDA	Accelerate-Stop Distance Available
ASHTAM	Special series of NOTAM notifying, by means of specific format, change in activity of a volcano, a volcano eruption and/or volcanic ash cloud that is of significance to aircraft operations
ASPH	Asphalt
ASR	*Airspace Reservation*
ATA	Actual Time of Arrival
ATA	*Aerial Tactics Area*
ATC	‡Air Traffic Control (in general)
ATCSMAA	*ATC Surveillance Minimum Altitude Area*
ATCSMAC	Ait Traffic Control Surveillance Minimum Altitude Chart (followed by name/title)
ATD	‡Actual Time of Departure
ATFM	Air Traffic Flow Management
ATIS	†Automatic Terminal Information Service
ATM	Air Traffic Management
ATN	Aeronautical Telecommunication Network
ATS	Air Traffic Service
ATSU	*Air Traffic Service Unit*
ATZ	Aerodrome Traffic Zone
AU	*Airspace Utilisation*
AUP	*Airspace Utilisation Plan*

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS (continued)

AUW	All Up Weight
AUX	Auxiliary
AVBL	Available OR Availability
AVGAS	†Aviation Gasoline
AVTUR	*Aviation Turbine Fuel*
AWR	*Air Weapon Range*
AWY	Airway
AZM	Azimuth
B	
BA	Braking Action
BBMF	*Battle of Britain Memorial Flight*
BCN	Beacon (Aeronautical ground light)
BDRY	Boundary
BFR	Before
BKN	Broken
BLCP	*Base Level Change Point*

DLA	Delay OR Delayed
DLY	Daily
DME	‡Distance Measuring Equipment
DNG	Danger OR Dangerous
DNM	*Directorate Network Management*
DOC	*Designated Operational Coverage*
DOM	Domestic
DPT	Depth
DR	Dead Reckoning
DRA	*Direct Route Airspace*
DRDF	*Digital Resolution Direction Finding*
DRG	During
DTAM	Descend to and Maintain
DTG	Date-Time Group
DU	Dust
DUC	Dense Upper Cloud
DUR	Duration
DVOR	Doppler VOR
DW	Dual Wheels
E	
EASA	*European Union Aviation Safety Agency*
EAT	Expected Approach Time
ECA	*Emergency Controlling Authority*
ECAC	*European Civil Aviation Conference*
EDT	*Estimated Departure Time*
EET	Estimated Elapsed Time
EFC	Expected Further Clearance
EFIS	†Electronic Flight Instrument System
eFPL	Filed flight plan exchanged via flight and flow - information for a collaborative environment (FF-ICE) services
EGNOS	European Geostationary Navigation Overlay Service
EHF	Extremely High Frequency (30000 to 300000 MHz)
ELBA	†Emergency Location Beacon - Aircraft
ELEV	Elevation
ELR	Extra Long Range
ELT	Emergency Locator Transmitter (GEN 3.6.6)
EMBD	Embedded in a Layer (To indicate cumulonimbus embedded in layers of other clouds)
EMERG	Emergency
END	Stop-end (related to RVR)
ENG	Engine
ENR	En-Route
EOBT	Estimated Off-Block Time
EQPT	Equipment
EST	Estimate OR Estimated OR Estimation (message type designator)
ETA	*‡Estimated Time of Arrival OR Estimating Arrival
ETD	‡Estimated Time of Departure OR Estimating Departure
ETFMS	*Enhanced Tactical Flight Management System*
ETOPS	*Extended Twin-jet Operations*
EXC	Except
EXER	Exercises OR Exercising OR To Exercise
EXP	Expect OR Expected OR Expecting
EXT	*Extension*
EXTD	Extend OR Extending
F	
FAC	Facilities
FAF	Final Approach Fix
FAM	*Flight Activation Monitoring*
FAP	Final Approach Point
FAS	Final Approach Segment
FAT	*Final Approach Track*
FATO	Final Approach and Take-off Area
FBL	Light (Used to indicate the intensity of weather phenomena, interference or static reports, eg FBL RA = Light rain)
FBO	*Fixed-base Operator*
FBU	*Flight Briefing Unit*
FBZ	*Flight Plan Buffer Zone*
FCT	Friction Coefficient
FDOD	*Flight Data Operations Division*
FDPS	Flight Data Processing System
FIC	Flight Information Centre
FIR	‡Flight Information Region
FIS	Flight Information Service
FISA	Automated Flight Information Service
FISO	*Flight Information Service Officer*
FL	Flight Level
FLAS	*Flight Level Allocation Scheme*
FLG	*Flashing*
FLR	Flares
FLR	*(ENR 5.4) Flare Pipe - On Land (In Refinery)*
FLT	Flight
FLTCK	Flight Check
FLY	Fly OR Flying
FM	From
FMC	Flight Management Computer
FMD	*Flow Management Division*
FMP	*Flow Management Position*
FMS	Flight Management System
FMU	Flow Management Unit
FNA	Final Approach
FOD	*Foreign Object Damage/Debris*
FPL	Filed Flight Plan exchanged via aeronautical fixed service (AFS)
FPM	Feet Per Minute
FPR	Flight Plan Route
FRA	*Free Route Airspace*
FRA (A)	*FRA Arrival Connecting Point*
FRA (D)	*FRA Departure Connecting Point*
FRA (E)	*FRA Horizontal Entry Point*
FRA (I)	*FRA Intermediate Point*
FRA (X)	*FRA Horizontal Exit Point*
FREQ	Frequency
FRNG	Firing
FRQ	Frequent
FRZ	*Flight Restriction Zone*
FSL	Full Stop Landing
FSS	Flight Service Station
FT	Feet (Dimensional Unit)
FU	Smoke
FUA	*Flexible Use of Airspace*
G	
G/A	Ground-to-Air
G/A/G	Ground-to-Air and Air-to-Ground
GA	General Aviation
GAGAN	GPS & Geostationary Earth Orbit Augmented Navigation
GAMET	General Aviation Meteorological Forecast

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS (continued)

GAT	*General Air Traffic*
GBAS	Ground Based Augmentation System
GCA	‡Ground Controlled Approach System OR Ground Controlled Approach
GEO	Geographic OR True
GES	Ground Earth Station
GLD	Glider
GLONASS	Global Orbiting Navigation Satellite System
GLS	‡GBAS Landing System
GMC...	Ground Movement Chart (followed by name/ title)
GMC	*Ground Movement Control*
GMR	*Ground Movement Radar*
GND	Ground
GNSS	Global Navigation Satellite System
GP	Glide Path
GPA	Glide Path Angle
GPS	Global Positioning System
GPWS	‡Ground Proximity Warning System
GR	Hail
GRAS	Ground Based Regional Augmentation system
GRASS	Grass Landing Area
GRF	*Global Reporting Format*
GRVL	Gravel
GS	Ground Speed
GUND	Geoid Undulation
GVS	*Gas Venting Site*
H	
H24	Continuous Day and Night Service
HAPI	Helicopter Approach Path Indicator
HBN	Hazard Beacon
HDF	High Frequency Direction-Finding Station
HDG	Heading
HEL	Helicopter
HEMS	*Helicopter Emergency Medical Service*
HF	‡High Frequency (3000 to 30000 kHz)
HGT	Height OR Height Above
HI	*High Intensity directional lights*
HIAL	*Highlands and Islands Airports Ltd*
HIRTA	*High Intensity Radio Transmission Area*
HJ	Sunrise to sunset
HLA	*High Level Airspace*
HLDG	Holding
HMRI	*Helicopter Main Routing Indicator*
HMU	*Height Monitoring Units*
HN	Sunset to Sunrise
HO	Service available to meet operational requirements
HOL	Holiday
HOPA	*Helicopter Operational Area*
HOSP	Hospital Aircraft
HOZ	*Helicopter Operating Zone*
HPA	Hectopascal
HR	Hours
HS	Service Available During Hours of Scheduled Operations
HT	*High Tension (power)*
HTA	*Helicopter Training Area*
HVDF	High and Very High Frequency Direction Finding Stations (At the Same Location)
HVY	Heavy
HX	No Specific Working Hours
Hz	Hertz (Cycle Per Second)
I	
IAC	Instrument Approach Chart
IAF	Initial Approach Fix
IAP	Instrument Approach Procedure
IAR	Intersection of Air Routes
IAS	Indicated Air Speed
IBN	Identification Beacon
ID	Identifier OR Identify
IDENT	†Identification
IF	Intermediate Approach Fix
IFF	Identification Friend/Foe
IFPS	*Integrated Flight Planning System*
IFR	‡Instrument Flight Rules
IGA	International General Aviation
ILS	‡Instrument Landing System
IM	Inner marker
IMC	‡Instrument Meteorological Condition
IMT	Immediate OR Immediately
INA	Initial Approach
INBD	Inbound
INC	In Cloud
INCERFA	†Uncertainty Phase
INFO	†Information
INOP	Inoperative
INS	Inertial Navigation System
INSTL	Install OR Installed OR Installation
INSTR	Instrument
INT	Intersection
INTL	International
INTSF	Intensify OR Intensifying
INTST	Intensity
IRS	Inertial Reference System
IRVR	*Instrumented Runway Visual Range*
ISA	International Standard Atmosphere
ISOL	Isolated
J	
JMC	*Joint Maritime Course*
JTST	Jet Stream
K	
KG	Kilogrammes
KHz	Kilohertz
KIAS	Knots Indicated Airspeed
KM	Kilometres
KMH	Kilometres per Hour
KPA	Kilopascal
KT	Knots
KW	Kilowatts
L	
...L	Left (preceded by runway designation number to identify a parallel runway)
L	Locator (NDB with published approach procedure. See LM, LO)
LAM	Logical Acknowledgement (message type designator)
LARS	*Lower Airspace Radar Service*
LAT	Latitude
LDA	Landing Distance Available
LDAH	Landing Distance Available, Helicopter
LDG	Landing
LDI	Landing Direction Indicator
LEN	Length
LF	Low Frequency (30 to 300 kHz)
LFA	*Low Flying Area*
LFC	*Low Flying Co-ord*
LFZ	*Low Flying Zone*
LGT	Light OR Lighting
LGTD	Lighted
LHA	*Lowest Holding Altitude*

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS (continued)

LHS	*Left hand side*
LI	*Low Intensity omni-directional lights*
LIH	Light Intensity High
LIL	Light Intensity Low
LIM	Light Intensity Medium
LITAS	*Low Intensity Two Colour Approach Slope Indicators at …… and …… metres from threshold bracketing approach angle of …… degrees*
LM	Locator, Middle
LNAV	† (to be pronounced "EL-NAV") Lateral Navigation
LNG	Long (Used to indicate the type of approach desired or required)
LO	Locator, outer
LOC	Localizer
LONG	Longitude
LORAN	†LORAN (Long Range Air Navigation System)
LP/LD	*Low Power/Low Drag*
LPV	Localizer Performance with Vertical Guidance
LTD	Limited
LV	Light and Variable (Relating to Wind)
LVL	Level
LVP	Low Visibility Procedures
M	
M	Metres (Preceded by figures)
MAA	Maximum Authorised Altitude
MAG	Magnetic
MAINT	Maintenance
MAP	Aeronautical maps and charts
MAPt	Missed Approach Point
MAS	*Manual A1 Simplex*
MASA	*Multifunctional Transport Satellite (MTSAT) Satellite Based Augmentation System*
MATZ	Military Aerodrome Traffic Zone
MAUW	*Maximum All Up Weight*
MCA	Minimum Crossing Altitude
MDH	Minimum Descent Height
MEA	Minimum En-route Altitude
MEDA	*Military Emergency Diversion Aerodrome*
MEHT	Minimum Eye Height over Threshold (For VASIS and PAPI)
MET	Meteorological OR Meteorology
MET	*(ENR 5.4) Meteorological Mast*
METAR	†Aviation routine weather report (In aeronautical meteorological code)
MF	Medium Frequency (300 to 3000 kHz)
MHDF	Medium and High Frequency Direction Finding Stations (At the same location)
MHVDF	Medium, High and Very High Frequency Direction Finding Stations (At the same location)
MHz	Megahertz
MID	Mid-point (related to RVR)
MIL	Military
MINE	*(ENR 5.4) Mine Shaft Superstructure*
MISC	*(ENR 5.4) Miscellaneous Air Obstruction (Man Made)*
MKR	Marker radio beacon
MLAT	*Multilateration*
MLS	‡Microwave Landing System
MM	Middle Marker
MNM	Minimum
MNPS	Minimum Navigation Performance Specifications
MNT	Monitor OR Monitoring OR Monitored
MNTN	Maintain
MOA	Military Operating Area
MOC	Minimum Obstacle Clearance (required)
MOCA	Minimum Obstacle Clearance Altitude
MOD	Moderate (Used to indicate the intensity of weather phenomena, interference or static reports, eg MOD RA = Moderate rain)
MOGAS	*Motor Gasoline*
MONT	*(ENR 5.4) Monument/Obelisk*
MPH	*Statute Miles Per Hour*
MPS	Metres Per Second
MRP	ATS/MET Reporting Point
MS	Minus
MSA	Minimum Sector Altitude
MSG	Message
MSL	Mean Sea Level
MTA	*Military Training Area*
MTOM	Maximum Take-off Mass
MTOW	*Maximum Take-off Weight*
MTRA	*Military Temporary Reserved Airspace*
MTU	Metric Units
MTWA	*Maximum Total Weight Authorised*
MVDF	Medium and Very High Frequency Direction Finding Stations (At the same location)
MWO	Meteorological Watch Office
N	
N	No distinct tendency (in RVR during previous 10 minutes)
NADP	Noise Abatement Departure Procedure
NAT	North Atlantic
NAV	Navigation
NB	Northbound
NBFR	Not Before
NC	No Change
NDB	‡Non-Directional Radio Beacon
NDS	*Non Deviating Status*
NEG	No OR Negative OR Permission not granted OR That is not correct
NERS	*North Atlantic European Routing System*
NGT	Night
NIL	*†No information available for publication. The absence of information has been confirmed by the Sponsor/Authorised Source. (See also "-")*
NM	Nautical Miles
NML	Normal
NOF	International NOTAM Office
NOSIG	†No Significant Change (Used in trend -type landing forecasts)
NOTA	*Northern Oceanic Transition Area*
NOTAM	†A notice containing information concerning the establishment, condition or change in any aeronautical facility, service, procedure or hazard, the timely knowledge of which is essential to personnel concerned with flight operations
NPA	Non Precision Approach
NPR	*Noise Preferential Routeing*
NPZ	*Non-standard Planning Zone*
NSC	Nil Significant Cloud
NSF	*Non Standard Flights*
NSGA	*Non-SSR Glider Areas*
NSU	*Nominated Service Unit*
NSW	Nil Significant Weather
NVG	*Night Vision Goggles*
O	
O/R	On Request
OAC	Oceanic Area Control Centre

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS (continued)

OAS	Obstacle Assessment Surface
OAT	*Operational Air Traffic*
OBS	Observe OR Observed OR Observation
OBSC	Obscure OR Obscured OR Obscuring
OBST	Obstacle
OCA	Oceanic Control Area
OCH	Obstacle Clearance Height
OCL	*Oceanic Clearance Link*
OCNL	Occasional OR Occasionally
OCS	Obstacle Clearance Surface
OFZ	Obstacle Free Zone
OHD	Overhead
OIL	*(ENR 5.4) Refinery*
OLDI	On-Line Data Interchange
OM	Outer Marker
OPH	*(ENR 5.4) Offshore Platform with Helipad*

PALS	Precision Approach Lighting System (Specify category)
PAMOS	*Partially Automated MET Observation System*
PANS	Procedures for Air Navigation Services
PAPA	*Parallax Aircraft Parking Aid*
PAPI	†Precision Approach Path Indicator
PAR	‡Precision Approach Radar
PAX	Passenger(s)
PBN	Performance-based Navigation
PCN	Pavement Classification Number
PCR	*Pavement Classification Rating*
PDG	Procedure Design Gradient
PER	Performance
PERM	Permanent
PFP	Preliminary Flight Plan
PFS	*(ENR 5.4) Floating Production Storage Offloading*
PGL	*(ENR 5.4) Gas Lift Platform*
PH	*Public Holiday*
PIB	Pre-flight Information Bulletin
PinS	Point-in-Space
PJE	Parachute Jumping Exercise
PLA	Practice Low Approach
PLN	*Flight Plan*
PLT	*(ENR 5.4) Power Plant; Industrial Structure, General; Tank, Telescoping Gasholder (Gasometer); Metal Processing Plant; Chemical Processing Plant; Tailings/Waste Pipe*
PN	Prior Notice required
PNdB	*Perceived Noise Decibels*
PNR	Point of No Return
POB	Persons On Board
POSS	Possible
POW	*(ENR 5.4) House of Religious Worship with Steeple; House of Religious Worship (Church/ Mosque/Synagogue/Temple)*
PPL	*(ENR 5.4) Offshore Platform with Derrick*
PPP	*(ENR 5.4) Offshore Platform*
PPR	Prior Permission Required
PRI	Primary
PRKG	Parking
PROB	†Probability
PROC	Procedure
PROV	Provisional
PSG	Passing
PSN	Position
PSR	Primary Surveillance Radar
PTN	Procedure Turn
PTS	Polar Track Structure
PWR	Power
PYL	*(ENR 5.4) Aerial Cable/Aerial Tramway or Power Transmission Line; Powerline Pylon, General; Powerline Pylon, Type A*
Q	
QDM	‡Magnetic Heading (zero wind)
QDR	Magnetic Bearing
QFE	‡Atmospheric pressure at aerodrome elevation (OR at runway threshold)
QFU	Magnetic orientation of runway
QNH	‡Altimeter sub-scale setting to obtain elevation when on the ground
QTE	True bearing
R	
...R	Right (preceded by runway designation number to identify a parallel runway)
R...	Radial from VOR (followed by three figures)
R…	Restricted Area (followed by identification)
RA	Resolution Advisory
RA(T)	*Restricted Area (Temporary)*
RAC	Rules of the Air and Air Traffic Services
RAD	*Route Availability Document*
RAF	*Royal Air Force*
RAFAT	*Royal Air Force Aerobatic Team*
RAFCT	*Royal Air Force Combined Training*
RAG	Runway Arresting Gear
RAI	Runway Alignment Indicator
RAS	*Radar Advisory Service*
RASA	*Radar Advisory Service Area*
RASC	Regional AIS System Centre
RB	Rescue boat
RCC	Rescue Co-ordination Centre
RCF	Radio Communication Failure (message type designator)
RCL	Runway Centre Line
RCLL	Runway Centre Line Light(s)
RDH	Reference Datum Height (For ILS)
RDL	Radial
RDO	Radio
REC	Receive OR Receiver
REDL	Runway Edge Light(s)
REF	Reference to … OR Refer to …
REG	Registration
REQ	Request OR Requested
RERTE	Re-route
RESA	Runway End Safety Area
RET	*Rapid Exit Taxiway*
RETIL	*Rapid Exit Taxiway Indicator Lights*
RFFS	Rescue and fire fighting services
RFF	*Fire and Rescue Equipment*
RHAG	*Rotary Hydraulic Arrester Gear*
RHS	*Right hand side*
RIS	*Radar Information Service*

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS (continued)

RL	Report Leaving
RLCE	Request Level Change En-route
RLLC	*Royal Low Level Corridor*
RLLS	Runway Lead-in Lighting System
RLNA	Requested Level Not Available
RMA	*Radar Manoeuvring Area*
RMK	Remark
RMZ	*Radio Mandatory Zone*
RN	*Royal Navy*
RNAV	†(To be pronounced 'AR-NAV') Area Navigation
RNG	Radio Range
RNHF	*Royal Navy Historical Flight*
RNP	‡Required Navigation Performance
ROBEX	†Regional OPMET Bulletin Exchange (Scheme)
ROD	Rate Of Descent
RON	Receiving Only
ROP	*Runway Observation Position*
RPL	Repetitive flight plan
RPLC	Replace OR Replaced
RPS	Radar Position Symbol
RPZ	*Runway Protection Zone*
RQMNTS	Requirements
RQP	Request flight plan (message type designator)
RQS	Request supplementary flight plan (message type designator)
RR	Report Reaching
RRA	(OR RRB, RRC . . . . etc, in sequence) Delayed meteorological message (message type designator)
RSCD	Runway Surface Condition
RSP	Responder beacon
RSR	En-Route Surveillance Radar
RTE	Route
RTF	Radiotelephone
RTG	Radiotelegraph
RTHL	Runway threshold light(s)
RTILS	*Runway Threshold Identification Lights*
RTM	*(ENR 5.4); Communication Tower; Microwave Tower, Type A (Has Reflector/Cone); Radio/ TV Tower Type A; Microwave Tower, Type I (Has Reflector/Cone)*
RTOAA	*Rejected Take-off Area Available*
RTODAH	Rejected Take-off Distance Available, Helicopter
RTR	*Radar Termination Range*
RTS	Return To Service
RTT	Radioteletypewriter
RTZL	Runway Touchdown Zone Light(s)
RV	Rescue Vessel
RVA	Radar Vectoring Area
RVP	*Rendezvous Point*
RVR	‡Runway Visual Range
RVSM	Reduced Vertical Separation Minimum
RWY	Runway
S	
SALS	Simple Approach Lighting System
SAMOS	*Fully automated with computer generated ATIS attached*
SAR	Search and Rescue
SARPS	Standards and Recommended Practices (ICAO)
SARSAT	*Search and Rescue Satellite Aided Tracking System*
SATCOM	†Satellite Communication
SBAS	Satellite Based Augmentation System
ScACC	*Scottish Area Control Centre*
ScATCC	*Scottish Area and Terminal Control Centre*
SDBY	Stand by
SDF	Step Down Fix
SEC	Seconds
SECT	Sector
SEG	*Stand Entry Guidance*
SELCAL	†Selective calling system
SER	Service OR Servicing OR Served
SERA	*Standardised European Rules of the Air (Commission Implementing Regulation (EU) No 923/2012).*
SFC	Surface
SGL	Signal
SHF	Super High Frequency (3000 to 30000 MHz)
SI	International system of units
SI	*Statutory Instruments*
SID	†Standard Instrument Departure
SIGMET	†Information concerning en-route weather phenomena which may affect the safety of aircraft operations
SIGWX	*Significant weather*
SIWL	Single Isolated Wheel Load
SKED	Schedule OR Scheduled
SLP	Speed Limiting Point
SMC	Surface Movement Control
SMR	Surface Movement Radar
SNOCLO	Aerodrome closed due to snow (used in METAR/SPECI)
SNOWTAM	†A special series NOTAM given in a standard format providing a surface condition report notifying the presence or cessation of hazardous conditions due to snow, ice, slush, frost, standing water or water associated with snow, slush, ice or frost on the movement area.
SOC	Start of Climb
SOTA	*Shannon Oceanic Transition Area*
SPECI	†Aviation selected special weather report (In aeronautical meteorological code)
SPECIAL	†Special meteorological report (In abbreviated plain language)
SPL	Supplementary flight plan (message type designator)
SR	Sunrise
SRA	Surveillance Radar Approach
SRD	*Standard Route Document*
SRE	Surveillance Radar Element of precision approach radar system
SRR	Search and Rescue Region
SRY	Secondary
SS	Sunset
SSR	‡Secondary Surveillance Radar
SST	Supersonic transport
STA	Straight in approach
STAR	†Standard instrument arrival
STD	Standard
STOL	Short Take-Off and Landing
STS	Status
STWL	Stopway light(s)
SUA	*Special Use Airspace (includes prohibited areas, restricted areas, danger areas, temporary segregated areas, temporary reserved areas and cross border areas)*
SUAAIS	*Special Use Airspace Activity Information Service*
SUACS	*Special Use Airspace Crossing Service*

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS (continued)

SUBJ	Subject to
SUP	Supplement (AIP Supplement)
SUPPS	Regional supplementary procedures
SVC	Service message
SVCBL	Serviceable
SVFR	*Special Visual Flight Rules*
SWY	Stopway
T	
...T	True (preceded by a bearing to indicate reference to True North)
TA	Transition Altitude
TAA	Terminal Arrival Altitude
TACAN	†UHF Tactical Air Navigation Aid
TAF	†Aerodrome forecast
TAR	Terminal Area Surveillance Radar
TAS	True Airspeed
TC	Tropical Cyclone
TCAS	*Traffic Alert and Collision Avoidance System*
TCAS RA	(to be pronounced "tee-cas-ar-ay") Traffic alert and collision avoidance system resolution advisory

UNREL	Unreliable
UTA	Upper Control Area
UTC	‡Co-ordinated Universal Time
V	
VA	Volcanic Ash
VAC	Visual Approach Chart
VAN	Runway Control Van
VAR	Visual-aural radio range
VASIS	†Visual Approach Slope Indicator System
VCY	Vicinity
VDF	Very High Frequency Direction Finding Station
VFR	‡Visual Flight Rules
VHF	‡Very High Frequency (30 to 300 MHz)
VIP	‡Very Important Person
VIS	Visibility
VLF	Very Low Frequency (3 to 30 KHz)
VLOS	*Visual Line Of Sight*
VLR	Very Long Range
VM(C)	*Visual Manoeuvring (Circling)*
VMC	‡Visual Meteorological Conditions
VOLMET	†Meteorological information for aircraft in flight
VOR	‡Very High Frequency Omnidirectional Radio Range
VORTAC	†VOR and TACAN combination
VPT	Visual manoeuvre with prescribed track
VRB	Variable
VRP	*Visual Reference Point*
VSP	Vertical speed
VSTOL	*Very Short Take-Off and Landing*
VTOL	Vertical Take-Off and Landing
W	
WAAS	Wide Area Augmentation System
WAC	World Aeronautical Chart — ICAO 1:1 000 000
WAFC	World Area Forecast Centre
WASTE	*(ENR 5.4) Disposal, General*
WBAR	Wing bar lights
WDI	Wind Direction Indicator
WEF	With Effect From OR Effective From

GEN 2.2 ABBREVIATIONS USED IN AERONAUTICAL INFORMATION PRODUCTS (continued)

WGS-84	World Geodetic System - 1984
WIE	With Immediate Effect OR Effective Immediately
WILCO	†Will comply
WIP	Work In Progress
WPT	Way-point
WRNG	Warning
WS	Windshear
WT	Weight
WX	Weather
X	
X	Cross
XBAR	Crossbar (of approach lighting system)
XNG	Crossing
Y	
YCZ	Yellow caution zone (runway lighting)
Z	
Z	Co-ordinated Universal Time

Terms which are not defined in ICAO Annexes or PANS but which are used regularly in the UK are defined below:

Glossary

Abbreviation	**Definition**
Aerodrome Approach:	That part of an Instrument Approach Procedure commencing at the designated height over the radio aid to be used and ending when the aircraft has broken cloud.
AIRPROX:	A situation in which, in the opinion of a pilot or a controller, the distance between aircraft as well as their relative positions and speed have been such that the safety of the aircraft involved was or may have been comprised.
ATC Surveillance Minimum Altitude Area:	A defined area in the vicinity of an aerodrome, in which the minimum safe levels allocated by a controller vectoring IFR flights with Primary and/or Secondary Radar equipment have been predetermined.
Cloud Ceiling:	In relation to an aerodrome, the distance measured vertically from the notified elevation of the aerodrome to the lowest part of any cloud visible from the aerodrome which is sufficient to obscure more than one half of the sky so visible.
Competent ATS Authority:	Means in relation to the UK, the Civil Aviation Authority, and in relation to any other country the authority responsible under the law of that country for promoting the safety of civil aviation.
Continuous Descent Approach:	A noise abatement technique for arriving aircraft in which the pilot, when given descent clearance below Transition Altitude by ATC, will descend at the rate he judges will be best suited to the achievement of continuous descent, whilst meeting the ATC speed control requirements, the objective being to join the glidepath at the appropriate height for the distance without recourse to level flight.
Dropping Zone/Drop Zone:	Means the notified portion of airspace within which parachute descents are made.
General Air Traffic (GAT):	Flights conducted in accordance with the Regulations and Procedures for flight promulgated by the State Civil Aviation Authorities and operating under the control or authority of the Civil ATS organisation.
Known Traffic:	Traffic the current flight details and intentions of which are known to the controller concerned through direct communication or co-ordination.
Low Power/Low Drag Approach (LP/LD):	A noise abatement technique for arriving aircraft in which the pilot delays the extension of wing flaps and undercarriage until the final stages of the approach, subject to compliance with ATC speed control requirements and the safe operation of the aircraft.
Night:	The time between half an hour after sunset and half an hour before sunrise, sunset and sunrise being determined at surface level.
Operational Air Traffic (OAT):	Flights conducted under the control or authority of the military ATS organisation.
Parachute Landing Area:	Means the terrain onto which parachute descents are made.
Radar Clear Range:	A range surveyed by radar within which the operating authority accepts responsibility for withholding fire if an aircraft is within the area into which, and through which, missiles are liable to fall.
Radar Departure:	The control of a departing aircraft by the use of surveillance radar to assist it to leave the vicinity of an aerodrome safely and expeditiously.
Radar Handover:	Transfer of responsibility for the control of an aircraft between two controllers using radar, following identification of the aircraft by both controllers.
Radar Surveillance:	Observance of the movements of aircraft on a radar display and the passing of advice and information to identified aircraft and, where appropriate, to other ATS Units.
Radial:	A magnetic bearing extending from a VOR/ VORTAC/TACAN.
Radio Mandatory Zone (RMZ):	A Radio Mandatory Zone (RMZ) is defined as airspace of defined dimensions wherein the carriage and operation of radio equipment is mandatory.
Semicircular Cruising Level:	Specified cruising levels determined in relation to magnetic track within hemispheres of the compass.
Stack Departure Time:	The time at which an aircraft is required to leave the holding facility to commence its approach.
Transition Altitude:	The altitude at or below which the vertical position of an aircraft is controlled by reference to altitudes.
Transition Layer:	The airspace between the transition altitude and the transition level.
Transition Level:	The lowest flight level available for use above the transition altitude.
UK Flight Information Service/Services:	UK Flight Information Service/Services (UK FIS). ICAO defines FIS: As a service provided for the purpose of giving advice and information useful for the safe and efficient conduct of flights. Within the UK, the scope of FIS as defined in ICAO Annex 11 is met through the application of any of the UK FIS. However, additional information and/or advice to airspace users are provided to meet their specific requirements. The suite of services together form the UK FIS as detailed in CAP 774 - UK Flight Information Services.

GEN 2.3 CHART SYMBOLS

AERONAUTICAL CHART SYMBOLOGY

AERODROME - Civil

AERODROME - Civil, limited or no facilities

HELIPORT - Civil

AERODROME - Government, available for Civil use

AERODROME - Government

HELIPORT - Government

MICROLIGHT FLYING SITES

DISUSED or ABANDONED Aerodrome

Aerodrome ELEVATION AMSL 250 250

AERODROME - Training Aerodrome: flight training, including circuit training, takes place from this aerodrome. See UK AIP ENR 1.1 & ENR 5.5

AERODROME - Unusual Activity: Unusual aerial activities including aerobatic and formation flights take place from this aerodrome. See UK AIP ENR 1.1 & ENR 5.5

Aerodrome having one or more IAPs outside Controlled Airspace

AERODROME TRAFFIC ZONE (ATZ)

Customs Aerodromes ..... MANCHESTER 257

AERODROME LIGHT BEACON ..... FIW FIG FIR

GLIDER LAUNCHING SITES

a. Primary activity at locations showing Maximum Altitude of winch launch. AMSL ..... G /2.5

b. Additional activity at locations showing Maximum Altitude of winch launch. AMSL G/2.5

c. Additional activity without cables ..... G

HANG/PARA GLIDING - showing Maximum Altitude of winch launch. AMSL ..... /2.5

FREE-FALL PARACHUTING DROP ZONE

OTHER SPORTING & RECREATIONAL ACTIVITIES ..... K1/3.1 SR
Showing Maximum Altitude AMSL: K = Kite Flying. M = Model Aircraft Flying. R = Rocket Launch Sites. See UK AIP ENR 5.5

RADIO NAVIGATION AIDS

Distance Measuring Equipment (DME)

VHF Omnidirectional Radio Range (VOR)

Collocated, freq-paired VOR/DME

UHF Tactical Air Navigation Aid (TACAN)

Non-Directional Radio Beacon (NDB and NDB(L))

Other Navigational Aids

VOR COMPASS ROSE
Oriented on Magnetic North

Marine Light ..... Fl(3)30·0secs

Lightship ..... FlWR12·0secs

MAXIMUM ELEVATION FIGURES (MEF) 32

MILITARY AERODROME TRAFFIC ZONE (MATZ) ..... 5NM 4 AMSL MATZ LARS 126·500 5NM
Standard MATZ with two stubs and LARS

CONTROLLED AIRSPACE

Annotation of vertical limits for controlled airspace which have an upper limit of FL195 are shown with a plus (+) after their base level altitude, eg 3000'-FL195 is shown as 3000'+. Where the upper limit is below FL195 both base and upper limits are shown. Airspace vertical limits are defined by altitude/flight level unless otherwise noted.
Wide tint banding denotes the extremity of controlled airspace and narrow tint banding denotes level changes within area.

A L10 A FL45+

C CTA C 2500'-FL185

D CTA D 2500'-3500'

E TMA E 2000'-6000'

All airspace not covered by classes A-E ..... G

Controlled Airspace or ATZ with Lower Limit as the surface

Low Level Corridor or Special Route ..... 750'-2500'

Radar Advisory Service Zone or Area

Air Traffic Service Unit (ATSU) Area

Transponder Mandatory Zone (TMZ)

Radio Mandatory Zone (RMZ)

RMZ/TMZ

Reporting Point

Compulsory Reporting Point

Altimeter Setting Region (ASR) Boundary ..... PORTREE ASR / BELFAST ASR

AIAA and ATA areas

Lines of equal magnetic variation ..... 2.5°W

Special Access Lane Entry/Exit (indicates centre of lane) ..... E/E MERSEY LANE

Visual Reference Point (VRP) Location identified by .... VRP SANDBACH

AIRSPACE RESTRICTIONS

Prohibited 'P', Restricted 'R' and Danger Areas 'D' are shown with identification number/effective altitude (in thousands of feet AMSL) or a Flight Level. Areas activated by NOTAM are shown with a broken boundary line

HIGH INTENSITY RADIO TRANSMISSION AREA (HIRTA) .....

BIRD SANCTUARIES

GAS VENTING OPERATIONS GVS/3.1

LASER SITES ..... LASER SITE/UNL

AIR NAVIGATION OBSTACLES

Exceptionally High Obstacle (Lighted) 1000ft or more AGL 1978 (1031)

Single Obstacle (Unlighted) 825 (350)

Multiple Obstacle (Lighted) 1614 (505)

Cable joining Obstacles ..... cables

Wind Turbine (Single Unlighted) 519 (394)

Windfarm (Multiple Lighted) minor group 1726 (328)

Windfarm (Multiple Lighted) major group 1841 (381)

CHANGE (8/25): OTHER SPORTING & RECREATIONAL ACTIVITES ADDED.

AERO INFO DATE 14 MAY 25

GEN 2.3 CHART SYMBOLS (continued)

ADDITIONAL SYMBOLS FOR THE 1:250,000 TOPOGRAPHICAL AIR CHARTS

AERODROMES - Field limits with hard runway pattern... Civil..... Government.....

- Showing disused runways as solid patterns .....

HELIPORT.....

MINOR AERODROME with runway pattern unknown or not portrayable and where flying training may be taking place .....

DISUSED or ABANDONED Aerodrome.
Shown for navigational landmark purposes only .....

Power Transmission Line .....

Power Transmission Line over 200' AGL ..... 200+

Low Level Corridor or Special..... 750'-2500' or

ADDITIONAL SYMBOLS FOR THE 1:50,000 HELICOPTER ROUTES IN THE LONDON CTR & THE LONDON CITY CTR (LONDON HELI CHART)

Annotation of vertical limits for controlled airspace which have an upper limit of FL195 are shown with a plus (+) after their base level/altitude, eg 3000'-FL195 is shown as 3000' +. Where the upper limit is below FL195 both base and upper limits are shown.

D ..... LONDON CTR D SFC-2500' ALT

A ..... LONDON TMA A 2500' ALT +

Cable Car, etc. ..... cables

Power Transmission Line (80'-200' AGL) .....

Power Transmission Line (over 200' AGL) ..... 200+

Hospital Helicopter Landing Site .....

Aerodrome Traffic Zone (ATZ) circle 2.0NM or 2.5NM radius and Local Flying Area within the London CTR .....

Route from BEDFONT to SIPSON & vice versa, as directed by ATC .....

Helicopter Routes .....

Helicopter Routes not available to single-engined Helicopters at night .....

Compulsory & On Request Reporting Point .....

Reporting Points where Holding may be required ..... H H

Route Identifier H3

Maximim Route Altitude between Max Altitude extent markers [ ] ..... VFR 1500 SVFR 1000

Suggested Minimum Route Altitude to achieve required obstacle clearance between consecutive reporting points [△ / ▲] 650

Special Access Lane, Entry/Exit .....

Aerodromes With Instrument Approach Procedures (IAP) Outside Controlled Airspace. Pilots are strongly recommended to contact aerodrome ATSU before flying within 10nm of any aerodrome marked with instrument approach feathers. Note that the feathers only align with the main instrument runway.There may also be approaches to other runways as well.

Runway Extended Centrelines .....

ADDITIONAL SYMBOLS FOR AERODROME AND AIRCRAFT PARKING/DOCKING CHARTS - ICAO

Wind Direction Indicator .....

Illuminated Wind Direction Indicator .....

Aerodrome Reference Point .....

Runway Visual Range .....

Pattern A (CAT I) Holding Position Closest to the Runway .....

Pattern B (CATII/III) Holding Position .....

Intermediate Holding Position .....

Holding Position Signs H1 D2

Helicopter Approach Aiming Point .....

Helicopter Training Area ..... HTA W

Approach Lighting, simple approach - 2 bar (spacing not to scale)

Approach Lighting ..... (spacing not to scale)

Supplementary Lighting (spacing not to scale)

Precision Approach Path Indicator (PAPI).....

GEN 2.3 CHART SYMBOLS (continued)

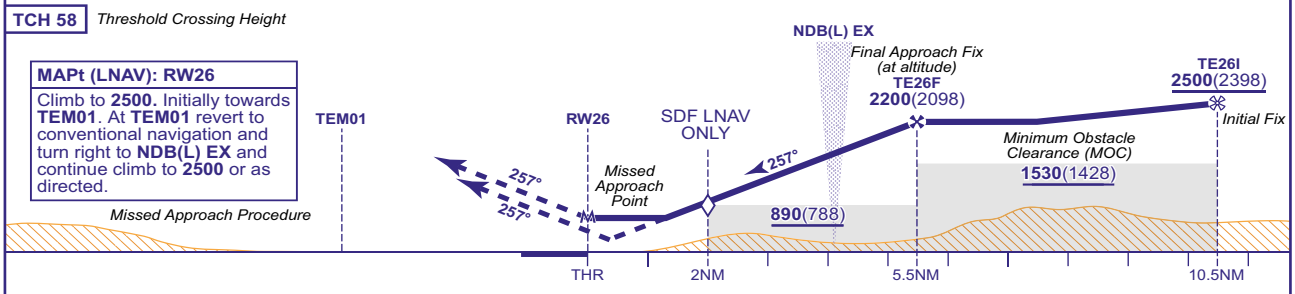
STANDARD INSTRUMENT DEPARTURE (SID) AND ARRIVAL ROUTES (STAR)	
1	SID procedure charts are located in AD 2. They consist of a textual description of the procedure, a graphical illustration and explanatory notes. Only aeronautical information pertinent to the procedure is shown and these charts should therefore be used together with a suitable En-route chart which gives details of Airspace Reservations, Controlled Airspace and ATS routes.
2	SID charts are arranged by Main Exit Points: the various runway directions which can be used to the relevant Main Exit Point will be found on one chart.
3	The procedure charts are drawn to scale. Unless otherwise indicated: a) Distances are in nautical miles; b) Headings, bearings, tracks and radials are in degrees magnetic; c) Heights/altitudes where stated are based on QFE/QNH; d) Horizontal datum WGS 84 (CO-ORDS in DEG MIN SEC).
4	Area Minimum Altitude (AMA). The lowest altitude to be used under instrument meteorological conditions (IMC) that will provide a minimum vertical clearance of 300M (1000FT) or in designated mountainous terrain 600M (2000FT) above all obstacles located in the area specified, rounded up to the nearest (next higher) 30M (100FT).
5	Net Climb Gradient. The climb gradient, expressed as a percentage, that the aircraft is required to achieve to meet standard (ICAO PANS-OPS) obstacle clearance requirements, will be detailed in the textural description of the SID procedure when the required gradient is greater than 3.3% to be achieved. Procedure design gradients are annotated on charts as necessary. A table for conversion of percentage climb gradients to rates of climb for various speeds is given in the GEN 2.6 section.
6	Arrival Charts. STARs or established inbound routes are shown in a similar fashion to SIDs. Tracks terminate at the main inbound holding point from which the Instrument Approach commences.



GEN 2.3 CHART SYMBOLS (continued)

ADDITIONAL SYMBOLS FOR INSTRUMENT PROCEDURE CHARTS

CHANGE (1/25): UPDATE, VARIOUS. PAGE NUMBER.

AERO INFO DATE 07 NOV 24

GEN 2.3 CHART SYMBOLS (continued)

Meteorological Charts-Explanatory Notes

1 Symbols for significant Weather, Tropopause and Freezing Level etc

	Thunderstorm
	Tropical cyclone
	Severe squall line
	Hail
	Moderate turbulence
	Severe turbulence
	Mountain waves
	Moderate aircraft icing
	Severe aircraft icing
	Freezing precipitation
	Drizzle
	Rain

	Snow
	Widespread blowing snow
	Shower
	Severe sand or dust haze
	Widespread sandstorm or duststorm
	Widespread haze
	Widespread mist
	Widespread fog
	Freezing fog
	Widespread smoke
	Volcanic eruption
	Radioactive materials in the atmosphere

Note: Altitudes between which phenomena and any associated cloud are expected are indicated by flight levels, top over base or top followed by base. 'XXX' means the phenomenon is expected to continue above and/or below the vertical coverage of the chart. Phenomena of relatively lesser significance, for example light aircraft icing or drizzle, are not usually shown on charts even when the phenomenon is expected. The thunderstorm symbol implies hail, moderate or severe icing and/or turbulence.

Tropopause spot altitude (eg FL400)

High point or maximum in tropopause topography (eg FL440)

Low point or minimum in tropopause topography (eg FL340)

Freezing level

Boundary of area of significant weather

Boundary of area of clear air turbulance. The CAT area may be marked by a numeral inside a square and a legend describing the numbered CAT area may be entered in the margin

State of sea (wave height in metres)

Sea surface temperature (°C)

2 Fronts and Convergence Zones

	Cold front at the surface
	Warm front at the surface
	Occluded front at the surface
	Quasi-stationary front at the surface

	Convergence line
	Inter-tropical convergence zone
	Position, speed and level of maximum wind
	Widespread strong surface wind

Note: An arrow with associated figures indicates the direction and the speed of the movement of the front (knots). Dots inserted at intervals along the line of a front indicate it is a developing feature (frontogenesis), while bars indicate it is a weakening feature (frontolysis).

CHANGE (2/21): PAGE FORMAT.
AERO INFO DATE 15 DEC 20

GEN 2.3 CHART SYMBOLS (continued)

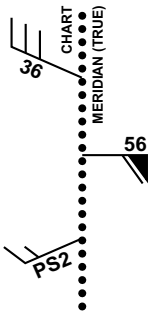
3 Cloud Abbreviations

3.1 Type

CI = Cirrus
CC = Cirrocumulus
CS = Cirrostratus
AC = Altocumulus
AS = Altostratus
NS = Nimbostratus
SC = Stratocumulus
ST = Stratus
CU = Cumulus
CB = Cumulonimbus (its insertion implies hail moderate or severe icing and/or turbulence)

3.2 Amount

Clouds except CB
FEW = few (1/8 or 2/8)
SCT = scattered (3/8 or 4/8)
BKN = broken (5/8 to 7/8)
OVC = overcast (8/8)
CB only
ISOL = individual CB's (isolated)
OCNL = well separated CB's (occasional)
FRQ = CB's with little or no separation (frequent)
EMBD = thunderstorm clouds contained in layers of other clouds (embedded).



4 Example Weather Abbreviations

RA = rain
DZ = drizzle
SN = snow
SH = showers
FZ = freezing
TS = thunderstorms

Other phenomena may be expressed as a combination of abbreviations or written in full. TS implies severe turbulence and icing.

5 Wind Symbols

5.1 Wind/Temperature Chart

Wind 300°(T) 30 KT, temperature -36°C at arrow head

Wind 090°(T) 60 KT, temperature -56°C at arrow head

nd 240°(T) 15 K T, temperature +2°C at arrow head

5.2 Significant Weather/Tropopause/ Maximum Wind Chart

Maximum wind 270°(T), 110 KT at FL380

A double bar marks a speed change of 20 KT, and/or height change of 3000 ft

FL 320
220/400

If the maximum wind speed is 120kt or more, the flight levels between which winds are greater than 80kts is placed below the maximum wind level.
In this example winds are greater than 80kt between FL220 and FL400

CLIMB GRADIENT TABLE

In order to assure obstacle clearance, controlled airspace containment or safe integration of procedures, some Standard Instrument Departure Procedures in the UK require Climb Gradients in excess of 3.3% to be achieved. Procedure design Gradients are annotated as percentage climb gradients where necessary. The Table below provides a conversion to rates of climb for various speeds.

		ground speed (kt)	75	100	150	180	200	210	250
Climb Gradient %	(ft/nm)	rate of climb (ft/min)							
3.9%	237 ft/nm		297	395	593	711	790	830	988
4.0%	243 ft/nm		304	405	608	730	810	851	1013
4.1%	249 ft/nm		311	415	623	748	830	872	1038
4.2%	255 ft/nm		319	426	638	766	851	894	1064
4.3%	261 ft/nm		327	436	654	784	871	915	1090

GEN 2.7 SUNRISE/SUNSET

1 Sunrise/Sunset/Twilight times for UK aerodromes can be obtained from the following internet websites:

a) US Navy Observatory website: https://aa.usno.navy.mil/data/RS_OneYear
b) HM Nautical Almanac Office website: https://hmnao.ukho.gov.uk/

INTENTIONALLY BLANK

GEN 3 SERVICES

GEN 3.1 AERONAUTICAL INFORMATION SERVICES

1 Responsible Service

1.1 The United Kingdom Aeronautical Information Service (UK AIS) is operated by NATS Limited. AIS is one of the services specified under the Air Traffic Services Licence granted to NATS by the Secretary of State and regulated by the UK Civil Aviation Authority. The Isle of Man, the Bailiwick of Jersey and the Bailiwick of Guernsey are Crown Dependencies of the United Kingdom and their AIS is provided as an integral part of the UK AIS system.

1.2 UK AIS is located at:

Post:	Aeronautical Information Service (AIS), NATS Swanwick, Sopwith Way, Southampton, Hants, SO31 7AY
Tel:	See paragraph 1.3
AFS:	EGGNYNYX
URL:	www.nats.aero/ais

1.3 Principal UK AIS sections and service hours are as follows:

NOTAM Office (NOF/INO)	H24	01489-612488 / 01489-612489 /notam.proposals@nats.co.uk
AIS Information Line UK	H24	08085-354802 / 01489-887515
Publications and Charts	Monday to Friday (0800-1600)	aissupervisor@nats.co.uk

2 Area of Responsibility

2.1 **The UK Aeronautical Information Service**

2.1.1 The UK Aeronautical Information Service is responsible for the collection and dissemination of information/data necessary for the safety, regularity and efficiency of air navigation throughout the entire territory and airspace of the UK, UK Crown Dependencies (the Isle of Man and the Bailiwicks of Jersey and Guernsey) and the airspace over the high seas under the jurisdiction of the UK for Air Traffic Control purposes.

2.1.2 In accordance with the requirements of ICAO Annex 15 and of ICAO DOC 10066, PANS AIM Chapter 3, the Aeronautical Information Service Unit has an established Quality Management System, which is certified and registered to International Standards Organisation – ISO 9001: 2015 Standard by DET Norske Veritas (DNV).

2.2 **International AIS Products**

2.2.1 It is strongly recommended that the AIS products published directly by the State(s) are consulted during the planning of international flight operations.

2.2.2 It is recommended that the GEN 1.2 section of the AIP published by the State describing Entry, Transit and Departure of Aircraft is consulted in the first instance.

2.2.3 ENR 1.10 and ENR 1.11 sections of the AIP are normally used to publish all flight planning requirements imposed by the State. The information will include all flight planning requirements for visiting, transiting and internal flight operations.

2.2.4 The link below provides information on AIS/AIM offices around the world. The information is divided into sections, where each state is listed alphabetically. The link provides information about AIS websites including contact email addresses. http://www.eurocontrol.int/articles/ais-online.

2.2.5 European AIS Products can be accessed through the contact details and websites of AIS/AIM providers listed at https://www.eurocontrol.int/articles/ais-online.

2.2.6 The UK AIS holds limited CD/DVD supplied by some international AIS offices that do not make their information available via the internet. Further information regarding the availability of this information is available by emailing aissupervisor@nats.co.uk.

GEN 3.1 AERONAUTICAL INFORMATION SERVICES (continued)

3 Aeronautical Publications

3.1 Aeronautical Information Products

3.1.1 The UK AIS operates in accordance with ICAO Annex 15 requirements and publishes aeronautical information as an integrated package.

3.1.2 Aeronautical information products consist of aeronautical data and information provided either as digital datasets or as a standardised presentation in paper or electronic media. Aeronautical information products include:

a) The Aeronautical Information Publication (AIP), including Amendments and Supplements (see paragraph 3.2, 3.3 and 3.4);
b) Aeronautical Information Circulars (see paragraph 3.5);
c) Aeronautical charts;
d) NOTAM (see paragraph 3.6);
e) Pre-Flight Information Bulletins (PIB) (see paragraph 3.8);
f) Check Lists (see paragraph 3.9); and
g) Digital datasets

3.2 **The United Kingdom Aeronautical Information Publication (AIP)**

3.2.1 The UK AIP is the official document used to publish Notifications required by the UK Air Navigation Order.

3.2.2 In order to register any permanent changes to the AIP, Information providers are required to register their details via the email support.aissupervisor@nats.co.uk. Changes to the contents of the IAIP can only be accepted from approved sponsors, using the online Portal https://www.aurora.nats.co.uk.

Note: *Changes of short term/temporary nature should follow the processes required for submission of NOTAM (see paragraph 3.6).*

3.2.3 **Civil Aviation Legislation**

3.2.3.1 UK legislation makes specific provision in a number of cases for Notification. The term 'notified' is defined as set forth in a document published by the Civil Aviation Authority and entitled 'United Kingdom AIP'. A list of principal civil aviation legislation and air navigation regulations is shown at section GEN 1.6 and references to the legislation under which Notification is made appear, as appropriate, within the UK AIP.

3.2.3.2 Notices relating to the limitation of noise at London Gatwick, London Heathrow and London Stansted aerodromes (Section 78 of the Civil Aviation Act 1982 refers) are required to be published in a format that may not be compatible with the host AIS document. Notices requiring operators of aircraft to ensure that specified requirements for limiting or mitigating the effect of noise and vibration are complied with by aircraft landing or taking off at those designated aerodromes appear in the UK AIP under each of the aerodromes' item AD 2.21. Notices specifying, for those designated aerodromes, a maximum number of take-offs or landings which may be permitted during specific periods and determining the operators who are entitled to land and take off during these periods and the number of occasions on which their aircraft may take off or land during those periods will appear in UK AIP Supplements.

3.3 **UK AIP Amendment Service (AMDT and AIRAC AMDT)**

3.3.1 The UK AIP is freely available on the internet http://www.nats.aero/ais. AIP Amendments may contain both AIRAC and Non-AIRAC changes (paragraphs 3.3.2, 3.3.3 and 4 refer). The electronic version will be updated to a specified AIRAC date and will also present a preview of AIRAC changes.

3.3.2 The ICAO AIRAC system is used to provide advance notice of the introduction of permanent operationally significant changes on an internationally recognised AIRAC effective date. AIRAC Amendment pages are identified by the footnote AIRAC AMDT and do not replace the existing AIP pages until the AIRAC effective date on which the changes take place. (See also paragraph 3.6.1.2).

3.3.3 Non-AIRAC amendments (AMDT) to the AIP comprise permanent operationally significant changes that have received previous notification by NOTAM and other permanent information that is not required to be announced by NOTAM. Non-AIRAC changes to the AIP are published together with AIRAC changes but may be considered to be effective on or before receipt, unless otherwise indicated. AIP pages (AIRAC and Non-AIRAC) should not be replaced before the stated date of the page.

3.3.4 The AIP Amendment cover sheet will indicate any NOTAM or permanent AIP Supplements that have been incorporated. On each replacement page, changes are either annotated or identified in the outer margin of the page by a vertical line or arrow adjacent to the change/addition/deletion.

3.3.5 Each AIP page is dated to reflect the Amendments AIRAC effective date or AIP insertion date and a complete checklist of AIP pages, relating page reference to date, is reissued with each amendment as AIP section GEN 0.4.

3.3.6 Each combined AIP amendment is allocated an AIRAC Cycle serial number that is consecutive and based on the calendar year.

GEN 3.1 AERONAUTICAL INFORMATION SERVICES (continued)

The Cycle, indicated by two digits, is a part of the serial number of the amendment, eg. AIRAC Cycle 01/2020. When necessary to provide additional advance notice of AIRAC changes, the Amendment may be issued in several parts, each relating to a common effective date. These Amendments will be identified by a part number suffix, eg. AIRAC Cycle 01/2020 Part 1.

3.4 **Supplements to the AIP (AIP SUP)**

3.4.1 UK AIP Supplements will normally contain temporary changes of long duration (three months or longer) and information of short duration containing extensive text or graphics which affect one or more parts of the AIP. Information must be of operational significance (e.g. major air exercises or aerodrome work programmes) that preclude 'complete' promulgation by NOTAM. See also paragraph 3.6.1.2.

3.4.2 UK AIP Supplements are freely available on the internet http://www.nats.aero/ais and are normally issued every 28 days.

3.4.3 AIP Supplements are to be retained for as long as all or some of their contents remain valid. The period of validity of the information contained in the AIP Supplement will normally be given in the Supplement itself. Alternatively, NOTAM may be used to indicate changes to the period of validity or to advise of the cancellation of an AIP Supplement.

3.4.4 A checklist of UK AIP SUP currently in force is normally included within each issue of Supplements.

3.5 **Aeronautical Information Circulars (AIC)**

3.5.1 As a general rule, AICs refer to subjects of an administrative rather than of an operational nature. They are, however, also used to publish advance warnings of impending operational changes and to add explanations or emphasis on matters of safety or operational significance. Aeronautical chart issues are also notified through the medium of the AIC.

3.5.2 UK AIC are freely available on the internet http://www.nats.aero/ais and are normally issued every 28 days.

3.5.3 AIC serial number are Series, Serial number and year; eg AIC W 076/2020. AIC are colour coded according to their subject matter as follows:

- White - Administrative matters (e.g. licence examination dates, services and publications).
- Yellow - Operational matters (including ATS facilities and requirements).
- Pink - Safety related matters.
- Mauve - UK Airspace Restrictions imposed under the Restriction of Flying Regulations.
- Green - Maps and Charts.

3.6 **NOTAM**

3.6.1 **General**

3.6.1.1 All operationally significant information not covered by AIP Amendment or AIP Supplement will be issued as a NOTAM (via the Aeronautical Fixed Telecommunication Network - AFTN).

3.6.1.2 All operationally significant information issued as AIRAC UK AIP Amendments or UK AIP Supplements will be additionally announced by NOTAM. The NOTAM will give an abbreviated description of the change, condition or activity together with the effective date(s) and the Amendment or Supplement reference number. These 'trigger' NOTAM ensure that brief entries appear in the appropriate Pre-flight Information Bulletins (PIB).

3.6.1.3 Trigger NOTAM used for Permanent changes in the AIP will remain valid for a maximum of 14 days after the effective date of change.

Trigger NOTAM used for an AIP Supplement (SUP) will remain valid for a maximum of 14 days after the effective period. If the information published in the SUP exceeds 14 days then the period the SUP is in force shall be indicated in NOTAM field E.

3.6.2 **NOTAM Proposals**

3.6.2.1 NOTAM Proposals shall be submitted by AFS to EUECYIYP. In the event of an outage to your AFS connection, email submissions will be accepted to notam.proposals@nats.co.uk using the online form.

3.6.2.2 NOTAM Proposals shall be submitted whenever possible, at least 24 HR in advance, to permit timely completion of the notification process and to facilitate airspace utilisation planning.

3.6.3 NOTAM Construction

3.6.3.1 To assist the automated processing of data, ICAO format NOTAM are issued with a 'qualifier line' (identified by the letter 'Q') which is composed by the issuing NOTAM Office (NOF).

3.6.3.2 Three NOTAM types are issued and are identified as follows:

- NOTAM **N** - New information/proposal;
- NOTAM **R** - Replaces a previous NOTAM;

GEN 3.1 AERONAUTICAL INFORMATION SERVICES (continued)

- NOTAM **C** - Cancels a previous NOTAM.

3.6.3.3 For AIS to receive the proposal, the first line of the message must be constructed according to a specific format indicating the type (T) and NOTAM identifier. NOTAM<T> PROPOSAL EGGN <Series>. Content of Series is optional. (See Table below for details of the subject matter of each individual NOTAM Series).

If the first line is incorrect, an automatic rejection will be issued, sent to the AFTN address of the sender, stating the non-compliance, together with instructions of the correct format for re-submission.

The textual content below the first line can take any form, see the examples below:

NOTAMN PROPOSAL EGGN

FROM 0800 ON 23 JAN TIL 2300 ON 24 JAN

E)OBSTACLE ERECTED AT 600FT AMSL, 500FT AGL IN THE MIDDLE OF NOWHERE)

NOTAMN PROPOSAL EGGN A

Q)EGTT/QOBCE/IV/M/E/000/005/XXXXNXXXXXE001

A)EGGN B) 2412121212 C)2412232323

E)THIS OBSTACLE IS IN THE MIDDLE OF NOWHERE)

NOTAMR PROPOSAL EGGN A0123/08

A)EGGN B) 0812121212 C)0812232323

E)CHANGE THE HEIGHT OF THIS OBSTACLE IN THE MIDDLE OF NOWHERE TO 900FT AMSL, 800FT AGL)

NOTAMC PROPOSAL EGGN A0125/08

E)THIS OBSTACLE HAS BEEN REMOVED FROM THE MIDDLE OF NOWHERE)

3.6.3.4

Table – UK NOTAM Series

Series	Content
A	Licensed Aerodromes within the London FIR: Cambridge, Cardiff, Liverpool, London Gatwick, London Heathrow, London Luton, London Stansted, Manchester, Norwich, and Southend.
B	En-route Airspace London FIR/UIR & Scottish FIR/UIR and the Channel Islands Airspace: Regulations & Procedures, En-route Navigation Aids described in ENR 4.1 (Inc. facilities used as Approach Aids), ATS and Air/Ground Communications.
C	Licensed Aerodromes within the London FIR and Channel Islands Aerodromes: Alderney, Biggin Hill, Birmingham, Blackpool, Bournemouth, Bristol, East Midlands, Exeter, Farnborough, Guernsey, Humberside, Isle of Man, Jersey, Leeds Bradford, London City, Lydd, Newquay, Shoreham, Southampton and Teesside International.
D	Special Use Airspace within ENR 5.1 and ENR 5.2 not described in Series G or M.
E	Unlicensed Aerodromes within the London FIR and Scottish FIR for the notification of safety related subjects relating to facilities and services.
G	En-route Airspace Shanwick Oceanic FIR: Regulations & Procedures, ATS, Air/Ground Communications, Special Use Airspace within ENR 5.1 and ENR 5.2, and Navigation Warnings and Temporary Danger Areas (TDA).
H	Navigation Warnings (except those catered for in Series G).
I	Licensed Aerodromes within the Scottish FIR.
J	Temporary Danger Areas (TDA), Restricted Areas (Temporary) in the London FIR/UIR & Scottish FIR/UIR.
L	Licensed Aerodromes within the London FIR, not covered in Series A or C.
M	AMC Managed Special Use Airspace within ENR 5.1 and ENR 5.2 including relevant Military Exercises in the London FIR/UIR & Scottish FIR/UIR.
N	En-route Obstacles and lights above 100 M (328 FT) AGL and En-route Obstacles and lights below 100 M (328 FT) AGL within the UK Military Low Flying System.
U	UK Military Aerodrome, UK Sovereign Bases and Overseas Territories: Gibraltar, Mount Pleasant, Port Stanley and British Antarctica Airstrips Rothera, Halley and Sky Blu, and Turks and Caicos Islands.
V	Notification of Security Advice to UK Air Operators by Government to provide guidance/instructions on Airspace Security Risks. Volcanic Ash related information within En-Route Airspace London FIR/UIR, Scottish FIR/UIR, Shannon FIR/UIR and Shanwick Oceanic FIR.
X	Contingency: Series applied in event of unplanned, long-term outage of normal NOTAM production system. Only time critical NOTAM shall be issued during period of outage. Distribution as per all of the above Series.

3.6.3.5 Each NOTAM series resets at the beginning of each calendar year (begins with 0001 on January 1 at 0000 UTC). NOTAM are

issued in ascending and continuous sequence in every series.

3.6.3.6 ICAO NOTAM format and conditions require that:

a) Each NOTAM deals only with one subject and one condition concerning that subject;
b) NOTAM text is both precise and concise, using plain language and commonly used ICAO Doc 8400 NOTAM abbreviations;
c) An activity or condition applying 'with immediate effect' (WIE) is indicated by a ten figure group (Year/Month/Day/Time) UTC reflecting the actual date/time of NOTAM issue;
d) All temporary NOTAM must include an expiry date/time. The term 'until further notice' (UFN) shall not be used. If estimated, then a ten figure group will be suffixed by 'EST' (eg 0104032100 EST). **NOTAM Sponsors are required to monitor their estimates,** and to advise the UK NOTAM Office of any change or cancellation. NOTAM with an estimated expiry date/time, remain in force until cancelled by a NOTAMC or replaced by a NOTAMR;
e) If information is permanent then the abbreviation 'PERM' will appear in the NOTAM.

3.6.3.7 More information about UK NOTAM can be found in the NOTAM Guidance Material part of the AIS website (www.nats.aero/ais).

3.7 **SNOWTAM**

3.7.1 SNOWTAM messages shall be submitted by the Aerodrome Operator or ATS Unit, using a strict format for automatic processing through the UK NOTAM OFFICE via AFTN using the address EUECYIYP.

3.7.2 The SNOWTAM serial number resets at the beginning of each calendar year (begins with SNOWTAM 0001 on January 1 at 0000 UTC).

3.7.3 More information about reporting of aerodrome surface conditions is provided in AD 1.2 paragraph 2 Runway surface condition assessment and reporting / snow plan.

3.8 **Pre-flight Information Bulletins (PIB)**

3.8.1 NOTAM are freely available on the Internet http://www.nats.aero/ais in the form of Pre-flight Information Bulletins (PIB). Users are required to register onto the web site in order to obtain a briefing. The UK AIS web site offers several methods by which users can obtain a PIB. Both UK and International NOTAM are available whereby the user inputs selectable parameters in order to obtain Narrow Route/Route/Aerodrome and Area briefings.

3.9 **Checklists and lists of valid NOTAM**

3.9.1 Checklists are issued as a NOTAM in the series that they refer to on the 1st of every month. Separate Checklists are issued for each NOTAM Series.

3.9.2 NOTAM checklists also contain the list of valid AIP Supplements and AIC.

3.9.3 NOTAM are also automatically transmitted by AFTN to the list of recipients who requested to be on distribution lists. Requests to amend the AFTN distribution lists used for NOTAM shall be directed to the UK AIS NOTAM Office using email address: notam.proposals@nats.co.uk.

3.10 **AIS Information Line**

3.10.1 The AIS information line is a voice recorded message system, designed to supplement the information available from the AIS website. It is not intended to replace the need to obtain a full briefing.

The message provides information on restricted areas (used to notify Red Arrows activities), airspace upgrades (to notify Royal flights operated in fixed wing aircraft) and emergency restrictions of flying (to prohibit flight in the vicinity of an accident or incident).

Phone: 08085-354802, International +44 (0)1489-887515

The information is recorded by the AIS staff at 1900L for next day's Airspace Upgrade and/or Restriction of Flying. The current day's information is updated during the day should any change or addition be required.

4 AIRAC System

4.1 AIRAC AIP Amendments are originated and distributed by AIS with the objective of reaching chart producers and data handlers at least 28 days in advance of the effective date. Information Providers should note that strict adherence to both the AIRAC publication and effective dates is essential if the information is to be incorporated in flight-deck documentation and flight management systems by the effective date of the selected AIRAC Cycle.

4.2 The information listed below is required by ICAO to be published and brought into effect in accordance with the AIRAC System.

a) The establishment and withdrawal of, and predetermined significant changes (including operational trials) to:

Horizontal and vertical limits, regulations and procedures applicable to FIR/UIR, CTA, CTR, Advisory Areas and ATS Routes; Permanent danger, prohibited and restricted areas (including type and periods of activity when known) and ADIZ, Permanent areas or routes or portions thereof where the possibility of interception exists;

b) Positions, frequencies, callsigns, known irregularities and maintenance periods of radio navigational aids and communications facilities;
c) Holding and approach to land procedures, arrival and departure procedures, noise abatement procedures and any other pertinent ATS procedures;
d) Meteorological facilities (including broadcasts) and procedures;
e) Runways and stopways.

4.3 In addition, the establishment and withdrawal of, and predetermined significant changes to the information listed below may be published and brought into effect in accordance with the AIRAC System:

a) Position, height and lighting of navigational obstacles;
b) Taxiways and aprons;
c) Hours of service: Aerodromes, facilities and services;
d) Customs, immigration and health services;
e) Temporary danger, prohibited and restricted areas and navigational hazards, military exercises and mass movements of aircraft;
f) Temporary areas or routes or portions thereof where the possibility of interception exists.

4.4 When operationally necessary, the ICAO AIRAC System permits major changes to be promulgated two Cycles (56 days) in advance. Similarly, additional notice is required if the introduction of an intended change cannot be planned to take place on an AIRAC effective date. Publication would then be required no later than the AIRAC Cycle within which the actual effective date falls.

4.5 Information Providers should consult the UK AIS Publications Section (see paragraph 1.3) for guidance and details of the promulgation schedules.

4.6 Schedule of AIRAC effective dates available at:

https://www2023.icao.int/airnavigation/information-management/Pages/AIRAC.aspx

5 Pre-Flight Information Service at Aerodromes/Heliports

5.1 UK AIS is operated from a single central location from which information is made available via multi-media output.

5.2 Aerodrome operators are responsible for providing briefing facilities, including UK AIP, AIP SUPs, AICs, NOTAM and/or selected Pre-flight Information Bulletins (PIB), is normally held and made available for reference and self briefing.

6 Digital Datasets

6.1 Digital datasets are hosted on the AIS website (http://www.nats.aero/ais/datasets).

6.2 Digital datasets are categorised as:

- **Regular Datasets**
  - Content produced and maintained by AIS in accordance with the UK Dataset Specification (SPC_AIM006_04);
  - Updated every AIRAC.
- **Irregular Datasets**
  - Content produced and maintained by AIS in accordance with the UK Dataset Specification (SPC_AIM006_04);
  - Updated only when the content has changed.
- **Non-Standard Datasets**
  - Content produced and maintained by dataset sponsor(s);
  - Updated only on receipt of a new file;
  - All queries are to be directed directly to the dataset sponsor(s).

6.3 All digital datasets will be released on published AIRAC effective dates and may contain both AIRAC and non-AIRAC change information.

6.4 Where datasets are provided in the AIXM 5.1 XML format, content is coded as closely as possible to the guidelines provided by Eurocontrol AIXM Confluence (https://eurocontrol.int), NATS reserve the right to model aeronautical information (AI) appropriately for AI product production and the right to adopt newer versions of AIXM with prior notification.

Certain datasets are provided in a secondary format as Keyhole Markup Language (KML), which is only recommended to be used for visual validation.

6.5 The following datasets will be provided with a minimum of 28 days notification prior to their effective date:

- UK UAS Flight Restrictions Dataset;
- UK ICAO AIP Dataset;
- Standard Route Document (SRD);
- UK Visual Reference Points (VRP) Dataset;
- London Area Control (LAC) and Prestwick Control (PC) Sector Dataset.

All other datasets will be processed on receipt and updated on the next effective AIRAC date.

GEN 3.1 AERONAUTICAL INFORMATION SERVICES (continued)

6.6 The AIXM datasets have extensive metadata in accordance with the Eurocontrol guidelines, and users are advised to process and present this metadata to end users. The metadata describes usage limitation, remarks and contact details applicable to the dataset.

6.7 The datasets are for Aviation Use Only.

6.8 ADQ non-compliances as reported in GEN 1.7 of the UK AIP applies to the datasets and should be referred to.

6.9 The following UK digital datasets are made available on the AIS website. A dataset checklist listing all datasets, and their effective date is available on the AIS website and should be referred to.

Dataset Title	General Description	Data Subjects Included (general)	Geographical Scope[1]	Usage Limitations/Remarks/Contact Details
UK ICAO AIP Dataset	Aeronautical information of lasting character representing the AIP content.	Aerodrome/heliport, Airspace, Final approach and take-off area, Radio navigation aid, Route, Route segment, Runway, Runway direction, Special activity airspace, Touch down and lift-off area (TLOF), Waypoint - en route.	Area 1	For Aviation Use Only, plus see dataset metadata and product specification. Contact: AIS.
UK ICAO Obstacle Dataset Area 1	Obstacles affecting air navigation (100 M AGL and above).	Vertical Structures Obstacle area	Area 1	For Aviation Use Only, plus see dataset metadata and product specification. Remarks: Replaces ENR 5.4 table. Contact: AIS.
UK ICAO Terrain Dataset Area 1	Area 1 Terrain.	Terrain	Area 1	See: https://www.ordnancesurvey.co.uk/products/os-terrain-50
UK ICAO Instrument Flight Procedures (IFP) Dataset	UK Licensed Aerodromes RNAV Instrument Flight Procedures.	RNAV Instrument Flight Procedures	Area 1	For Aviation Use Only, plus see dataset metadata and product specification. Remarks: For Evaluation Only. Contact: AIS.
UK UAS Flight Restrictions Dataset	Airspace restrictions applicable to UAS.	Airspace	Area 1	For Aviation Use Only, plus see dataset metadata and product specification. Contact: AIS.
UK Visual Reference Points (VRP) Dataset	Visual Reference Points.	Designated Points	Area 1	For Aviation Use Only, plus see dataset metadata and product specification. Contact: AIS.
London Area Control (LAC) and Prestwick Control (PC) Sector Dataset	Sector volumes reflecting operational sectorisation for London Area and Prestwick ATC centres.	Airspace	Area 1	For Aviation Use Only, plus see dataset metadata and product specification. Contact: AIS.
Aerodrome Obstacle Datasets[2]	Obstacles affecting air navigation at aerodromes.	Vertical Structures Obstacle area	Obstacle areas 2, 3, 4 as appropriate for the specified aerodrome	For Aviation Use Only, plus see dataset metadata and product specification. Contact: AIS.
Aerodrome Terrain Datasets[3]	Terrain affecting air navigation at aerodromes.	Terrain	Terrain areas 2, 3, 4 as appropriate for the specified aerodrome	For Aviation Use Only. Contact: Individual Aerodrome.
Standard Route Document (SRD)	A list of preferred IFR routes between airports in the UK and Ireland.	Routes, Route segments	Area 1	For Aviation Use Only Contact: Dataset Sponsor.

GEN 3.1 AERONAUTICAL INFORMATION SERVICES (continued)

Dataset Title	General Description	Data Subjects Included (general)	Geographical Scope[1]	Usage Limitations/Remarks/Contact Details
Secondary Surveillance Radar (SSR) Code List	SSR code List.	Secondary Surveillance Radar (SSR) Codes	Area 1	For Aviation Use Only. Contact: Dataset Sponsor.

[1]Area 1 is defined as the entire territory and airspace of the UK and UK Crown Dependencies (the Isle of Man and the Bailiwicks of Jersey and Guernsey).

[2]Aerodrome Obstacle Datasets will be provided following the submission of the aerodromes next survey to AIS. At the same time the Aerodromes AD 2.10 section will be removed.

[3]Aerodrome Terrain Datasets are not provisioned by AIS. Availability and contact information is provided the AIS website.

GEN 3.2 AERONAUTICAL CHARTS

1 Responsible Service

1.1 General

1.1.1 Aeronautical Charts are produced and published by NATS on behalf of the UK Civil Aviation Authority. NATS publish a range of aeronautical charts for use by all types of civil aviation.

Post: Aeronautical Chart Section, Aeronautical Information Service (AIS), NATS Swanwick, Sopwith Way, Southampton, Hants, SO31 7AY.
Email: aissupervisor@nats.co.uk

1.2 Applicable ICAO Documents

1.2.1 The Standards, Recommended Practices and, when applicable, the procedures contained in the following ICAO documents are applied:

Annex 4	Aeronautical Charts;
Doc 8168-OPS/611	Aircraft Operations (Holding patterns, OCH and Instrument Approach Procedures diagrams);
Doc 8697 AN/889	Aeronautical Chart Manual.

1.2.2 Differences from ICAO Standards Recommended Practices and Procedures are given at GEN 1.7.

1.3 ICAO IAP Charts

1.3.1 Instrument Approach Charts (IAC) are produced and published by NATS/AIM in the UK AIP.

1.3.2 An Approved Procedure Design Organisation (APDO) will be contracted by the relevant sponsor to design the Instrument Flight Procedures (IFPs). The responsibility for the notification of IFPs (including IAC, for civil aerodromes) in the UK lies with the sponsor: the Aerodrome Licence Holder or ANSP.

1.3.3 Users are invited to forward comments or questions on all policy matters relating to the regulation and design of IFPs to:

Post: Airspace Regulation, CAA, 1 NE Aviation House, Beehive Ring Road, Crawley, West Sussex, RH6 0YR
Email: airspace@caa.co.uk

2 Maintenance of Charts

2.1 Chart Amendment and Revision

2.1.1 New editions of charts are published as often as resources permit with priority being given to those charts affected by major changes to aeronautical information. However, due to high production costs some charts - particularly those listed at GEN 3.2 paragraphs 5.1 and 5.2 have an edition life of at least 1 year. The publication of each new edition will replace the previous edition, which will then become obsolete. Details will be notified by AIP Amendment as appropriate. The aeronautical information validity date will be specified on each edition and topographical and hydrographical information will have been revised where necessary.

2.1.2 Before using any chart operationally, users must determine what aeronautical changes have taken place since its validity date and amend the chart accordingly. This will require users to consult all UK AIP amendments issued since the charts validity date. If in doubt, they should consult AIS Central Office. A list of amendments for the VFR chart series is available on the AIS web site: www.nats.aero/ais.

2.1.3 Amendments to the Aerodrome Obstacle Charts - ICAO - Type A and to the Chart of United Kingdom Airspace Restrictions and Hazardous Areas may be published as or when necessary, but the Chart of UK Areas of Intense Air Activity, Aerial Tactics Areas and Military Low Flying System is amended by annual re-issue.

3 Purchase Arrangements

3.1 The VFR charts listed at GEN 3.2 paragraphs 5.1, 5.2, 5.3, 5.4, 5.5 and 5.6, may be obtained through NATS R&M (Renewables and Mitigations) and other NATS Ltd Chart Stockists listed at www.nats.aero/ais.

Post: NATS R&M (Renewables and Mitigations)
Phone: +44 (0) 1489-444321
Email: renewablesandmitigations@nats.co.uk

3.2 A selection of Royal Air Force aeronautical charts and planning documents are available from:

Post: Operations Centre, No1 AIDU
Phone: +44 (0) 20 8833 8587
Email: UKStratCom-DI-NCGI-AIDU-OPSCentre@mod.gov.uk

GEN 3.2 AERONAUTICAL CHARTS (continued)

A catalogue and price list are available on request.

3.3 A series of LORAN C Charts are published by the Hydrographic Department of the Admiralty for all areas where coverage exists (with the exception of the Mediterranean), and can be obtained from Admiralty Chart Agents.

4 Aeronautical Chart Series Available

4.1 Specifications

4.1.1 Internationally agreed standards for aeronautical charts are set down by the International Civil Aviation Organisation in Annex 4 to the convention on International Civil Aviation. In general, the charts listed below conform to these standards where they apply.

4.1.2 Co-ordinate Datum Reference = WGS 84.

4.2 General Description of CAA Aeronautical Charts

4.2.1 **Aeronautical Charts ICAO Scale 1:500,000 - United Kingdom**

4.2.1.1 This series, covering the United Kingdom, is constructed on a Lambert conformal conic projection and conforms with ICAO specifications for Topography, Culture and Aeronautical Information. A Chart List is at GEN 3.2 paragraph 5.1 with an Index at GEN 3.2 paragraph 6.

4.2.2 **Topographical Air Charts of the United Kingdom - Scale 1:250,000**

4.2.2.1 This series is constructed on a Transverse Mercator projection. The Aeronautical Information generally conforms with the series at paragraph 4.2.1, though runway patterns of both active and disused aerodromes are shown where reliable information is available. The vertical limit of the series is 5000 FT ALT. To assist users, airspace with a base of FL 55 is shown, EXCEPT where a minimum ALT in excess of 5000 FT applies. If the QNH is below 1013 hPa Controlled Airspace not shown on the charts may be below 5000 FT ALT and reference must be made to Aeronautical Chart ICAO 1:500,000 to ensure adequate vertical separation. A chart list is at GEN 3.2 paragraph 5.2 with an index at GEN 3.2 paragraph 7. Under normal conditions the revision cycle for sheets 6 and 8 is annual, while the remaining sheets will be bi-annual.

4.2.3 **Procedural and Aerodrome Charts**

a) **Instrument Approach and Aerodrome Charts - ICAO**

i. Refer to GEN 3.2 paragraph 1.3 for information on departmental responsibilities within the CAA for Instrument Approach Charts - ICAO.
ii. These charts are available for all aerodromes where Instrument Approach Procedures have been established and approved by the CAA. They conform to ICAO specifications, and appear in AD 2.
iii. Separate charts for initial arrival procedures, instrument approach procedures, aerodrome charts and, where necessary, parking/docking charts, are now available for all aerodromes used by international commercial air transport listed in Sections AD 2 and AD 3 of the UK AIP. See GEN 3.2 paragraph 3.2.

b) **Aerodrome Obstacle Charts - ICAO Type 'A'.** These charts are available for most aerodromes designated for use by scheduled international air services. Where a Type 'A' Chart is not published, operators are advised to refer to the appropriate 1:50,000 Ordnance Survey Maps.
c) **Precision Approach Terrain Charts - ICAO.** These charts are designed to provide detailed terrain profile information within a defined portion of the final approach so as to enable aircraft operating agencies to assess the effect of the terrain on decision height determination by the use of radio altimeters. They are published for aerodromes with precision approach runways Categories II and III.
d) **Standard Instrument Departure, Standard Instrument Arrival, Standard Terminal Arrival Route and Noise Abatement Charts.** These charts show designated Departure and Arrival routes for all aerodromes where such procedures are established, and are suitable for operational use. They conform to ICAO specifications. See GEN 3.2 paragraph 3.2.

4.2.4 **Miscellaneous Charts**

a) **UK Airspace Restrictions and Hazardous Areas - 1:1,000,000:** This chart shows all UK airspace restrictions including danger areas and other areas where a potential hazard to air navigation may exist. This chart is available online from the NATS/AIS website at www.nats.aero/ais.
b) **UK Areas of Intense Air Activity, Aerial Tactics Areas and Military Low Flying System - 1:1,000,000:** This chart portrays areas of intense military air activity and elements of the military low flying system within the Scottish FIR and London FIR. This chart is available online from the NATS/AIS website at www.nats.aero/ais.
c) **Helicopter Routes in the London Control Zone - Scale 1:50,000:** This chart is based on a modified version of the 1:50,000 Ordnance Survey Landranger series, and shows the London Control Zone, Helicopter Routes, the Specified Area, aerodromes, heliports and reporting points within the Zone.
d) **UK ATS Airspace Classifications - 1:1,000,000:** This chart depicts UK airspace in accordance with ATS airspace classification criteria. This chart is available online from the NATS/AIS website at www.nats.aero/ais.
e) **Miscellaneous AIP Charts:** The UK AIP charts are available to the public.

GEN 3.2 AERONAUTICAL CHARTS (continued)

4.2.5 Refer to GEN 3.2 paragraph 5 for lists of available charts.

4.3 Symbol Sheet

4.3.1 The aeronautical symbols used on charts are shown at GEN 2.3. They correspond with the internationally agreed symbols contained in ICAO Annex 4, except that some additional symbols are included where appropriate ICAO equivalents do not exist.

5 List of Aeronautical Charts Available

5.1 Aeronautical Charts, ICAO, United Kingdom (Scale 1:500,000) (see Index at GEN 3.2 paragraph 6)

For latest editions and next planned additions see www.nats.aero/ais/vfr_schedule for details.

Sheet Ref	Chart Title
2150ABCD	Scotland
2171AB	Northern England and Northern Ireland
2171CD	Southern England and Wales

5.2 Topographical Air Charts of the United Kingdom (Scale 1:250,000) (see Index at GEN 3.2 paragraph 7)

For latest editions and next planned additions see www.nats.aero/ais/vfr_schedule for details.

Sheet Ref	Chart Title
1	Northern Scotland West
2	Northern Scotland East
3	Northern Ireland
4	The Borders
5	Central England and Wales
6	England East
7	The West and South Wales
8	England South

Note: *All the above Charts (listed in para 5.1 and 5.2) are available as laminated sheets.(Postage and Packing are extra).*

5.2.1 For comments/feedback on these charts:

Post: Aeronautical Chart Section, Aeronautical Information Service (AIS), NATS Swanwick, Sopwith Way, Southampton, Hants, SO31 7AY.
Email: vfrcharts@nats.co.uk

5.3 Instrument Approach and Aerodrome Charts - ICAO, SID/STAR Charts, and Noise Abatement Charts

Refer to paragraph 5.6, and to Sections AD 2 and AD 3.

5.4 Aerodrome Obstacle Charts - ICAO TYPE A - Operating Limitations

a) For latest editions and downloadable copies see www.nats.aero/ais/type_a for details.

GEN 3.3 AIR TRAFFIC SERVICES

1 Responsible Service

1.1 Responsibility for the overall administration of the Air Traffic Services in the United Kingdom is vested in the Chief Executive of the National Air Traffic Services Ltd (NATS Ltd) acting under the powers of the Secretaries of State for Transport and for Defence.

Post: Chief Executive NATS Ltd, Corporate and Technical Centre, 4000 Parkway, Whiteley, Fareham, Hants. PO15 7FL.
Phone: 01489-616001

1.2 **Applicable ICAO Documents**

1.2.1 The Standards, Recommended Practices and, when applicable, the procedures contained in the following ICAO documents are applied:

- Annex 2 - Rules of the Air;
- Annex 11 - Air Traffic Services;
- Doc 4444 - Procedures for Air Navigation Services - Air Traffic Management;
- Doc 7030 - Regional Supplementary Procedures;
- Doc 7754 - Air Navigation Plan - European Region;
- Doc 8755 - Air Navigation Plan - North Atlantic.

1.2.2 Differences from ICAO Standards Recommended Practices and Procedures are given at GEN 1.7.

2 Area of Responsibility

2.1 **National Responsibilities**

2.1.1 Air Traffic Services, notified in the AIP, are provided for the Airspace above the UK and surrounding seas within the London and Scottish FIRs/UIRs. By arrangement with the appropriate State authorities, this responsibility has, in some areas, been delegated to the UK. In other areas, responsibility has been delegated to the appropriate State authority.

a) Under the terms of a bi-lateral contract between the European Organisation for the safety of Air Navigation (Eurocontrol) and the UK Government, Air Traffic Services above FL 245 are provided by the London and Scottish ACCs throughout the Scottish FIR/UIR and the London FIR/UIR, and certain portions of Airspace over the Republic of Ireland and its territorial waters, but excluding a portion of the London UIR in the southwest and portions of routes over the North Sea, where arrangements for delegation of control have been made with the appropriate authorities.
b) By agreement with the North Atlantic Provider States, Air Traffic Services are provided by Scottish ACC for the Airspace over the high seas encompassed by the boundaries of the Shanwick Oceanic Control Area, except for a portion of the Shannon Oceanic Transition Area, where arrangements for delegation of control have been made with the Irish authorities.
c) The United Kingdom, Denmark and Norway have agreed, to transfer responsibility for providing Air Traffic Services to all aircraft at and below FL 85 in those areas of their FIRs between the FIR boundary and the Median Line (the demarcation line of National areas for sea bed natural resource exploration and exploitation), to the nation exploiting the natural resources of the area. The areas are shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraphs 1.1.1 to 1.1.3.
d) The United Kingdom and Iceland have agreed to transfer responsibility to the UK for providing Air Traffic Services to all aircraft at and below FL 85 within a defined area of the Reykjavik FIR/OCA during the hours of operation of Sumburgh ATSU as listed at ENR 1.6, paragraph 4.5.2.2. The area is shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraph 1.1.4.
e) The United Kingdom and Iceland have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft from the surface to FL 660 to Iceland. These areas are shown at ENR 2.2 paragraph 1.10.1 and 1.10.2.
f) The United Kingdom and the Netherlands have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft at FL 55 and below (FL 45 and below, beneath EGD323D and EGD323E) in those areas of the London and Scottish FIRs between the FIR boundaries and the Median Line (the demarcation line of National areas for sea bed natural resource exploration and exploitation), to the Netherlands. The area is shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraph 1.2.1.
g) The United Kingdom and Denmark have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft between FL 195 and FL 660 (inclusive) in parts of the London and Scottish FIRs/UIRs to Denmark. The area is shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraph 1.3.1.
h) The United Kingdom and the Netherlands have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft between FL 175 and FL 245 (inclusive) in parts of the London FIR to the Netherlands. The areas are shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraph 1.4.1.
i) The United Kingdom and the Netherlands have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft between FL 215 and FL 660 (inclusive) and between FL 55 and FL 660 (inclusive) in parts of the Amsterdam FIR to the United Kingdom. The areas are shown at ENR 2.2 paragraphs 1.5.1 and 1.5.2, 1.6.1 and 1.6.2.
j) The United Kingdom, France and the Irish Republic have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft between FL 245 and FL 660 (inclusive) in parts of the London UIR to France and the Irish Republic. The areas are shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraphs 1.7.1 and 1.7.2.

k) The United Kingdom and the Irish Republic have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all GAT in a part of the London FIR to the Irish Republic. These areas are shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraphs 1.8.1 and 1.8.4.

l) The United Kingdom and the Irish Republic have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all GAT in a part of the Shannon UIR to the United Kingdom. These areas are shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraph 1.9.1.

m) The United Kingdom and the Irish Republic have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft in a part of the Shannon FIR to the United Kingdom. This area is shown at ENR 2.2 paragraph 1.9.2 to 1.9.4.

n) The United Kingdom and France have arranged, through the exchange of a bi-lateral Letters of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft between FL 115 and FL 660 (levels vary within areas) in parts of the Paris and Reims FIRs/UIRs to the United Kingdom. The areas are shown at ENR 2.2, paragraphs 1.11.1 to 1.11.3, 1.12.1 and 1.12.2.

o) The United Kingdom and Jersey have arranged, through the exchange of a bi-lateral Letter of Agreement to transfer responsibility for providing Air Traffic Services to all aircraft between FL 55-FL 195, and between SFC-FL 195, in parts of the London FIR to Jersey (during the opening hours of Jersey ATC). The areas are shown at ENR 2.2.8 paragraphs 1.14.1 and 1.14.2.

p) The United Kingdom and the Irish Republic have arranged, through the exchange of a bi-lateral Letter of Agreement, to transfer responsibility for providing Air Traffic Services to all aircraft between FL 255 and FL 660 (inclusive) in a part of the Scottish UIR to the Irish Republic. The area is shown at ENR 2.2 (Airspace within which ATS is Delegated), paragraph 1.10.3.

2.1.2 Flight Information Service and Alerting Service will be provided throughout all the Airspace described above. Whenever part of the FIR or UIR has been further classified, FIS and Alerting Service will be provided by the controller giving other ATS appropriate to the airspace classification. In those parts of the FIR or UIR which have not been further classified, FIS and Alerting Service will be provided by a special Area FIS Officer operating from the appropriate ACC.

2.2 **Provision of Air Traffic Services (ATS)**

2.2.1 The provision of ATS within the United Kingdom's areas of responsibility described in paragraph 1 is shared by several organisations, both Civil and Military.

2.2.2 NATS Ltd provides the principal en-route (ACC/OAC) services together with aerodrome ATS at the airports listed at GEN 3.4, paragraph 2.2.2. Other en-route and aerodrome ATS are provided by civil and military organisations identified within the specific AIP entries.

3 Types of Service

3.1 **Air Traffic Control Clearances**

3.1.1 Clearances are issued solely for expediting and separating air traffic and are based on known traffic conditions which affect safety in aircraft operation. Such traffic conditions include not only aircraft in the air and on the manoeuvring area over which control is being exercised, but also any vehicular traffic or other obstructions not permanently installed on the manoeuvring area in use.

3.1.2 If an air traffic control clearance is not suitable to the pilot-in-command of an aircraft, the flight crew may request and, if practicable, obtain an amended clearance.

3.1.3 The issuance of air traffic control clearances by Air Traffic Control units constitutes authority for an aircraft to proceed only in so far as known air traffic is concerned. ATC clearances do not constitute authority to violate any applicable regulations for promoting the safety of flight operations or for any other purpose; neither do clearances relieve a pilot-in-command of any responsibility whatsoever in connection with a possible violation of applicable rules and regulations.

3.1.4 Occasionally, instances of false or deceptive transmissions on ATC frequencies may occur. Flight crews should challenge or verify with the ATC unit concerned any instruction or clearance issued to them, which they suspect may be false or deceptive.

3.2 **Types of Service - Overview**

3.2.1 The type of air traffic service (ATS) to be provided will depend on the class of airspace within which the aircraft is flying, and the type of ATS unit, ie Area, Aerodrome, or Approach. Information on Area, Aerodrome and Approach services are contained herein.

3.2.2 Several other civil and military ATS units provide air traffic services which are detailed at ENR 1.1 (ARA), ENR 1.6 subsection 4.1 (LARS), ENR 1.6 subsection 4.5 (Offshore), ENR 2.2 (MATZ) and ENR 5.1 (SUACS/SUAAIS). Details of air traffic services provided within specific airspace classifications can be found at ENR 1.1 (General Rules) and ENR 1.4 (ATS Airspace Classification).

3.3 **Area Control Centre Air Traffic Services**

3.3.1 Area Control Centre (ACC) ATS within the UK FIRs encompass the provision of surveillance and non-surveillance Area Control, Alerting, and UK Flight Information Services, to traffic not under the jurisdiction of an approach or aerodrome control unit. This includes the provision of a Basic Service as defined at ENR 1.1, subsection 2 by ACC Flight Information Service Officers (FISO).

GEN 3.3 AIR TRAFFIC SERVICES (continued)

In addition to a Basic Service, the FISO will:

a) On receipt of a request for joining or crossing clearance of Controlled Airspace or Advisory Routes either:
   i. inform the pilot that he should change frequency in time to make the request direct to the appropriate ATC Unit at least ten minutes before ETA for the entry or crossing point; or
   ii. obtain the clearance from the appropriate ATC Unit himself/herself and pass it to the pilot on the FIR frequency.
b) Pass ETA to destination aerodromes in special circumstances, such as diversions, or at particular locations when traffic conditions demand it. Normally, however, pilots who wish destination aerodromes outside Controlled Airspace to have prior warning of arrival should communicate direct with ATC at the aerodrome concerned, at least ten minutes before ETA.
c) Accept airborne flight plans and pass the information to the appropriate authority.

3.4 **Aerodrome Air Traffic Services**

3.4.1 ATC at an aerodrome is responsible for the control of aircraft in the air in the vicinity of the aerodrome and for the control of all traffic on the manoeuvring area. All movements of aircraft and vehicles on the manoeuvring area are subject to prior permission from ATC.

3.4.2 Control of movements of vehicles and persons on the apron is the responsibility of the aerodrome authority. Movement of aircraft on the apron is subject to prior permission from ATC, who will provide advice and instructions to assist in the prevention of collisions between moving aircraft.

3.4.3 The total ATC responsibility at an aerodrome is shared between Aerodrome Control and Approach Control. Aerodrome Control is responsible for aircraft on the manoeuvring area except the runways-in-use. The point dividing the responsibilities of Aerodrome Control and of Approach Control for aircraft on the runways-in-use and in the air may vary with different weather conditions or for other considerations, but it is the normal rule that departing aircraft contact Aerodrome Control first and that arriving aircraft contact Approach Control first for ATC instructions.

3.4.4 Three types of service are used at United Kingdom aerodromes for the control or supervision of aerodrome traffic. Where Air Traffic Control is required an Aerodrome Control Service (TWR) is provided. At other aerodromes, either an Aerodrome Flight Information Service (AFIS) or an Air-Ground Service (A/G) may be provided. Where traffic levels are variable, the available service may be changed at specific times or by arrangement.

3.4.5 ATC fulfils its functions at an aerodrome by giving aircraft by RTF the instructions and information required for taxiing, take-off or landing.

3.4.6 At some busy airports to alleviate RTF loading on the operational channels, Automatic Terminal Information Service (ATIS) broadcast messages are used to pass routine arrival/departure information on a discrete RTF frequency or on an appropriate VOR. Pilots of aircraft inbound to these airports are required on first contact with the aerodrome ATS Unit to acknowledge receipt of current information by quoting the code letter of the broadcast. Pilots of outbound aircraft are not normally required to acknowledge receipt of departure ATIS but are requested to ensure that they are in possession of up-to-date information. It may not be possible for ATC to provide the contents of the ATIS message on operational ATC frequencies due to RT and controller workload and pilots should only request such assistance when operationally essential and the ATIS frequency is unable to be monitored.

3.4.7 **Uncertainty of position on the manoeuvring area**

3.4.7.1 Except as provided for in 3.4.7.2, a pilot in doubt as to the position of the aircraft with respect to the manoeuvring area shall immediately:

a) Stop the aircraft; and
b) simultaneously notify the appropriate ATS unit of the circumstances (including the last known position).

3.4.7.2 In those situations where a pilot is in doubt as to the position of the aircraft with respect to the manoeuvring area, but recognizes that the aircraft is on a runway, the pilot shall immediately:

a) Notify the appropriate ATS unit of the circumstances (including the last known position);
b) if able to locate a nearby suitable taxiway, vacate the runway as expeditiously as possible, unless otherwise instructed by the ATS unit; and then,
c) stop the aircraft.

3.4.7.3 A vehicle driver in doubt as to the position of the vehicle with respect to the manoeuvring area shall immediately:

a) Notify the appropriate ATS unit of the circumstances (including the last known position);
b) simultaneously, unless otherwise instructed by the ATS unit, vacate the landing area, taxiway, or other part of the manoeuvring area, to a safe distance as expeditiously as possible; and then
c) stop the vehicle.

3.4.7.4 In the event the aerodrome controller becomes aware of an aircraft or vehicle that is lost or uncertain of its position on the manoeuvring area, appropriate action shall be taken immediately to safeguard operations and assist the aircraft or vehicle

GEN 3.3 AIR TRAFFIC SERVICES (continued)

concerned to determine its position.

3.5 **Phraseology**

3.5.1 Pilots should be aware that ATC use of the phrase 'No ATC Speed Restriction' does not absolve pilots from the responsibility to operate at speeds that would:

a) Ensure adequate obstacle clearance;
b) comply with flight operations manual requirements;
c) not prejudice the 'see and avoid' principle (for both conflicting parties);
d) comply with the airspace speed limit in Class E, F or G Airspace;
e) enable adherence to tracks and levels specified in Noise Preferential Routes or Noise Abatement Procedures (including Continuous Descent Approaches).

3.6 **Approach Control Service (APP)**

3.6.1 Approach Control Services are provided at aerodromes which are within Controlled Airspace and some aerodromes which are outside controlled airspace. In the latter case, however, there is no legal requirement for pilots to comply with the instructions issued by Approach Control unless they are within the Aerodrome Traffic Zone. Nor is there any legal requirement for such pilots to report their presence. It is, therefore, impossible for Approach Control to be sure that they are giving separation from all aircraft in their area.

3.6.2 The more aircraft that are known to Approach Control at an aerodrome outside Controlled Airspace, the better will be the service provided and pilots are therefore strongly recommended either:

a) To avoid flying under IFR within 10 nm radius at less than 3000 ft above an aerodrome having Approach Control; or
b) if it is necessary to fly under IFR in such an airspace, to contact Approach Control when at least 10 minutes flying time away and to comply with any instructions they may give.

3.6.3 Responsibility of APP at Aerodromes inside Controlled Airspace

3.6.3.1 Approach Control will provide standard separation to IFR flights from the time or place at which:

a) Inbound aircraft are released by the ACC or Zone Control until they are transferred to Aerodrome Control; and
b) outbound aircraft are taken over from Aerodrome Control until they are handed over to the ACC or Zone Control;
c) aircraft inbound from the FIR come under its jurisdiction within the Controlled Airspace until they are transferred to Aerodrome Control.

3.6.4 Responsibility of APP at Aerodromes outside Controlled Airspace

3.6.4.1 Approach Control will provide air traffic services between aircraft under its jurisdiction from the time and place at which:

a) Arriving aircraft are released by the ACC until they are transferred to Aerodrome Control;
b) arriving aircraft first place themselves under Approach Control until they are transferred to Aerodrome Control;
c) departing aircraft are taken over from Aerodrome Control until they are transferred to the ACC, or they state that they no longer wish to be controlled or they are more than 10 minutes flying time away from the aerodrome, whichever is the sooner;
d) transit aircraft first place themselves under the control of Approach Control until they are clear of the approach pattern or state they no longer wish to be controlled.

3.7 **Aerodrome Flight Information Service (AFIS)**

3.7.1 The Aerodrome Flight Information Service (AFIS) is a service provided by Aerodrome Flight Information Service Officers (AFISO) to give information useful for the safe and efficient conduct of aerodrome traffic, including assisting pilots in the prevention of collisions, and to give taxi instructions on the apron and manoeuvring area. From the information received pilots will be able to decide the appropriate course of action to be taken to ensure the safety of flight.

3.7.2 AFIS is available at aerodromes during the hours of operation indicated at AD 2 and AD 3. The service is easily identifiable by the call sign suffix 'INFORMATION'. Only the holder of an AFISO licence is permitted to use this suffix.

3.7.3 The AFISO is responsible for:

a) Issuing information to aircraft flying in and in the vicinity of the ATZ to assist pilots in preventing collisions;
b) issuing instructions and information to aircraft on the apron and manoeuvring area to assist pilots in preventing collisions between aircraft and vehicles/obstructions on the manoeuvring area, or between aircraft moving on the apron;
c) issuing instructions to vehicles and persons on the manoeuvring area;
d) informing aircraft of essential aerodrome information (ie the state of the aerodrome and its facilities);
e) provision of an alerting service;
f) initiating overdue action.

3.8 **Services and Procedures for Arriving Flights**

3.8.1 Pilots of arriving aircraft should contact Approach Control when instructed to do so by the ACC. If flying outside Controlled Airspace

GEN 3.3 AIR TRAFFIC SERVICES (continued)

in IMC the first call should be made to Approach Control at least 10 minutes before ETA at the aerodrome.

3.8.1.1 As soon as practicable after pilots have made contact with Approach Control they will be given:

a) Runway-in-use;
b) Current meteorological information which will include:

i. Surface wind direction (in degrees magnetic) and speed;
ii. visibility;
iii. present weather;
iv. significant cloud amount and height of base;
v. QFE or QNH (with height of aerodrome);
vi. any other relevant information (gusts, icing, etc);
vii. Runway Visual Range

Note: *This information may be reduced to items (i) and (v) when aircraft are below cloud, flying in VMC and able to continue in VMC to the landing, or at busy aerodromes within Control Zones when visibility and cloud base permit approaches under VFR.*

c) Current runway surface conditions where appropriate;
d) any changes in the operational status of visual and non-visual aids essential for approach and landing.

3.8.2 **Holding**

3.8.2.1 Holding will normally be carried out in accordance with the procedures set out on IAC. Certain procedures are mandatory and are notified for the purpose of Rule 34(3) of the Rules of the Air Regulations 2007. If none have been published, or if a pilot does not know them, Approach Control should be advised and full instructions will then be given.

3.8.2.2 If for any reason a pilot is unable to comply with any particular holding instruction he should advise Approach Control and ask permission to follow an alternative procedure. Permission will normally be given if traffic conditions permit.

3.8.2.3 A pilot will be given a time at which to leave the holding point and commence his approach. This will be given sufficiently in advance for him to arrange his flight so as to arrive at the holding point at the time specified.

3.8.3 **Procedures for Arriving VFR Flights**

3.8.3.1 An aircraft approaching an aerodrome under VFR where an Approach Control Service is available should make initial RTF contact when 15 nm or five minutes flying time from the Aerodrome Traffic Zone boundary, whichever is the greater. If the aircraft is not equipped with the Approach frequency, communication on the Aerodrome Control frequency will be acceptable. As well as landing information, ATC will pass information on pertinent known traffic to assist pilots of VFR flights to maintain separation from both IFR and other VFR flights.

3.8.3.2 If radar sequencing of IFR flights is in progress, ATC will provide VFR flights with information to enable them to fit into the landing sequence.

3.8.4 **Instrument Approaches**

3.8.4.1 Pilots will be expected to be conversant with the correct notified Instrument Approach Procedures detailed in published charts, but on request, in exceptional circumstances, Approach Control will supply the following information

a) The aid concerned, aircraft category and Final Approach Track;
b) arrival level;
c) type of reversal manoeuvre, including outbound track, length in time or distance, level instructions, and direction of procedure turn where applicable;
d) intermediate and final approach tracks and fixes, and step down fixes (where applicable), with level instructions;
e) Obstacle Clearance Height;
f) Missed Approach Point and Missed Approach Procedure.

3.8.4.2 A pilot finding that he can see the ground before he has completed the approach procedure must, nevertheless, carry out the entire procedure, unless he specifically requests and ATC gives permission for him to complete his approach visually. This permission will only be given when:

a) The pilot can maintain visual reference to the surface; and
b) the reported cloud ceiling is not below the initial approach level or the pilot reports that visibility will permit a visual approach and he is reasonably confident that a landing can be accomplished.

ATC will continue to provide IFR separation from other aircraft.

3.8.4.3 Providing that it is not at night or in Class A Airspace, a pilot is entitled to ask ATC to cancel his IFR plan during his approach to land providing that he can continue in uninterrupted VMC. In this case, he must accept responsibility for maintaining his own

separation from other aircraft.

3.8.4.4 An arriving aircraft may be cleared, by day only, to descend remaining in VMC and maintaining own separation if reports indicate that this is possible. Essential traffic information will be given.

3.8.5 **Visual Circuit Reporting Procedures**

3.8.5.1 In order that the maximum use may be made of aerodromes for the purpose of landing and taking-off, it is essential that pilots accurately report their positions in the circuit.

3.8.5.2 **Standard Overhead Join**

3.8.5.2.1 An aircraft which has been instructed to complete a standard overhead join will:

a) Overfly the aerodrome at 2000 FT AAL;
b) descend on the 'dead side' to circuit height;
c) join the circuit by crossing the upwind end of the runway at circuit height;
d) position downwind.

3.8.5.3 Position reports are to be made as follows:

a) **Downwind** - Aircraft are to report 'Downwind' when abeam the upwind end of the runway. Aircraft report ‘Late downwind’ if they are on downwind leg, have been unable to report ‘Downwind’ and have passed abeam the downwind end of the runway.
b) **Base Leg** - Aircraft are to 'Report Base', if requested by ATC, immediately on completion of the turn on to base leg.
c) **Final** - Aircraft are to report 'Final' after the completion of the turn on to final approach and when at a range of not more than 4 NM from the approach end of the runway.
d) **Long Final** - Aircraft flying a final approach of a greater length than 4 NM are to report 'Long Final' when beyond that range, and 'Final' when a range of 4 NM is reached. Aircraft flying a straight-in approach are to report 'Long Final' at 8 NM from the approach end of the runway, and 'Final' when a range of 4 NM is reached.

Note 1: *At grass aerodromes, the area to be used for landing should be regarded as the runway for the purposes of position reporting.*

Note 2: *Pilots are reminded that, when operating in the vicinity of aerodromes and not in receipt of Air Traffic Control instructions to the contrary, SERA.3225 (Operation on and in the Vicinity of an Aerodrome) applies, and that an aircraft operated on or in the vicinity of an aerodrome shall:*

i. observe other aerodrome traffic for the purpose of avoiding collision;
ii. conform with or avoid the pattern of traffic formed by other aircraft in operation;
iii. except for balloons, make all turns to the left, when approaching for a landing and after taking off, unless otherwise indicated, or instructed by ATC;
iv. except for balloons, land and take off into the wind unless safety, the runway configuration, or air traffic considerations determine that a different direction is preferable, and they should 'conform to the pattern of traffic formed by other aircraft intending to land at that aerodrome'.
Flights contemplating carrying out a straight in approach should bear in mind that, on many occasions, this method of joining will may not permit compliance with this Rule.

3.8.6 **Visual Approaches**

3.8.6.1 Subject to the conditions in paragraph 3.7.6.3, clearance for an IFR flight to execute a visual approach may be requested by a flight crew or initiated by the controller. In the latter case, the concurrence of the flight crew shall be required.

3.8.6.2 Controllers will exercise caution in initiating a visual approach when there is reason to believe that the flight crew concerned is not familiar with the aerodrome and its surrounding terrain. Controllers will also take into consideration the prevailing traffic and meteorological conditions when initiating visual approaches.

3.8.6.3 An IFR flight may be cleared to execute a visual approach provided the pilot can maintain visual reference to the terrain and:

a) the reported ceiling is at or above the approved initial approach level for the aircraft so cleared; or
b) the pilot reports at the initial approach level or at any time during the instrument approach procedure that the meteorological conditions are such that with reasonable assurance a visual approach and landing can be completed.

3.8.6.4 Separation shall be provided between an aircraft cleared to execute a visual approach and other arriving and departing aircraft.

3.8.6.5 For successive visual approaches, separation will be maintained by the controller until the pilot of a succeeding aircraft reports having the preceding aircraft in sight. The aircraft will then be instructed to follow and maintain own separation from the preceding aircraft. When both aircraft are of a heavy wake turbulence category, or the preceding aircraft is of a heavier wake turbulence category than the following, and the distance between the aircraft is less than the appropriate wake turbulence minimum, the controller will issue a caution of possible wake turbulence. The pilot-in-command of the aircraft concerned shall be responsible for ensuring that the spacing from a preceding aircraft of a heavier wake turbulence category is acceptable. If it is determined that

additional spacing is required, the flight crew shall inform the ATC unit accordingly, stating their requirements.

3.8.6.6 Transfer of communications to the aerodrome controller will be effected at such a point or time that information on essential local traffic, if applicable, and clearance to land or alternative instructions can be issued to the aircraft in a timely manner.

3.9 **Runway Utilisation Procedures**

3.9.1 **Runway-in-Use**

3.9.1.1 The runway-in-use is selected by Aerodrome Control as the best for general purposes. If it is unsuitable for a particular operation, ATC may offer, or the pilot can obtain permission from ATC to use another runway but must accept that he may thereby incur a delay.

3.9.2 **Clearance for Immediate Take-Off**

3.9.2.1 A pilot receiving the ATC instruction 'cleared for immediate take-off' is required to act as follows:

a) If waiting clear of the runway, taxi immediately on to it and begin his take-off run without stopping his aircraft;
b) if already lined up on the runway, take-off without delay;
c) if unable to comply with the instruction, inform ATC immediately

3.9.3 **Land After Procedure**

3.9.3.1 Normally, only one aircraft is permitted to land or take-off on the runway-in-use at any one time. However, when the traffic sequence is two successive landing aircraft, the second one may be allowed to land before the first one has vacated the runway-in-use, providing:

a) the runway is long enough, and there is no evidence to indicate that braking may be adversely affected.
b) it is during daylight hours.
c) the first landing aircraft is not required to backtrack to vacate the runway.
d) the second aircraft will be able to see the first aircraft clearly and continuously until it has vacated the runway.
e) the second aircraft has been warned. ATC will provide this warning by issuing the pilot of the second aircraft with permission to land using the phraseology "... land after the (first aircraft type) ..." instead of issuing a landing clearance.
f) responsibility for ensuring adequate separation between the two aircraft rests with the pilot of the second aircraft.

An example of the RTF exchange is as follows:

ATC: “(Call sign) runway (designator), **land after** the (first aircraft type), surface wind (direction and speed)”.

Pilot: “Runway (designator), **land after** the (first aircraft type), (Call sign)”.

3.9.4 **Special Landing Procedures at London Gatwick and London Stansted Airports.**

3.9.4.1 Special landing procedures may be in force at London Gatwick (except for Runway 08L/26R) and London Stansted (Land after Departure only) in conditions shown hereunder, when the use will be as follows:

a) When the runway-in-use is temporarily occupied by other traffic, landing clearance will be issued to an arriving aircraft provided that at the time the aircraft crosses the threshold of the runway-in-use the following separation distances will exist:

London Gatwick

i. Landing following landing - The preceding landing aircraft will be clear of the runway-in-use or will be at least 2500 M from the threshold of the runway-in-use.
ii. Landing following departure - The departing aircraft will be airborne and at least 2000 M from the threshold of the runway-in-use, or if not airborne, will be at least 2500 M from the threshold of the runway-in-use

London Stansted

Landing following departure - The departing aircraft will be airborne and at least 2000 M from the threshold of the runway-in-use, or if not airborne, will be at least 2500 M from the threshold of the runway-in-use.

b) Reduced separation distances as follows will be used where both the preceding and succeeding landing aircraft or both the landing and departing aircraft are propeller driven and have a maximum total weight authorised not exceeding 5700 KG:

London Gatwick

i. Landing following landing - The preceding aircraft will be clear of the runway-in-use or will be at least 1500 M from the threshold of the runway-in-use.
ii. Landing following departure - The departing aircraft will be airborne or will be at least 1500 M from the threshold of the runway-in-use.

London Stansted

Landing following departure - The departing aircraft will be airborne and at least 1500 M from the landing threshold, or if not airborne, will be at least 1500 M from the landing threshold.

GEN 3.3 AIR TRAFFIC SERVICES (continued)

Note: *The reduced distances do not apply to those jets which are 5700 KG MTWA or less.*

c) Conditions of Use. The procedures will be used by DAY only under the following conditions:

London Stansted

i. When the reported meteorological conditions are equal to or better than a visibility of 6 KM and a cloud ceiling of 1000 FT and the Air Controller is satisfied that the pilot of the next arriving aircraft will be able to observe continuously the relevant traffic.
ii. When both the preceding and succeeding aircraft are being operated in the normal manner. (Pilots are responsible for notifying ATC if they are operating their aircraft in other than the normal manner; eg final approach speed greater than 160 KT).
iii. When the runway is dry and free of all precipitants such that there is no evidence that the braking action may be adversely affected.
iv. When the Air Controller is able to assess the separation either visually or by means of Aerodrome Traffic Monitor.

London Gatwick

1. When 26L/08R is in use;
2. When the controller is satisfied that the pilot of the next arriving aircraft will be able to observe the relevant traffic clearly and continuously;
3. When the pilot of the following aircraft is warned;
4. When there is no evidence that the braking action may be adversely affected;
5. When the controller is able to assess separation visually or by radar derived information.

d) When issuing a landing clearance following the application of these procedures ATC will issue the second aircraft with the following instructions:

London Gatwick

..... (call sign) ..... after the landing/departing ..... (Aircraft Type) cleared to land Runway ..... (Designator).

London Stansted

..... (call sign) ..... after the departing ..... (Aircraft Type) cleared to land Runway ..... (Designator).

3.10 **Handling of Aircraft in Emergency where the Intended Flight Path passes over Densely Populated Areas**

3.10.1 When a pilot has declared an emergency and stated the aerodrome to which he wishes to proceed, controllers will acknowledge this message. The controller may be instructed to inform the pilot that the aircraft is required or requested to divert to another aerodrome together with the reason for this change. This message, together with the reason, shall then be passed to the captain and his intentions requested.

3.10.2 The decision to comply with advice or instructions to land at an airport, other than his selected diversion, lies with the captain of the aircraft who has ultimate responsibility for the safety of his aircraft.

3.10.3 It is desirable that aircraft in an emergency should not be routed over densely populated areas, particularly if there is reason to believe that the aircraft's ability to remain in controlled flight is compromised or that parts of the aircraft could detach while in flight. If this is inconsistent with providing the most appropriate service to the aircraft, for example when any extended routeing could further jeopardise the safety of the aircraft, the most expeditious route will be given. Where possible, when expeditious routeing is not required, suggestions of alternative runways or aerodromes together with the rationale that the routeing would avoid densely populated areas and be consistent with safety, shall be passed to the pilot and his intentions requested.

3.10.4 It is recognised that controllers providing en-route services at Area Control Centres may not be aware of the boundaries of major cities, towns or villages. However, controllers providing aerodrome, approach or approach radar control services should be familiar with the centres of population within their areas of jurisdiction.

3.11 **Departure Clearances**

3.11.1 ATC clearances shall specify some or all of the following as necessary:

a) Direction of take-off and turn after take-off;
b) track to be made good before proceeding on desired heading;
c) level to maintain before continuing climb to assigned cruising level, time, point and/or rate at which level change shall be made;
d) and any other manoeuvre necessary to maintain separation as appropriate.

3.11.2 A departing aircraft may be cleared to climb, subject to remaining in VMC and maintaining own separation, until a specified time, place or level if reports indicate that this is possible. Essential traffic information will be given.

3.12 **Lamp, Pyrotechnic and Ground Signals**

3.12.1 Non-radio aircraft may be given instructions or information by signal lamp or pyrotechnics from the Control Tower and by ground

GEN 3.3 AIR TRAFFIC SERVICES (continued)

signals in the Aerodrome Signals Area.

3.12.2 Lamp and pyrotechnic signals may be made to any aircraft, radio-equipped or otherwise from a subsidiary control point such as a Runway Control Vehicle.

3.13 **Initial Calls**

3.13.1 **Initial Call to the Aerodrome Control Tower**

3.13.1.1 For aircraft on the ground being provided with an aerodrome control service, the initial call to the aerodrome control tower shall contain:

a) Callsign;
b) Position; and
c) Any additional elements, as required by the appropriate ATS authority and notified in the relevant AIP AD section.

3.13.1.2 Pilots should make arrangements to obtain time checks from sources other than ATC.

3.13.2 **IFR Flights**

3.13.2.1 Pilots of aircraft flying Instrument Departures (including those outside controlled airspace) shall include the following information on initial contact with the first en-route ATS Unit:

a) Callsign;
b) SID or Standard Departure Route Designator (where appropriate);
c) Current or passing level; **PLUS**
d) Initial climb level (ie the first level at which the aircraft will level off unless otherwise cleared. For example, on a Standard Instrument Departure that involves a stepped climb profile, the initial climb level will be the first level specified in the profile).

3.13.2.2 Unless otherwise instructed or where paragraph 3.12.2.1 applies, when changing communication channel to an ATC unit (including changes within the same ATS unit), the initial call on the new frequency shall include **aircraft identification and level only** .

3.13.2.3 When making such an initial call and the aircraft is in level flight but cleared to another level, the call shall include the **aircraft identification followed by the current level and the cleared level** .

3.13.2.4 When making such an initial call and the aircraft is not in level flight, the call shall include the **aircraft identification followed by the cleared level only** .

3.13.2.5 When making such an initial call and the aircraft has been assigned a speed, this information shall also be included.

4 Co-ordination between the Operator and ATS

4.1 Co-ordination between the Operator and ATS is effected in accordance with ICAO Annex 11 Chapter 2, paragraph 2.16 and ICAO Doc 4444 - Chapter 11 paragraphs 11.2.1.1.4 and 11.2.1.1.5.

5 Minimum Flight Altitude

5.1 The minimum flight altitudes on the ATS routes, as presented in section ENR 3, have been determined by the En-route ANSP so as to ensure a minimum vertical clearance above the controlling obstacle in the area concerned.

6 ATS Units Address List

Name	Postal Address	Tel	Fax	Telex	AFS

Details of other ATS Unit contact numbers and addresses appear within the AD and ENR sections.

GEN 3.4 COMMUNICATION AND NAVIGATION SERVICES

1 Responsible Services

1.1 The Civil Aviation Telecommunications Services in the United Kingdom are administered by the Civil Aviation Authority.

Post: CNS and Spectrum, Civil Aviation Authority, Aviation House, Beehive Ring Road, Crawley, West Sussex, RH6 0YR
Email: spectrum@caa.co.uk
Phone: 033-0022 1500

1.2 **Applicable ICAO Documents**

1.2.1 The Standards, Recommended Practices and, when applicable, the procedures contained in the following ICAO documents are applied:

Annex 10	- Aeronautical Telecommunications;
Doc 7030	- Regional Supplementary Procedures;
Doc 7910	- Location Indicators for geographical locations;
Doc 8400	- ICAO Abbreviations and Codes;
Doc 8585	- Designators for Aircraft Operating Agencies, Aeronautical Authorities and Services.

1.2.2 Differences from ICAO Standards Recommended Practices and Procedures are given at GEN 1.7.

2 Area of Responsibility

2.1 En-route Telecommunications Services

2.1.1 All en-route telecommunications (air-interpreted navigational aids and communications) services, together with those services at aerodromes administered by Highlands and Islands Airports Ltd, except where otherwise identified in the AIP, are provided by the NATS (En Route) plc.

Post: NATS (En Route) plc, Director of Service Delivery, Corporate and Technical Centre, 4000 Parkway, Whiteley, Fareham, Hampshire. PO15 7FL.
Phone: 07785-953265
Fax: 01489-444015

2.2 Communications and Navigational Aids at UK Aerodromes

2.2.1 Several organisations are approved by the CAA to provide Civil Aviation Telecommunications Services at UK aerodromes.

2.2.2 The telecommunication service provider for each aerodrome can be contacted using the ATS/ATC telephone number stated at AD 2.2/AD 3.2.

2.3 Aeronautical Fixed Telecommunication Network (AFTN)/ATS Message Handling System (AMHS) and associated Data Services

2.3.1 NATS Aeronautical Met & Messaging Service (AMMS) operates AFTN/AMHS services on behalf of the UK. AFTN/AMHS are part of the ICAO Aeronautical Fixed Service (AFS).

2.3.2 The UK is an ICAO designated Regional Operational Meteorological (OPMET) information Centre (ROC) for the management, distribution, and exchange of OPMET information within a defined area of responsibility, and between international OPMET databanks. NATS AMMS carries out the applicable responsibilities of this service as ROC London.

Post: NATS, Aeronautical Met & Messaging Service, Box 25, Sopwith Way, Swanwick, Southampton, Hampshire, SO31 7AY
Phone: Operations (H24) 01489-612790, Support (Mon-Fri) 01489-887155
Email: dataservicessupport@nats.co.uk

2.4 Enquiries and Complaints

2.4.1 Enquiries or complaints about the performance of Civil Aviation Telecommunications Services should be referred in the first instance to the operational organisation providing the services. Urgent matters should be communicated verbally and supported

GEN 3.4 COMMUNICATION AND NAVIGATION SERVICES (continued)

by written reports.

3 Type of Service

3.1 Radio Navigation Services

3.1.1 The following types of radio aids to navigation are provided in the UK:

a) MF Non-Directional Beacon (NDB);
b) VHF Direction-Finding Station (VDF);
c) Approach Radar (RAD);
d) Precision Approach Radar (PAR) at certain military aerodromes;
e) Instrument Landing System (ILS);
f) VHF Omni-directional Radio Range (VOR);
g) Distance Measuring Equipment (DME).

3.1.2 **MF Non-directional Beacon (NDB)**

a) The range promulgated for UK NDBs is based on a daytime protection ratio between wanted and unwanted signals that limits bearing errors at that distance to ±5 degrees or less. At ranges greater than those promulgated bearing errors will increase. Adverse propagation conditions particularly at night will also increase bearing errors.
b) NDBs provided for use as approach aids, during the notified hours of ATS, at aerodromes for which instrument approach procedures are published in the AD section are notified in this AIP as locator beacons (L). Most locator beacons continue to transmit a usable signal outside notified hours, these signals are provided for the purposes of navigational aid only. Aerodrome NDBs not notified as locator beacons are provided for navigational use only.
c) Details of the Maritime Radio beacons (NDB) are published by the Hydrographer of the Navy, Hydrographic Department (MOD), Taunton, Somerset TA1 2DN, and are available from Admiralty Chart Agents.

3.1.3 **VHF Direction-Finding Station (VDF)**

a) VDF bearings are classified as follows:

- Class A: accurate to within ±2 degrees;
- Class B: accurate to within ±5 degrees;
- Class C: accurate to within ±10 degrees.

b) VDF bearing information will only be given when conditions are satisfactory. Normally no better than Class B bearing will be available.

3.1.4 **Approach Radar (RAD)**

a) The VHF communications frequencies for use with Approach Radars are listed in AD 2 item 2.18

3.1.5 **Instrument Landing System (ILS)**

a) Aircraft overflying the localizer or manoeuvring on or near the runway may disturb the ILS guidance signals. ATC will apply increased separation and such other measures considered necessary to prevent interference during Category II and III operations.
b) Such measures will also be applied at the discretion of ATS when requested by pilots wishing to use Category II and III landing procedures when meteorological conditions do not necessitate them
c) For all civil ILS notified in AD 2 item 2.19 the Localizer usable coverage sector is ±35° about the nominal course line and the glidepath provides coverage to the minimum ICAO requirement of 10 NM unless otherwise stated. Pilots using these instrument landing systems are advised not to attempt to intercept and follow the glidepath until the aircraft is established on the Localizer centre-line. Due to the presence of false courses on some localizers operating in the UK, pilots are advised not to attempt to use any ILS facility outside ±35° of the front course line. This advice is in addition to the notes promulgated in AD 2 item 2.19 for individual ILS.
d) Steep Angle facilities listed in the ILS entries in AD 2 item 2.19 provide a more limited coverage than that described in paragraph 1.5(c), the Localizer usable coverage sector being limited to 10 NM at ±35° and to 18 NM at ±10°. The glidepath provides coverage to 8 NM.
e) Although all MoD ILS facilities are technically classed as ‘uncategorised’, they are flight checked to ICAO CAT I standards. However, pilots of aircraft cleared to carry out practice auto-coupled approaches with the appropriate visual references to below CAT I limits are to note the following: Unless specifically promulgated otherwise, ILS facilities at MoD airfields are not capable of providing the required quality of beam structure to enable auto-coupled approaches to be continued below the minimum CAT I Decision Height.

3.1.6 **Instrument Landing System (ILS) and Distance Measuring Equipment (DME)**

a) A DME facility at an aerodrome, which is frequency paired with the ILS, is arranged to give zero range indication with respect to the threshold of the runway with which it is associated and precise ranges will only be indicated when aircraft are in line with the runway on the approach path. As a consequence of this, if used other than in accordance with promulgated procedures indicated range should be taken as an approximate range to the aerodrome.

GEN 3.4 COMMUNICATION AND NAVIGATION SERVICES (continued)

3.1.7 **VHF Omni-directional Radio Range (VOR) and Distance Measuring Equipment (DME)**

a) The Designated Operational Coverage promulgated for UK VOR and DME together with details of any unsatisfactory conditions known to exist, are listed in AD 2 item 2.19 or at ENR 4.1.
b) Because inaccurate bearing information may be radiated by a VOR during a changeover to the standby transmitter, no identification signal is radiated until the changeover is completed. Pilots are advised to continually monitor the identification signal throughout a VOR approach.
c) Where a VOR and TACAN are frequency paired, but not within the co-location limit of 600 M, the last letter of the TACAN identification will be a 'Z'. Civil Pilots are advised not to make operational use of distance information provided by Military TACAN facilities promulgated as unreliable and/or transmitting a series of dots after the identification code.
d) Where an en-route VOR or VOR/DME facility has an instrument approach procedure published in the AD section, a note in Column 7 at ENR 4.1 indicates the aerodrome so served. The hours of service as an approach aid are within the notified hours of the Air Traffic Services at the aerodrome served.

3.1.8 **Aerodrome Distance Measuring Equipment (DME)**

a) Aerodrome DME referred to in an instrument approach procedure published in the AD section is provided for use as an approach aid during the notified hours of ATS only. Most DME continue to transmit outside ATC notified hours for the purpose of navigational aid only.
b) Aerodrome DME with their zero range off-set to occur at specific runway thresholds are identified by comments in Column 7 at AD 2 item 2.19. Any DME range indications observed when between runway thresholds should be ignored. Other aerodrome DME indicate true slant range from aircraft to DME site.

3.1.9 **Radio Navigation Aids - Designated Operational Coverage**

3.1.9.1 Due to the limitations in the availability of spectrum, most NDB, VOR and DME facilities operate on a shared frequency channel. Frequency planning criteria based on ICAO Standards and Recommended Practices are employed to reduce the risk of interference from other facilities operating on the same frequency (co-channel interference).

3.1.9.2 When interference occurs, it is likely to be manifested in one of the following ways:

a) Garbled identification;
b) Bearing/range errors;
c) Inability to acquire the navigational signal;
d) Acquiring the undesired signal instead of the desired one.

3.1.9.3 Under abnormal propagation conditions interference can occur. For VOR and DME this is rare in the European region. However for a NDB, such conditions occur for a number of reasons (see paragraph 3.1.11).

3.1.9.4 The attention of pilots and aircraft operators is drawn to the following:

a) Using a VOR/DME outside the Designated Operational Coverage (DOC) can lead to errors in navigation. Such errors can be dangerous. This is particularly to be noted when using multiple DME in the RNAV configuration where it is difficult, if not impossible, to make a positive identification of the beacon being used.
b) DOCs are published in the UK AIP AD 2 item 2.19 and ENR 4.1. Where pilot channel selection is made, it is essential that this document be consulted as part of the pre-flight briefing to determine the DOC of every radio navigation aid upon which the safety of the intended flight may depend.

3.1.10 **Limitations of Non-Directional Beacons and Automatic Direction Finding Equipment**

3.1.10.1 Although VHF Omni-Range facilities (VOR) have increasingly replaced Non-Directional Beacons (NDBs) in many parts of the world, NDBs are still in use as navigation and instrument approach aids and are likely to be utilised in these roles for several years to come.

3.1.10.2 The increasing use of VOR may result in pilots losing sight of the inherent limitations of the NDB and its associated airborne Automatic Direction-Finding (ADF) equipment which if used under certain conditions is capable of producing large and potentially dangerous errors.

3.1.10.3 The principal factors liable to affect NDB/ADF system performance and integrity are:

- Static Interference;
- Station Interference;
- Night Effect;
- Mountain Effect;
- Coastal Refraction;
- Absence of failure warning system.

3.1.10.3.1 Very occasionally the Authority becomes aware of other conditions in ADF/NDB systems which give rise to false indications. In all such cases notification is given to the affected aircraft and ground equipment operators.

3.1.10.3.2 **Static Interference -** All kinds of precipitation (including falling snow) and thunderstorms can cause static interference of varying

intensity to ADF systems. Precipitation static reduces the effective range and accuracy of bearing information and thunderstorms can give rise to bearing errors of considerable magnitude and even to false 'overhead' indications. Indeed it is often said that in an area affected by thunderstorm activity, the ADF bearing pointer is useful only as an indication of the direction of the most active storm cell.

3.1.10.3.3 **Station Interference -** Most countries adopt measures to minimise the possibility of interference between transmissions from different stations by spacing frequencies and limiting the power outputs of those which might conflict. However, the LF and MF frequency bands remain inevitably congested and there is a risk that some interference will occasionally occur. When interference is experienced, bearing errors of varying degree will result. By day, the use of a NDB within the promulgated service range (based on daylight conditions) will normally afford protection against interference. Providing the NDB is correctly selected and identified reliable performance can usually be expected. By night, however, it is possible for skywave signals from other (more distant) transmitters to penetrate those areas considered protected during the day, thus giving rise to the possibility of two signals being received and resulting in unreliable bearing indications. Extreme care should therefore be exercised when making use of NDBs during night or twilight hours, even when well within the promulgated service range. A similar degree of care is necessary by day when close to the limit of the promulgated service range. Positive identification of the callsign of the required NDB is essential and is just as important with modern incrementally-tuned crystal controlled ADF sets, as with the earlier designs since frequency references alone cannot guarantee that the required NDB is being unambiguously received. Following initial identification and when ADF indications are being followed, further checks on reception of the correct callsign and on the accuracy of tuning should also be made at frequent intervals.

3.1.10.3.4 **Night Effect -** At night in addition to the interference which can occur between transmissions from different stations (already described in paragraph 1.11.3.3) it is possible for the reception of a ground wave signal from an individual NDB to be contaminated by a skywave signal from the same transmission source. This will give rise to bearing errors of varying magnitude depending on the heights of the ionised layers and the polarisation of the signals on arrival at the receiver. Night effect is usually most marked during the twilight hours when skywave contamination can cause 'fading' of signal strength with resultant wandering of the ADF bearing pointer. Caution should therefore be exercised whenever fluctuations in bearing indications are observed in the circumstances described.

3.1.10.3.5 **Mountain Effect -** ADF systems may be subject to errors caused by the reflection and refraction of the transmitted radio waves in mountainous areas. High ground between the aircraft and the NDB may increase the errors especially at low altitude.

3.1.10.3.6 **Coastal Refraction -** In coastal areas the differing radio energy absorption properties of land and water result in refraction of NDB transmissions. This error, known as 'Coastal Refraction', is most marked when the transmissions cross the coastline at an oblique angle and when the NDB is located away from the coast. Such bearings should, therefore, be used with caution.

3.1.10.3.7 **Lack of Failure Warning System -** Because of the absence of failure warning devices on most ADF instruments, failure in any part of the system (including the NDB) may produce false indications which are not readily detectable. NDB failures in particular could adversely effect both systems of a dual ADF installation in the aircraft. Having selected and identified the NDB, monitoring the audio identification signal and the pointer behaviour is the correct method of assuring normal system operation. This will reduce the risk of a false indication being followed and applies particularly when making an approach toward the NDB, when, in the event of failure, the ADF pointer could indicate that the beacon is ahead of the aircraft even though the beacon has been passed. Particular care should be exercised when an instrument approach procedure is commenced at ADF pointer reversal, in Instrument Meteorological Conditions to below sector safety altitude where no independent cross check is available.

3.1.10.4 Two methods of modulation are used to transmit the Morse identification signal of a NDB. In the UK all NDB utilise Modulated Continuous Wave (N0N A2A) type of modulation but in many other countries Interrupted Continuous Wave (N0N A1A) modulation may be employed which requires the use of a Beat Frequency Oscillator (BFO) or tone generator in the ADF receiver. Pilots must therefore be aware of the type of emission to expect and to pre-select the ADF receiver controls accordingly. In the case of Interrupted Continuous Wave (N0N A1A) type emissions, the ADF bearing pointer may wander during the ident period, due to the interruptions in the carrier frequency.

3.1.10.5 In conclusion it has to be stressed that at the comparatively short distances, ie less than 50 nautical miles, over which NDB are most commonly used, the most potentially dangerous errors are those resulting from all types of precipitation static, thunderstorms and station interference (particularly at night). When these are experienced, the ADF system should be used only when necessary and then with extreme caution; VHF aids are much less affected and these should be used in preference wherever possible. Cross-checking on the accuracy of ADF indications by reference to other available navigational aids is not only a matter of good airmanship but also a most necessary safeguard wherever any difficulty is experienced in the reception or identification of the intended NDB.

3.2 Voice and/or data link Services

3.2.1 General

a) Facilities are provided to meet the Air/Ground communications requirements of the Air Traffic Services described in the AIP and the Emergency Services detailed at paragraph 3.2.7. These services include coverage over the greater part of the United Kingdom Flight Information Regions above 3000 FT. Some limited cover may be possible below this altitude.
b) United Kingdom Air/Ground facilities will communicate with aircraft on frequencies within the Aeronautical Mobile (R) Service which has been allocated to the band 118 to 136.975 MHz.

c) United Kingdom airspace utilises 8.33 kHz channel spacing in line with Assimilated Regulation (EU) No. 1079/2012. All airspace users, unless otherwise notified, in ENR 1.8, will be required to be equipped with 8.33 kHz VCS capable radios.
d) The language to be used when communicating on the United Kingdom Aeronautical Mobile Service is English.
e) Procedures to follow in the event of Radio failures are contained in the AD and ENR Sections.
f) At a civil aerodrome the following words in a callsign identify an Air Traffic Control Service: TOWER, APPROACH, GROUND, ZONE, RADAR, DIRECTOR, DELIVERY.
g) In a callsign, only the word INFORMATION is used to identify an Aerodrome Flight Information Service, Aerodrome Terminal Information Service or Area Flight Information Service.
h) In a callsign, only the word RADIO is used to identify an aerodrome Air/Ground communication service.

3.2.2 Use of VHF R/T Channels

a) Geographical separation between international services using the same or adjacent frequencies is determined so as to ensure as far as possible that aircraft at the limits of height and range to each service do not interfere with one another. In the case of en-route sectors these limits correspond to that of the ATC sector concerned and those for international aerodrome services are appropriate a radius of 25 NM up to a height of 4000 FT (TWR) or 10000 FT (APP).
b) Except in emergency, or unless otherwise instructed by the Air Traffic Services, pilots should observe these limits. Services other than international services are provided on frequencies which are shared between numerous ground stations and have to operate to a higher utilisation in order to satisfy the demand for frequencies. Pilots using these frequencies should assist in reducing interference by keeping communications to a minimum and by limiting the use of aircraft transmitters to the minimum height and distance from the aerodrome that are operationally necessary. In the case of TWR, AFIS and A/G facilities, communications on these frequencies should be restricted as far as possible to heights up to 1000 FT in the immediate vicinity of the aerodrome concerned and in any event within 10 NM and 3000 FT.

3.2.3 Common Channel for Helicopter Departures

a) At locations having no ground radio facilities a VHF channel is available to assist departing helicopters.
b) Conditions of use are:

   i. It shall only be used at locations having no radio facilities. If another VHF assignment is valid for that location, it must be used even outside the normal operating hours;
   ii. Transmissions shall occur only when helicopters are below 500 FT AGL;
   iii. Helicopters approaching a site should monitor the channel. Blind transmissions are not permitted, except where Pilot Controlled Lighting is used.

c) Departing helicopters shall state:

   i. 'To all stations';
   ii. The callsign of the aircraft;
   iii. The location either by name or by reference to a readily identifiable feature;
   iv. The direction and height of the intended departure.

d) The channel assigned is 122.955 and shall be known as 'DEPCOM'.
e) Where Pilot Controlled Lighting systems are used, arriving helicopters may transmit a sequence of microphone clicks to activate the ground lighting system, within 6 NM from the ground location. Pilot Controlled Lighting systems using the common channel must not transmit from the ground.

3.2.4 Common VHF Channel for Use at Aerodromes having no notified Ground Radio Channel

a) At aerodromes having no notified ground radio facilities a VHF channel is available to assist pilots to avoid potential collisions between arriving and departing aircraft. Pilots may use this channel to broadcast their intentions for safety purposes.
b) The channel assigned is 135.480 and is known as 'SAFETYCOM'.
c) The conditions of use are:

   i. SAFETYCOM shall only be used at aerodromes having no notified ground radio facility. If a VHF channel is notified for a location, that notified channel must be used even outside the notified operating hours.
   ii. Transmissions shall be made only within a maximum range of 10 NM of the aerodrome of intended landing, and below 2000 FT above the aerodrome elevation.
   iii. SAFETYCOM shall only be used to transmit information regarding the pilot's intentions, and there should be no response, except where the pilot of another aircraft also needs to transmit his intentions or, exceptionally, has information critical to the safety of an aircraft in a condition of distress or urgency.
   iv. Phraseology is to comply with the requirements of CAP 413 (Radiotelephony Manual) Chapter 4 Section 6.
   v. SAFETYCOM is not to be used for the conduct of formation flights unless landing at or taking off from an aerodrome for which no other frequency is notified and within the limits specified at sub paragraph (ii).
   vi. Pilots operating at aerodromes without a notified channel are recommended to use SAFETYCOM, but its use is not mandatory. However, if pilots choose to use it, they must make the transmissions listed in CAP 413 as 'essential'. It must not be assumed that all other pilots in the vicinity are monitoring the channel and, as at all other times, pilots must maintain a good lookout.
   vii. No air traffic service is associated with SAFETYCOM. Where an aerodrome lies within controlled airspace, pilots must establish contact with the responsible air traffic services unit, and obtain clearance prior to entering controlled airspace.
   viii. Information transmitted on SAFETYCOM confers no priority or right of way. Pilots shall comply with the Rules of the Air Regulations, including the provisions in relation to avoiding aerial collisions.

GEN 3.4 COMMUNICATION AND NAVIGATION SERVICES (continued)

d) Unless specifically approved by the CAA, SAFETYCOM is not to be used for special events as defined in CAP 403 (Flying Displays and Special Events: A Guide to Safety and Administrative Arrangements). Channels for special events should continue to be requested through existing contacts.

3.2.5 **VHF Low Level Common Frequency for use within the UK Low Flying System (UKLFS)**

a) Available for use by all aircrew, military and civilian, operating in Class G airspace at or below 2000 FT AGL in the UKLFS and should be monitored whenever possible.
b) Pilots should use this channel to broadcast their intentions to help improve situational awareness between all aircrew operating in the same area.
c) The channel assigned is 130.490 and shall be known as the “LL-Common Frequency”.
d) The conditions of use are:

i. Pilots should make use of the LL Common Frequency only when not in receipt of a Lower Airspace Radar Service or other Air Traffic Service, or when operating outside an area where a Frequency Monitoring Code and associated ATC frequency/channel is used.
ii. Pilots should make blind calls. To prevent clutter the channel must not be used as a chat channel.
iii. Transmissions should be accurate, clear and concise.

e) Transmission Timing:

i. When safe and suitable.
ii. When entering/exiting the UKLFS.
iii. At turning points or significant heading changes.
iv. Approaching well-known and recognisable physical features.
v. Any time it is considered beneficial to the safety of the aircraft.

f) Blind call Content:

i. Call Sign.
ii. Aircraft type (and number, in case of formations).
iii. Position in relation to reference points immediately identifiable to other pilots (using cardinal or inter-cardinal directions).
iv. Altitude.
v. Heading.
vi. Next significant reference point.

g) Details of the UKLFS are shown in ENR 6-20 and ENR 6-21.

Note: *Whilst civil aircraft will broadcast their Altitude above sea level based on QNH, military aircraft in the UKLFS will be operating on Radar Altimeter heights and broadcasting their height Above Ground Level. Civil operators should consider their actual height above ground when assessing any potential conflict with military traffic.*

3.2.6 **Common Air-to-Air Channels for General Aviation**

a) Two channels 123.065 and 123.135 have been assigned for Air-to-Air communications. These channels should be used to share important safety information between pilots, where information is not provided by other services, such as ATC or FIS, mainly in uncontrolled airspace.

- Sharing Weather Issues
- Formation Flights
- Flights in Areas without ATC (Airspace Classes Golf and Echo)
- Flights in Areas without FIS Coverage
- Local Competitions (within Flying Clubs)
- Self-Coordination

b) The channels will eventually be allocated European-wide to enable cross-border communication without the necessity to retune to other channels. The International Council of Aircraft Owner and Pilot Associations (IAOPA) can provide an updated list of other States currently using these channels for Air-to-Air communications.

3.2.7 **Emergency Service**

a) An emergency communications and aid service is continuously available on 121.500 from the Distress and Diversion (D & D) section located at RAF (U) Swanwick.
b) Operational control is exercised from RAF (U) Swanwick D & D, callsign 'LONDON CENTRE'. The service provides coverage over the greater part of the United Kingdom above 3000 FT. In addition, the stations and units listed at GEN 3.6 have the capability of providing an emergency service on 121.500. (For further details see GEN 3.6, paragraph 6.5).
c) Pilots of aircraft in emergency and using 121.500 should broadcast the initial 'MAYDAY' or 'PAN PAN' call. The Air Traffic Controller at Swanwick will answer the call and initiate appropriate action. (For use of SSR in emergency see ENR 1.6).
d) If the emergency is ended the pilot should inform the controlling authority of the fact and state his intentions before leaving the frequency. This will ensure that any action to alert diversion aerodromes or other assistance will be cancelled.
e) Details of the ATSUs with Emergency Facilities are shown at GEN 3.6.

GEN 3.4 COMMUNICATION AND NAVIGATION SERVICES (continued)

3.2.8 **Emergency Satellite Voice Calls from Aircraft** – See GEN 3.6.

3.2.9 **Radio Communications between Aerodrome Fire Services and Aircraft during an Emergency**

a) Whenever an emergency has been declared at an aerodrome where this service is notified, aircraft may communicate direct with the Fire Service in attendance with the following conditions:

i. The service must be used only when the aircraft is on the ground.
ii. Contact with ATC, on the appropriate frequency must be maintained.

Note: *This service is only available by arrangement via ATC and may only be used for the duration of the emergency. The fire service does not normally monitor this service at other times.*

b) The availability of this service is indicated in the AD section at item 2.18. It should be noted that the service provided is not an Air Traffic Service.

3.2.10 **Aeronautical Fixed Services**

3.2.10.1 In the United Kingdom the following Aeronautical Fixed Services are provided:

a) The Operational Telephone Network for use by ATC and supporting operational services;
b) the Administrative Telephone Network for use by authorised agencies connected with air traffic operations;
c) the Aeronautical Fixed Telecommunications Network (AFTN), for the exchange of messages between aeronautical fixed stations within the network.

Note: *Messages of authorised categories can be accepted at designated stations for transmission on the AFS. The rules and procedures for handling of communications on the AFS are contained in Annex 10, Vol II Chapters 3-4.*

3.3 Aeronautical Broadcast Service

3.3.1 The Aeronautical Broadcast Services provide broadcasts which contain meteorological, navigation and aerodrome information.

3.3.2 Details of navigation and aerodrome information broadcasts are listed under the name of the controlling aerodrome or Air Traffic Control Unit in the AD section at 2.18/3.17 (Air Traffic Services Communication Facilities).

3.3.3 Meteorological Radio Broadcasts (VOLMET) are available for the use of aircraft in flight. Full details are given in subsection GEN 3.5, paragraph 7 (VOLMET Service).

3.3.4 Aeronautical Fixed Service (AFS) Operational Meteorological (OPMET) information broadcasts are disseminated to all civil aviation users that register for access to the AFS OPMET Service. Full details are given in subsection GEN 3.5, paragraph 9 (Other automated meteorological services).

4 Requirements and Conditions

4.1 **Approval and Licensing of Aircraft Radio Stations**

4.1.1 **General**

4.1.1.1 The Civil Aviation Authority must approve in writing the design and installation of radio equipment in aircraft and the station must be licensed by the Ofcom, Aeronautical Licensing Section before such radio equipment may be operated in an aircraft. The regulations governing the compulsory carriage of radio equipment are contained in Part III of the UK Air Navigation Order.

4.1.2 **Approval and Licensing Procedure**

4.1.2.1 Full details of the procedure governing the approval and licensing of aircraft radio stations, together with information regarding modifications to such stations, are contained in Assimilated Regulation (EU) 2018/1139 (the UK Basic Regulation) and its delegated and implementing act.

The approval of an aircraft radio station is based, among other things, upon the results of radio tests in flight; details of the associated procedures are given below.

4.1.3 **Carriage of Radio and Radar Equipment**

4.1.3.1 The requirements for the carriage of radio and radar equipment are contained in the UK Air Navigation Order and the Air Navigation (General) Regulations 1993 as amended. The main provisions are published at GEN 1.5 paragraph 5.

4.1.4 **Radio Tests in Flight**

4.1.4.1 The CAA only expects Radio Tests in flight to be carried out in exceptional circumstances.

4.1.4.2 Tests of VHF RTF communications equipment may be carried out with one of the Air Traffic Service Units listed below. Such tests may only be carried out on the frequency stated and when the aircraft is within the Designated Operational Coverage (DOC) of

GEN 3.4 COMMUNICATION AND NAVIGATION SERVICES (continued)

the station as described in the table below.

Air Traffic Service Unit	RTF Call sign	Channel/ Frequency (MHz)	DOC (based upon ARP unless otherwise stated)
Aberdeen/Dyce	Aberdeen Approach / Aberdeen Radar	119.055	55 NM / FL 250
Belfast Aldergrove	Aldergrove Approach / Aldergrove Radar	133.130	60 NM / FL 245
Birmingham	Birmingham Radar	123.980	40 NM / FL 200
Bournemouth	Bournemouth Approach / Bournemouth Radar	119.480	50 NM / FL 120
Cambridge	Cambridge Approach	120.965	40 NM / FL 200
Cardiff	Cardiff Approach / Cardiff Radar	125.855	50 NM / FL 190
East Midlands	East Midlands Radar	134.180	60 NM / FL 150
Edinburgh	Edinburgh Approach /Edinburgh Radar	121.205	40 NM / FL 100
Exeter	Exeter Approach / Exeter Radar	128.980	40 NM / FL 160
Glasgow	Glasgow Approach / Glasgow Radar	119.105	25 NM / FL 100
Isle of Man	Ronaldsway Approach / Ronaldsway Radar	120.855	40 NM / FL 100
Leeds Bradford	Leeds Approach / Leeds Radar	134.580	40 NM / FL 100
Liverpool	Liverpool Approach /Liverpool Radar	119.855	40 NM / FL 100
London Terminal Control	Stansted Radar	120.625	Within the operational area of Stansted Radar.
Newcastle	Newcastle Approach / Newcastle Radar	124.380	60 NM / FL 250
Norwich	Norwich Approach / Norwich Radar	119.355	40 NM / FL 70
Prestwick	Prestwick Approach / Prestwick Radar	129.455	40 NM / FL 195
Shoreham	Shoreham Approach / Shoreham Tower / Shoreham Radio	123.155	25 NM / FL 100
Southend	Southend Approach / Southend Radar	130.780	40 NM / FL 100
Sumburgh	Sumburgh Tower	118.255	25 NM / FL 40

4.1.4.3 Please note that not all these aeronautical radio stations operate H24, for hours of operation refer to the relevant aerodrome's AIP entry.

4.1.4.4 Prior arrangement with these aeronautical radio stations is not required, however, when radio traffic conditions are unfavourable it may not be possible for tests to be carried out. Where possible prior arrangements with the ATSU concerned should be made.

4.1.4.5 Test of HF RTF communications equipment may be carried out with any ATSU that is suitably equipped, it should be noted that the UK does not have any ATSU that operate HF for this purpose.

4.1.4.6 Radio tests in flight of other radio equipment, including the testing of all prototype radio equipment, shall only be carried out with the prior agreement of the Safety Regulation Group of the Civil Aviation Authority.

4.1.4.7 **Conditions for Tests**

4.1.4.7.1 Except where problems are suspected to have developed during the current flight, RTF equipment tests in flight shall only be made following satisfactory ground testing.

4.1.4.7.2 VHF RTF test transmission may only be made with the following emission characteristics.

4.1.4.7.2.1 6K80A3EJN for 25 kHz frequency assignments.

4.1.4.7.2.2 5K00A3EJN for 8.33 Channel assignments.

4.1.4.7.3 HF RTF test transmissions may only be made, using fixed or trailing antenna, with either 2K70J3EJN or 6K00A3EJN emission characteristics as appropriate to the radio station that the communications is with.

4.1.4.8 **Priority of Messages**

4.1.4.8.1 Communications concerning safety or flight regularity will always be given priority over messages transmitted for test purposes.

4.1.4.9 **Radio Test in Flight Procedure**

4.1.4.9.1 Aircraft must meet minimum airworthiness requirements before commencing any flight for radio test in flight purposes.

4.1.4.9.2 Aircraft must comply with the Air Traffic Service rules applicable to the area within which they are flying.

4.1.4.9.3 All radio transmissions for test in flight purposes shall be of the minimum duration necessary for the test and shall not continue for

more than 10 seconds. The recurrence of such transmissions shall be kept to the minimum necessary for the test.

4.1.4.9.4 The nature of the test transmission shall be such that it is identifiable as a test transmission and can not be confused with other communications. To achieve this the following format shall be used:

a) 'the call sign' of the aeronautical radio station being called, followed by the words ‘THIS IS’;
b) 'the aircraft identification';
c) the words ‘RADIO CHECK ON’;
d) 'the channel (or frequency (MHz))' being used for the test;
e) 'the aircraft identification'.

4.1.4.9.5 The operator of the aeronautical radio station being called will assess the transmission and will advise the aircraft making the test transmission in terms of the readability scale below, together with a comment on the nature of any abnormality noted (ie excessive noise) using the following format:

a) ‘the aircraft identification' followed by the words ‘THIS IS’;
b) 'the call sign' of the aeronautical radio station replying;
c) information regarding the readability of the aircraft transmission using the words ‘READABILITY x’ where 'x' is a number taken from the table below that equates to the assessment of the transmission;
d) additional concise and unambiguous information with respect to the noted abnormality may be given;
e) 'the call sign' of the aeronautical radio station replying;
f) for practical reasons it may be necessary for the operator of an aeronautical radio station to reply with ‘THIS IS' followed by 'the call sign' of the aeronautical radio station ‘STATION CALLING ON’ state 'the channel (or 8.33 frequency (MHz)) UNREADABLE’

Quality	Scale
Unreadable	1
Readable now and then	2
Readable but with difficulty	3
Readable	4
Perfectly Readable	5

4.1.4.9.6 The test transmission and reply thereto are recorded at the ATSU.

4.1.4.9.7 The operator of the airborne station shall complete a 'Flight Test Report' based upon the assessment information conveyed to them, this should be recorded in the aircraft maintenance records. Action should be taken to rectify any identified problems be fore further test or use.

4.2 Approval and Licensing of Ground Radio Stations

4.2.1 General

4.2.1.1 The Civil Aviation Authority must approve in writing the operation of a ground radio station and the station must be licensed by Ofcom under the terms of the Wireless Telegraphy Act before it may be operated.

4.2.2 Approval and Licensing Procedure

4.2.2.1 Full details of the procedures governing the approval and licensing of ground radio stations are obtainable from:

Post: Civil Aviation Authority, ATM Oversight Team, Aviation House, Gatwick Road, Gatwick Airport South, West Sussex RH6 0YR
Phone: 03301-382036/03301-382883
Email: Approvals.RCS@caa.co.uk

4.2.2.2 Full details of the procedures governing the Wireless Telegraphy Act, aeronautical licensing are obtainable from:

Http: www.ofcom.org.uk/manage-your-licence/radiocommunication-licences/aeronautical-licensing

4.3 Malfunctions, Maintenance and Test Transmissions

4.3.1 During periods of malfunction or maintenance of navigational aids, the promulgated identification signal is suppressed as a means of warning users that the transmission cannot be safely used for navigation purposes. The identification signal will be suppressed in one of two ways:

a) by complete removal;
b) by radiating a continuous tone.

GEN 3.4 COMMUNICATION AND NAVIGATION SERVICES (continued)

4.3.2 Any transmission using the identification 'TST' is radiating for test purposes only and must not be used for operational purposes.

4.4 **Interference from High Powered Transmitters**

4.4.1 Pilots are advised that interference may be experienced in aircraft flying in the vicinity of high power broadcast stations. If such interference is troublesome or is experienced well beyond the vicinity of the ground transmitter, pilots are requested to report concerns to the Civil Aviation Authority.

4.4.2 The CAA coordinates through Ofcom to ensure that any changes or additions to the FM broadcasting service in the UK and adjacent states do not have any impact on FM immune ILS/VOR navigation and VHF communications receivers. Older receivers that do not meet the FM immune standard may suffer interference.

4.4.2.1 Since 1 Jan 2001, the use of FM-immune ILS/VOR navigation and VHF communications receivers is required for IFR operations within the London and Scottish FIRs. Further details of FM immunity requirements are listed in GEN 1.5.

4.4.3 Safety concerns can be reported to the CAA marked for the attention of ‘CNS and Spectrum Team’ using the details below:

Post: Civil Aviation Authority, CNS and Spectrum Team, Aviation House, Gatwick Road, Gatwick Airport South, West Sussex RH6 0YR
Http: www.caa.co.uk/Our-work/Make-a-report-or-complaint/Report-a-safety-concern/

Reports should include the following information:

a) Frequency on which interference occurred;
b) Approximate position and height of aircraft;
c) aircraft registration letters;
d) date and time of interference;
e) description of interfering signal e.g. music, speech, language, etc.

4.4.4 Other sources of High Intensity Radio Transmission (HIRTA) are listed in the ENR Section. Pilots are warned that within the areas defined, interference or damage to aircraft electronic equipment may occur. Navigation information from equipment may be unreliable.

5 Miscellaneous

5.1 To be developed.

GEN 3.5 METEOROLOGICAL SERVICES

1 Responsible Service

1.1 The Civil Aviation Authority is the Meteorological Authority for the United Kingdom (UK). This authority is derived from Directions issued under section 66(1) of the Transport Act 2000 relating to the Civil Aviation Authority's performance of air navigation functions. The policy of the UK Met Authority is to discharge its responsibilities for the provision of meteorological services to UK based national and international civil aviation operations in accordance with International, European, and National requirements as may be promulgated from time to time including Assimilated Regulation UK Reg 2017/373, hereafter referred to as UK Reg (EU) 2017/373, ICAO Annex 3 and CAP 746.

Post: Civil Aviation Authority, Aviation House, Beehive Ringroad, Crawley, West Sussex, RH6 0YR
Email: metauthority@caa.co.uk

1.2 Meteorological forecasting and climatological services for civil aviation in the United Kingdom are provided by the Met Office designated as the Meteorological Air Navigation Service Provider (ANSP) for the UK under the UK Service Provision Regulation:

Post: Hd Aviation Business, Met Office, Fitzroy Road, Exeter, EX1 3PB

Phone: 0330-135 0000 and 0370-900 0100 or outside the UK +44 (0)330-135 0000

Fax: 0330-135 0050 or outside the UK +44 (0)330-135 0050

AFS: EGRRYTYH (Administrative) or EGRRYMYX (Operations Centre)

Email: enquiries@metoffice.gov.uk

1.3 Applicable ICAO Documents

1.3.1 The Standards, Recommended Practices and, when applicable, the procedures contained in the following ICAO documents are applied:

Annex 3	- Meteorological Service for International Air Navigation;
Doc 7754	- Air Navigation Plan - EUR Region;
Doc 8400	- PANS - ICAO Abbreviations and Codes;
Doc 8755	- Air Navigation Plan - NAT Region;
Doc 8896	- Manual of Aeronautical Meteorological Practice;
Doc 9328	- Manual of Runway Visual Range Observing and Reporting Practices.

1.3.2 The UK Met Authority's objective is to supply operators, flight crew members, ATS units, airport management and other civil aviation users with the meteorological information necessary for the performance of their respective functions, thus contributing towards the safety, regularity and efficiency of air navigation. All ICAO Annex 3 standards and recommended practices, including ICAO definitions listed in Chapter 1 of Annex 3, are applied in the UK unless a difference has been filed with ICAO. UK differences from ICAO standards and recommended practices are listed in GEN 1.7.

2 Area of Responsibility

2.1 The United Kingdom provides area Meteorological Watch for the London and Scottish FIR/UIRs and for the Shanwick Oceanic FIR. The Met Office's Operations Centre, Exeter, acts as the Meteorological Watch Office (MWO) for these areas.

2.2 The UK operates one of the two World Area Forecast Centres (WAFC), responsible for the provision of global forecasts of significant weather and the following global grid point data; wind, temperature, humidity, tropopause height and temperature, maximum wind speed, direction and height. In the event of an interruption of the operation of a WAFC, its functions will be provided by the other WAFC. Additionally, the UK operates a Volcanic Ash Advisory Centre; further information on this service can be found at https://www.metoffice.gov.uk/services/transport/aviation/regulated

3 Meteorological Observations and Reports

3.1 **Observing Systems and Operating Procedures**

3.1.1 Surface wind sensors on aerodromes are positioned to give the best practical indication of the winds which an aircraft will encounter during take-off and landing within the layer between 6 and 10 M above the runway(s). The surface wind reported for take-off and landing by ATS Units at aerodromes supporting operations by aircraft whose maximum total weight authorised is below 5700 KG is usually an instantaneous wind measurement with direction referenced to Magnetic North. However, at other designated aerodromes the wind reports for take-off and landing are averaged over the previous 2 minutes. Variations in the wind direction are given when the total variation is 60° or more and the mean speed 3 KT or more, the directional variations are expressed as the two extreme directions between which the wind has varied in the past 10 minutes. In reports for take-off, surface winds of 3 KT or less include a range of wind directions whenever possible if the total variation is 60° or more. Variations from the mean wind speed (gust and lulls) during the past 10 minutes are only reported when the variation from the mean speed has

GEN 3.5 METEOROLOGICAL SERVICES (continued)

exceeded 10 KT. Such variations are expressed as the maximum and minimum speeds attained.

3.1.1.1 At aerodromes which normally report surface wind averaged over the previous 2 minutes, the instantaneous wind velocity is available on request. Where an instantaneous wind velocity has been requested the word 'instant' will be inserted in the report (eg. 'G-CD Runway 34 cleared to land instant surface wind 270 7' or 'G-CD Runway 34 cleared to land instant 270 7'). An indication of the wind velocity normally reported at particular aerodromes is included in Table 3.5.3.2.

3.1.1.2 Surface wind measurements contained in the Meteorological Aerodrome Report, METAR and special report are referenced to True North and are averaged over the previous 10 minutes, except when during the 10 minute period there is an abrupt and sustained change in wind direction of 30° or more, with a wind speed of at least 10 KT both before and after the change, or a change in wind speed of 10 KT or more lasting more than 2 minutes. In this case only data occurring since the abrupt change will be used to obtain the mean values. METAR and special reports may give variations in wind direction if during the 10 minute period preceding the time of observation, the total variation in wind direction is 60° or more but less than 180° and the speed is 3 KT or more. The maximum speed is only given if it exceeds the mean speed by 10 KT or more. At aerodromes with wind sensors at two or more sites, METAR surface wind reports are always obtained from one designated 'aerodrome system' irrespective of the system currently in use by the ATS Unit for take-off and landing reports.

3.1.2 Temperature is reported in whole degrees from liquid-in-glass or electrical resistance thermometers located in a ventilated screen.

3.1.3 Horizontal surface visibility is assessed by human observer, assisted at some aerodromes by a visiometer. Visibility is reported in increments of 50 M up to and including 800 M and then increments of 100 M up to 5000 M and in units of kilometres for 5000 M or more.

3.1.3.1 Pilots are reminded that surface visibility forecast in a TAF, TREND or Area Forecast might be subject to marked deterioration caused by smoke at any time. Such deteriorations in surface visibility will be reported as they occur in routine or special aerodrome meteorological reports and forecasts might consequently be amended. It is not possible to forecast the onset or cessation of the smoke, or the precise amount of visibility deterioration. Turbulence and breathing difficulty might be encountered in the area affected by the smoke.

3.1.4 For aerodromes employing IRVR systems.

3.1.4.1 RVR tendency abbreviations U, D or N shall be reported in METARs. When the variation of the RVR values shows an upward or downward tendency, this should be indicated by the abbreviation 'U' or 'D', respectively. In cases when actual fluctuations during the 10-minute period show no distinct tendency, this should be indicated using the abbreviation 'N'. When indications of tendency are not available, no abbreviations should be included.

3.1.4.2 When the RVR is above the maximum value that can be determined by the system in use, it shall be reported using the abbreviation 'ABV' in local routine and local special reports, and when the RVR is below the minimum value that can be determined by the system in use, it shall be reported using the abbreviation 'BLW' in local routine and local special reports.

3.2 **Accuracy of Meteorological Measurement or Observation**

The United Nation's World Meteorological Organisation (WMO) has assessed the attainable accuracy of meteorological measurement or observation of a number of meteorological parameters, described below. However it should be noted that in most cases this exceeds the requirements for aeronautical meteorological observations specified by ICAO.

Element	Accuracy of Measurement or Observation
Mean surface wind	Direction: ± 5° Speed: ± 1 KT up to 10 KT, ± 10% above 10 KT
Variations from the mean surface wind speed	± 1 KT
Visibility	± 50 M up to 550 M ± 10 % between 600 M and 1500 M ± 20 % above 1500 M
RVR	± 10 M from 50 M to 400 M ± 25 M from 400 M to 800 M ± 10 % above 800 M
Cloud amount	± 1 okta
Cloud height	± 30 FT up to 300 FT ± 10 % above 300 FT
Air temperature and dew point temperature	± 1°C
Pressure value (QNH, QFE)	± 0.5 hPa

3.3 Details of UK aerodromes certified to provide METARs are listed in Table 3.5.3.2. Whilst a list of those aerodromes certified to provide local observations only is given in paragraph 3.7.

3.4 **Aerodrome Weather Warnings Service**

3.4.1 Aerodrome Warnings will be issued at the times shown in the table below, and for the periods of validity indicated, if one or more

GEN 3.5 METEOROLOGICAL SERVICES (continued)

of the specified phenomena occurs or is expected to occur (Note: Thunderstorms will have at least 15 minutes lead time). If it is forecast that there is a 40% or greater chance that the phenomena will occur, the warning will say that the phenomena is 'likely to occur'. If there is a less than 40% chance that the phenomena will occur, the warning will say that the phenomena 'may occur':

Set review and Issue Times between (See Note)	Maximum Validity Period Thunderstorm warnings	Maximum Validity Period All other warnings
0530 - 0545	0600 - 1200	1200 - 1800
1130 - 1145	1200 - 1800	1800 - 0000
1730 - 1745	1800 - 0000	0000 - 0600 (next day)
2330 - 2345	0000 - 0600 (next day)	0600 - 1200 (next day)
Note: *For operational reasons certain aerodromes will be provided with an Enhanced Warning Service and at these aerodromes warnings will be issued and amended 24/7 as required.*		

a) Gales (when the mean surface wind is expected to exceed 33 KT, and/or if gusts are expected to exceed 42 KT);
b) Strong wind warnings (When the surface wind is expected to reach or exceed mean wind speed 20 KT and/or gusts of 28 KT);
c) thunderstorms, hail or squalls;
d) snow, including the:

   i. time of onset;
   ii. intensity (slight, moderate or heavy);
   iii. expected time of cessation (including thaw if appropriate);
   iv. approximate depth of snow likely (cm) and;
   v. type of snow (Wet or Dry);
   vi. possibility of drifting (significant falls of snow with high winds (>15 KT);
   vii. visibility when expected to fall below 600 M.

e) frost warnings are issued when any of the following conditions are expected:

   i. A ground frost with air temperatures not below freezing point;
   ii. the air temperature above the surface is below freezing point (air frost);
   iii. frozen deposits (hoar frost, rime or glaze) are expected to form on parked aircraft, runways or taxiways.

f) fog (when the visibility is expected to fall below 600 M);
g) freezing rain or drizzle.

Amendments or cancellations will not be issued.

3.4.2 Aerodrome operators requiring notification of the above warnings should apply to the MET Authority (see GEN 3.5 paragraph 1).

3.4.3 The normal method of notifying Aerodrome Warnings is by a single AFS or email to the aerodrome, with local dissemination of the warning being the responsibility of the aerodrome operator. Warnings will also be published on the Met Office website: https://www.metoffice.gov.uk/services/transport/aviation/regulated/aviation-briefing-service-guidance and all aviation users can register via the website to receive email alerts.

3.5 **Special Facilities**

3.5.1 Warnings of Marked Temperature Inversion are issued whenever a temperature difference of 10°C or more exists between the surface and any point up to 1000 FT above the aerodrome. This warning is broadcast on departure and arrival ATIS at aerodromes so equipped, or in the absence of ATIS passed by radio to departing aircraft before take-off, and to arriving aircraft as part of the report of aerodrome meteorological conditions.

3.5.2 **Windshear Warning Service**

3.5.2.1 Forecasters regularly review the weather conditions and monitor aircraft reports of windshear experienced on the approach or climb out. Where a potential low level (below 1600 FT) windshear condition exists, a Warning is issued; this will be based on one or more of the following criteria:

a) Mean surface wind speed at least 20 KT;
b) the magnitude of the vector difference between the mean surface wind and the gradient wind (an estimate of the 2000 FT wind) at least 40 KT;
c) thunderstorm(s) or heavy shower(s) within approximately 5 NM of the airport.

Note 1: *Warnings are also issued based on recent pilot reports of windshear on the approach or climb-out.*

Note 2: *Windshear warnings will be cancelled when aircraft reports indicate that windshear no longer exists.*

3.5.2.2 The Warning message is given in the arrival and departure ATIS broadcasts in one of three formats:

a) 'WINDSHEAR FORECAST' (WSF) - when the meteorological conditions indicate that low level windshear on the approach or climb-out (below 2000 FT) might be encountered;
b) 'WINDSHEAR FORECAST AND REPORTED' (WSFR) - as above, supported by a report from at least one aircraft of windshear on the approach or climb-out within the last hour;

GEN 3.5 METEOROLOGICAL SERVICES (continued)

c) 'WINDSHEAR REPORTED' (WSR) - when an aircraft has reported windshear on the approach or climb-out within the last hour, but insufficient meteorological evidence exists for the issue of a forecast of windshear.

3.5.2.3 Pilot reports of windshear on approach or climb-out can greatly enhance the operational efficiency of this service. In addition, they also serve in the continuous evaluation of the criteria upon which Warnings are forecast. Thus pilots who experience windshear on the approach or climb-out are requested to report the occurrence to ATC, as soon as it is operationally possible to do so, even if a warning has been issued. Windshear reporting criteria are shown at paragraph 6.3.2. Pilots who experience windshear at any UK aerodrome are requested to report it in the same way.

Note: *No UK aerodromes are currently equipped with automated ground-based remote-sensing equipment for the detection of windshear.*

3.5.3 **Runway Visual Range (RVR)**

3.5.3.1 RVR assessment is made by either a Human Observer or an Instrumented RVR system (IRVR). Most IRVR systems have an upper limit of 1500 M; the upper limit of the Human Observer system is normally less than this. The system in use at particular aerodromes is indicated in Table 3.5.3.2, and explained in Table 3.5.3.3.

3.5.3.2 The United Kingdom standard RVR reporting incremental scale is 25 M between 0 and 400 M, 50 M between 400 and 800 M, and 100 M above 800 M. Some IRVR systems are unable to report every incremental point in the scale. Known limitations in IRVR systems are as follows:

Liverpool (EGGP)	IRVR 50 - 1500 M (175 M not reported).
London/City (EGLC)	IRVR 50 - 1500 M IRVR remains serviceable if TDZ fails.
London Gatwick (EGKK)	RWY 08L IRVR remains serviceable if TDZ fails.
	RWY 26R TDZ IRVR is considerably displaced from Start-to-Roll position.

3.5.3.3 The assessment and reporting of RVR begins whenever the horizontal visibility or the RVR is observed to be less than 1500 M. At those aerodromes where IRVR is available, RVR may also be reported when the observed value is at or below the maximum reportable value or when shallow fog is forecast or reported.

3.5.3.4 RVR is passed to aircraft before take-off and during the approach to landing. Changes in the RVR are passed to aircraft throughout the approach. Additionally, information from pilot reports or ATC observation that the visibility on the runway is worse than that indicated by the RVR report, for example patches of thick fog, are passed.

3.5.3.5 Table 3.5.3.2 shows which IRVR system is provided at an aerodrome. Aerodromes using AGIVIS systems suppress mid-point and/or stop-end values when:

a) They are equal to or higher than the touchdown zone value unless they are less than 400 M; or
b) they are 800 M or more.

Aerodromes using MET-1 systems suppress mid-point and/or stop-end values unless they are 550 M or less.

3.5.3.6 At those aerodromes having multi-site IRVR the standard UK procedure is that the touchdown zone RVR is always given first, followed by any values for the mid-point RVR and/or stop-end RVR which have not been suppressed. With the above in mind, the co-operation of the pilots is sought in avoiding unnecessary radio requests for mid-point and/or stop-end values when they have not been given. When all three values are given they are passed as a series of numbers, for example, 'RVR 600, 500, 550' relates to touchdown zone, mid-point and stop-end respectively. If two values are to be passed, they are to be individually identified, eg 'touchdown 650, stop-end 550'.

3.5.3.7 If a single transmissometer fails, and the remainder of the IRVR system is still serviceable, RVR readings are not suppressed for the remaining sites and these values are passed to pilots. For example, if the touchdown zone transmissometer is unserviceable, 'RVR: touchdown not available, mid-point 600, stop-end 400'. If two transmissometers fail in a three-site IRVR system, the remaining value is passed and identified provided that it is not the stop-end value, in which event the system is considered unserviceable for that runway direction. In a two-site IRVR system, giving touchdown zone and stop-end values, if the touchdown zone transmissometer fails, the system is considered unserviceable for that runway direction.

3.5.3.8 When RVR information is not available, or when the RVR element of Aerodrome Operating Minima falls outside the range of reportable RVR, pilots should use meteorological visibility in the manner specified in their operations manuals, or at AD 1.1 subsection 4 (Aerodrome Operating Minima – Non-public transport flights by aircraft).

3.6 Climatological information for certain UK aerodromes is available for civil aviation purposes from the Met Office, according to the following criteria:

Table 3.5.3.1 — Climatological Information

A	Climatological statistics readily available based on at least 10 years' of three-hourly (usually hourly) data.
B	Climatological statistics readily available based on less than 10 years' data and/or some gaps in night-time data.
C	Limited climatological statistics available based on available METAR reports starting July 1983 or later.
D	No data available or insufficient data available to provide climatological statistics.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

The aerodromes are so classified at Table 3.5.3.2.

3.6.1 Climatological statistics for routes and areas in the United Kingdom are not available. However, global climatology of upper wind and temperature data is held by the Met Office.

3.6.2 Climatological data related to sites for new aerodromes (or additional runways at existing aerodromes) are available from the Met Office.

	METAR *	Trend Forecast appended to METAR
Observation Frequency (column 3)	h	half-hourly
	h/H	half-hourly during operational hours/Hourly overnight
Observation Warnings (column 4)	AW	Aerodrome warning includes warning of Marked Temperature Inversion.
	Windshear	Aerodrome warning includes warning of windshear.
Surface Wind (column 5)		See paragraphs 3.1 and 3.2.
RVR (columns 6 and 7)	TDZ	touchdown zone
	MID	mid-point
	END	stop end
	OBS	human observer
	AGIVIS, Biral, CS, MET-1, Telvent & Vaisala	types of IRVR system
	FSM	Forward Scatter Meter
Observing hours (column 8)	HO	available to meet operational requirements (ie during aerodrome opening hours)
	HO+	more than HO but not H24
	H24	24 hours
Climatological data (column 9)	A, B, C, D	See Table 3.5.3.1
Note: *Table 3.5.3.2 lists only those aerodromes with accredited observers that produce METARs. Observations from other aerodromes not listed shall be regarded as unofficial.*		

3.7 The following aerodromes are certified to provide local meteorological observations:

Aerodrome / Location Indicator

Barra EGPR, Blackbushe EGLK, Chichester Goodwood EGHR, Duxford EGSU, Elstree EGTR, Fairoaks EGTF, Kemble EGBP, Lerwick/Tingwall EGET, Llanbedr EGFD, London Heliport EGLW, Manchester Barton EGCB, Old Warden EGTH, Penzance Heliport EGHK, Redhill EGKR, Shobdon EGBS, Solent EGHF, Walney EGNL, Warton EGNO, Wellesbourne Mountford EGBW, West Wales/Aberporth EGFA, Wolverhampton/Halfpenny Green EGBO, Wycombe Air Park/Booker EGTB, Yeovil/Westland EGHG →

GEN 3.5 METEOROLOGICAL SERVICES (continued)

3.8 **Aerodrome Weather Report Codes (Actuals)**

3.8.1 The content and format of an actual weather report is as shown in the following table:

Report Type	Location Identifier	Date/Time	Automatic Observation	Wind	Visibility	RVR	Present weather
METAR	EGZZ	231020Z	AUTO	31015G30KT 280V350	6000 2500SW	R24/P1500	SHRA

Cloud	Temp/ Dewpoint	QNH	Recent Weather	Windshear	Sea Surface Temperature and Sea State	TREND
FEW005 SCT010CB BKN025	10/03	Q0995	RETS	WS RWY 24	W07/S4	NOSIG

Note: *UK Aerodromes should not insert windshear groups in METAR since these are passed to pilots by the ATS unit.*

3.8.2 **Identifier**

3.8.2.1 The identifier has three components as shown below:

a) Report type

i. METAR - Aviation routine weather report. These are compiled half-hourly at fixed times while the aeronautical station is open;
ii. SPECI - Aviation selected special weather report. Special reports are prepared to supplement routine reports when improvements or deteriorations through certain criteria occur. However, by ICAO Regional Air Navigation agreement, they are not disseminated in Europe.

b) Location indicator

ICAO four-letter code letters (for UK aerodromes, see GEN 2.4)

c) Date/Time

The date and time of observation, specified as the day of the month, hours and minutes UTC, followed by the letter Z. Example: METAR EGSS 231020Z.

d) AUTO

At aerodromes where a Met observing system is installed that can be operated automatically, it may be possible for the system to generate fully automated weather reports in the form of AUTO METARs. Should an aerodrome wish to provide AUTO METARs then the permission of the CAA is required. Where a report contains fully automated observations with no human intervention, it will be indicated by the code word 'AUTO', inserted immediately before the wind group. Users are reminded that in particular reports of visibility, present weather and cloud from automated systems should be treated with caution due to the limitations of the sensors themselves, the spatial area sampled by the sensors and the associated algorithms employed by the observing system. AUTO METAR shall indicate the limitations of the observing equipment through the use of additional codes, where applicable, given in paragraph 3.8.16.

3.8.3 **Wind**

3.8.3.1 The mean wind direction is given in degrees True (three digits) rounded to the nearest 10 degrees, followed by the mean windspeed (two digits, exceptionally three). The mean is usually calculated from the ten minute period immediately preceding the time of observation. These are followed without a space by one of the abbreviations KT, KMH or MPS, to specify the unit used for reporting the windspeed.

Example: 31015KT

3.8.3.2 A further two or three digits preceded by a G gives the maximum gust speed in knots when it exceeds the mean speed by 10 KT or more

Example: 31015G30KT.

3.8.3.3 Calm is indicated by '00000', followed by the units abbreviation, and variable wind direction by the abbreviation 'VRB' followed by the speed and unit.

3.8.3.4 If, during the 10 minute period preceding the time of the observation, the total variation in wind direction is 60° or more, the observed two extreme directions between which the wind has varied will be given in clockwise order, separated by the indicator letter V but only when the mean speed is 3 KT or more.

Example: 31015G30KT 280V350.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

3.8.4 **Horizontal Visibility**

3.8.4.1 In the METAR, the visibility reported is the prevailing visibility and, under certain conditions, the minimum visibility. Prevailing visibility is the visibility value that is reached or exceeded within at least half the horizon circle or within at least half of the surface of the aerodrome. These areas could comprise contiguous or non-contiguous sectors.

3.8.4.2 If the visibility in one direction which is not the prevailing visibility, is less than 1500 M or less than 50% of the prevailing visibility, the lowest visibility observed should also be reported and its general direction in relation to the aerodrome indicated by reference to one of the eight points of the compass. If the lowest visibility is observed in more than one direction, then the most operationally significant direction should be reported. When the visibility is fluctuating rapidly and the prevailing visibility cannot be determined, only the lowest visibility should be reported, with no indication of direction.

Note: *There is no requirement to report the lowest visibility if it is 10 KM or more.*

3.8.4.3 Visibility is recorded in metres (M) rounded down to:

a) the nearest 50 M when the visibility is 800 M or less;
b) the nearest 100 M when the visibility is greater than 800 M but less than or equal to 5000 M, and expressed in kilometres (KM);
c) The nearest 1 kilometre when the visibility is greater than 5000 M.

Note: *The code 9999 indicates a visibility of 10 KM or more; 0000 a visibility of less than 50 M.*

3.8.5 **RVR**

3.8.5.1 An RVR group always includes the prefix R followed by the runway designator and a diagonal, in turn followed by the touch-down zone RVR in metres. If the RVR is assessed on two or more runways simultaneously, the RVR group will be repeated; parallel runways will be distinguished by appending, to the runway designator, L, C or R indicating the left, central or right parallel respectively.

Examples: R24L/1100 R24R/0750.

3.8.5.2 When the RVR is greater than the maximum value which can be assessed the group will be preceded by the letter indicator P followed by the highest value which can be assessed.

Example: R24/P1500.

3.8.5.3 When the RVR is below the minimum value which can be assessed, the RVR will be reported as M followed by the appropriate minimum value assessed.

Example: R24/M0050.

3.8.5.4 If it is possible to determine mean values of RVR, the mean value of RVR over the 10 minute period immediately preceding the observation will be reported; trends and significant variations may be reported as follows:

a) Trends. If RVR values during the 10 minute period preceding the observation show a distinct increasing or decreasing tendency, such that the mean during the first five minutes varies by 100 M or more from the mean during the second five minutes, this will be indicated by subscripts U or D for increasing or decreasing tendencies; otherwise, subscript N will indicate no distinct change during the period.

   Example: R24/1100D.

b) Significant Variations. When the RVR at a runway varies significantly such that, during the 10 minute period preceding the observation, the 1 minute mean extreme values vary from the 10 minute mean value by either more than 50 M or more than 20% of the 10 minute mean value (whichever is greater), the 1 minute mean minimum and maximum values will be given in that order, separated by V, instead of the 10 minute mean.

   Example: R24/0750V1100.

3.8.5.5 If the 10 minute period immediately preceding the observation includes a marked discontinuity in runway visual range values, only those values occurring after the discontinuity should be used to obtain mean values.

3.8.5.6 A complete RVR group may therefore be of the form:

Example: R24L/0750V1100U.

Note: *Until further notice, UK aerodromes will not be required to report RVR trends and significant variations. RVR is reported when the horizontal visibility or RVR is less than 1500 M. For multi-site RVR/IRVR systems, the value quoted is that for the Touch Down Zone (TDZ). If the RVR is assessed for two or more runways simultaneously, the value for each runway is given.*

3.8.6 **Weather**

3.8.6.1 Each weather group may consist of appropriate intensity indicators and letter abbreviations combined in groups of two to nine

GEN 3.5 METEOROLOGICAL SERVICES (continued)

characters and drawn from the following table:

Table 3.5.3.4 — Significant Present and Forecast Weather Codes

Qualfier		Weather Phenomena		
Intensity or Proximity	**Descriptor**	**Precipitation**	**Obscuration**	**Other**
- Light	BC — Patches	DZ — Drizzle	BR — Mist	DS — Duststorm
	BL — Blowing	GR — Hail	DU — Widespread Dust	FC — Funnel Cloud(s) (tornado or water-spout)
Moderate				
+ Heavy ('Well developed' in the case of FC and PO)	DR — Drifting	GS — Small hail (<5 mm diameter) and/or snow pellets)	FG — Fog	PO — Dust/Sand Whirls (Dust Devils)
VC				
In the vicinity (not at the aerodrome but not further away than approx 8 KM from the aerodrome perimeter)	FZ — Freezing (Super-Cooled)		FU — Smoke	SQ — Squall
	MI — Shallow	PL — Ice-Pellets	HZ — Haze	SS — Sandstorm
	PR — Partial (covering part of aerodrome)	RA — Rain	SA — Sand	—
	SH — Shower(s)	SG — Snow Grains	VA — Volcanic Ash	—
	TS — Thunderstorm	SN —Snow	—	—

3.8.6.2 Mixture of precipitation types may be reported in combination as one group, but up to three separate groups may be inserted to indicate the presence of more than one independent weather type.

Examples: MIFG, VCSH, +SHRA, RASN, -DZ HZ.

Note 1: *BR, HZ, FU, DU and SA will not be reported when the visibility is greater than 5000 M.*

Note 2: *Some codes are shown that will not be used in UK METARs and TAFs but may be seen in continental reports and when flying in Europe.*

3.8.7 **Cloud**

3.8.7.1 A six character group will be given under normal circumstances. The first three to indicate cloud amount:

a) FEW to indicate 1 to 2 oktas;
b) SCT (scattered) to indicate 3 to 4 oktas;
c) BKN (broken) to indicate 5 to 7 oktas;
d) OVC (overcast) to indicate 8 oktas.

and the last three characters indicate the height of the base of the cloud layer in hundreds of feet above aerodrome level.

Example: FEW018.

3.8.7.2 Types of cloud other than significant convective clouds are not identified. Significant clouds are:

a) CB Cumulonimbus;
b) TCU Towering Cumulus.

Example:SCT018CB.

3.8.7.3 Reporting of layers or masses of cloud is made as follows:

a) First Group: Lowest individual layer of any amount;
b) Second Group: Next individual layer of more than 2 oktas;
c) Third Group: Next higher layer of more than 4 oktas;
d) Additional Group: Significant convective cloud if not already reported.

The cloud groups are given in ascending order of height.

Example: FEW005 SCT010 SCT018CB BKN025

3.8.7.4 When there is no cloud below 5000 FT or below the highest minimum sector altitude (whichever is the greater) and there is no towering cumulus or cumulonimbus, 'NSC' (no significant cloud) is reported. However, the amount, height of cloud base and cloud type of towering cumulus or cumulonimbus shall be reported, irrespective of the cloud base height.

3.8.7.5 Sky obscured is coded by VV followed by the vertical visibility in hundreds of feet. When the vertical visibility cannot be assessed

GEN 3.5 METEOROLOGICAL SERVICES (continued)

the group will read VV///: (See GEN 1.7)

Example: VV003.

3.8.8 **CAVOK**

3.8.8.1 The visibility, RVR, weather and cloud groups are replaced by CAVOK when the following conditions exist:

a) Prevailing visibility is 10 KM or more;
b) No minimum visibility is reported
c) No cloud below 5000 FT or below the highest Minimum Sector Altitude, whichever is the greater.
d) No towering cumulus or cumulonimbus clouds.
e) No significant weather phenomena at or in the vicinity of aerodrome.

3.8.9 **Air Temperature/Dewpoint**

3.8.9.1 These are given in Degrees Celsius, M indicates a negative value.

Examples: 10/03, 01/M01.

If the dew point is missing, the temperature would be reported as 10///.

3.8.9.2 Temperatures are reported to the nearest whole degree Celsius, with observed values involving 0.5°C rounded up to the next higher degree Celsius, for example +2.5°C is rounded off to +3°C, -2.5°C is rounded off to -2°C.

3.8.10 **QNH**

3.8.10.1 QNH is rounded down to the next whole hectopascal and reported as a four digit group preceded by the letter indicator Q. If the value of QNH is less than 1000 hPa the first digit will be 0.

Example: Q0995.

3.8.10.2 Where reported in inches of mercury, the pressure is prefixed by 'A', and the pressure entered in hundredths of inches, viz with the decimal point omitted between the second and third figure.

Example: A3027

3.8.11 **Supplementary Information**

a) **Recent Weather**. Recent Weather will be operationally significant weather observed in the period since the previous observation (or in the last hour whichever period is the shorter), but not now. The appropriate present weather code will be used, preceded by the letter indicator RE; up to three groups may be inserted to indicate the former presence of more than one weather type.
b) **Windshear.** UK aerodromes will not insert windshear groups in the METAR, instead it is passed by the local ATS unit to flight crew via RTF.
c) **Sea surface temperature and state.** The sea surface temperature is preceded by the letter indicator W and given in Degrees Celsius, with M indicating a negative value. The sea state is a single numerical value, 0-9, preceded by the letter indicator S and decodes to give the height in metres of well-developed wind waves over the open sea. Sea surface temperature and state are not used in the UK.

Table 3.5.3.5 - State of the Sea

Code	Description	Height (M)
0	Calm (Glassy)	0
1	Calm (Rippled)	0 - 0.1
2	Smooth (Wavelets)	0.1 - 0.5
3	Slight	0.5 - 1.25
4	Moderate	1.25 - 2.5
5	Rough	2.5 - 4
6	Very Rough	4 - 6
7	High	6 - 9
8	Very High	9 - 14
9	Phenomenal	Over 14

Note 1: *These height values may be used by observers when reporting the total state of agitation of the sea resulting from various factors such as wind, swell, currents, angle between swell and wind etc.*
Note 2: *The exact bounding height shall be assigned for the lower code: eg a height of 4 M is coded as sea state 5.*

Example: Sea surface temperature of 13°C with a moderate sea state would be coded in the METAR as: W13 S4.

→

GEN 3.5 METEOROLOGICAL SERVICES (continued)

3.8.12 **TREND**

3.8.12.1 For selected aerodromes, this is a forecast of significant changes in conditions during the two hours after the observation time:

a) Change Indicator: BECMG (becoming) or TEMPO (temporary), which may be followed by a time group (hours and minutes UTC) preceded by one of the letter indicators FM (from), TL (until), AT (at);
b) Weather: Standard codes are used. NOSIG replaces the trend group when no significant changes are forecast to occur during the trend forecast period.

Examples: BECMG FM1100 25035G50KT; TEMPO FM0630 TL0830 3000 SHRA.

3.8.13 **'RMK'**

3.8.13.1 The indicator 'RMK' (remark) denotes an optional section containing additional meteorological elements. It will be appended to METARs by national decision and should not be disseminated internationally. In the UK, the section will not be inserted without the prior agreement of the Met Authority.

3.8.14 **Missing Information**

3.8.14.1 Information that is missing in a METAR or SPECI may be replaced by diagonals.

3.8.15 **Examples of METAR:**

a) METAR EGGX 301220Z 14005KT 1200 0600E R12/1000N DZ BCFG VV/// 08/07 Q1004 NOSIG=
b) METAR EGLY 301220Z 24015KT 200V280 8000 -RA SCT010 BKN025 18/15 Q0983 TEMPO 3000 RA BKN008 OVC020=
c) METAR EGPZ 301220Z 30025G37KT 270V360 1200 0800NE +SHSNRAGS FEW005 SCT010 BKN020CB 03/M01 Q0999 RETS BECMG AT1300 9999 NSW SCT015 BKN100=

The above METAR for 1220 UTC on the 30th of the month, in plain language:

EGGX: Surface wind: mean 140 Deg True, 5 KT; Prevailing visibility 1200 M, minimum visibility 600 M to east; mean RVR 1000 M (at threshold Runway 12, no apparent tendency); moderate drizzle with fog patches ; Sky obscured, vertical visibility not available; dry bulb temperature Plus 8 C, dew point Plus 7 C; Aerodrome QNH 1004 hPa; Trend: no significant change expected next two hours;

EGLY: Surface wind: mean 240 Deg True, 15 KT; varying between 200 and 280 deg; Prevailing visibility 8 KM; Light rain; cloud 3-4 oktas base 1000 FT, 5-7 oktas 2500 FT; dry bulb: plus 18 C, dew point; plus 15 C; QNH 983 hPa; Trend: temporarily 3000 M in moderate rain with 5-7 oktas 800 FT, 8 oktas 2000 FT;

EGPZ: Surface wind: mean 300 Deg True, 25 KT; Gust 37 KT, varying between 270 and 360 deg; Prevailing visibility 1200 M, minimum visibility 800 M to northeast; heavy shower of snow, rain and small hail; 1-2 oktas base 500 FT, 3-4 oktas base 1000 FT, 5-7 oktas CB base 2000 FT; dry bulb: plus 3 C, dew point: minus 1 C; QNH 999 hPa; thunderstorm since previous report. Trend: improving at 1300 UTC to 10 KM or more, nil weather, 3- 4 oktas 1500 FT, 5-7 oktas 10000 FT.

3.8.16 **AUTO METAR coding**

3.8.16.1 Where the observation is generated by an automatic observing system without any human input, the code 'AUTO' shall be inserted between the date/time of the report group and the wind group. In an AUTO METAR or automated weather report on ATIS, the presence or absence of the phenomena may not have been verified by a human observer. Aircraft operators are therefore advised to exercise caution with respect to phenomena likely to affect their flight.

3.8.16.2 Where the observation is generated by an automatic observing system without any human input or supervision and the present weather cannot be detected due to unserviceable or missing present weather sensors, the lack of present weather information should be indicated by two slashes (//). If the present weather sensor is unable to determine the state or form of the precipitation, 'UP' (unidentified precipitation) or 'FZUP' (freezing unidentified precipitation), together with any intensity qualifiers, should be reported as appropriate. If the present weather sensor is serviceable but not detecting any present weather, then no present weather group shall be reported in the METAR.

3.8.16.3 Where the observation is generated by an automatic observing system and showers cannot be determined based upon a method that takes account of convective cloud, precipitation should not be characterised by SH.

3.8.16.4 Recent unidentified precipitation ('REUP') shall be reported if moderate or heavy unidentified precipitation has ceased or decreased in intensity since being reported in the last routine report or within the last hour, whichever is the shorter.

3.8.16.5 When the observation is generated by an automated observing system without human input or supervision the following coding may be seen related to cloud observations.

a) NNNhhh/// Cloud detected, but it is unknown whether it is a convective cloud type (ie TCU or CB).
b) ///////// Detection of cloud height & type not available.
c) NCD No Clouds Detected. No cloud of operational significance or convective cloud detected by the automated system
d) //////TCU Towering Cumulus detected, but no information on its height or cloud cover is available.
e) //////CB Cumulonimbus detected, but no information on its height or cloud cover is available.
f) VCTS Indicates lightning has been detected between 9-16 KM from the aerodrome reference point.

4 Types of Service

4.1 **Forecast Offices providing a service to Civil Aviation**

4.1.1 The designated forecast office(s) for principal aerodromes are given in AD 2.11 (Meteorological Information Provided), in the Aerodromes section of the AIP. Designated forecast offices operate H24.

4.1.2 Some Military and Government aerodromes provide a forecast and briefing service for Civil Aviation, but only for departures from those aerodromes.

4.2 **Pre-flight Briefing**

4.2.1 The primary method of meteorological briefing for flight crew in the UK is by self-briefing, using information and documentation routinely displayed in aerodrome briefing areas. English is the language used for all UK documentation and forecast clarification. The primary method of briefing does not require prior notification to a Forecast Office.

4.2.2 Where this primary method is not available, or is inadequate for the intended flight, Special Forecasts, as described at paragraph 5, may be provided.

4.2.3 A wide range of meteorological information is available on the world wide web for pre-flight planning. Flight Briefing Information from the Met Office is available at **http://www.metoffice.gov.uk/aviation**. However, users should be aware of the risks of use of the public Internet in this regard. This includes, but not limited to, a browsers' cache facility not providing the user with the very latest information; delays to, or irregular update of sites; or the receipt of falsified data purporting to have come from a legitimate provider. Users should ensure, wherever possible, that the data is up to date and consistent with the general weather situation.

4.2.4 When necessary, the personal advice of a forecaster, or other meteorological information, can be obtained from the appropriate forecast office. Pilots departing from Military or Government aerodromes may find an on-site Forecaster or Briefing Service available. **Forecaster advice or other information for safety related clarification/amplification will only be given on the understanding that full use has already been made of available meteorological briefing material. Forecaster clarification/ amplification of conditions en-route is not provided for flights departing from locations outside the UK**.

4.2.5 The Met Office operates a centralised telephone enquiry system. Pilots should state their requirements to the operator who may provide the necessary information or who will promptly transfer the call to the most suitable location.

Table 3.5.4.1 — Forecast Offices providing service to Civil Aviation

Forecast Office	Services Available	Telephone	Remarks
Met Office	A, B, C, D, E	0370-900 0100	Alternate 0330-135 0000.
Isle of Man Airport	A, B, C	01624-821641	Isle of Man services B and C available only to departures from within the Isle of Man.
Jersey Met	A, B, C	01534-448765	Jersey Met services B and C available only to departures from within the Channel Islands.

Key to Services Available:

A. – Provision of TAF, warnings and take-off data for the assigned principal aerodrome. Amplification/ clarification of these aerodrome forecasts and warnings only.

B. – Dictation of TAFs and METARs unobtainable from the automated services (usually limited to four aerodromes).

C. – Amplification/clarification of GAMET Regional/Area Forecasts and Metforms 214/215, and requests for Special Forecast.

D. – Dictation of GAMET amendments and Regional Forecasts.

E. – Amplification/clarification and amendments for Metforms 414/415 and EUR Charts

4.2.6 Forecast Offices and self-briefing facilities are under no obligation to prepare briefing documentation packages.

4.2.7 Meteorological observations and forecasts have certain expected tolerances of accuracy. Pilots interpreting observations and forecasts should be aware that information could vary within these tolerances, which are shown at paragraph 3.2 and Table 3.5.4.3. respectively. Additionally, observations and forecasts are not normally amended until certain criteria for change are exceeded. These are shown at paragraph 4.7.

4.2.8 The specific value of any of the elements given in a forecast shall be understood to be the most probable value which the element is likely to assume during the period of the forecast. Similarly, when the time occurrence or change of an element is given in a

forecast, this time shall be understood to be the most probable time.

4.2.9 The issue of a new forecast, such as an aerodrome forecast, shall be understood to automatically cancel any forecast of the same type previously issued for the same place and for the same period of validity or part thereof.

4.3 **UK Low Level Weather and Spot Wind Forecast Charts – Metform 215/214**

4.3.1 **The UK Low Level Forecast (Metform 215)** is a forecast of in-flight conditions from the surface to 10000 FT, covering the UK and near Continent. The form comprises:

a) A fixed time forecast weather chart and text box describing the expected visibility and weather, the cloud and the height of the zero degree isotherm in each separate area of weather highlighted on the chart. An outlook box describes the main weather developments in the 7-hour period beyond the end of the validity period of the forecast.
b) A separate outlook chart, available on the internet only, shows the expected position of the principle synoptic features, 1 hour after the end of the validity period of the forecast.

4.3.2 Information on Form. The following sub-paragraphs summarise the contents of Metform 216 (Explanatory Notes for Form 215), available in A4 or larger size on application to the address at paragraph 1.2.

4.3.2.1 **Main Forecast Weather Chart and Text**

a) The fixed time weather chart

i. The weather chart shows the forecast position, direction and speed of movement of surface fronts and pressure centres for the fixed time shown in the chart legend. The position of highs (H) and lows (L), with pressure values in hectopascals is shown by the symbols O and X. The direction and speed of movement (in knots) of fronts and other features is given by arrows and figures. Speeds of less than 5 knots are shown as 'SLOW'.
ii. Zones of distinct weather patterns are enclosed by continuous scalloped lines, each zone being identified by a letter within a rectangle. The forecast weather conditions (visibility, weather, cloud and height of the zero degree isotherm) during the period of validity, together with warnings and any remarks are given in the text to the right of the charts, each zone being dealt with separately and completely.

b) In the text

i. Surface visibility and weather

1. surface visibility is expressed in metres (M) or kilometres (KM), with the change over at 5000 M;
2. weather is described using the METAR code form; the full list of terms is available at paragraph 3.8.6.
3. warnings and the expected occurrence of icing and turbulence are highlighted, using standard ICAO symbolism and abbreviations where possible (see AIP GEN 2.2);

ii. Cloud

1. cloud amount is described using the METAR code form, where FEW indicates 1 to 2 oktas, SCT (scattered) indicates 3 to 4 oktas, BKN (broken) indicates 5 to 7 oktas and OVC (overcast) indicates 8 oktas.
2. cloud type is given using standard meteorological and ICAO abbreviations (see AIP GEN 2.2).
3. the height of the cloud base and top is given in the form 'height of cloud base / height of cloud top' with all heights in hundreds of feet (FT) above mean sea level:

iii. The height of the zero degree Celsius isotherm.

1. the height of the zero degree Celsius isotherm is given with all heights in hundreds of feet (FT) AMSL.
2. the height of any sub-zero layer below the main layer will also be given.

c) Outlook text

An outlook box describes the main weather developments in the 7-hour period beyond the end of the validity period of the forecast.

d) Notes

i. A forecast of thunderstorm (TS) and/or cumulonimbus (CB) implies hail and severe turbulence and icing;
ii. Hill fog will be included as a warning in the text whenever the base of any cloud is forecast to be at the same height or below the height of the highest ground in the zone. Hill fog implies visibility less than 200 M:
iii. The specific value of any elements given in a forecast shall be understood to the most probable value which the element is likely to assume during the period of the forecast.

4.3.2.2 Outlook Chart

4.3.2.2.1 A separate outlook chart, available on the internet only, shows the expected position of the principle synoptic features 1 hour after the end of the validity period of the forecast. No weather zones are given on the outlook chart but the pattern of surface isobars and frontal positions are shown.

4.3.3 **The UK Low Level Spot Wind Forecast (Metform 214)** is fixed time, and suitable for use for a period three hours before or after

GEN 3.5 METEOROLOGICAL SERVICES (continued)

the validity time.

a) The data provided is for Latitude/Longitude positions shown at the top of each box;
b) Wind Speed and temperature information is provided for a selected range of altitudes and are shown in thousands of feet above mean sea level and Degrees Celsius.

4.3.4 **Weather Forecast Chart Issues**

4.3.4.1 The date and time that each Metform 215/415 is issued by the Met Office will be shown at the bottom of the form. A summary of the times of issue and validity times of the F215 chart is given in the table below.

Time when F215 Forecast Chart becomes available	Front and Weather Zones forecast time	Period of validity
0330	1200	0800 – 1700
0930	1800	1400 – 2300
1530	0000	2000 – 0500
2130	0600	0200 – 1100

4.3.4.2 **Amendments**

a) Amendments may appear as complete re-issues of the Metform in which case the validity start time may be different from the routine issue.
b) An amended Metform 215 is indicated by the word AMENDED at the top of the form, and the element amended written in bold and underlined.

4.4 **Northwest Europe Low Level Weather and Spot Wind Forecast Charts - Metforms 415/414**

a) These charts are similar in format to Metforms 214/215 and extend the low-level flight forecast coverage more into continental Europe.
b) They are issued daily at the same times as Metform 214/215 and are valid for the same periods.
c) Amendments will appear as complete re-issues of the Metform in which case the validity start time may be different from the routine issue.

4.5 **European Medium / High Level Spot Wind / Temperature Forecast Chart - Metform 614**

a) This chart is similar in format to Metforms 214 and 414 but extends the coverage to most of Europe and western parts of the Mediterranean and North Africa.
b) It is available only from METFAX (09060 700 541) and provides a single sheet alternative to part of the area covered by the six standard EUR wind/temperature charts between FL 050 and FL 340 to accompany the EUR significant weather chart.

4.6 **Global upper-air wind and temperature data**

a) Global upper-air wind and temperature data, as well as data on upper-air humidity, tropopause heights and temperatures and maximum wind speed, direction and height are available in grid points in digital form, updated four times per day, from the address given in paragraph 1.2.
b) Specific chart areas representing part or all of the above data may be available from some suppliers.

Upper wind	± 15 KT up to FL 250 ± 20 KT above FL 250 (modulus of vector difference for 500 NM	90
Significant en-route WX phenomena and cloud	Occurrence or non-occurrence Location: ± 60 NM Vertical extent: ± 2000 FT	80 70 70

4.7 **Aerodrome Forecast (TAF)**

4.7.1 The Aerodrome Forecast (TAF) is the primary method of providing the forecast weather information that pilots require about an airfield in an abbreviated format. The TAF consists of a concise statement of the mean or average meteorological conditions expected at an aerodrome or heliport during the specified period of validity.

4.7.2 UK civil TAFs are prepared to cover the notified hours of operation of those principal civil aerodromes that have accredited meteorological observers, who produce regular aerodrome weather reports. Being site-specific, to provide an aerodrome forecast in TAF form requires the forecaster to be confident in the knowledge of the weather conditions prevailing at that aerodrome. In the interests of flight safety, continuity of regular reports, and ideally special reports when significant changes occur (particularly if the deterioration or improvement has not been forecast or is mis-timed), are essential for the routine updates and an adequate amendment service to be provided by the forecast office.

4.7.3 Therefore, where an aerodrome is not open H24, the issue of a TAF will be delayed until at least two consecutive METARs have been received and accepted by the forecaster at the forecast office responsible for its preparation.

4.7.4 The METARs will be produced by an accredited observer and separated by an interval of not less than 20 minutes and not more than 1 hour. In practice, when METARs are prepared every 30 minutes, a TAF will be drafted by the forecaster once the first METAR has been seen, and when the second METAR is received 30 minutes later and confirms the prevailing weather over the aerodrome the forecaster will issue the TAF.

4.7.5 However, in the event that an automatic observing system located on the aerodrome regularly issues AUTO METARs containing information on wind speed and direction, visibility, cloud amount and height, present weather, pressure, temperature and dewpoint when the aerodrome is closed, the forecaster will, with agreement of the CAA Met Authority issue the TAF on the basis of the AUTO METAR.

4.7.6 If a gap of two hours between METAR reports occurs or if an element is missing from more than three consecutive reports then the TAF will be cancelled. The TAF will not be re-issued until two complete METARs have been received.

4.7.6.1 In practical terms this means that the TAF will be cancelled if:

a) More than 3 half hourly METARs are not received;
b) More than 3 half hourly METARs contain missing or erroneous data;
c) A second hourly METAR is not received.

4.7.7 Accredited observers at some H24 aerodromes take a duty break overnight, of maximum two hours duration. A supply of AUTO METARs will be provided during this period. If the duty observer has not recommenced observations after two hours (ie when more than 3 AUTO METARs are issued) the TAF may be cancelled.

4.7.8 If a TAF needs to be amended due to a deterioration or improvement that has not been forecast or is mis-timed, such amendments shall be issued within 15 minutes of receipt of the observation at the forecast office.

4.7.9 In order to reduce the number of TAF cancellations that are required to be issued when an aerodrome closes, the UK issues TAFs of duration 2-24 hours where appropriate.

0600	0600	0500
1200	1200	1100
1800	1800	1700

30 Hour TAF		
Start Time	End Time (Next Day)	Approx Issue Time
0000	0600	2300
0600	1200	0500
1200	1800	1100
1800	2400	1700

4.8 **Aerodrome Forecast (TAF) Codes**

4.8.1 TAFs describe the forecast prevailing conditions at an aerodrome and usually cover a period of 9, 24 or 30 hours. TAFs valid for 9 hours are updated and re-issued every 3 hours and those valid for more than 12 hours, every 6 hours. Amendments are issued as and when necessary. TAFs are issued separately from the METAR or SPECI and do not refer to any specific report; however, many of the METAR groups are also used in TAFs and significant differences are detailed in paragraph 4.9.

4.8.2 The content and format of a TAF is as in the following table:

Report Type	Location Identifier	Date/Time of Origin	Validity Time	Wind	Visibility	Weather
TAF	EGZZ	130505Z	1306/1315	31015KT	8000	-SHRA

Cloud	Variant	Validity Times
FEW005 SCT018CB BKN025	TEMPO	1311/1315

Visibility	Weather	Cloud	Probability	Validity Time	Weather
4000	+SHRA	BKN010CB	PROB30	1312/1315	TSRA

4.8.2.1 Example of TAF

a) 9 hour TAF:

TAF EGGY 162005Z 1621/1706 13018KT 9999 BKN012 BECMG 1623/1702 FEW020 BECMG 1704/1706 3000 BR BKN007=

The validity group should be read as 2100 UTC on the 16th of the month to 0600 UTC on the 17th of the month. The first BECMG group should be read as 2300 UTC on the 16th of the month to 0200 UTC on the 17th of the month. The second BECMG group should be read as 0400 UTC on the 17th of the month to 0600 UTC on the 17th of the month.

b) 24 hour TAF:

Example 24 Hour TAF illustrating the use of the FM group, as used regularly by some states to indicate a change to alternative conditions, from a specific time:

TAF KGGY 160505Z 1606/1706 13018KT 9999 BKN020 TEMPO 1608/1612 17025G45KT 3000 TSRA BKN010CB FM161230 21015KT TEMPO 1703/1706 4000 BR =

The example above shows 'FM161230', which should be read as from 1230 UTC on the 16th of the month.

c) 30 hour TAF:

GEN 3.5 METEOROLOGICAL SERVICES (continued)

TAF EGGY 160505Z 1606/1712 13018KT 9999 BKN020 TEMPO 1608/1612 17025G45KT 3000 TSRA BKN008CB BECMG 1612/1614 20015KT FEW020 TEMPO 1703/1706 4000 BR TEMPO 1709/1712 BKN012=

The validity group should be read as 0600 UTC on the 16th of the month to 1200 UTC on the 17th of the month. The first TEMPO group should be read as from 0800 UTC on the 16th of the month to 1200 UTC on the 16th of the month. The BECMG group should be read as 1200 UTC on the 16th of the month to 1400 UTC on the 16th of the month. The last TEMPO should be read as 0900 UTC on the 17th of the month to 1200 UTC on the 17th of the month.

4.9 **Differences from the METAR**

a) **Identifier**. In the validity period, the first two digits indicate the day on which the period begins, the next two digits indicate the time of commencement of the forecast in whole hours UTC and the last two digits are the time of ending of the forecast in whole hours.

b) **Wind**. In the forecast of the surface wind, the expected prevailing direction will be given. When it is not possible to forecast a prevailing surface wind direction due to its expected variability, for example, during light wind conditions (3 KTS or less) or thunderstorms, the forecast wind direction will be indicated by the use of the abbreviation 'VRB'.

c) **Horizontal Visibility**. As with the METAR code, except that only one value (the prevailing visibility) will be forecast. Visibility is reported in steps detailed in para 3.8.4.3.

d) **Weather**. If no significant weather is expected the group is omitted. However, after a change group, if the weather ceases to be significant, the abbreviation NSW is used for No Significant Weather.

e) **Cloud**. When no cumulonimbus, towering cumulus or clouds below 5000 FT or below the highest minimum sector altitude, whichever is the greater, are forecast and CAVOK is not appropriate, then NSC (No Significant Cloud) is used. Only CB and TCU clouds will be specified.

f) **Significant Changes**. The abbreviation FM followed by the date and time to the nearest hour and minute UTC is used to indicate the beginning of a self contained part in a forecast. All conditions given before this group are superseded by the conditions indicated after the group.

Example: FM161220 27017KT 4000 BKN010.

The change indicator BECMG followed by an eight figure date and time group, indicates an expected permanent change in the forecast meteorological conditions, at either a regular or irregular rate, occurring at an unspecified time within the period. The time period should not normally exceed 2 hours but in any case should not exceed 4 hours.

Example: BECMG 1721/1724 1500 BR

The change indicator TEMPO followed by a eight figure date and time group indicates a period of temporary fluctuations to the forecast meteorological conditions which may occur at any time during the period given. The conditions following these groups are expected to last less than one hour in each instance and in aggregate less than half the period indicated.

Example: TEMPO 0911/0916 4000 +SHRA BKN010CB.

g) **Probability**. The probability of occurrence happening will be given as a percentage, although only 30% and 40% will be used. The abbreviation PROB is used to introduce the group, followed by a time group, or an indicator and a time group.

Examples:

i. PROB30 1205/1207 0800 FG BKN004;
ii. PROB40 TEMPO 1214/1216 TSRA.

h) **Amendments**. When a TAF requires amendment, the amended forecast shall be indicated by inserting AMD after TAF in the identifier and this new forecast covers the remaining validity period of the original TAF.

Example: TAF AMD EGZZ 130820Z 1308/1316 21007KT 9999 BKN020 BECMG 1309/1312 4000 RADZ BKN008=

Any further amendments to a TAF that has already been amended will result in the same 'TAF AMD' coding being used; however, the date and time of origin will be updated

i) **Corrections**. When a METAR or TAF requires correction, the correction shall be indicated by inserting COR after TAF or METAR in the identifier.

Example:

Original: TAF EGZZ 140905Z 1409/1418 27012KT 4000 RUDZ BKN012 TEMPO 1410/1419 BKN008=

Update: TAF COR EGZZ 140918Z 1409/1418 27012KT 4000 RADZ BKN012 TEMPO 1410/1419 BKN008=

Note: *A correction will be issued only to correct an obvious typographical error. However a TAF amendment shall be issued instead whenever such a change would result in the meteorological conditions forecast being better or worse than previously stated, for example, 3000 RADZ instead of 4000 RADZ.*

j) **Cancellations**. Where the forecaster has cancelled a TAF, for example when routine METARs are not being made available the abbreviation CNL will be used.

Example: TAF AMD EGZZ 101030Z 1009/1018 CNL=

k) **Other Groups**. Three further TAF groups are not used for civil aerodromes in the UK but are shown here to assist in decoding overseas and UK military TAF.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

Forecast Temperature		TXaa/ggZ TNbb/hhZ
aa	Maximum temperature preceded by the letter indicators TX and given in Degrees Celsius, with M indicating a negative value.	
gg	Time of maximum temperature, in UTC.	
bb	Minimum temperature preceded by the letter indicators TN and given in Degrees Celsius, with M indicating a negative value.	
hh	Time of minimum temperature, in UTC.	

Example: TX25/13Z TN09/05Z

i.

Airframe Ice Accretion 6 Ic hhh tL

6 Group Indicator

I_c Type of airframe ice accretion:

- 0 none
- 1 light
- 2 light in cloud
- 3 light in precipitation
- 4 moderate
- 5 moderate in cloud
- 6 moderate in precipitation
- 7 severe
- 8 severe in cloud
- 9 severe in precipitation

hhh Height above ground level of lowest icing level (hundreds of feet)

t_L Thickness of icing layer:

- 0 up to top of clouds
- 1-9 thickness in thousands of feet

Example of an icing forecast: 650104.

This decodes as moderate icing potential is expected in clouds (code 5) from 1000 FT (code 010 in hundreds of feet) to 5000 FT AGL (4000 FT thickness as denoted by the ending '4')

ii.

Turbulence 5 B hhh tL

- 0 none
- 1 light
- 2 moderate in clear air, infrequent
- 3 moderate in clear air, frequent
- 4 moderate in cloud, infrequent
- 5 moderate in cloud, frequent
- 6 severe in clear air, infrequent
- 7 severe in clear air, frequent
- 8 severe in cloud, infrequent
- 9 severe in cloud, frequent

hhh Height above ground level of lowest level of turbulence (hundreds of feet)

t_L Thickness of turbulent layer:

- 0 up to top of clouds
- 1-9 thickness in thousands of feet

Example of a turbulence forecast: 530804.

This decodes as frequent moderate turbulence is expected in clear air (code 3 from the table) and that the turbulence will extend from 8000 FT to 12000 FT AGL. As with the icing forecast above, if a layer of turbulence is forecast to exceed 9000 FT in thickness, a second group would be required.

4.10 Reports in Abbreviated Plain Language

4.10.1 Some reports may be disseminated in abbreviated plain language. These will use:

a) Standard ICAO abbreviations and
b) numerical values of a self explanatory nature.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

The abbreviations referred to under (a) are contained in the Procedures for Air Navigation Services - ICAO Abbreviations and Codes (ICAO Doc 8400).

4.11 **Criteria for Special Meteorological Reports and Forecasts**

4.11.1 The following are the criteria for the issue of Special Aerodrome Meteorological Reports, TRENDS, TAF Variants/Amendments and Amended Route/Area Forecasts:

a) **Special Report**

i. **Surface Wind**: Issued only when no serviceable wind indicator in ATC; criteria to be agreed locally, based on changes of operational significance at aerodrome; for example:

1. A change in mean direction of 60° or more, mean speed before or after change being 10 KT or more; and/or a change of 30°, the speed 20 KT or more;
2. a change in mean speed of 10 KT or more;
3. a change in gust speed of 10 KT or more, the mean speed before or after the change being 15 KT or more.

ii. **Visibility:**

1. A change in the prevailing visibility from one of the following ranges to another:

   10 KM or more

   5000 M to 9 KM

   3000 M to 4900 M

   2000 M to 2900 M

   1500 M to 1900 M

   800 M to 1400 M

   750 M or less

2. At the onset or cessation of the requirement to report minimum visibility ie. when the minimum visibility in one or more directions is less than 50% of the prevailing visibility.
3. If the minimum visibility is being reported, when the minimum visibility changes from one of the ranges, given in (1) above, to another.
4. Additional change groups of 100 M or less, 150 to 300 M, 350 to 550 M and 600 to 750 M are used where an RVR is not available, either permanently or during temporary unserviceablilty. These criteria will apply by local arrangement.
5. Additional change groups of 3000 to 3900 M and 4000 to 4900 M apply at Aberdeen/Dyce airport.

iii. **Runway Visual Range (RVR)**:

1. A change from one of the following ranges to another:

   800 M or more

   550 M to 750 M

   300 M to 500 M

   275 M to 175 M

   175 M to 50 M

   50 M or less

2. Note that special reports for RVR are only made by local arrangement.
3. See para 3.1.4.2 for reporting RVR minimum and maximum values.

iv. **Weather** and Recent Weather:

1. The onset, cessation or change in intensity of any of the following weather phenomena or combinations:

   -- Freezing rain or freezing drizzle of any intensity;

   -- Freezing fog;

   -- Moderate or heavy precipitation (including showers);

   -- Thunderstorm (with or without precipitation);

   -- Squall, funnel cloud;

   -- Low drifting or blowing: snow, sand or dust.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

2. In local routine reports and local special reports when reported by a semi-automatic observing system, recent weather phenomena should be reported, up to a maximum of three groups, in the supplementary information. The following recent weather information shall be reported:

    1. freezing precipitation;
    2. moderate or heavy precipitation, including showers;
    3. blowing snow;
    4. dust storm, sandstorm;
    5. thunderstorm;
    6. funnel cloud, tornado or water spout; and
    7. volcanic ash.

v. **Cloud**:

1. When the base of the lowest cloud of over 4 oktas (BKN or OVC) changes from one of the following ranges to another:

    2000 FT or more

    1500 FT to 1900 FT

    1000 FT to 1400 FT

    700 FT to 900 FT

    500 FT to 600 FT

    300 FT to 400 FT

    200 FT

    100 FT

    Less than 100 FT*

2. *This includes state of sky obscured. ANSPs should also review whether there is a requirement to report the height of cloud base in steps of 50 FT up to and including 300 FT in local routine reports and local special reports.
3. When the amount of cloud below 1500 FT changes from 4 oktas or less (nil, FEW, SCT) to more than 4 oktas (BKN or OVC), and vice versa.

vi. **Temperature:** When the air temperature changes by 2 degrees or more, from that given in the last report.
vii. **Pressure:** When the 'as read' pressure changes by 1.0 hPa or more since the last report.
viii. **Severe/Icing/Turbulence:** After confirmation by the duty forecaster, pilot reports of severe icing or severe turbulence, either on the approach to, or climb out from, the aerodrome.

b) **Trend**

i. **Surface Wind**

1. A change in mean direction of 30° or more, the mean speed before or after the change being 20 KT or more; a change in mean direction of 60° or more, the mean speed before or after the change being 10 KT or more.
2. A change in mean speed of 10 KT or more.

ii. **Surface Visibility.**

1. A change in the prevailing visibility from one of the following ranges to another:

    5000 M or more

    3000 M to 4900 M

    1500 M to 2900 M

    800 M to 1400 M

    600 M to 750 M

    350 M to 550 M

    150 M to 300 M

    100 M or less

iii. **Weather**

1. Onset, cessation or change in intensity of:

    – freezing precipitation;

    – moderate or heavy: precipitation, including showers;

GEN 3.5 METEOROLOGICAL SERVICES (continued)

– freezing fog and freezing precipitation;

– low drifting: sand, dust or snow;

– blowing: sand, dust or snow;

– thunderstorm;

– squall, funnel cloud, tornado or waterspout;

– other phenomena if associated with a significant change in visibility or cloud, whatever the intensity.

iv. **Cloud**

1. When the base of the lowest cloud of over 4 oktas (BKN or OVC) changes from one of the following ranges to another:

   1500 FT or more

   1000 FT to 1400 FT

   500 FT to 900 FT

   300 FT to 400 FT

   200 FT

   100 FT

   Less than 100 FT*

2. *This includes state of sky obscured.
3. Additional change groups of 500 to 600 feet and 700 to 900 feet apply at aerodromes serving oil rig helicopter operations where a TREND service is provided; Aberdeen and Norwich.
4. When the amount of the lowest cloud below 1500 FT changes from half or less (nil, FEW or SCT) to more than half (BKN or OVC) and vice versa. A change to no cloud below 5000 FT and no CB or TCU should be shown as No Significant Cloud - NSC, unless CAVOK applies.

c) **TAF Variants/Amendments**

i. **Surface Wind**

1. A change in mean direction of 30° or more, the mean speed before or after the change being 20 KT or more; a change in mean direction of 60°, the mean speed before or after the change being 10 KT or more
2. a change in mean speed of 10 KT or more.
3. a change in gust speed of 10 KT or more, the mean speed before or after the change being 15 KT or more.

ii. **Surface Visibility**

1. A change in the prevailing visibility from one of the following ranges to another:

   10 KM or more

   5000 M to 9 KM

   1500 M to 4900 M

   800 M to 1400 M

   350 M to 750 M

   300 M or less

2. Additional change groups of 1500 M to 2900 M and 3000 M to 4900 M as well as 5000 M to 6 KM and 7 to 9 KM apply at aerodromes serving oil rig helicopter operations; Aberdeen, Benbecula, Blackpool, Humberside, Inverness, Kirkwall, Liverpool, Norwich, Sumburgh and Wick.

iii. **Weather**

1. Onset, cessation or change in intensity of:

   freezing precipitation;

   freezing fog;

   moderate or heavy: precipitation, including showers;

   low drifting: sand, dust or snow;

   blowing: sand, dust or snow;

   thunderstorm;

GEN 3.5 METEOROLOGICAL SERVICES (continued)

squall, funnel cloud, tornado or waterspout;

other phenomena if associated with a significant change in visibility or cloud, whatever the intensity.

CAVOK conditions.

iv. **Cloud**

1. When the base of the lowest cloud of over 4 oktas (BKN or OVC) changes from one of the following ranges to another:

   5000 FT or more

   1500 FT to 4900 FT

   1000 FT to 1400 FT

   500 FT to 900 FT

   200 FT to 400 FT

   100 FT or less*

2. *This includes state of sky obscured.
3. Additional change groups of 500 FT to 600 FT and 700 FT to 900 FT apply at aerodromes serving oil rig helicopter operations; Aberdeen, Benbecula, Blackpool, Humberside, Inverness, Kirkwall, Liverpool, Norwich, Sumburgh and Wick.
4. When the amount of the lowest cloud below 1500 FT changes from half or less (nil, FEW or SCT) to more than half (BKN or OVC) and vice versa. A change to no cloud below 5000 FT and no CB or TCU should be shown as No Significant Cloud - NSC, unless CAVOK applies.

d) **Amended Route/Area Forecast (Advisory Criteria)**

i. 1000 FT, 3000 FT and 6000 FT Wind. A change in direction of 30° or more, the speed before and/or after the change being at least 30 KT. A change of speed of 20 KT or more.
ii. Temperature/Dew Point. 5°C or more.
iii. Cloud Amount. Changes in the general forecast lowest cloud base below 1500 FT from 4 oktas or less to more than 4 oktas, or more than 4 oktas to 4 oktas or less.

Element		Original Forecast	Revised Opinion
iv	Surface visibility (general visibility)	8 KM or more 5000 M to 8 KM 3700 M to 5000 M 2500 M to 3700 M 1600 M to 2500 M 800 M to 1600 M 0 M to 800 M	Less than 8 KM Less than 5000 M or more than 8 KM Less than 3700 M or more than 5 KM Less than 2500 M or more than 3700 M Less than 1600 M or more than 2500 M Less than 800 M or more than 1600 M Less than 800 M
v	Weather phenomena TS, SQ, GR, SA, RASN, SN, FZFG, FZRA, FZDZ	Not included Included	Now expected Not now expected
vi	Cloud Height (general forecast lowest cloud base)	2500 FT or more 1500 FT to 2500 FT 700 FT to 1500 FT 500 FT to 700 FT 300 FT to 500 FT 200 FT to 300 FT Surface to 200 FT	Less than 2500 FT Less than 1500 FT or more than 2500 FT Less than 700 FT or more than 1500 FT Less than 500 FT or more than 700 FT Less than 300 FT or more than 500 FT Less than 200 FT or more than 300 FT Less than 200 FT
vii	Turbulence	Nil Light Moderate Severe	Moderate or severe Severe Nil Nil or light
viii	Zero degree Celsius isotherm	Below 5000 FT Above 5000 FT	Changes of 1000 FT or more Changes of ±25% or 2000 FT, whichever is smaller.
ix	Airframe icing	Nil Light Moderate Severe	Moderate or severe Severe Nil Nil or light
x	Area boundaries, significant fronts and tropical disturbances	Not included Included	Now expected Not now expected or ± 60 NM different from forecast.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

4.12 Aeronautical Meteorological Observer Training

4.12.1 **Accredited Aerodrome Meteorological Observer Training**

4.12.1.1 At most aerodromes, there is usually a requirement to provide weather reports for aircraft taking-off and landing and flying in the area. An observer does not need accreditation to give an opinion on the latest meteorological conditions but these are not regarded as 'official' for air navigation purposes, and the observer is required to have a basic competency in assessing conditions and reading instrumentation. However, a METAR issued from a UK aerodrome and disseminated beyond the aerodrome must be prepared by an accredited meteorological observer.

4.12.2 **Accredited Aerodrome Meteorological Observer Training Courses**

4.12.2.1 Training for aerodrome personnel to enable them to gain accreditation in meteorological observing is provided by CAA approved training organisations.

4.12.2.2 The duration of each Full Met Observer course is two weeks. The first week covers theory training followed by a week of practical experience (including night-time observations) under the supervision of a professional meteorological trainer.

4.12.2.3 A 5 day course is available for staff at aerodromes using a semi-automatic observing system, this course develops the skills necessary to observe, report and encode the 'visual' elements of the METAR to a standard that meets CAA requirements.

4.12.2.4 Further details and costs on Full and Restricted Observer courses are available from approved training organisations. However, it is essential that those nominated for courses have a basic knowledge of the aeronautical weather code, sufficient at least to decode a METAR without difficulty, prior to attending the course. It is also desirable to have had experience of an Air Traffic Services environment.

4.12.2.5 Trainees successfully completing a course are awarded an Aeronautical Met Observing Certificate for the production of aerodrome weather reports that meet the requirements of ICAO Annex 3. Restricted certificates are for use solely at aerodromes similarly equipped to the training site at which the trainee gained their certification.

4.12.3 **Other Aviation Meteorological Observer Training**

4.12.3.1 Refresher and Met Focal Point training is aimed at qualified observers who have not carried out the making of official Met reports for some considerable time, or who are designated aerodrome Met Focal Points, and Offshore Observer Training which is designed to enable observers make accurate weather reports for offshore helicopter operations.

4.12.4 **Approved Aeronautical Meteorological Observer Training Organisations**

4.12.4.1 Applications for Full, Restricted and Offshore Observer training courses should be made to one of the CAA approved training organisations detailed below. Applications can only be accepted from aerodrome sponsors (e.g. ATS Managers) prepared to accept responsibility for trainees.

4.12.4.2 Met Office Aeronautical Meteorological Observer training courses.

Post: Account Manager Aviation Observer Courses, Met Office College, Met Office, Fitzroy Road, Exeter, Devon, EX1 3PB
Email: aviationtraining@metoffice.gov.uk

4.12.4.3 StormGeo Aeronautical Meteorological Observer training courses Training Co-ordinator, StormGeo.

Phone: +44 (0)1224-766581
Email: training@stormgeo.com

5 Notification Required from Operators

5.1 Changes to Meteorological Services

5.1.1 Where a change to the MET information being provided is required by an operator, they should notify the Meteorological Authority (contact details are provided in paragraph 1) in advance. The Meteorological Authority will review the request for the change and provide a response within an agreed time.

5.2 **Special Forecasts and Specialised Information**

5.2.1 For departures where the standard pre-flight meteorological self-briefing material cannot be obtained or is inadequate for the intended flight, a Special Forecast may be issued on request to the appropriate Forecast Office for a specific period for a designated route, or an area which includes the route. Normally, a Special Flight Forecast will be supplied from the last UK departure point to the first transit aerodrome outside the coverage of standard documentation, at which point pilots should re-brief. However, by prior arrangement, a forecast may be prepared for other legs, provided initial ETD to final ETA does not exceed 6 hours and no stops longer than 60 minutes are planned. The usual method of issuing Special Flight Forecasts is by AFS or email to the aerodrome of departure, but if the Flight Briefing Unit is not so equipped or will not be open, pilots may telephone the

GEN 3.5 METEOROLOGICAL SERVICES (continued)

Forecasting Office for a dictation of the forecast. Similarly, Aerodrome Forecasts and reports for the destination and up to four alternates will be provided with the forecast, if not otherwise available.

5.3 **Prior Notification for Special Forecasts**

5.3.1 Forecast Offices normally require prior notification for Special Forecasts as follows:

a) For flights up to 500 NM, at least two hours before the time of collection;
b) for flights of over 500 NM, at least four hours before the time of collection.

5.3.1.1 Request for Special Forecasts must include details of the route, the period of the flight and where appropriate the ETD/ETA of each leg, the height to be flown and the time at which the forecast is required. Ideally a forecast should be collected no earlier than 90 minutes before departure.

5.3.2 It is in the interest of all concerned that the maximum possible period of notice is given. The Forecast Office will give priority to emergencies, in-flight forecast and to forecast requirements which have been properly notified. Other requests could be delayed at busy periods and might not comprise full forecasts. A Forecast collected a long time in advance of departure will be less specific and might be less accurate than one prepared nearer departure time.

5.3.3 Forecast Offices providing Special Forecasts are shown at Table 3.5.4.1. They are not provided for flights inbound to the UK.

5.3.4 Take-off forecasts containing information on expected conditions over the runway complex in respect of surface wind, temperature and pressure can be made available from Forecast Offices. Requests for the routine provision of these forecasts should be made to the Meteorological Authority (contact details are provided in paragraph 1.1). For ad hoc requests prior notification is not normally required, requests should be made directly to the Met Office, three hours before the expected time of departure.

5.3.5 Meteorological information for specialised aviation use, as defined below, is not included in the GAMET service or given as Special Forecasts but arrangements can be made for its provision on prior request:

a) To provide meteorological information for special aviation events for which routine forecasts are not adequate;
b) to provide helicopter operators in off-shore areas with forecast winds and temperatures at 1000 FT AMSL, information on airframe icing, and sea state and temperature.

5.3.6 Appropriate forecasts for (a) above will be made available up to twice in any 24 hour period. For (a), the initial request should be made to the nearest forecasting office designated as providing service 'C' at Table 3.5.4.1 at least 2 hours in advance of the forecast being required. For (b), application must be made to the Meteorological Authority for approval (see paragraph 1.1), giving at least 6 weeks' notice of the requirement. The application must specify the nature of the aviation activity, the location(s) involved, the meteorological information required and the associated time periods. If appropriate an AFTN address or Fax number should be included. Applicants will be advised of the time at which the information will be available and the means of delivery.

5.4 **Additional Meteorological Services**

5.4.1 When specialist, non-standard, aviation meteorological services additional to those given above are required (eg forecaster briefings for aerial photography, test flying, crop spraying and for outlooks for over a day ahead), they may be obtained on a repayment basis by prior arrangement with the Met Office. Enquiries should be directed to the Met Office address at paragraph 1. 2, or to one of the Forecast Offices listed at Table 3.5.4.1

6 Aircraft Reports

6.1 **Routine Aircraft Observations**

6.1.1 Routine Observations in the Scottish FIR/UIR, the London FIR/UIR or the Shanwick Oceanic FIR are only required to be made by aircraft equipped with air ground data link.

6.2 **Special Aircraft Observations**

6.2.1 Special aircraft observations are required to be issued by aircraft as special air-reports in the Scottish FIR/UIR, the London FIR/ UIR or the Shanwick Oceanic FIR whenever any of the following conditions are encountered or observed:

a) moderate icing (MOD ICE) or severe icing (SEV ICE); or
b) moderate turbulence (MOD TURB) or severe turbulence (SEV TURB); or
c) severe mountain wave (SEV MTW); or
d) thunderstorms with or without hail (that are obscured, embedded, widespread or in squall lines) (TSGR or TS);or
e) if volcanic ash cloud is observed or encountered, or if pre-eruption volcanic activity or a volcanic eruption is observed to assist other Users, ATS Providers and the Volcanic Ash Advisory Centre (VAAC);

6.2.2 Special aircraft observations may be reported when other meteorological conditions are encountered which, in the opinion of the pilot-in-command, might affect the safety or markedly affect the efficiency of other aircraft operations, for example, other en-route weather phenomena specified for SIGMET messages, or adverse conditions during the climb-out or approach not previously forecast or reported to the pilot-in-command.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

6.3 Turbulence and Icing Reporting Criteria

6.3.1 Turbulence (TURB)

6.3.1.1 While MOD and SEV TURB are to be reported, TURB remains an important operational factor at all levels but particularly above FL 150 therefore all pilots encountering TURB are requested to report this to the ATS Unit with whom they are in radio contact. High level turbulence (normally above FL 150 not associated with cumuliform cloud, including thunderstorms) should be reported as TURB, preceded by the appropriate intensity or preceded by Light or Moderate Chop.

Table 3.5.6.1 — TURB and other Turbulence Criteria Table

Incidence	Occasional — less than 1/3 of the time	Intermittent — 1/3 to 2/3 Continuous — more than 2/3
Intensity	**Aircraft Reaction (transport size aircraft)**	**Reaction Inside Aircraft**
Light	Turbulence that momentarily causes slight, erratic changes in altitude and/or attitude (pitch, roll, yaw) IAS fluctuates 5 - 15 KT. (<0.5 g at the aircraft's centre of gravity) Report as ' **Light Turbulence** '. or; turbulence that causes slight, rapid and somewhat rhythmic bumpiness without appreciable changes in altitude or attitude. No IAS fluctuations. Report as ' **Light Chop** '	Occupants may feel a slight strain against seat belts or shoulder straps. Unsecured objects may be displaced slightly. Food service may be conducted and little or no difficulty is encountered in walking.
Moderate	Turbulence that is similar to Light Turbulence but of greater intensity. Changes in altitude and/or attitude occur but the aircraft remains in positive control at all times. IAS fluctuates 15 - 25 KT. (0.5-1.0g at the aircraft's centre of gravity). Report as ' **Moderate Turbulence** '. or; turbulence that is similar to Light Chop but of greater intensity. It causes rapid bumps or jolts without appreciable changes in altitude or attitude. IAS may fluctuate slightly. Report as ' **Moderate Chop** '.	Occupants feel definite strains against seat belts or shoulder straps. Unsecured objects are dislodged. Food service and walking are difficult.
Severe	Turbulence that causes large, abrupt changes in altitude and/or attitude. Aircraft may be momentarily out of control. IAS fluctuates more than 25 KT. (> 1.0 g at the aircraft's centre of gravity). Report as ' **Severe Turbulence** '	Occupants are forced violently against seat belts or shoulder straps. Unsecured objects are tossed about. Food service and walking impossible.

Note: *Pilots should report location(s), time(s) (UTC), incidence, intensity, whether in or near clouds, altitude(s) and type of aircraft. All locations should be readily identifiable. Turbulence reports should be made on request, or in accordance with paragraph 6.2. Example:*

a) Over Pole Hill 1230 intermittent Severe Turbulence in cloud, FL 310, B747.
b) From 50 NM north of Glasgow to 30 NM west of Heathrow 1210 to 1250, occasional Moderate Chop TURB, FL 330, MD80.

Note: *The UK does not use the term 'Extreme' in relation to turbulence.*

6.3.2 Windshear Reporting Criteria

6.3.2.1 Pilots using navigation systems providing direct wind velocity readout should report the wind and altitude/height above and below the shear layer, and its location. Other pilots should report the loss or gain of airspeed and/or the presence of up-or-down draughts or a significant change in crosswind effect, the altitude/height and location, their phase of flight and aircraft type. Pilots not able to report windshear in these specific terms should do so in terms of its effect on the aircraft, the altitude/height and location and aircraft type, for example, 'Abrupt windshear at 500 feet QFE on finals, maximum thrust required, B747'. Pilots encountering windshear are requested to make a report even if windshear has previously been forecast or reported.

6.3.3 Airframe Icing

6.3.3.1 All pilots encountering unforecast icing are requested to report time, location, level, intensity, icing type* and aircraft type (see Table 3.5.6.2 below) to the ATS Unit with whom they are in radio contact. It should be noted that the following icing intensity criteria are reporting definitions; they are not necessarily the same as forecasting definitions because reporting definitions are related to aircraft type and to the ice protection equipment installed, and do not involve cloud characteristics. For similar reasons, aircraft icing certification criteria might differ from reporting and/or forecasting criteria.

Table 3.5.6.2 — Airframe Icing Intensity Criteria

Intensity	Ice Accumulation
Trace	Ice becomes perceptible. Rate of accumulation slightly greater than rate of sublimation. It is not hazardous even though de-icing/anti-icing equipment is not utilised, unless encountered for more than one hour.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

Table 3.5.6.2 — Airframe Icing Intensity Criteria	
Intensity	**Ice Accumulation**
Light	The rate of accumulation might create a problem if flight in this environment exceeds one hour. Occasional use of de-icing/anti-icing equipment removes/prevents accumulation. It does not present a problem if de-icing/anti-icing equipment is used.
Moderate	The rate of accumulation is such that even short encounters become potentially hazardous and use of de-icing/anti-icing equipment, or diversion, is necessary.
Severe	The rate of accumulation is such that de-icing/anti-icing equipment fails to reduce or control the hazard. Immediate diversion is necessary.
*Rime Ice: *Clear Ice:	Rough, milky, opaque ice formed by the instantaneous freezing of small supercooled water droplets. A glossy, clear, or translucent ice formed by the relatively slow freezing of large supercooled water droplets.

6.3.4 Volcanic Ash Reporting

6.3.4.1 Whenever volcanic ash is observed or encountered, a special air-report shall be provided; additionally a post-flight report shall be made on the Volcanic Activity Reporting (Model VAR). All elements which are observed shall be recorded and indicated respectively in the appropriate places on the Model VAR. Once completed, the form should be submitted to the UK Met Office by telephone (+44 (0)330 -1354246) or email to AviationForecasters@metoffice.gov.uk and emarc@metoffice.gov.uk.

GEN 3.5 METEOROLOGICAL SERVICES (continued)

2. Special air-report of volcanic activity form (Model VAR)

MODEL VAR: to be used for post-flight reporting

VOLCANIC ACTIVITY REPORT

Air-reports are critically important in assessing the hazards which volcanic ash cloud presents to aircraft operations.

OPERATOR:			A/C IDENTIFICATION: (as indicated on flight plan)		
PILOT-IN-COMMAND:					
DEP FROM:	DATE:	TIME; UTC:	ARR AT:	DATE:	TIME; UTC:
ADDRESSEE			AIREP SPECIAL		
Items 1–8 are to be reported immediately to the ATS unit that you are in contact with.					
1) AIRCRAFT IDENTIFICATION			2) POSITION		
3) TIME			4) FLIGHT LEVEL OR ALTITUDE		
5) VOLCANIC ACTIVITY OBSERVED AT (position or bearing, estimated level of ash cloud and distance from aircraft)					
6) AIR TEMPERATURE			7) SPOT WIND		
8) SUPPLEMENTARY INFORMATION SO_2 detected Yes ☐ No ☐ Ash encountered Yes ☐ No ☐			Other _____ (Brief description of activity especially vertical and lateral extent of ash cloud and, where possible, horizontal movement, rate of growth, etc.)		
After landing complete items 9–16 then fax form to: (Fax number to be provided by the meteorological authority based on local arrangements between the meteorological authority and the operator concerned.)					
9) DENSITY OF ASH CLOUD	☐ (a) Wispy	☐ (b) Moderate dense	☐ (c) Very dense		
10) COLOUR OF ASH CLOUD	☐ (a) White	☐ (b) Light grey	☐ (c) Dark grey		
☐	(d) Black	☐ (e) Other _____			
11) ERUPTION	☐ (a) Continuous	☐ (b) Intermittent	☐ (c) Not visible		
12) POSITION OF ACTIVITY	☐ (a) Summit	☐ (b) Side	☐ (c) Single		
	☐ (d) Multiple	☐ (e) Not observed			
13) OTHER OBSERVED FEATURES OF ERUPTION	☐ (a) Lightning	☐ (b) Glow	☐ (c) Large rocks		
	☐ (d) Ash fallout	☐ (e) Mushroom cloud	☐ (f) All		
14) EFFECT ON AIRCRAFT	☐ (a) Communication	☐ (b) Navigation systems	☐ (c) Engines		
	☐ (d) Pitot static	☐ (e) Windscreen	☐ (f) Windows		
15) OTHER EFFECTS	☐ (a) Turbulence	☐ (b) St. Elmo's Fire	☐ (c) Other fumes		
16) OTHER INFORMATION (Any information considered useful.)					

6.4 In-flight Procedures

6.4.1 Information to aircraft in flight is usually supplied in accordance with area Meteorological Watch procedures, supplemented when necessary by an En-route Forecast service. Information is also available from the appropriate ATS Unit at the commanders request, or from meteorological broadcasts.

6.4.2 An in-flight en-route service is available in exceptional circumstances by prior arrangement with the Meteorological Authority (see paragraph 1). A meteorological office is designated to provide the aircraft in flight with the winds and temperatures for a specific route sector. Applications for this service should be made in advance, stating:

GEN 3.5 METEOROLOGICAL SERVICES (continued)

a) The flight level(s) and the route sector required;
b) the period of validity necessary;
c) the approximate time and position in flight at which the request will be made
d) the ATS Unit with whom the aircraft is expected to be in contact.

6.4.3 Aircraft can obtain aerodrome weather information from any of the following:

a) VOLMET broadcasts (see paragraph 7);
b) Automatic Terminal Information Service (ATIS) broadcasts (and D-ATIS where available);
c) by request to an ATS Unit but whenever possible only if the information required is not available from a broadcast.

6.4.4 When an aircraft diverts, or proposes to divert, to an aerodrome along a route for which no forecast has been provided, the commander may request the relevant information from the ATS Unit serving the aircraft at the time, and the necessary forecasts will be provided by the associated Forecast Office.

7 VOLMET Service

Table 3.5.7.1 — Meteorological Radio Broadcasts (VOLMET)

Call Sign/ID	EM	Frequency MHz	Operating Hours	Stations	Contents	Remarks
1	2	3	4	5	6	7
London Volmet (Main)	A3E	135.375	H24 continuous	Amsterdam Brussels Dublin Glasgow London Gatwick London Heathrow London Stansted Manchester Paris/Charles de Gaulle	1. Half hourly reports (METAR) 2. The elements of each report broadcast in the following order: 1. Surface wind 2. Visibility (or CAVOK) 3. RVR if applicable 4. Weather 5. Cloud (or CAVOK) 6. Temperature 7. Dewpoint 8. QNH 9. Recent Weather if applicable 10. Windshear if applicable 11. TREND if applicable 3. Non-essential words such as ‘surface wind’, ‘visibility’ etc are not spoken. 4. All broadcasts are in English	
London Volmet (South)	A3E	128.600	H24 continuous	Birmingham Bournemouth Bristol Cardiff Jersey London Luton Norwich Southampton Southend Exeter		
London Volmet (North) **(Note 1)**	A3E	126.600	H24 continuous	East Midlands Humberside Isle of Man Leeds Bradford Liverpool London Gatwick Manchester Newcastle Teesside International		
Scottish Volmet	A3E	125.725	H24 continuous	Aberdeen/Dyce Belfast Aldergrove Edinburgh Glasgow Inverness London Heathrow Prestwick Stornoway Sumburgh		

Note 1: *Broadcasting range extended to cover Southeast England and English Channel.*
Note 2: *An HF VOLMET broadcast for North Atlantic flights (Shannon VOLMET) is operated by the Republic of Ireland.*

GEN 3.5 METEOROLOGICAL SERVICES (continued)

8 SIGMET and AIRMET Service

Table 3.5.8.1 — SIGMET and AIRMET SERVICES

Name of MWO Location Indicators	Hours	FIR or CTA served	Type of SIGMET validity	Specific SIGMET Procedures	AIRMET Procedures	ATS Unit Served	Additional Information
1	2	3	4	5	6	7	8
Met Office Exeter EGRR	H24	London FIR/ UIR Scottish FIR/ UIR Shanwick OCA Shanwick FIR	SIGMET 4 hours Volcanic Ash SIGMET 6 hours	Tropical cyclone SIGMET is not issued.	ICAO Annex 3 AIRMET (low level en-route weather warning) is not issued in the UK.	London Area Control Centre (Swanwick), London Terminal Control (Swanwick), Scottish AC (Prestwick), Shanwick OCA	NIL

8.1 MWOs are responsible for the preparation and dissemination of SIGMETs to appropriate ACC/FIC within their own and agreed adjacent FIRs. Aircraft in flight should be warned by the ACC/FIC of the occurrence or expected occurrence of one or more of the following SIGMET phenomena for the route ahead for up to 500 NM or 2 hours flying time:

- thunderstorm (see Note 2);
- heavy hail (see Note 2);
- tropical cyclone;
- freezing rain;
- severe turbulence (not associated with convective cloud);
- severe icing (not associated with convective cloud);
- severe mountain waves;
- heavy sand/dust storm;
- volcanic ash cloud.

Note 1: *In general, SIGMET messages are identified by the letters WS at the beginning of the header line, but those referring to tropical cyclones and volcanic ash will be identified by WC and WV respectively. SIGMETs are valid for 4 hours, for volcanic ash cloud and tropical cyclones, a further outlook for up to 6 hours may be included and are re-issued if they are to remain valid after the original period expires. They can be cancelled or amended within the period of validity. SIGMETs are numbered sequentially from 0001 UTC each day.*

Note 2: *This refers only to thunderstorms (including if necessary, cumulo-nimbus cloud which is not accompanied by a thunderstorm) widespread within an area with little or no separation (FRQ), along a line with little or no separation (SQL), embedded in cloud layers (EMBD), or concealed in cloud layers or concealed by haze (OBSC), but does not refer to isolated or occasional thunderstorms not embedded in cloud layers or concealed by haze. Thunderstorms and tropical cyclones each imply moderate or severe turbulence, moderate or severe icing and hail. However, heavy hail (HVYGR) may be used as a further description of the thunderstorm as necessary.*

Note 3: *A volcanic ash cloud SIGMET will be issued based on advisory information provided by the relevant VAAC. The Met Watch Office listed in Table 3.5.8.1 will ensure that information included in SIGMET and NOTAM messages is consistent.*

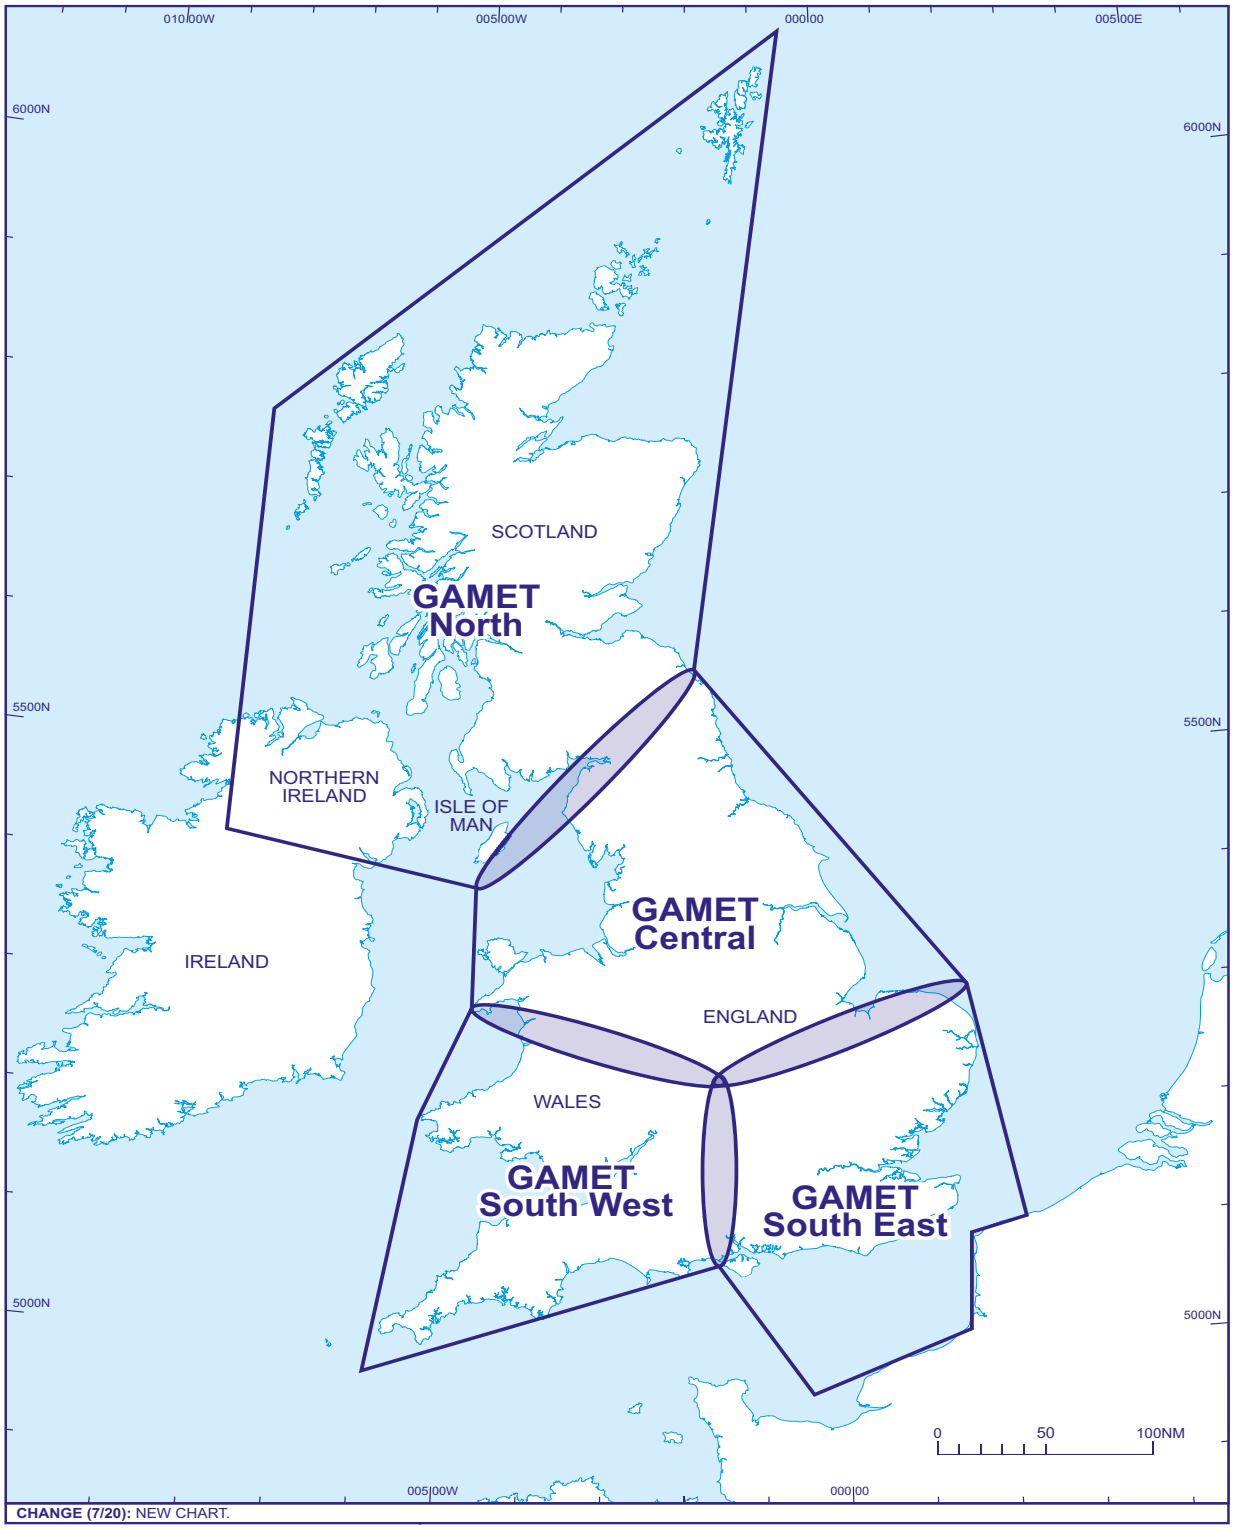
Note 4: *SIGMET messages will be issued not more than 4 hours before the commencement of the period of validity. In the special case of SIGMET messages for volcanic ash cloud and tropical cyclones, these messages will be issued as soon as practicable but not more than 12 hours before the commencement of the period of validity. SIGMET messages for volcanic ash and tropical cyclones will be updated at least every 6 hours.*

8.2 **GAMET Service**

8.2.1 GAMET is a general aviation weather briefing service providing four area forecasts covering the UK for low level flights in plain language, which detail the current Met situation and also contain forecasts of wind, freezing level and weather conditions, and a forecast outlook. GAMET covers the UK. A map giving details of the GAMET forecast areas is shown after paragraph 8.2.4. GAMET information is also provided in text form via the AFS and Internet.

https://www.metoffice.gov.uk/services/transport/aviation/regulated/aviation-briefing-service-guidance.

8.2.2 The forecasts will reflect the contents of SIGMETs which are current at the time of issue or amendments of the forecasts. Safety related amplification of an GAMET forecast may be obtained from a forecaster by telephoning one of the forecast offices listed in Table 3.5.4.1 as providing service 'E'. Callers must be able to confirm that they have obtained a current GAMET forecast on contacting the forecast office, otherwise no additional forecast information will be given.



8.2.3 Special Forecasts in accordance with paragraph 5.2 are not provided for flights within the coverage of GAMET Forecasts. For flights which extend beyond the area of coverage, Special Forecasts will be available on request from selected forecast offices providing a service to civil aviation (see Table 3.5.4.1).

8.2.4 Channel Islands Low Level Flight Forecast. Jersey Met provides a 100 NM radius Channel Islands low level forecast. Available on the Internet at http://www.gov.je/Weather/AviationForecast/Pages/Aviation.aspx. Amplification or clarification of the current

GEN 3.5 METEOROLOGICAL SERVICES (continued)

Channel Islands Low Level Flight Forecast may be obtained, following receipt of the forecast, by consulting Jersey Met. Telephone numbers are shown in Table 3.5.4.1.

GAMET FORECAST AREAS

9 Other Automated Meteorological Services

9.1 Details regarding VOLMET radio broadcasts are given in subsection GEN 3.5, paragraph 7. The table below provides details of other automated services for the provision of UK meteorological information.

Table 3.5.9.1 — Other automated meteorological services			
Service name	**Information available**	**Area, route, and aerodrome coverage**	**Access details**
UK OPMET Service (provided by National OPMET Centre (NOC) London, operated by NATS over the AFS).	Volcanic ash advisories; Volcanic Ash SIGMETs; Space weather advisories.	UK and International	Civil aviation users must register for access to the UK OPMET Service by email to: DataServicesSupport@nats.co.uk Registration is free but an AFTN/AHMS connection is required. All registered users of the UK OPMET Service are supplied with all of the information detailed in column 2.
	OPMET: • METAR; • TAF; • Aerodrome Warnings; • Regional Pressure Settings (Forecast QNH); • SIGMET (Warnings of weather significant to flight safety); • GAMET (General Aviation weather briefing forecasts).	UK	When registering for access to the UK OPMET Service users must request specific UK OPMET information selected from the list in column 2 OPMET information for applicable UK locations are disseminated in compiled Bulletins as detailed in Table 3.5.9.2
	OPMET: • METAR; • SPECI; • TAF; • SIGMET (Warnings of weather significant to flight safety); • Tropical Cyclone SIGMET; • Tropical Cyclone Advisories.	International (Special Reports in the SPECI code form are defined as Special Reports disseminated beyond the aerodrome of origin. SPECI are not applicable at UK civil aerodromes).	When registering for access to the UK OPMET Service users must request specific International OPMET information selected from the list in column 2. International OPMET is made available in a data set. Details of the data set are listed in the “ICAO EUR region and SADIS OPMET Catalogue” https://www.icao.int/airnavigation/aeronautical-meteorological-service/documents which is maintained on the ICAO Public website in the “MOG-SADIS/WIFS Reference Documents” section.
UK Quantitative Volcanic Ash (QVA) Service (provided by VAAC London)	Quantitative Volcanic Ash (QVA) service • Expected (Forecast) Ash Concentration; • Probability of Ash Exceedance; • Feature Objects; • Published data covers the period T+0 to T+24 at 3-hourly intervals.	Gridded data and feature objects are available for areas within the VAAC London and VAAC Toulouse area of responsibility. Gridded data sets available in 5000 FT thick horizontal slices for FLs: 000-050, 050-100, 100-150, 150-200, 200-250, 250-300, 300-350, 350-400, 400-450, 450-500, 500-550, 550-600. Horizontal resolution 0.25 degrees.	• General information about the QVA forecasts can be found on the VAAC London website, including example QVA charts: https://www.metoffice.gov.uk/services/transport/aviation/regulated/international-aviation/vaac/qva/index • More detailed information about the service is contained in the VAAC London Quantitative Volcanic Ash (QVA) API – User Guide, available from https://www.metoffice.gov.uk/binaries/content/assets/metofficegovuk/pdf/services/transport/aviation/vaac/vaac-london-qva-user-guide-v1.0.pdf

GEN 3.5 METEOROLOGICAL SERVICES (continued)

Table 3.5.9.1 — Other automated meteorological services

Service name	Information available	Area, route, and aerodrome coverage	Access details
ICAO Secure Aviation Data Information Service Application Programming Interface – SADIS API (provided by the Met Office on behalf of ICAO).	World Area Forecast System Upper Air Gridded Data Forecasts. • Wind, temperature, relative humidity, tropopause height/ temperature, icing and turbulence severity, cumulonimbus extent, base and top. • Forecast timesteps from T+06 hours up to T+120 hours.	Gridded data is available globally for up to 56 vertical levels or as regional subsets.	Civil aviation users must apply to the UK Met Authority (CAA) for authorization to access SADIS. Applications should be submitted by email to: metauthority@caa.co.uk Access to SADIS is free at the point of use but an internet connection is required, and user's systems (software and hardware) must meet minimum requirements to enable connection, download, and use of IWXXM and TAC format data from the SADIS API. Note: Certain OPMET Data supplied via the SADIS API is only provided in TAC or Graphic format. Full details of the SADIS API are available via the following link: https://www.metoffice.gov.uk/services/transport/aviation/regulated/international-aviation/sadis/sadis-api/index
	World Area Forecast System Upper Air Significant Weather (SIGWX) Forecasts. • Jet stream, turbulence, cumulonimbus clouds, icing, the tropopause, volcanic eruptions, tropical cyclones and nuclear releases. • Forecast timesteps from T+06 hours up to T+48 hours.	SIGWX forecast information is available globally and covers FL100 to FL600.	
	OPMET: • METAR; • SPECI; • TAF; • SIGMET (Warnings of weather significant to flight safety); • AIRMET; • Volcanic Ash Advisory; • Tropical Cyclone Advisory SIGMET; • GAMET; • Nuclear emergency messages; • Volcanic Ash NOTAMs and ASHTAMs.	UK and International (Special Reports in the SPECI code form are defined as Special Reports disseminated beyond the aerodrome of origin. SPECI are not applicable at UK civil aerodromes).	

GEN 3.5 METEOROLOGICAL SERVICES (continued)

Table 3.5.9.1 — Other automated meteorological services

Service name	Information available	Area, route, and aerodrome coverage	Access details
Met Office Aviation Briefing Service (ABS)	TAFs and METARs	UK, Europe & Global	All information specified in column 2 is available to civil aviation users by registering for access to the Met Office Aviation Briefing Service web portal (free registration) via this link: https://www.metoffice.gov.uk/services/transport/aviation/regulated/national-aviation/abs/index
	SIGMET & GAMET	UK	
	Ballooning Forecast (Contains forecasts of surface wind, thermal activity, inversions, wind shear, sea breezes, plus forecasts of the lowest pressure (QNH), humidity and surface temperature).	UK (The information is provided as a combination of site-specific data, area text, and graphical visualisation of forecasts)	
	London Helicopter Forecast (Contains forecasts of cloud base, surface visibility and freezing level provided as text, with each forecast area colour-coded to alert users when forecast data indicates that cloud base and/or surface visibility might breach specified thresholds).	London CTA (For the purposes of this service, the London CTA is split into four forecast areas covering the London CTR and London/City CTR).	
	Regional Pressure Settings	UK	
	Volcanic Ash Advisories	issued by VAAC London and/or VAAC Toulouse	
	Briefing charts (Surface pressure, F214/F215 spot winds and F215/F415 low-level significant weather).	UK & Europe	
	Interactive briefing maps displaying TAF & METAR status and user selected weather layers (current weather, forecast wind, temperature & precipitation).	UK & Europe	
Met Office Aerodrome Weather Warning Service	Issued to provide notice to users of adverse conditions at aerodromes (Strong wind, Frost, Snow, Fog, Thunderstorm, Hail, Freezing Precipitation and Temperature Inversion).	UK	Aerodrome Warnings are accessed via the Met Office Aviation Briefing Service (ABS) portal. Users can also set up warnings by email by selecting specific aerodromes within the ABS portal.
Met Office Space Weather Service	Aviation sector specific Space Weather Alerts and Warnings.	Global	To receive automated email alerts and warnings users must request a space weather account from the Met Office via this link: https://weather.metoffice.gov.uk/specialist-forecasts/space-weather
Met Office training and reference resources	Information on accessing aviation related meteorological information from a variety of sources.	UK & Europe	Downloaded as a pdf from the Met Office website via this link: https://www.metoffice.gov.uk/services/transport/aviation/regulated/training-resources-for-aviation/index#GetMet

Note: *Details of meteorological briefing at aerodromes are given in the individual aerodrome sections i.e. AD 2.11 and AD 3.11.*

INTENTIONALLY BLANK

GEN 3.6 SEARCH AND RESCUE

1 Responsible Services

1.1 Responsibility for Search and Rescue (SAR) for civil aircraft within the UK Search and Rescue Region (SRR) rests with the Department for Transport (DfT). Responsibility for Aeronautical SAR Coordination is discharged by the UK Joint Rescue Centre (UK JRCC), which is staffed by specialist personnel of His Majesty's Coastguard (HMCG). SAR Helicopter Services are provided under contract to DfT by Bristow Helicopters Ltd, while fixed wing SAR Services are provided under contract to DfT by 2Excel Aviation Ltd and Reconnaissance Ventures Ltd.

1.1.1 The DfT is responsible for SAR policy for civil aviation.

Post: Department for Transport, Airports Policy Division, Great Minster House, 76 Marsham Street, London, SW1P 4DR
Phone: 020-7944 4393
Fax: 020-7944 2192

1.1.2 The Civil Aviation Authority (CAA) acts as adviser on SAR to the DfT. Queries on SAR for civil aviation, including matters arising from this section of the AIP, should be addressed to:

Post: Airspace Regulation, CAA, 1 NE Aviation House, Beehive Ring Road, Crawley, West Sussex, RH6 0YR
Email: airspace@caa.co.uk

1.1.3 SAR aviation services are managed by the Maritime and Coastguard Agency (MCA) Commercial Directorate.

Post: MCA Commercial Directorate (Aviation). Spring Place, 105 Commercial Road, Southampton, Hampshire, SO15 1EG
Phone: 023-8032-9416 or 023-8032-9486

1.1.4 Implementation of SAR services for civil aviation throughout the UK SRR is undertaken by the UK JRCC.

Post: UK JRCC, 12 Kites Croft Business Park, Fareham, Hampshire, PO14 4LW
Phone: 023-8032-9100

1.2 **Applicable ICAO Documents**

1.2.1 The Standards, Recommended Practices and, when applicable, the procedures contained in the following ICAO documents are applied:

Annex 2	-	Rules of the Air;
Annex 3	-	Meteorological Services for International Air Navigation;
Annex 6	-	Operation of Aircraft - Parts I, II & III;
Annex 10	-	Aeronautical Telecommunications - Volume I & II;
Annex 11	-	Air Traffic Services;
Annex 12	-	Search and Rescue;
Annex 13	-	Aircraft Accident Investigation;
Annex 15	-	Aeronautical Information Services;
Annex 17	-	Security;
Annex 18	-	The Safe Transport of Dangerous Goods by Air;
Doc 4444 ATM/501	-	Procedures for Air Navigation Services - Air Traffic Management;
Doc 7030	-	Regional Supplementary Procedures;
Doc 7754	-	Air Navigation Plan - European Region;
Doc 8755	-	Air Navigation Plan - North Atlantic;
Doc 9731	-	IAMSAR Manual.

2 Area of Responsibility

2.1 In general, aeronautical SRR boundary coincides with FIR boundary. The UK SRR comprises the London, Scottish and Shanwick FIRs but to the North and East of the UK, the boundaries with Iceland, Norway, Denmark and Germany have been modified by a series of bilateral agreements. Under these agreements, the SRR boundary no longer follow the FIR boundaries but have been aligned with the median line. The UK SRR boundary co-ordinates are given below and a chart depicting the areas of responsibility is shown after GEN 3.6, paragraph 6.12, Tables 1 and 2.

2.2 UK JRCC. The area of responsibility is enclosed by the lines joining the following points:

610000N 0300000W - 610000N 0040000W - 632833N 0004622W - 632833N 0000000E - 620000N 0000000E

620000N 0012222E - 614410N 0013329E - 612122N 0014718E - 595346N 0020430E - 591722N 0014236E

582546N 0012854E - 575416N 0015748E - 563540N 0023642E - 560510N 0031455E - 555458N 0032055E

GEN 3.6 SEARCH AND RESCUE (continued)

555004N 0032355E - 554552N 0032208E - 543715N 0025349E - 542245N 0024543E - 531803N 0030319E

524657N 0031213E - 523715N 0031055E - 522457N 0030325E - 521721N 0025555E - 520557N 0024249E

515857N 0023731E - 514815N 0022849E - 513000N 0020000E - 510700N 0020000E - 510000N 0012800E

504000N 0012800E - 500000N 0001500W - 500000N 0020000W - 485000N 0080000W - 450000N 0080000W

450000N 0300000W - 610000N 0300000W.

with the exception of the Shannon FIR which is bounded by lines joining the following points:

540000N 0150000W - 543400N 0100000W - 544500N 0090000W - 552000N 0081500W - 552500N 0072000W

552000N 0065500W - 542500N 0081000W - 535500N 0053000W - 522000N 0053000W - 510000N 0080000W

510000N 0150000W - 540000N 0150000W.

3 Types of Service

3.1 Locations and types of dedicated SAR facilities are listed below, and shown on the chart published after GEN 3.6, paragraph 6.12, Tables 1 and 2:

a) HMCG helicopters, under DfT contract;
b) MCA fixed wing aircraft, under DfT contract.

3.1.1 Specialized SAR helicopters are equipped with winch gear.

Table 3.6.3.1 State of readiness of individual SAR units

Unit	State of Readiness	Remarks
HM Coastguard	15 min (0800-2200 local time) 45 min (2200-0800 local time)	
MCA Fixed Wing Aircraft	45 min (0800-2200) 60 min (2200-0800)	

3.1.2 In undertaking Aeronautical SAR Coordination for incidents on land or at sea, the UK JRCC works in partnership with those agencies with statutory responsibility, or primacy, for SAR Coordination respective of the environment of the incident. In responding to aeronautical incidents, the UK JRCC works in partnership with the Distress and Diversion Cell (D&D), 78 Sqn Swanwick Mil, based at NATS Swanwick. In responding to satellite emergency beacon alerts, the UK JRCC works in partnership with the UK Mission Control Centre, which is co-located with the JRCC. Through these agencies, the JRCC can call upon the following resources for assistance:

a) HM Coastguard Coastal Rescue Teams;
b) Royal National Lifeboat Institution vessels;
c) MoD aircraft, vessels and personnel;
d) Police, Fire and Ambulance services;
e) Commercial Air Transport aircraft;
f) Merchant and leisure vessels;
g) Civilian Volunteer Land Rescue Teams;
h) RAF Mountain Rescue;
i) COSPAS/SARSAT and SAR SPOT satellite distress alerting systems;
j) Neighbouring and International SAR Agencies;
k) Commercial SAR Aircraft.

3.1.3 **Distress Frequencies**

3.1.3.1 SAR aircraft and other military aircraft carry the distress frequencies shown in table 3.6.3.2:

Table 3.6.3.2 Distress frequencies carried by SAR aircraft and other military aircraft

Frequency	Speech Facility	Homing Facility
121.500 MHz	a) HMCG helicopters. b) MCA fixed wing aircraft. c) MoD helicopters and fixed wing aircraft. d) Commercial Air Transport aircraft.	a) HMCG helicopters. b) Some MoD helicopters and fixed wing aircraft.
243.00 MHz	a) HMCG helicopters. b) MoD helicopters and fixed wing aircraft.	a) HMCG helicopters. b) Some MoD helicopters and fixed wing aircraft.

GEN 3.6 SEARCH AND RESCUE (continued)

3.1.4 **Scene of Search Frequencies**

3.1.4.1 SAR aircraft may use any of the following frequencies as a Scene of Search frequency:

	123.100 MHz	Civil;		156.300 MHz	Channel 6 VHF/FM Marine;
	282.800 MHz	NATO;	*	156.800 MHz	Channel 16 VHF/FM Marine;
*	5680 kHz	Civil/Military-Day (SAMAR 1);	*	3023 kHz	Civil/Military-Night (SAMAR 1);
*	3085 kHz	Military-Night (SAMAR 4);	*	5695 kHz	Military-Day (SAMAR 4);
			*	8364 kHz	International intercommunication.
*	Emission J3E or 6K00A3EJN				

Note: *Other HF frequencies may be used as directed by the controlling JRCC.*

4 SAR Agreements

4.1 As a Contracting State under the Convention on International Civil Aviation, the United Kingdom is committed to providing SAR services for international civil aviation throughout defined areas on a 24 hour basis. These areas consist of the UK overland area and adjacent sea areas to approximately midway to the European mainland to the east and to 030W over the North Atlantic, excluding the Shannon FIR (see chart published after GEN 3.6, paragraph 6.12, Tables 1 and 2).

4.1.1 The International Civil Aviation Organization's (ICAO) Regional Air Navigation Plans do not define the scale of effort which should be available but identify the required facilities by types of services which should be provided with due regard to the density of traffic and the size and passenger capacity of aircraft operating in the region.

4.1.2 As a member of NATO, a contracting State under the ICAO Convention and according to bilateral inter-RCC agreements, the United Kingdom can seek SAR assistance from the resources of other nations as necessary.

4.1.3 When the UK JRCC requests the assistance of suitable SAR aircraft from a neighbouring State RCC, it will provide all pertinent details on the scope of the assistance required. Entry and flight of the requested SAR aircraft into or over the territory of the UK for the purpose of conducting SAR operations may be conducted in accordance with the procedures and approvals granted by the State of the operator of the aircraft. If it is necessary for the requested SAR aircraft to land at a UK airfield or to make use of other facilities in the course of performing its assigned SAR task, the UK JRCC will coordinate arrangements and liaise with the appropriate organisations to facilitate the taking of such measures or actions.

5 Conditions of Availability

5.1 The availability of both British military SAR facilities is on the authority of MoD. The availability of Foreign civilian and NATO military SAR facilities is on the authority of the appropriate RCC which remains responsible for operational control of such facilities throughout the duration of the requirement (whether a Maritime RCC (MRCC) or Joint Rescue Coordination Centre (JRCC)).

6 Procedures and Signals Used

6.1 The Rescue Organisation

6.1.1 When D&D has reason to believe that an aircraft is in a state of emergency, it will alert the JRCC who will, in turn, alert SAR units and the Police (D&D may alert the Police directly in extremis if appropriate to do so); the police will notify civilian MRT, fire, ambulance and hospital services. In addition, the JRCC may alert RAF Mountain Rescue Teams, via the MoD. Should the first report of an accident be given to the police by a member of the public, the police will alert fire and other services. The police will also advise the ACC of the rescue action being taken and give full details.

6.1.2 The JRCC will handover responsibility, or primacy, for SAR Coordination to the best placed Maritime Rescue Coordination Centre should an Aviation SAR incident become a Maritime accident. Where an Aviation SAR incident occurs across an SRR boundary, the UK JRCC will liaise with the relevant foreign RCC, confirming the individual RCC responsibilities, and primacy, for the response.

6.1.3 When the location of a civil aircraft which has crashed on land is known, and no air search is necessary, the civil ground organization (normally the police) takes responsibility for dealing with the incident. However, it is essential that both D&D **and** the JRCC are informed to avoid duplication of effort and for expert consideration of any SAR back-up services which could be required.

6.1.4 In the vicinity of aerodromes it is not possible to define in specific terms where the responsibility of the SAR services begins and that of the aerodrome emergency services ends with respect to potential incidents, so the closest co-operation must be maintained between these two services.

6.1.5 Direct speech circuits exist between the UK JRCC and the (D&D) cell at the 78 Sqn Swanwick Mil (Co-located at NATS Swanwick). Under normal circumstances, the quickest and most reliable means for an aerodrome to alert the JRCC is via D&D cell, but a direct

GEN 3.6 SEARCH AND RESCUE (continued)

call to the JRCC on any of its listed numbers may at times be more expedient.

6.2 Alerting

6.2.1 The alerting service is available for all aircraft which are known by the air traffic services to be operating within the UK Flight Information Regions (FIRs). The responsibility for initiating action normally rests with the Air Traffic Service Unit (ATSU) which was last in communication with the aircraft in need of SAR assistance or which receives such information from an external source.

6.2.2 If a distress signal and/or message is intercepted by their aircraft, pilots are to inform the appropriate ATSU giving all available information who are in turn to inform D&D. The UK JRCC does not maintain a listening watch on VHF.

6.2.3 **Difficult Areas for SAR**

6.2.3.1 Although the UK has not formally designated land or sea areas where SAR operations would be difficult, EASA regulations state that all General Aviation (GA) aircraft, should carry appropriate survival equipment, including an Emergency Locator Transmitter (ELT) or Personal Locator Beacon (PLB).

6.2.3.2 The following areas within the UK are considered to be difficult from a SAR aspect:

The Scottish Highlands;	The Hebrides, Orkneys and Shetlands;	The Pennine Range;
The Lake District;	The Yorkshire Moors;	The Welsh Mountains;
The Peak District of Derbyshire;	Exmoor;	Dartmoor.

6.2.4 For flight over the North Atlantic (NAT), International GA (IGA) pilots should pay particular attention to the varying requirements of the NAT provider states. Canada, Iceland, Denmark and Greenland have requirements more stringent than those of the UK particularly regarding the carriage of ELTs, survival equipment, communications, aircraft inspections and navigation equipment, fuel reserves and instrument ratings. IGA pilots planning trans-oceanic flight are strongly recommended to read the North Atlantic International General Aviation Operations Manual and to seek advice and guidance from the UK Aeronautical Information Service (see GEN 3.1).

6.3 Communication

6.3.1 Distress and urgency communications within the UK SRR are in accordance with standard international procedures.

6.3.2 **Emergency Service**

6.3.2.1 An emergency communications and aid service is continuously available on 121.500 MHz. The service covers most of the UK above 3000 FT, but in many areas reception is good below this altitude. In an emergency, pilots who have difficulty in establishing communication on the frequency in use should make use of the service on 121.500 MHz.

6.3.2.2 Executive control is exercised from D&D, callsign 'London Centre', throughout the London and Scottish FIRs/UIRs. Aerodromes capable of providing an emergency service on 121.500 MHz are listed via paragraph 6.5 below.

6.3.2.3 It is not necessary for pilots in emergency to address the initial 'MAYDAY' or 'PAN PAN' call to a specific unit. The D&D Emergency Controller at Swanwick will answer the call irrespective of the location of the transmission. If transponder fitted, in emergency select code 7700 (emergency) or 7600 (radio failure) to assist the Emergency Controller in determining your position and providing a timely response.

6.3.2.4 Pilots should be aware that the airspace west of ATS Route N864 has limited VHF Direction Finding (VDF) coverage and the Emergency Controller's ability to locate an aircraft using VDF is dependent on the aircraft's position and altitude. Furthermore, at the D&D, due to the lack of primary radar in the Southwest, non-transponding aircraft will be difficult to locate and will not receive a radar service from the D&D Emergency Controller. Response time to any incident is governed by the amount of assistance received from other ATC units and the Coastguard authorities.

6.4 Emergency Satellite Voice Calls from Aircraft

6.4.1 For aircraft flying in the London, Scottish and Shanwick FIRs/UIRs, in the event that all other means of communication have failed, dedicated satellite voice telephone numbers for the D&D section and for the Shanwick OAC have been programmed into the aeronautical Ground Earth Stations of the Inmarsat Signatories.

6.4.2 The allocated airborne numbers for use via the aircraft satellite voice equipment are as follows:

(a) Shanwick OAC	423201	To be used only in emergency situations. This facility is provided in addition to the number for routine ATS messages via Shanwick Radio (425002) and allows direct pilot/controller communication.
(b) 78, Sqn, Swanwick D&D	423202	

GEN 3.6 SEARCH AND RESCUE (continued)

6.4.3 It must be emphasised that these numbers are for emergency use only, when all other airborne means of communication with the appropriate ATSU have failed.

6.4.4 Almost instantaneous aircraft position fixing by auto-triangulation is available H24 on 121.500 MHz over most of central and southeast England above 3000 FT AMSL but down to 2000 FT AMSL in the vicinity of the London airports. Outside the coverage of the auto - triangulation system, position may be fixed by use of surveillance equipment or by investigative measures based upon last known position and when, speed, direction of travel and observable features from the aircraft which may take several minutes and multiple transmissions.

6.4.5 Aircraft operating in the Shanwick OCA are required to maintain a continuous watch on 121.500 MHz (see ENR 2.2 (Shanwick Oceanic Control Area (North Atlantic Region - NAT) paragraph 9). For operations over the sea, out of range of land based emergency communications, pilots, particularly IGA pilots at low altitude, should, if in difficulty, attempt to establish contact with aircraft at higher levels.

6.4.6 When an emergency is ended, it is important that the controlling authority is so informed and that the pilot states his intentions before leaving the frequency in use. This will ensure that SAR actions already underway are cancelled.

6.5 Units with Emergency Facilities on 121.500 MHz

6.5.1 In addition to the 24 hour service provided by the London ACC, there are a number of UK aerodromes that can provide a service on 121.500 MHz, including UK civil aerodromes listed in the ICAO European Air Navigation Plan, Volume I Part II (AOP) Table AOP I-1, International Aerodromes Required in the EUR Region. At Brize Norton which is the Military Emergency Diversion Aerodrome (MEDA), a 24 hour communications monitor is maintained on 121.500 MHz. The civil aerodromes listed do not routinely monitor 121.500 MHz, but this frequency can be activated as necessary to provide a clear channel for emergency traffic. This facility can be requested by direct call to the unit concerned on an in-use frequency, or, more usually, by request from an ACC.

6.5.2 **Aircraft Not Equipped with Radio**

6.5.2.1 A pilot of an aircraft not equipped with radio is advised to file a Flight Plan if he intends to fly more than 10 NM from the coast or over sparsely populated or mountainous areas as this will assist rescue action should the aircraft be reported overdue. Pilots should particularly note that Flight Plans can only be delivered to destinations which are on the AFS or linked to the AFS by the parent station scheme and that search action can only be initiated if an aircraft is reported overdue. This action is performed by the destination aerodrome ATSU, when established, but pilots intending to fly to destinations which are not on the AFS or linked to them by a parent station should advise a responsible person at their destinations of the intended flight and arrange for that person to notify the ATS authorities in the event of non-arrival.

6.6 Flight in Areas in which Search and Rescue Operations are in Progress

6.6.1 To avoid interference with SAR operations and to avoid unnecessary collision hazard, pilots are strongly advised not to fly near an area where SAR operations are known to be in progress. Crews of aircraft involved in the SAR operation may be performing complex manoeuvres, often in poor weather conditions, and may not be able to maintain a good lookout for itinerant aircraft.

6.6.2 Pilots who consider it necessary to fly in a known area of SAR operations should:

a) Contact the JRCC by telephone before departure;
b) file a Flight Plan giving times of entering and leaving the area and the height to be flown, ensuring that the JRCC is included among the addressees;
c) obtain the latest information about weather conditions en-route and in the search area;
d) monitor the VHF International Distress (121.500 MHz) and the Scene of Search (123.100 MHz) frequencies when in the vicinity, but avoid transmitting on these frequencies.

6.6.3 Under certain circumstances, a Temporary Danger Area (TDA) may be established around the scene of an incident. This will normally be established by NOTAM. If such a measure fails to achieve its objective, Restriction of Flying (Emergency) Regulations may be invoked. These will make it an offence for an aircraft to be flown in the designated area. Such regulations will also be promulgated by NOTAM (see also ENR 1.1.5).

6.7 Action by Survivors

(See also paragraphs 8 and 10)

6.7.1 Basic procedures that can assist SAR operations are set out below.

6.7.1.1 Life Rafts

Survivors should use some or all of the following methods when search aircraft or surface craft are seen or heard:

a) Fire distress flares or cartridges;
b) use some object with a bright flat surface as a heliograph;
c) flash torch or mobile phone;

d) fly anything in the form of a flag and, if possible, make the international distress signal by flying a ball, or something resembling a ball, above or below it;
e) use the fluorescent marker to leave a trail in the sea.

6.7.1.2 Crash Landing in Isolated Area

Survivors should use some or all of the following methods to attract attention when aircraft or surface craft are heard or seen:

a) Visual and ground signals (see paragraphs 6.10 to 6.12 and the Ground to Air Emergency Signalling Code Tables 1 and 2 following paragraph 6.12);
b) make the aircraft as conspicuous as possible by spreading any parachutes or other material over the wings and fuselage;
c) smoke or fire. A continuously burning fire is recommended, with material kept ready to hand to cause it to smoke at short notice. A quantity of green branches, leaves, oil or rubber from the aircraft should achieve the desired result. Three fires in the form of a triangle make a good signal especially at night.

6.8 Emergency Locator Transmitters (ELT) and Personal Locator Beacons (PLBs)

6.8.1 The COSPAS/SARSAT (C/S) system uses near-polar orbital satellites, the LEOSAR system, Geostationary satellites, the GEOSAR system, and global orbiting satellites called the MEOSAR system, to detect and localize signals from ELTs, PLBs and EPIRBs. The UK has a Local User Terminal (LUT), currently at Lee-On-Solent, that processes the satellite downlink from all three satellite constellations, and passes ELT, PLB and EPIRB locations to the UK Mission Control Centre (UKMCC) collocated at the JRCC in Fareham. These beacons operate on the 406.0 - 406.1 MHz frequency and detect transmissions across the entire globe. Location accuracy is normally better than 5 KM through the LEOSAR satellites, whereas the Geostationary satellites require position information to be included in the beacon alert transmission, achieved through a GNSS chip contained within the beacon, which can provide position accuracy to greater than 1 KM. The MEOSAR system, when at Full Operational Capability, will achieve greater location accuracy of 5 KM or less, 95% of the time, with near instantaneous alert information. This is due to the unique continuous global coverage. Position resolution (5 KM or better) via the LEOSAR system does not usually exceed 90 minutes. This is due to this system working solely on Doppler and requires at least two satellite passes, for position resolution. If the beacon has a GNSS chip within it, position detection and position information is near instantaneous, via the GEOSAR satellites.

6.8.2 Because the C/S system can detect 406 MHz beacon transmissions throughout the entire globe, and because much of the UK SRR covers an area of busy civil and military air traffic where the distress frequencies are routinely monitored, survivors should switch on an ELT without delay.

6.8.3 Valuable SAR assets can be expended searching for the source of inadvertent distress transmissions and thus delay the response to an actual emergency situation; great care should be taken to avoid inadvertent transmissions, especially during maintenance or testing of 406 MHz beacons, which is when the beacon should be placed in self-test mode. Should inadvertent transmissions occur, a report should be made immediately to the nearest MCC to where the beacon is currently located, to cancel an unnecessary SAR response. If the beacon is within the UK, contact should be made to the UKMCC on +44(0)34438-20902.

6.8.4 ELT/PLB coding and registration arrangements are provided at AIC P 053/2018.

6.9 SAR Callsigns

6.9.1 Within the UK SRR, forces engaged in SAR operations normally use callsigns assigned by the JRCC and prefixed by the root word 'RESCUE'. Fixed-wing assets use a 2 figure number, for example 'RESCUE 41'. DfT contracted SAR helicopters use the prefix 'RESCUE' plus a 3 digit numeric, for example 'RESCUE 175'.

6.10 Search and Rescue Signals

6.10.1 The SAR signals to be used are in accordance with international procedures. When signalling to surface craft, visual signals can be more effective than audio signals because of possibly high noise levels on board the surface craft.

6.10.2 Signals to Surface Craft

GEN 3.6 SEARCH AND RESCUE (continued)

6.10.2.1 The following manoeuvres performed in sequence by an aircraft mean that the aircraft wishes to direct a surface craft towards an aircraft or a surface craft in distress:.

a) Circling the surface craft at least once.
b) Crossing the projected course of the surface craft ahead at low altitudes and:

i. rocking the wings; or
ii. opening and closing the throttle; or
iii. changing the propeller pitch.

c) Heading in the direction in which the surface craft is to be directed. Repetition of such manoeuvres has the same meaning.

6.10.2.2 The following manoeuvre by an aircraft means that the assistance of the surface craft to which the signal is directed is no longer required:

Crossing the wake of the surface craft close astern at a low altitude and:

a) rocking the wings; or
b) opening and closing the throttle; or
c) changing the propeller pitch.

6.10.3 The following replies may be made by surface craft to the signals in paragraph 6.10.2.1 (b).

6.10.3.1 To acknowledge receipt of signals:

a) hoist the 'code pennant' (vertical red and white stripes) close up (meaning understood);
b) flash a succession of 'T's by signal lamp in the Morse Code;
c) change heading to follow the aircraft.

6.10.3.2 To indicate inability to comply:

a) hoist the international flag 'N' (a blue and white chequered square);
b) flash a succession of 'N's in the Morse Code.

6.11 Ground-to-Air Emergency Signalling Code

6.11.1 The following guidelines should be employed when using the symbols, as detailed in Tables 1 and 2 shown after GEN 3.6, paragraph 6.12.

6.11.2 The symbols should be at least 2.5 M (8 FT) long and should be made as conspicuous as possible by attempting to provide the maximum colour contrast between the symbols and the background against which they are displayed.

6.11.3 Care should be taken to lay out symbols exactly as depicted to avoid any possible confusion with other symbols.

6.11.4 Symbols may be formed by any means such as: strips of fabric, parachute material, pieces of wood, stones, by trampling, or staining the surface with oil etc. When the surface is snow covered, signals can be made by dragging, shovelling or trampling the snow. The symbols thus formed will appear to be black from the air.

6.11.5 In addition to using these symbols every effort should be made to attract attention to them by means of radio, flares, smoke, reflected light or by other available means.

6.12 Air-to-Ground Signals

6.12.1 The following signals by aircraft mean that the ground signals have been understood.

- During the hours of daylight: — rocking the aircraft's wings.
- During the hours of darkness: — flashing on and off twice the aircraft's landing lights or, if not so equipped, by switching its navigation lights on and off twice.

6.12.2 Lack of the above signals indicates that the ground signal is not understood.

GEN 3.6 SEARCH AND RESCUE (continued)

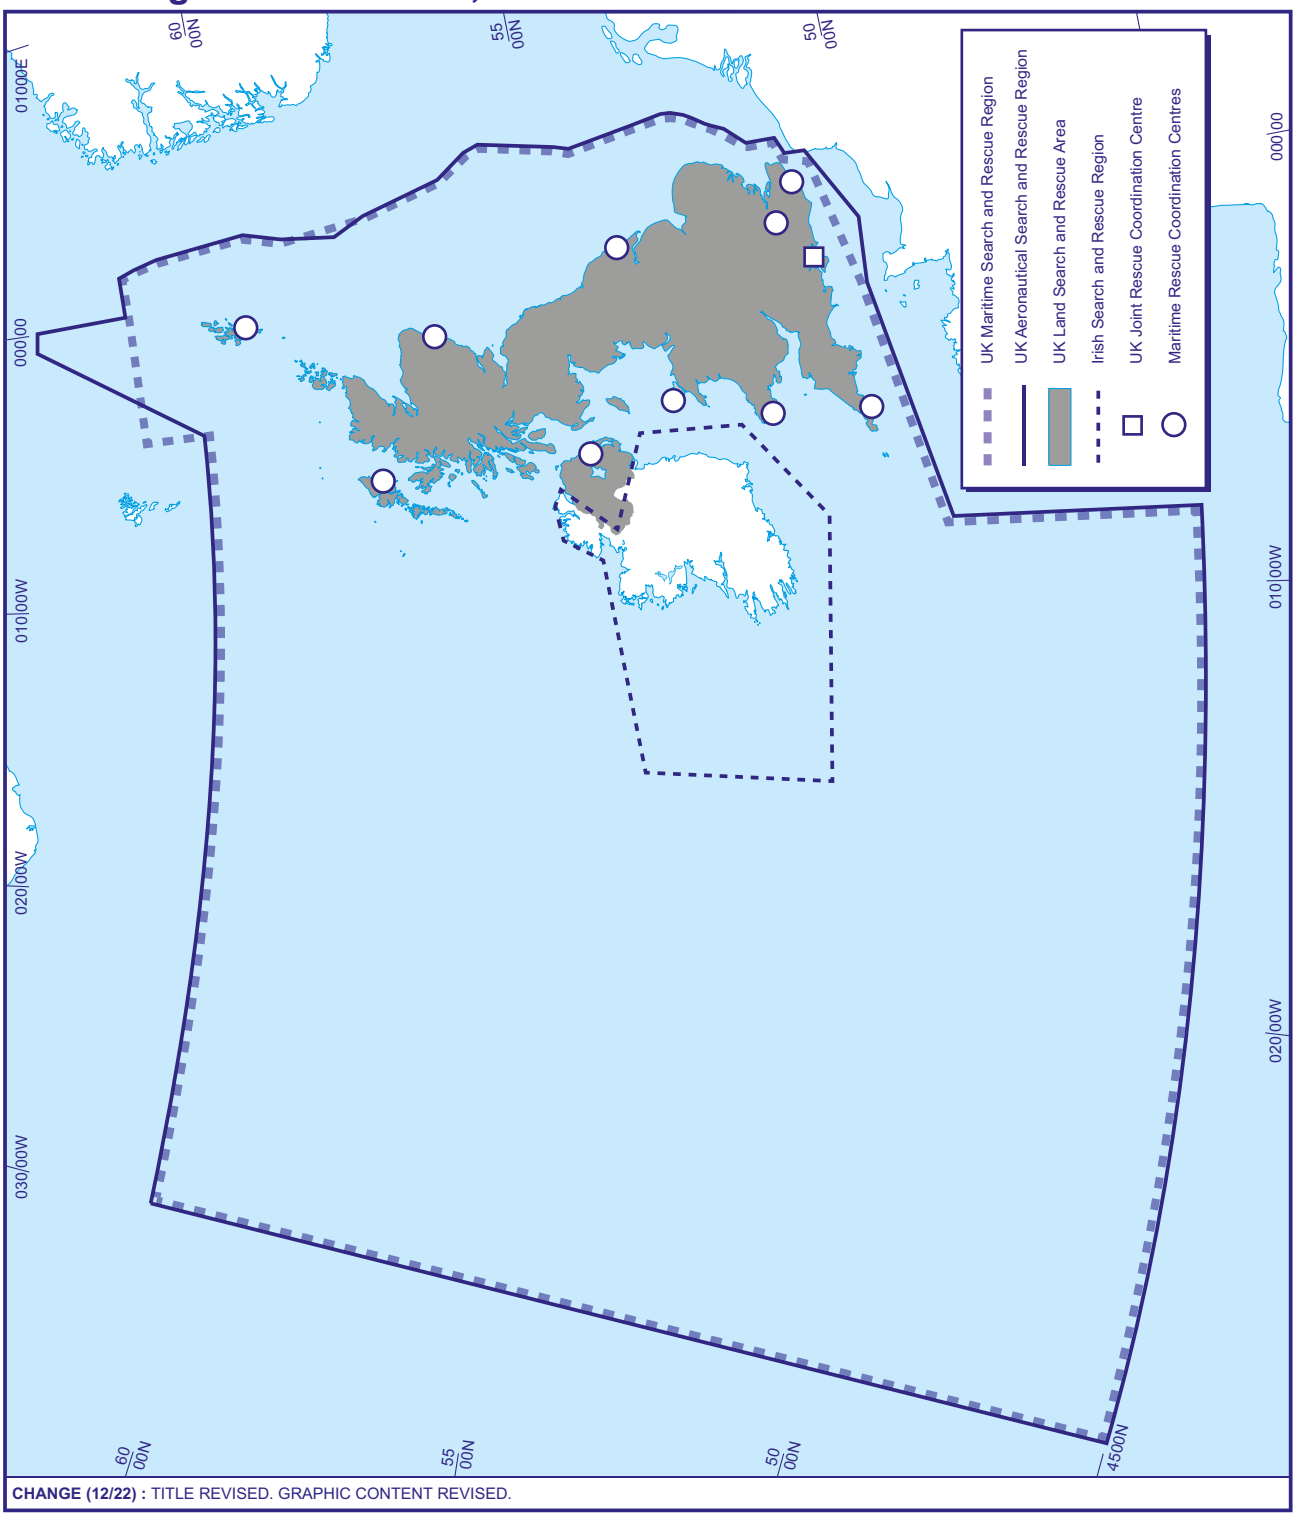
GROUND TO AIR EMERGENCY SIGNALLING CODE

Table 1:

GROUND-AIR VISUAL SIGNAL CODE FOR USE BY SURVIVORS

No.	Message	Code Symbol
1	Require assistance	
2	Require medical assistance	
3	No or negative	
4	Yes or affirmative	
5	Proceeding in this direction	

Table 2:



GROUND-AIR VISUAL SIGNAL CODE FOR USE BY RESCUE UNITS

No.	Message	Code Symbol
1	Operation completed	
2	We have found all personnel	
3	We have found only some personnel	
4	We are not able to continue. Returning to base	
5	We have divided into two groups. Each proceeding in direction indicated	
6	Information received that aircraft is in this direction	
7	Nothing found. Will continue to search

INTENTIONALLY BLANK

GEN 4 CHARGES FOR AERODROMES/HELIPORTS AND AIR NAVIGATION SERVICES

GEN 4.1 AERODROME/HELIPORT CHARGES

1 Landing charges for UK Aerodromes and Heliports are not established centrally and vary between Aerodrome Operators.

2 Landing of Aircraft

2.1 Charges are generally calculated on the Aircraft's Maximum Total Weight Authorised (MTWA) in accordance with its Certificate of Airworthiness.

2.2 Additional Charges may be levied for:

a) Parking, hangarage and storage of aircraft;
b) passenger load supplements;
c) security;
d) noise related items.

3 Conditions Applicable to the Landing, Parking or Storage of Aircraft

3.1 The conditions under which aircraft may land, be parked, housed or otherwise dealt with, are governed by the Acts of Parliament in respect of certain aerodromes and are established by the aerodrome authority in respect of others.

3.1.1 In general, it is a condition that the Aerodrome Authority shall have a lien on the aircraft, its parts and accessories, for fees and charges which become due and payable, and shall be at liberty, subject to certain provisions, to sell, remove, destroy or otherwise dispose of the aircraft and any of its parts and accessories in order to satisfy any such lien.

3.1.2 To obtain the precise legal terms and conditions of use for any specific aerodrome, reference should be made to the appropriate authorities at that aerodrome.

4 Aerodrome Operators

a) British Airports Authority PLC (BAA)

i. BAA operates London Gatwick, Heathrow and Stansted, and Southampton Airports as subsidiary companies.
ii. The Conditions of Use and Scale of Charges can be obtained from the Finance Departments at the addresses below:

Post: BAA PLC
130 Wilton Road, London SW1V 1LQ
Phone: 020-7834 9449,
Fax: 020-7932 6699,
Telex: 919268 BAAPLC G

Post: Gatwick Airport Ltd
PO Box 29, Horley, Surrey RH6 0YP
Phone: 01293-503249,
Fax: 01293-504700

Post: Heathrow Airport Ltd
Hounslow, Middlesex TW6 1JH
Phone: 020-8745 7970,
Fax: 020-8745 7832

Post: Stansted Airport Ltd
Stansted, Essex CM24 9QW
Phone: 01279-662382,
Fax: 01279-662974

Post: Managing Director
Southampton International Airport Ltd, Southampton Airport, Southampton, Hants SO9 1RH
Phone: 023-8062 9600,
Fax: 023-8062 9300

b) Scottish Airports Ltd

i. Scottish Airports Ltd operates Aberdeen, Edinburgh and Glasgow Airports.
ii. The Conditions of Use and Scale of Charges can be obtained from the Finance Departments at the addresses below:

Post: Scottish Airports Ltd
St Andrew's Drive, Glasgow Airport, Paisley, Renfrewshire PA3 2SW
Phone: 0141-887 1111,

GEN 4.1 AERODROME/HELIPORT CHARGES (continued)

Fax: 0141-887 1669

Post: Aberdeen Airport Ltd
Dyce, Aberdeen AB2 0DU
Phone: 01224-722331,
Fax: 01224-725724

Post: Edinburgh Airport Ltd
Edinburgh EH12 9DN
Phone: 0131-333 1000,
Fax: 0131-335 3181

Post: Glasgow Airport Ltd
Paisley, Renfrewshire PA3 2ST
Phone: 0141-887 1111,
Fax: 0141-848 4586

c) Highlands and Islands Airports Ltd (HIAL)

i. The airports managed by HIAL are:

Barra	Benbecula	Campbeltown	Dundee	Inverness	Islay
Kirkwall	Stornoway	Sumburgh	Tiree	Wick	

ii. The Conditions of Use and Scale of Charges can be obtained from the Finance Department at the address below:

Post: Highlands and Islands Airports Ltd
Head Office, Inverness Airport, Inverness IV2 7JB
Phone: 01667-462445,
Fax: 01667-464216,
Email: hial@hial.co.uk

d) Other Civil Aerodrome Operators

i. The Conditions of Use and Scale of Charges at aerodromes not listed in this section may be obtained on application to the individual aerodrome operators, the addresses of which appear in the AD section.

e) Ministry of Defence (Government Aerodromes)

i. The Ministry of Defence is responsible for RAF Aerodromes, RN Stations and other Government Aerodromes.
ii. The Conditions of Use and Scale of Charges can be obtained from the address below:

Post: Ministry of Defence CS (CTS) 1a, HQ Air Command, RAF High Wycombe, Bucks HP14 4UE
Phone: 01494-461461 Ext 7234,
Fax: 01494-497227

GEN 4.2 AIR NAVIGATION SERVICES CHARGES

1 AERODROME AIR NAVIGATION SERVICE CHARGES

1.1 Charges at London Heathrow, London Gatwick, London Stansted, London City and London Luton.

1.1.1 Consequent to the Civil Aviation Authority (Navigation Services Charges) Specification 2026 the following are the charges payable for navigation services at the aerodromes to which the Specification applies from 1 January 2026.

1.1.2 The operator of every aircraft for which chargeable air services are provided by NERL in connection with an approach to any of London Heathrow, London Gatwick, London Stansted, London City and London Luton aerodromes (whether or not the services are actually used or could be used with the equipment installed in the aircraft), shall pay to NERL a charge calculated according to the following formula:

r = TSU x U

Where **r** is the charge for the flight,

TSU is the terminal service unit relating to that flight, and

U is the unit rate of £19.48.

1.1.3 For the purposes of paragraph 1.1.2 the terminal service unit relating to a flight shall be equal to the weight factor for the aircraft concerned. The weight factor, expressed as a figure taken to two decimal places, shall be the quotient, obtained by dividing by fifty the number of metric tons in the highest maximum certified take-off weight of the aircraft, to the power of 0.7.

1.1.4 For the purposes of paragraph 1.1.3 the highest maximum certified take-off weight of the aircraft is the maximum certified take-off weight of the aircraft as shown in the Aircraft Flight Manual or equivalent document, converted into metric tons where appropriate. Where an aircraft has multiple certified maximum take-off weights, the highest one shall be used. Where the weight factor is unknown, the weight factor shall be calculated by taking the weight of the heaviest aircraft of the same type known to exist.

2 EN-ROUTE AIR NAVIGATION SERVICE CHARGES

2.1 Charges for En-route Navigation Services made available by NATS in the Shanwick Oceanic Control Area

2.1.1 Subject to the provisions of the Civil Aviation Authority (Navigation Services Charges) Specification 2026, the charge payable by the operator of every aircraft (whether or not registered in the United Kingdom) that flies within the Atlantic (formerly NAT) area of the Shanwick Oceanic Control Area and in respect of which a flight plan is communicated to the appropriate air traffic control unit is £60.07 (the Atlantic Core charge).

The operator of every aircraft (whether or not registered in the United Kingdom) that flies within the Tango area of the Shanwick Oceanic Control Area shall pay to NERL, for the chargeable air services made available by it in relation to that flight, a charge of £59.73 per flight (the Tango Core charge).

Charges for ADS-B data. The operator of every aircraft (whether or not registered in the United Kingdom) that flies across the Atlantic (formerly NAT) area shall pay to NERL an ADS-B data charge ("the Atlantic data charge") of £39.70 per flight, provided that at the time of the flight the ADS-B service is fully available. The operator of every aircraft (whether or not registered in the United Kingdom) that flies across the Tango area shall pay to NERL an ADS-B data charge of £0.81 per flight provided that at the time of the flight the ADS-B service is fully available. Oceanic Tango flights are defined as flights operating along the length of ATS routes T9 and T290, as defined and promulgated in the UK AIP, within a defined volume of airspace bounded by coordinates 4500N 01000W, 4500N 00845W, 4834N 00845W, 4841N 01000W, 4500N 01000W. Flights that cross both the Atlantic and Tango areas will pay only the Atlantic Core and ADS-B data charge. For the purposes of this Specification, the ADS-B service is fully available as certified by NERL's Board in December 2019, which means that NERL is providing an Automatic Dependent Surveillance-Broadcast-based Oceanic En route Air Traffic Control Service to at least 99% of all users of the En route (Oceanic) Area that have the correct and functioning equipment, regulatory approval and plan to use it.

2.1.2 NATS currently grants dispensations from the Shanwick charges in the following cases:

a) Flights made for the purposes of Search and Rescue operations;
b) flights other than military flights made exclusively for the carriage on official business of a reigning Monarch or his immediate family, a Head of State, a Head of Government or a Government Minister;
c) flights made for the purpose of checking or testing equipment used or intended to be used as aids to air navigation;
d) test flights and flights made exclusively for the purposes of instruction or training of flight crew;
e) flights made by aircraft of which the Maximum Total Weight Authorised is less than 5.7 metric tonnes.

2.2 Charges for the Navigation Services made available by NATS for flights made by Helicopter to a Vessel or Off-shore Installation in the North Sea

2.2.1 Subject to the provisions of the Civil Aviation Authority (Navigation Services Charges) Specification 2026, the charge payable by the operator of every helicopter (whether or not registered in the United Kingdom), which flies from any point within the United

GEN 4.2 AIR NAVIGATION SERVICES CHARGES (continued)

Kingdom to a vessel or an off-shore installation within the area described below, is as described in CAA Official Record Series 7.

2.2.1.1 The area is bounded by straight lines joining successively the following points:

6300N 00500W – 632833N 0000000W – thence South along the UK Median Line to 5500N 00302E – 5500N 00100W – 5600N 00230W – 5740N 00230W – 5740N 00400W – 5830N 00400W – 5830N 00500W – 6300N 00500W.

2.2.2 Subject to the provisions of the Civil Aviation Authority (Navigation Services Charges) Specification 2026, the charge payable by the operator of every helicopter (whether or not registered in the United Kingdom), which flies from any point within the United Kingdom to a vessel or an off-shore installation within the area described below, is as described in CAA Official Record Series 7.

2.2.2.1 The area is bounded by straight lines joining successively the following points:

5500N 00100W – 5500N 00300E – 5423N 00245E – 5256N 00309E – 5230N 00247E – 5226N 00137E – 5238N 00140E – 5251N 00124E – 5319N 00010E – 5500N 00100W.

2.2.3 NATS grants a dispensation from the charge for flights made for the purpose of Search and Rescue operations.

2.3 Eurocontrol

2.3.1 Charges for En-route Navigation Services made available in the Airspace of Member and Contracting States of Eurocontrol.

2.3.1.1 Under a Multilateral Agreement (Cmnd 4916) concluded between the Member States of the European Organization for the Safety of Air Navigation 'EUROCONTROL' (Belgium, France, the Federal Republic of Germany, the Republic of Ireland, Luxembourg, the Netherlands and the United Kingdom), a system of charges for the use of route air navigation facilities and services in the airspace of the Member States of the Organization was introduced on 1 November 1971. A Multilateral Agreement (Cmnd 8662) relating to route charges was concluded at Brussels on 12 February 1981 between the following Contracting States – Austria, Belgium, France, Germany, Ireland, Luxembourg, Netherlands, Portugal, Spain, Switzerland and the United Kingdom. Since then the following States have also signed the Multilateral Agreement – Albania, Armenia, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Finland, Georgia, Greece, Hungary, Italy, Latvia, Lithuania, the Former Yugoslav Republic of Macedonia, Malta, Moldova, Monaco, Montenegro, Norway, Poland, Romania, Serbia, Slovak Republic, Slovenia, Sweden and Turkey.

2.3.1.2 The Civil Aviation Authority (Eurocontrol Charges) Specification 2026, prescribes the charges payable to Eurocontrol by the operator of any aircraft (whether or not registered in the United Kingdom), for which navigation services (not being navigation services provided in connection with the use of an aerodrome) are made available in the airspace comprising the following regions:

- London Flight Information Region;
- London Upper Flight Information Region;
- Scottish Flight Information Region;
- Scottish Upper Flight Information Region.

2.3.1.3 The charges collected in respect of the defined airspace, less the costs of collection, are remitted to the United Kingdom Government by Eurocontrol in accordance with a bilateral agreement (Cmnd 4915).

2.3.1.4 The Specification prescribes that the following flights will not be subject to the United Kingdom charges:

a) Flights by military aircraft;
b) flights made for the purposes of Search and Rescue operations;
c) flights by aircraft of which the Maximum Total Weight Authorised is 5700 KG or less made entirely in accordance with the Visual Flight Rules in the Rules of the Air (SERA.5005 and SERA.5010)(c);
d) flights terminating at the aerodrome from which the aircraft has taken off;
e) flights other than the flights referred to in (a) of this paragraph made exclusively for the purpose of the carriage on official business of a reigning Monarch or his immediate family, a Head of State, a Head of Government or a Government Minister;
f) flights made exclusively for the purpose of checking or testing equipment used or intended to be used as aids to air navigation;
g) flights made exclusively for the purposes of the instruction or testing of flight crew within the specified airspace of the United Kingdom;
h) flights made by aircraft of which the Maximum Total Weight Authorised is less than two metric tonnes;
i) flights made by helicopters from any point in the United Kingdom to a vessel or an off-shore installation within the area bounded by straight lines joining successively the following points:

   6300N 00500W – 632833N 0000000W – thence South along the UK Median Line to 5500N 00302E – 5500N 00100W – 5600N 00230W – 5740N 00230W – 5740N 00400W – 5830N 00400W – 5830N 00500W – 6300N 00500W.

j) flights made by helicopters from any point in the United Kingdom to a vessel or an off-shore installation within the area bounded by straight lines joining successively the following points:

   5500N 00100W – 5500N 00300E – 5423N 00245E – 5256N 00309E – 5230N 00247E – 5226N 00137E – 5238N 00140E – 5251N 00124E – 5319N 00010E – 5500N 00100W.

GEN 4.2 AIR NAVIGATION SERVICES CHARGES (continued)

2.3.1.5 Further information concerning the Eurocontrol Route Charges System may be obtained from:

Post: Eurocontrol
Central Route Charges Office
Rue de la Fusee, 96
B-1130 - Brussels
BELGIUM
Phone: 00-32-2-729 9011
Fax: 00-32-2-729 9094

3 METHODS OF PAYMENT

3.1 Aerodrome, North Sea Helicopter and Shanwick Charges

3.1.1 Navigation Service charges are invoiced to the aircraft operators, and are payable to:

Post: NATS (En Route) Plc
Accounts Receivable, 2nd Floor, Citypoint
65 Haymarket Terrace
Edinburgh
EH12 5HD

3.2 Eurocontrol Charges

3.2.1 The charges prescribed in the Specification are payable in euros to Eurocontrol at its principal office in Brussels. Arrangements have been made under which United Kingdom citizens and companies registered in the United Kingdom may pay either in sterling or euros into a Eurocontrol bank account in the United Kingdom. Other operators, who are nationals of a Member State of Eurocontrol may pay the charges in euros or their national currencies in the State of which they are nationals. Arrangements have also been made that will enable operators, who are not nationals of a Member State, to pay the charges in euros into bank accounts designated by Eurocontrol in any of the Member States.

3.3 Value Added Tax

3.3.1 The charges quoted herein are exclusive of any Value Added Tax which may be chargeable in accordance with the provisions of the Finance Act 1972 or with any Orders or Regulations made thereunder or by virtue of any Act replacing or amending the same.

ENR 1 GENERAL RULES AND PROCEDURES

ENR 1.1 GENERAL RULES

1 ATS Routes and Upper Control Areas (UTA)

1.1 ATS Routes — Description

1.1.1 ATS Routes are predicated upon significant geographical points which may or may not coincide with the location of a radio navigation aid. These significant points are shown in column 1 of the table depicted in ENR 3. Any coincident radio navigation aid is depicted immediately underneath.

1.1.2 Except where stated otherwise the width of an Airway is 5 NM either side of a straight line joining each two consecutive points shown in column 1 of the table. Upper ATS Routes have no declared width but for the purposes of ATS provision are deemed to be 5 NM either side of a straight line joining each two consecutive points. The vertical extent is shown in column 3 of the table. Where lower limits of Airways are defined as Flight Levels an absolute minimum altitude of 3001 FT applies unless otherwise stated in column 3 and the minimum cruising level shown in column 5 may not always be available.

1.1.3 Unless otherwise stated the ATS Routes catalogued in the table in ENR 3 are designed to contain aircraft navigating to RNAV 5 (ICAO DOC 9613 - AN/937 refers).

1.1.4 The ATS Route network is hereby notified for the purposes of the UK Air Navigation Order.

1.1.5 When an ATS Route transits a TMA, the status of the TMA takes precedence in airspace classification and conditions of use. Aircraft filed to fly on an ATS route that transits a TMA are required to be a minimum of RNAV 5 compliant.

1.1.6 CDR - A route which is permanently plannable during the times published in ENR 3 and may be used tactically at the discretion of ATC. Conditional routes (CDRs) are non-permanent ATS routes. They are designed to complement the permanent ATS route network and to allow flights to be planned on ATS routes, or portions thereof, that are not always available.

In the ATS route tables hereafter the CDR category is indicated under “Route availability” as “CDR” and is permanently plannable during the times published in the AIP. Due to military or other activities, the route may be closed. The unavailability is published daily in the EAUP/EUUP (European airspace use plan/European updated airspace use plan) in table “ATS Route and CDR Type 1 Closure”. The EAUP/EUUP is published on the Network Portal (NOP): https://www.public.nm.eurocontrol.int/PUBPORTAL/. In the event of a short notice unavailability of a CDR, rerouting around an associated AMC-Manageable Area will be made on ATC instructions.

1.1.7 In addition to published ATS routes, specific direct (DCT) options are allowed via the RAD Annex 3B. Specified DCT routes connecting the Reykjavik/Scottish boundary points and the UK Upper ATS route network should be used when flight planning to cross 61N between 000E and 006W.

1.2 ATS Route Designators

1.2.1 In accordance with ICAO Annex 11, the following prefix designators are used to indicate European Regional RNAV Routes, L, M, N, P and for non Regional RNAV Routes Q, T, Y, Z. Routes designated with these prefixes are compulsory RNAV at all levels except when otherwise notified.

1.3 Free Route Airspace

1.3.1 Free Route Airspace (FRA) is a volume of airspace in which the ATS route structure has been removed allowing operators to flight plan any DCT route option of their choosing between specific FRA entry/exit/arrival/departure and published intermediate waypoints.

FRA lateral and vertical limits are included in ENR 2.2 and depicted at ENR 6-70.

1.4 Airspace Security Warnings by the Department for Transport

1.4.1 **Introduction**

1.4.1.1 Security advice to UK air operators by government is issued in the form of a NOTAM to provide guidance or direction on airspace security risks. Longer term, ongoing warnings are included within the UK Aeronautical Information Publication (AIP). The DfT has developed an Airspace Security Warning Protocol that culminates in the issue of an airspace security warning as V Series NOTAM. Most of these NOTAMs will relate to potential risks to civil aircraft from surface-to-air missiles. However, the use of a NOTAM could also be for other security related threats that may arise.

1.4.2 **Information**

1.4.2.1 The opening text of the NOTAM takes the form: “SECURITY - HAZARDOUS SITUATION [COUNTRY/IES]”. The NOTAM will clearly specify the particular FIR(s) affected, and, where appropriate, give more precise details of the geographic area of concern, using coordinates, or by other means of demarcation (e.g. “...IN THE xxxx FIR, EAST OF 0310000E”). This will be followed by a

ENR 1.1 GENERAL RULES (continued)

brief description of the type of threat, e.g. “POTENTIAL RISK FROM ANTI-AIRCRAFT WEAPONRY”.

1.4.2.2 Where the potential risk is from Man-Portable Air Defence Systems (MANPADS), there is likely to be a restriction on flying below 25,000 FT AGL. Where there is a potential threat from air defence systems with a greater operational ceiling, this is likely to be 'Surface to Unlimited'. In the case of a threat from missiles, it is possible to extend their effective ceiling by launching from elevated terrain. For that reason, most height restrictions stated in an airspace security risk NOTAM will be noted as ‘Above Ground Level’ (AGL).

1.4.3 **Guidance**

1.4.3.1 Following the information on location and threat, there will (usually) be one of 3 forms of wording employed in expressing DfT’s guidance to operators:

a) “UK CIVIL AIR OPERATORS ARE ADVISED TO TAKE POTENTIAL RISK INTO ACCOUNT [IN FIR NAME] / WITHIN THE TERRITORY AND AIRSPACE OF [COUNTRY]”.
b) “UK CIVIL AIR OPERATORS ARE RECOMMENDED NOT TO ENTER THE [FIR NAME] / TERRITORY AND AIRSPACE OF [COUNTRY]”.
c) “IN ACCORDANCE WITH DIRECTION UNDER THE AVIATION SECURITY ACT 1982 UK CIVIL AIR OPERATORS SO SERVED ARE PROHIBITED TO ENTER THE [FIR NAME] / TERRITORY AND AIRSPACE OF THE STATE OF [COUNTRY]”.

1.4.3.2 The wording will generally follow the patterns above, but could vary as, e.g., it may not always be possible to specify the precise nature of a potential security risk to aircraft, or, the geographic area may be complex to describe.

1.4.3.3 DfT will review the content of the NOTAM 60 days from the date of issue, 30 days prior to its expiry. Due to the evolving and fluid nature of many conflicts, NOTAMs may be extended for a further 90 days if appropriate. Advice which is to remain in place beyond this will in most cases be moved into the AIP..

1.4.3.4 UK civil air operators planning to operate in airspace covered by DfT NOTAMs or AIP entries are strongly encouraged to contact DfT in advanced of operating to ensure they have the latest available information to inform the air carriers own risk assessment.

1.4.3.5 Queries can be made to:

Global Risk & Response Team, Aviation Security Division: +44 (0)207-082 6639, Mon-Fri 0830-1630 (0730-1530);

If urgent, out of hours the Aviation Security Duty Officer can be contacted via +44 (0)207-944 3111.

1.4.4 **International Co-ordination**

1.4.4.1 The International Civil Aviation Organisation (ICAO) has established a website from which links are available to relevant information from any participating State source to support the assessment of risks over conflict zones. As part of the UK’s contribution to this ICAO initiative, all UK NOTAMs relating to conflict zone issues will be made available on the AIS Website, to which a link will be provided from the ICAO website.

1.4.4.2 It is possible that other States’ advice may differ from that provided by the UK. UK NOTAMs or AIP entries concerning conflict zones represent the best advice available from UK Government sources in support of airline risk assessments. Nonetheless, if operators are concerned about advice from other States that conflicts with, or does not align with, that issued by the UK they should contact DfT on the numbers provided above.

ENR 1.1 GENERAL RULES (continued)

1.4.5 **Current Airspace Warnings**

Serial	Location	Text	Lower Altitude	Upper Altitude	Date of Issue
1	Afghanistan	**Security - Hazardous Situation in Afghanistan** UK registered air operators are advised to take potential risk into account within FIR Kabul (OAKX). Potential risk from heightened military activity.	Surface	Unlimited	29 Oct 26
2	(Gulf of) Aqaba	**Security - Hazardous Situation in Gulf of Aqaba** UK civil air operators are advised to take risk into account when operating up to 150 NM from the centre point of the Gulf of Aqaba (calculated to be 284536N 344236E) due to potential risk from heightened military activity.	Surface	Unlimited	26 Dec 24
3	Belarus	**Security - Hazardous Situation in Belarus** UK civil air operators are recommended not to enter FIR MINSK (UMMV). Potential safety and security risks.	Surface	Unlimited	24 Jan 22
4	Democratic Republic of the Congo	**Security - Hazardous Situation in the Democratic Republic of the Congo** UK civil air operators are recommended not to enter FIR KINSHASA (FZZA) within 200 NM of the eastern boundary, between the 1st parallel north and the 5th parallel south. Potential risk from anti-aircraft weaponry.	Surface	Unlimited	16 Apr 26
5	Iran	**Security - Hazardous Situation in Iran** UK civil air operators are recommended not to enter FIR TEHRAN (OIIX). Potential risk from anti-aircraft weaponry and heightened military activity.	Surface	Unlimited	03 Oct 24
6	Haiti	**Security - Hazardous Situation in Haiti** UK civil air operators are recommended not to enter FIR PORT-AU-PRINCE (MTEG) below 10,000 FT AGL due to potential risk to aviation from small arms fire.	Surface	10,000 FT AGL	15 Nov 24
7	Iraq	**Security - Hazardous Situation in Iraq** UK civil air operators are recommended not to enter FIR BAGHDAD (ORBB) below FL 320. Potential risk from anti-aircraft weaponry.	Surface	FL 320	12 Sep 22
8	Lebanon	**Security - Hazardous Situation in Lebanon** UK registered air operators are recommended not to enter FIR Beirut (OLBB). Potential risk from heightened military activity.	Surface	Unlimited	29 Oct 26
9	Libya	**Security - Hazardous Situation in Libya** UK registered air operators are recommended not to enter FIR TRIPOLI (HLLL). Potential risk from anti-aircraft weaponry.	Surface	Unlimited	12 Jun 15
10	Mali	**Security - Hazardous Situation in Mali** UK civil air operators are advised to take potential risk into account within FIR NIAMEY (DRRR) and FIR DAKAR (GOOO) within the territory and airspace of Mali. Potential risk from anti-aircraft weaponry.	Surface	Unlimited	17 Mar 23
11	Myanmar	**Security - Hazardous Situation in Myanmar** UK civil air operators are advised to take potential risk into account when operating below 25,000 FT above ground level (AGL) in FIR YANGON (VYYF). Potential risk from anti-aircraft weaponry.	Surface	25,000 FT AGL	15 May 25

ENR 1.1 GENERAL RULES (continued)

12	North Korea / Sea of Japan	**Security - Hazardous Situation in North Korea / Sea of Japan** UK civil air operators are recommended not to enter FIR PYONGYANG (ZKKP) and are advised to take potential risk into account over the Sea of Japan (within the geographical coordinates of 1280000E and 1400000E degrees of longitude). Potential risk from unannounced missile tests.	Surface	Unlimited	23 Aug 17
13	Red Sea	**Security - Hazardous Situation in the Red Sea** UK civil air operators are advised to take potential risk into account when operating over the waters of the Red Sea due to potential risk from heightened military activity.	Surface	Unlimited	26 Dec 24
14	Somalia	**Security - Hazardous Situation in Somalia** UK civil air operators are recommended not to enter FIR MOGADISHU (HCSM) below 25,000 FT above ground level (AGL). Potential risk from anti-aircraft weaponry.	Surface	25,000 FT AGL	15 Jan 16
15	Sudan	**Security - Hazardous Situation in Sudan** UK civil air operators are recommended not to enter FIR KHARTOUM (HSSS) within the territory and airspace of Sudan. Potential risk from anti-aircraft weaponry and heightened Military activity.	Surface	Unlimited	21 Apr 23
16	South Sudan	**Security - Hazardous Situation in South Sudan** UK civil air operators are advised to take potential risk into account within FIR KHARTOUM (HSSS) within the territory and airspace of South Sudan below 25,000 FT above ground level (AGL). Potential risk from anti-aircraft weaponry.	Surface	25,000 FT AGL	12 Jun 15
17a	Syria	**Security - Hazardous Situation in Syria** In accordance with Direction under the Aviation Security Act 1982, UK civil operators so served are prohibited to enter FIR DAMASCUS (OSTT) / territory and airspace of the Syrian Arab Republic. Potential risk from anti-aircraft weaponry. UK operators not currently subject to direction under the Aviation Security Act should contact UK Department for Transport (DfT) before operating in this area.	Surface	Unlimited	12 Jun 15
17b	(Vicinity of) Syria	**Security - Hazardous Situation in Vicinity of Syria** UK civil air operators are advised to take potential risk into account when operating up to 200 NM outside FIR DAMASCUS (OSTT). Potential risk from anti-aircraft weaponry.	Surface	Unlimited	22 Oct 18
18	Ukraine	**Security - Hazardous Situation in Ukraine** In accordance with Direction under the Aviation Security Act 1982, UK registered air operators so served are prohibited to enter FIR LVIV (UKLV), FIR SIMFEROPOL (UKFV), FIR ODESA (UKOV), FIR KYIV (UKBV) and FIR DNIPROPETROVSK (UKDV) / territory and airspace of Ukraine. Potential risk from anti-aircraft weaponry and heightened military activity. UK operators not currently subject to direction under the Aviation Security Act should contact UK Department for Transport (DfT) before operating in this area.	Surface	Unlimited	24 Feb 22
19	Yemen	**Security - Hazardous Situation in Yemen** UK civil air operators are recommended not to enter FIR SANAA (OY-SC). Potential risk from anti-aircraft weaponry. Excluded from this recommendation are airways N315, UL425 and R401.	Surface	Unlimited	08 Sep 15

ENR 1.1 GENERAL RULES (continued)

1.5 Flight Planning Restrictions

1.5.1 Flight planning restrictions applicable to UK airspace are published within the **Network Manager (NM) RAD**. UK restrictions are contained within the RAD denoted with 'EG'. Please refer to the Eurocontol website for full details of the RAD: https://www.nm.eurocontrol.int/

1.5.1.1 Changes to the RAD are published in line with the AIRAC cycle. Any changes required between AIRAC Cycle publication dates, due to urgent operational reasons, will be notified by NOTAM or via RAD Increment and will be published accordingly by NM via rolling RAD.

1.5.1.2 Operators should refer to the RAD and its various annexes when constructing routes for an IFR flight within or overflying UK airspace.

1.5.2 For information on standard routings within UK airspace, and alternative routings during danger area activity, users should refer to the **UK & Ireland Standard Route Document (SRD)** as published at https://nats-uk.ead-it.com/cms-nats/opencms/en/Publications/digital-datasets/

1.5.2.1 The United Kingdom & Ireland SRD is issued in line with the AIRAC cycle and is available to assist aircraft operators in constructing RAD compliant UK and Irish portions of IFR flight plannable routes. The route listings contained should be considered as 'preferred' and are not mandatory, however they are promulgated to identify optimum routings for operators with due regard for the ATC system. Reference may be made to applicable RAD restrictions for a route, details of which may be found via the Eurocontrol website.

1.5.3 Temporal flight planning buffers are added to Special Use Airspace (SUA) activation times in order to allow for flights departing late (or early) on their scheduled ETD. The parent Area Control Centre Airspace Management Cell (AMC) define the buffer requirement and parameters during the airspace planning phase of Airspace Management.

When SUA areas are active, the AUP/UUP published activation time includes temporal buffer at the start and end of the activity. No extra buffer is required for flight planning purposes. SUA activation NOTAM define the actual parameters of the activity and do not include any element of a temporal flight planning buffer, therefore the NOTAM start, and end time of the actual activity will be different to the AUP times.

1.6 Rules and Procedures

1.6.1 **Control Areas (Airways)**

1.6.1.1 **Radio Communications and Equipment**

1.6.1.1.1 The requirements for radio communications and equipment are set out in GEN 1.5.

1.6.1.2 **ATC Clearance**

1.6.1.2.1 One of the following phrases may be included in the initial clearance when the air traffic situation necessitates the regulation of departing flights:

a) 'Clearance expires ..... (time)' - this indicates that if the aircraft is not airborne by the time stated, a fresh clearance will need to be obtained;
b) 'Take-off not before ..... (time)' - this is given so that the pilot can calculate the best time to start engines;
c) 'Unable to clear ..... (level planned)' - when ATC is unable to clear the flight at the level planned an alternative will be offered whenever possible, the acceptance of which will avoid or reduce delay;
d) 'Join Airways at ..... (place and level) not before ..... (time)' - may be used when an Airways clearance is given to an aircraft, the first part of whose flight from the origination aerodrome is in uncontrolled airspace.

1.6.1.3 **Airborne Procedures (See also ENR 1.4, paragraph 2.1, Note 2)**

1.6.1.3.1 When an aircraft is cleared to leave or join an Airway at a certain point, it should be flown so as to cross the actual boundary of the Airway as near to that point as is practicable.

1.6.1.3.2 All aircraft flying Airways are required to adhere to IFR procedures in all weather conditions. However, when radar cover is not available ATC may offer VMC climb or descent clearances in order to avoid excessive traffic delays. Such clearances will be offered subject to the following:

a) By day only in Visual Meteorological Conditions;
b) subject to the agreement of the pilot concerned;
c) the pilot will be responsible for effecting his own separation;
d) essential traffic information will be given;

1.6.1.3.3 Unless otherwise authorized by ATC, aircraft flying along Airways are required, in so far as practicable, to operate along the de-

ENR 1.1 GENERAL RULES (continued)

fined centre-line.

1.6.1.4 **Flights Joining Airways**

1.6.1.4.1 Pilots wishing to join an Airway are required to file a flight plan either before departure or when airborne, and to request joining clearance when at least 10 minutes flying time from the intended joining point. If the destination or any part of the route is subject to Air Traffic Flow Management, pilots must have received the required authorisation/approval from the appropriate Air Traffic Flow Management Unit (ENR 1.9).

1.6.1.4.2 Joining clearance should be obtained as follows: Initial call - '..... (identification) request joining clearance ..... (Airway) at ..... (position)'. When instructed by ATC the following flight details should be passed:

a) Identification;
b) Aircraft type;
c) Position and heading;
d) Level and flight conditions;
e) Departure aerodrome;
f) Estimated time at entry point;
g) Route and point of first intended landing;
h) True Airspeed;
i) Desired level on Airway (if different from the above).

1.6.1.4.3 Requests for joining clearance of Airways for which the Controlling Authorities are London or Scottish Control should be obtained as follows:

a) From the ATSU with which the aircraft is already in communication; or
b) from the appropriate FIR Controller (if different from (a)); or, if it is not possible to obtain any form of clearance using (a) or (b), then
c) on the published frequency of the Airway Controlling Authority.

1.6.1.4.4 In order to prevent confliction with other Airways traffic, pilots should ensure that they are at the cleared flight level when they cross the Airway boundary, unless specific permission to do otherwise has been given by ATC.

1.6.1.5 **Flights Crossing Airways in IFR**

1.6.1.5.1 Pilots wishing to cross an Airway are required to file a flight plan either before departure or when airborne, and to request crossing clearance when at least ten minutes flying time from the intended crossing point.

1.6.1.5.2 Crossing clearance should be obtained as follows: Initial call - '..... (identification) request crossing ..... (Airway) at ..... (position)'. When instructed by ATC the following flight details should be passed:

a) Identification;
b) Aircraft type;
c) Position and heading;
d) Level and flight conditions;
e) Position of crossing;
f) Requested crossing level;
g) Estimated time of crossing.

1.6.1.5.3 Requests for joining clearance of Airways for which the Controlling Authorities are London or Scottish Control should be obtained as follows:

a) From the ATSU with which the aircraft is already in communication; or
b) from the appropriate FIR Controller (if different from (a)); or, if it is not possible to obtain any form of clearance using (a) or (b), then
c) on the published frequency of the Airway Controlling Authority.

1.6.1.5.4 Unless otherwise requested by ATC, aircraft crossing Airways will remain in communication with the FIR Controller and, after obtaining clearance, will report as follows when the aircraft is estimated to be at the boundary of the Airway:

'..... (identification) - Crossing ..... (Airway) ..... (position) ..... (time) ..... at ..... (level)'.

1.6.1.5.5 Except where otherwise authorized by ATC, aircraft are required to cross the Airway by the shortest route (normally, at right angles) and to be in level flight at the cleared flight level on entering the Airway.

1.6.1.6 **Airway Crossings or Penetrations in VMC - Civil Aircraft**

1.6.1.6.1 **Powered Aircraft - Airway Crossings (See also ENR 1.4, paragraph 2.1, Note 2)**

1.6.1.6.1.1 Powered aircraft may cross an Airway in VMC by day without compliance with the full IFR requirements in relation to the aircraft equipment provided that the pilot holds a valid Instrument Rating and that clearance is obtained from the appropriate ACC. This

ENR 1.1 GENERAL RULES (continued)

clearance must be obtained by RTF (normally on the FIR frequency); the request for clearance and a crossing report should be made as shown in paragraphs 1.4.1.5.3 and 1.4.1.5.5.

1.6.1.6.2 **Powered Aircraft - Other penetrations of Airways (see also ENR 1.1, paragraph 4.1 and ENR 1.4, paragraph 2.1, Note 2).**

1.6.1.6.2.1 Other flights in VMC, for example photographic survey flights, may also do so without compliance with full IFR requirements, provided that:

a) Prior arrangements are made with the appropriate ACC;
b) specific ATC clearance is obtained for individual flights;
c) the aircraft can communicate by RTF on the appropriate Airways frequency.

1.6.1.7 **Procedures for Military Aircraft**

1.6.1.7.1 These procedures apply to military aircraft in all weather conditions.

1.6.1.7.1.1 Military aircraft flying along Airways will conform to the normal Airways procedures.

1.6.1.7.1.2 Military aircraft crossing Airways will do so either:

a) Under the control of an approved Air Traffic Control Radar Unit; or
b) under a positive Air Traffic Control Clearance.

1.6.1.7.1.3 In an emergency, where neither a radar nor a procedural crossing can be obtained, an Airway may be crossed at an intermediate 500 FT level. The intermediate 500 FT levels referred to are flight levels of whole thousands plus 500 FT.

1.6.2 **Air Traffic Advisory Routes**

None are currently established by the UK.

1.6.3 **The Upper Airspace Control Area**

1.6.3.1 **Rules.** The following rules apply to aircraft flying in the Upper Airspace Control Area:

A flight plan must be filed; ATC permission must be obtained before the Area is entered; a continuous RTF watch must be kept on the appropriate frequency; the flight must be conducted in accordance with ATC instructions.

1.6.3.1.1 **Altimeter Setting Procedures**

1.6.3.1.1.1 All aircraft flying in the Upper Airspace Control Area must use the standard altimeter setting of 1013.2 mb.

1.6.3.1.2 **Cruising Levels**

1.6.3.1.2.1 Cruising levels will be allocated in accordance with the semi-circular rules depicted in the Table of Cruising Levels at ENR 1.7, paragraph 6. ATC may allocate a level not appropriate to the aircraft track, e.g. to effect transition to and from Oceanic levels.

1.6.3.1.2.2 The providers of Air Traffic Services in the United Kingdom Upper Airspace may apply a reduced vertical separation minimum of 1000 FT, between FL 290 and FL 410 inclusive, in the London and Scottish UIRs between aircraft that are RVSM approved. Aircraft that are not RVSM approved will be provided with a minimum of 2000 FT separation.

1.6.3.1.3 **Exemptions**

1.6.3.1.3.1 By prior agreement, Research and Development flights may be exempted from some of the rules and procedures but ATC will co-ordinate such flights.

1.6.3.1.3.2 The above rules and procedures do not apply to gliders.

1.6.3.1.3.3 By prior agreement, civil aircraft operating on contract to the MoD, aircraft undergoing air tests, or aircraft calibrating navigation aids may be exempted from the RVSM requirements.

1.6.3.2 **Co-ordination of Civil and Military Aircraft**

1.6.3.2.1 NATS radars cover most of the Upper Airspace. Within this cover, procedures exist for the co-ordination of civil and known military aircraft and they receive a radar control and/or a procedural ATC Service. Outside radar cover, a procedural ATC service is provided.

1.6.3.2.2 Military aircraft are normally under the control of NATS or autonomous radar Units but outside the Mandatory Radar Service Area, they are not obliged to receive an ATC Service. In these circumstances it is not always possible for ATC to offer avoiding action because the behaviour of such aircraft is unpredictable. However, whenever practicable, ATC will pass traffic information on them to aircraft under control.

ENR 1.1 GENERAL RULES (continued)

1.6.3.2.3 Due to the routine operation of high-speed military aircraft within the UIRs, civil aircraft operators should flight plan only on the published ATS Route Structure when operating outside the FRA volume as defined in ENR 2.2. When traffic conditions permit, ATC may authorize aircraft to fly more direct tracks. When planning through FRA, operators shall avoid active SUAs and associated FBZs and NPZs at their discretion unless specific routings are mandated: See ENR 1.10 Sect 3.

1.6.3.2.3.1 For individual flights within the Scottish UIR and outside the area defined for FRA operations, operators may file outside the published ATS Route Structure subject to authorisation by the Scottish ACC ATC Watch Manager (Tel: 01292-692763, Fax: 01292-692872). Authorisation for routine operations outside the published ATS Route Structure must be obtained from ATC Operational Support at Scottish ACC (Tel: 01292-692611, Fax: 01292 - 692610).

1.6.3.2.4 There is a military TACAN route system in the Upper Airspace. Some of the routes join the published Upper ATS Route Structure at certain reporting points as well as to a similar TACAN route network over the rest of Europe. See chart of the military TACAN routes at ENR 6-72.

1.6.3.3 **Non-Standard Civil Flights and Unusual Aerial Activities in the UK Upper Airspace**

1.6.3.3.1 Certain civil flying activities such as training and general test flying in Class C Airspace above FL 195 may require a specialized radar service that can best be provided by military ATS Units. However, it should be borne in mind that the aircraft handling capacity of military ATS Units may be committed to the Units primary tasks, and therefore, it is advisable that aircraft operators requiring a service should discuss their proposed task with the relevant ATS Unit prior to commencement of the flight.

1.6.3.3.2 Information concerning the military ATS Units may be obtained from the RAF en-route documents or from civil ATS Units.

1.6.3.3.3 The approval of an Unusual Aerial Activity (UAA) in Class C Airspace above FL 195 can often only be given after extensive co-ordination and the request should be submitted at the earliest opportunity to Airspace Regulation (Utilisation) (AR(U)), Airspace Regulation, Aviation House, Gatwick RH6 0YR, as detailed at ENR 1.1, paragraph 4.3.

1.6.3.4 **Flight Plans, ATC clearance and other procedures**

The normal requirements for flight plans, ATC clearance, and the regulations, rules and procedures appropriate for flight in Control Areas apply.

1.6.3.4.1 **Night Time Fuel Saving Routes**

1.6.3.4.1.1 Night Time Fuel Saving Routes (NTFSR) are introduced in UK upper airspace, excluding airspace defined as FRA, and are routes that formalise the practice of giving flight plannable direct routings (DCT) to GAT at set times overnight. NTFSR will enable the proportion of flights flying direct to increase during their hours of operation and will thereby produce a reduction in CO_2 emissions. Details of the routes are included in Annex 3B of the NM RAD.

1.6.3.4.2 **Loss of Communication**

1.6.3.4.2.1 In the event of radio communication failure, pilots will follow the procedures shown at ENR 1.1, paragraph 3.4. Attempts should also be made to establish communication on other control channels available in the Scottish FIR/UIR or on NARTEL HF channels.

1.6.3.5 **Military Training Areas (MTA)**

1.6.3.5.1 MTAs are established in the UK for the operational freedom of military aircraft engaged in exercise or training, and the nature of this activity is incompatible with civil air traffic services procedures. Civil pilots should not therefore flight plan any route through active MTAs nor make in-flight requests for transit through these areas when they are active as ATC cannot authorise such flights. However, for the following categories of civil registered aircraft, an ATS may be available within an active MTA from the appropriate military air traffic control radar unit:

a) Aircraft in emergency which may have to be routed through an active MTA for flight safety reasons;
b) aircraft sponsored by DE&S;
c) test flights by UK manufacturers of military and civilian aircraft;
d) airtests by civil or military aircraft departing from or arriving at UK aerodromes;
e) special flights authorised by HQ AIR (ATM Force);
f) air ambulance flights, where the most expeditious routing is justifiable on humanitarian grounds.

Note 1: *Pilots of such aircraft requiring this service should make their request to the UK Civil ATS Unit or Military Unit with which they are in contact.*

Note 2: *Military controllers may provide aircraft in the above categories with UK Flight Information Services (UK FIS) (radar services detailed in ENR 1.6, paragraph 1.3) and pilots are to ensure that they are familiar with the types of services available.*

1.6.3.5.2 If pilots inadvertently flight plan to transit MTAs during notified periods of activity, ATS instructions will be issued to re-route the aircraft around those areas. To avoid such unexpected routing, pilots are requested to ensure that account is taken of the published periods of activity of any MTA near the route (detailed in ENR 5.2), when planning their flight.

1.6.3.5.3 MTAs are depicted on the charts at ENR 6-70 and ENR 6-75.

ENR 1.1 GENERAL RULES (continued)

1.6.3.6 **North Sea Reduced Co-Ordination Area**

1.6.3.6.1 The North Sea Reduced Co-ordination Area (RCA) has been established within UK Upper Airspace to optimise airspace availability as a result of tactical handbacks of any portion of the EGD323 complex. As a result, direct point to point routings may be offered when airspace structures permit that would not normally allow the availability of a published CDR. The co-ordination requirements between OAT and GAT follow those set out within CAP 1430 and the Eurocontrol Airspace Management Handbook which are detailed within an LOA between the MOD and NATS.

1.6.3.6.2 Description of lateral and vertical dimension of the North Sea RCA are contained within ENR 2.2 and depicted in ENR 6.

1.6.3.7 **FRA Reduced Co-Ordination Area**

1.6.3.7.1 The FRA Reduced Co-ordination Area (RCA) has been established within UK upper airspace. The lateral and vertical dimension of the FRA RCA match that of the EGPX FRA area and are contained within ENR 2.2 and depicted in ENR 6-70.

1.7 Reporting Points

1.7.1 Compulsory Reporting Points are marked with a ▲. Reporting Points marked with a ∆ are 'on request' Reporting Points, at which a report will be made only when requested by the controlling authority.

1.8 Terrain Clearance

1.8.1 **Control Areas (Airways)**

1.8.1.1 Where the lower limit of a section of an Airway is defined as a Flight Level and therefore varies in height, an absolute minimum altitude applies. This minimum altitude for the Airway base is at least 1000 FT above any fixed obstacle within 15 NM of the centre-line. The lowest usable level will always be at least 500 FT above the Airway base, thus providing not less than 1500 FT terrain clearance within 15 NM of any position on the centre-line of the Airway.

1.8.1.2 On sections of Airways adjacent to Control Zones and Areas where the lower limit is established at not less than 700 FT above terrain, ATC clearances are designed to enable aircraft to remain at least 500 FT above the base of the Airway.

1.9 En-Route Holding

1.9.1 **Control Areas (Airways)**

1.9.1.1 Except where otherwise instructed by ATC, holding en-route will be carried out on tracks parallel to the centre-line of the Airway, turning right at the Reporting Point. Exceptions are shown at ENR 3.6.

1.9.1.2 Whenever possible, pilots will be given a specific time at which to leave the Reporting Point and the holding pattern should be adjusted accordingly.

1.9.1.3 Pilots are required to report as follows:

a) The time and level of reaching a specific holding point to which cleared;
b) when leaving a holding point;
c) when vacating a previously assigned level for a new assigned level.

1.9.2 **En-Route High Level Holding**

1.9.2.1 Within the Upper Airspace, en-route holding patterns have been established. The 1.5 minute holding patterns, based on ICAO recommended speeds, are as shown at ENR 3.6.

1.10 Hazards and Danger Areas

1.10.1 **The Upper Airspace Control Area**

1.10.1.1 The Chart of the United Kingdom Airspace Restrictions at ENR 6-75 (as amended), NOTAM and AICs should always be consulted for information on activity in Danger Areas adjacent to the route being flown.

1.11 Glider Operations above FL 195

1.11.1 The paragraphs below set out the procedures for glider operations above FL 195 within the following airspace structures:

a) Temporary Reserved Area (Gliding) (TRA (G)) in Class C Airspace between FL 195 - FL 240 (ENR 5-2-4/7);
b) Temporary Reserved Area (Gliding) (TRA (G)) in Class C Airspace above FL 240 (ENR 5-2-4/7);
c) Temporary Reserved Area (TRA) in Class C Airspace between FL 195 and FL 245 (ENR 5-2-2/3);
d) Class C Airspace outside TRA and TRA (G) between FL 195 - FL 285.

ENR 1.1 GENERAL RULES (continued)

1.11.2 Glider operations above FL 195 are to be conducted only in accordance with the following criteria:

1.11.2.1 VFR criteria:

Level	Distance from Cloud	Flight Visibility
At and above FL 195	1500 M Horizontally 1000 FT Vertically	8 KM

1.11.2.2 Operations shall be in accordance with a Letter of Agreement (LoA), or specific permission.

1.11.2.3 Operations shall be conducted on the SPS (1013.2 mb).

1.11.2.4 Radio contact must be maintained on the appropriate frequency.

Note: *Radio frequency requirements for VFR operations by gliders above FL 195 within a Temporary Reserved Area (TRA), Temporary Reserved Area (Gliding) (TRA (G)) or for a specified VFR permission outside a TRA, will be detailed in the respective TRA Letter of Agreement (LoA), or specific permission.*

1.11.3 **Procedures for non-SSR equipped Glider Operations within Temporary Reserved Area (Gliding) (TRA (G)) in Class C Airspace between FL 195 - FL 240**

1.11.3.1 TRA (G) have been provided to accommodate non-SSR equipped gliders. (See ENR 5.2, ENR 6-64 and ENR 6-65).

1.11.3.2 Gliders equipped with SSR transponders should squawk 7006 whilst operating in the TRA (G).

1.11.3.3 **Glider Operations in TRA (G) between FL 195 - FL 240 must comply with the following requirements:**

a) Each TRA (G) shall have a nominated gliding club(s) to manage booking arrangements with the appropriate ACC.
b) The nominated gliding club(s) will request booking of the required TRA (G) airspace 2 hours in advance on the day of operation.
c) A requested upper flight level shall be specified at the time of booking.
d) ACC civil and military supervisors shall co-ordinate booking request and agree initial access arrangements based on the prevailing and forecast GAT/OAT traffic situation.
e) A request to activate the TRA (G) shall be made only when the club(s) have positively established that access is required. No glider will enter until a positive ATC clearance has been obtained to enter the TRA (G). This may be either by telephone or RTF contact with the ACC.
f) Gliders shall monitor the appropriate gliding frequency specified in the LoA whilst operating within the TRA (G).
g) Gliders shall remain within the lateral boundaries of the TRA (G) and below the agreed upper flight level.
h) The gliding club(s) shall provide a contact telephone number to enable the parent ACC to close the TRA (G); if such a request is received the nominated gliding club(s) will direct gliders to vacate the TRA (G) as expeditiously as possible.
i) The nominated gliding club(s) will notify the ACC that TRA (G) activity is complete.
j) Additional requirements and detailed contact arrangements will be contained in a LoA between the responsible ACC and nominated gliding club.

1.11.4 **Procedures for non-SSR equipped Glider Operations within Temporary Reserved Area (Gliding) (TRA (G)) in Class C Airspace above FL 240**

1.11.4.1 All non-SSR equipped glider operations above FL 240 must be conducted in TRA (G).

1.11.4.2 The gliding representative will initiate a request to the appropriate area control supervisor (see paragraph 9.4.3) 2 hours in advance of the intended flight advising the intention to use the designated area and confirm the following details:

a) Temporary Reserved Areas concerned (See ENR 5.2, ENR 6-66 and ENR 6-67);
b) Requested upper limit (Scottish Upper Area (North) has an upper limit of FL 270);
c) Expected time of entry into, and duration in the Upper TRA (G) (negotiated if any other priority ACC task);
d) The number of gliders and associated callsign(s);
e) Name and telephone contact number.

1.11.4.3 Area Control contact telephone numbers:

For Scottish, Spadeadam, Yorkshire and Northern Ireland areas, contact Scottish ACC, Civil ATC Watch Supervisor (WS) on Tel: 01292-692763.

For Welsh areas, contact Swanwick Military Supervisor (SMS) on Tel: 01489-612417.

1.11.4.4 Following notification, the Supervisor will contact the gliding representative to discuss the activity, and allocate the frequency to be employed, or, if the activity cannot be accommodated, advise the representative of the reason and negotiate a new period.

1.11.4.5 The glider pilot shall establish 2-way RTF contact passing FL 200 in the climb, obtain an ATC clearance to enter the TRA (G),

ENR 1.1 GENERAL RULES (continued)

maintain a listening watch on the frequency, and report again when passing FL 240 in descent.

1.11.4.6 The military controller will initiate a radio check with the glider pilot on the hour and half hour whilst the aircraft is above FL 240 to confirm continuing RTF contact. In the event of not receiving a radio check call the glider pilot will immediately attempt to re-establish 2-way contact and if unsuccessful shall descend below FL 240 within 15 minutes.

Note: *15 minutes after the last unsuccessful 'operations normal' radio check by the military controller the airspace above FL 240 will be deemed clear of gliders and GAT aircraft will be allowed access.*

1.11.4.7 The glider pilot is responsible for remaining within the designated area. In addition, all gliders flying within TRA (G) above FL 240 are to be fitted with appropriate radio and navigational equipment. In the event of either of these equipments becoming unserviceable, gliders are to descend below FL 240.

1.11.4.8 Whilst operating within a designated area, glider pilots will be in receipt of a Flight Information Service with proximity warnings of either aircraft in emergency or Air Defence Flights, which need to transit the area. The glider pilots will be responsible for their own separation.

1.11.4.9 Whilst operating within a designated TRA (G) above FL 240, all position reports are to be made in relation to Airway/Upper ATS Route Reporting Points.

1.11.4.10 Additional requirements and detailed contact arrangements will be contained in a LoA between the responsible ACC and nominated gliding club(s).

1.11.5 **Procedures for SSR equipped Glider Operations within Temporary Reserved Area (TRA) in Class C Airspace between FL 195 - FL 245**

1.11.5.1 Gliders equipped with RTF and SSR transponder may operate in accordance with VFR within Temporary Reserved Areas (TRA) in Class C Airspace between FL 195 and FL 245 provided that the pilot:

a) Files a flight plan (when specified an abbreviated flight plan will be acceptable).
b) Obtains an ATC clearance to enter the TRA (See ENR 5.2 and ENR 6-13).
c) Monitors ATC frequency.
d) Selects SSR Code A/C as directed by ATC.
e) Whilst operating within a designated area, glider pilots will be in receipt of a Flight Information Service.

1.11.5.2 Detailed access requirements to TRA will be detailed in the LoA between the ACC responsible for the airspace and the nominated gliding club(s) concerned.

1.11.6 **Procedures for Glider Operations in Class C Airspace outside TRA and TRA (G) between FL 195 - FL 285**

1.11.6.1 Glider operations in Class C Airspace between FL 195 - FL 285 must comply with the following requirements:

a) The flight must be conducted in accordance with ATC instructions and/or conditions specified in LoAs or specific permission.
b) A flight plan must be filed. Where specified an Abbreviated Flight Plan will be acceptable as detailed in the LoA between the ACC responsible for the airspace and the nominated gliding club(s) concerned.
c) An ATC clearance must be obtained to fly within the airspace.
d) Select SSR Code A/C as directed by ATC.
e) Maintain listening watch on the ATC frequency.
f) In the event that 2-way RTF contact is lost, pilots shall squawk 7600 and descend below controlled airspace (FL 195) as expeditiously as possible.

1.11.6.2 Other Gliding Activity

1.11.6.2.1 Gliding clubs seeking access to airspace above FL 195 to facilitate special events should contact AUS in accordance with procedures detailed at ENR 1.1, paragraph 4.1.9.

1.12 Procedures for Non-SSR Transponder equipped Glider Operations at and above FL 100 up to FL 195

1.12.1 Non-SSR Glider Areas have been established to accommodate non-transponder equipped glider operations at and above FL 100 up to FL 195 (See ENR 5.2 and ENR 6-63).

1.12.2 ATC clearance is required prior to access of that Class A, C and D Airspace lying within Non-SSR Glider Areas.

1.12.3 Other than that portion of airspace notified as Class A, C and D Airspace the background airspace classification of Non-SSR Glider

ENR 1.1 GENERAL RULES (continued)

Areas is Class G, with UK FIS provided on request, where available; and in accordance with ENR 1.1 and ENR 1.6.

1.12.4 The glider pilot is responsible for remaining within the designated area.

2 UK Flight Information Services

2.1 Overview

2.1.1 The ICAO requirements for a Flight Information and Alerting Service are met in the Scottish FIR/UIR and the London FIR/UIR through a suite of services, collectively known as the UK Flight Information Services (FIS), and are provided through the following provisions:

a) To participating flights arriving at, departing from and overflying aerodromes located within Class G Airspace as listed at GEN 3.3.
b) To participating VFR flights operating within Class E Airspace, as listed at ENR 3.1.
c) To aircraft within Advisory Radio Areas as listed at ENR 1.1, paragraphs 5.2.5/6 and ENR 5.2.
d) Lower Airspace Radar Services (LARS) and Radar Service - FL 100 and above (outside CAS), as listed at ENR 1.6.
e) Area Control Centre (ACC) services, including the provision of service by ACC FISOs as detailed at GEN 3.3.

2.1.2 The UK FIS (Basic Service, Traffic Service, Deconfliction Service, Procedural Service) are detailed herein. Within the UK, the scope of FIS, as defined in ICAO Annex 11, is met through the provision of a Basic Service.

2.2 Service Principles

2.2.1 Within Class G Airspace, regardless of the service being provided, pilots are ultimately responsible for collision avoidance and terrain clearance, and they should consider service provision to be constrained by the unpredictable nature of this environment.

2.2.2 A pilot shall determine the appropriate service for the various phases and conditions of flight and request that service from the controller/FISO; a Deconfliction Service and Procedural Service shall only be provided to flights under IFR, irrespective of meteorological conditions. An Alerting Service will be provided in association with all services.

2.2.3 Controllers will make all reasonable endeavours to provide the service that a pilot requests. However, due to finite resources or controller workload, tactical priorities may influence service availability. FISOs are not licensed to provide Traffic Service, Deconfliction Service, or Procedural Service.

2.2.4 Instructions issued by controllers/FISOs to pilots operating outside controlled airspace are not mandatory; however, the services rely upon pilot compliance with the specified terms and conditions so as to promote a safer operating environment for all airspace users.

2.2.5 Agreements can be established between a controller and a pilot such that the operation of an aircraft is laterally or vertically restricted beyond the core terms of the Basic Service or Traffic Service. Unless safety is likely to be compromised, a pilot shall not deviate from an agreement without first advising and obtaining a response from the controller.

2.2.6 There may be circumstances that prevent controllers/FISOs from passing timely traffic information and/or deconfliction advice, eg high workload, areas of high traffic density, against unknown aircraft conducting high energy manoeuvres, or when traffic is not displayed to the controller or obscured by surveillance clutter. Controllers/FISOs shall inform the pilot of known reductions in traffic information along with the reason and the probable duration; however, it may not always be possible to provide these warnings in a timely fashion.

2.3 Basic Service

2.3.1 Basic Service provides advice and information useful for the safe and efficient conduct of flights. This may include weather information, changes of serviceability of facilities, conditions at aerodromes, general airspace activity information, and any other information likely to affect safety. The avoidance of other traffic is solely the pilot's responsibility.

2.3.2 Basic Service is available under IFR outside controlled airspace in any meteorological conditions, or under VFR.

2.3.3 Pilots should not expect any form of traffic information from a controller/FISO and the pilot remains responsible for collision avoidance at all times. However, where a controller/FISO has information that indicates that there is aerial activity in a particular location that may affect a flight, they should provide traffic information in general terms to assist with the pilot's situational awareness. This will not normally be updated by the controller/FISO unless the situation has changed markedly, or the pilot requests an update.

2.3.4 Basic Service is available at all levels and the pilot remains responsible for terrain clearance at all times.

2.3.5 Unless the pilot has entered into an agreement with a controller to maintain a specific course of action, a pilot may change heading, route, or level without advising the controller. A controller will not issue specific heading instructions; however, generic navigational

ENR 1.1 GENERAL RULES (continued)

assistance may be provided on request.

2.4 Traffic Service

2.4.1 Traffic Service is a surveillance based ATS, where in addition to the provisions of a Basic Service, the controller provides specific surveillance derived traffic information to assist the pilot in avoiding other traffic. The avoidance of other traffic is solely the pilot's responsibility.

2.4.2 Traffic Service is available under IFR outside controlled airspace in any meteorological conditions, or under VFR. If a controller issues a heading and/or level that would require flight in IMC, a pilot who is not suitably qualified to fly in IMC shall inform the controller and request alternative instructions.

2.4.3 The controller will pass traffic information on relevant traffic, and update the traffic information if it continues to constitute a definite hazard, or if requested by the pilot. However, high controller workload and RTF loading may reduce the ability of the controller to pass traffic information, and the timeliness of such information. Whether traffic information has been passed or not, a pilot is expected to discharge his collision avoidance responsibility without assistance from the controller. Whilst operating in Class G Airspace, if after receiving traffic information a pilot requires deconfliction advice, an upgrade to Deconfliction Service shall be requested. Deconfliction Service is not available in Class E Airspace.

2.4.4 Subject to ATS surveillance system coverage, Traffic Service may be provided at any level and the pilot remains responsible for terrain clearance at all times.

2.4.5 A pilot may operate under their own navigation and may select their own operating levels, or a controller may provide headings and levels for the purpose of positioning, sequencing or as navigational assistance. If a heading or level is unacceptable to the pilot they shall advise the controller immediately.

2.4.6 When operating under their own navigation, pilots may alter course as required; however, unless safety is likely to be compromised, pilots shall not change their general route or manoeuvring area without first advising and obtaining a response from the controller.

2.4.7 When following an ATC heading, unless safety is likely to be compromised, a pilot shall not change heading without first advising and obtaining a response from the controller.

2.4.8 Unless safety is likely to be compromised, a pilot shall not change level or level band without first advising and obtaining a response from the controller.

2.5 Deconfliction Service

2.5.1 A Deconfliction Service is a surveillance based ATS where, in addition to the provisions of a Basic Service, the controller provides specific surveillance derived traffic information and deconfliction advice.

2.5.2 A Deconfliction Service shall only be provided to flights under IFR in Class G Airspace, irrespective of meteorological conditions. The controller will expect the pilot to accept headings and/or levels that may require flight in IMC. A pilot who is not suitably qualified to fly in IMC shall not request a Deconfliction Service unless compliance permits the flight to be continued in VMC.

2.5.3 A controller will provide traffic information, accompanied with a heading and/or level aimed at achieving a planned deconfliction minima. High controller workload or RTF loading may reduce the ability of the controller to pass such deconfliction advice; furthermore, unknown aircraft may make unpredictable or high-energy manoeuvres. Consequently, controllers cannot guarantee to achieve these deconfliction minima; however, they shall apply all reasonable endeavors. The avoidance of traffic is ultimately the pilot's responsibility.

2.5.4 The pilot shall inform the controller if he elects not to act on the controller's deconfliction advice, and therefore accepts responsibility for initiating any subsequent collision avoidance against that particular conflicting aircraft.

2.5.5 A Deconfliction Service will only be provided to aircraft operating at or above a terrain safe level, unless on departure from an aerodrome when climbing to a terrain safe level, or when following notified instrument approach procedures. If a controller detects a confliction when an aircraft is departing from an aerodrome and climbing to the terrain safe level, or when following notified instrument approach procedures, traffic information without deconfliction advice shall be passed. However, if the pilot requests deconfliction advice, or the controller considers that a definite risk of collision exists, the controller shall immediately offer such advice.

2.5.6 Unless safety is likely to be compromised, a pilot shall not change heading or level without first obtaining approval from the controller.

2.6 Procedural Service

2.6.1 A Procedural Service is a non surveillance ATS where, in addition to the provisions of a Basic Service, the controller provides instructions, which if complied with, shall achieve deconfliction minima against other aircraft participating in the Procedural Service.

Neither traffic information nor deconfliction advice can be passed with respect to unknown traffic.

2.6.2 A Procedural Service shall only be provided to flights under IFR, irrespective of meteorological conditions. The controller will expect the pilot to accept levels, radials, tracks, routes and time allocations that may require flight in IMC. A pilot who is not suitably qualified to fly in IMC shall not request a Procedural Service unless compliance permits the flight to be continued in VMC.

2.6.3 A Procedural Service is available at all levels and the pilot remains wholly responsible for terrain clearance at all times.

2.6.4 A controller will provide deconfliction instructions by allocating levels, radials, tracks, routes, time restrictions, approach clearances and holding instructions, or use pilot position reports, aimed at achieving a planned deconfliction minima. The pilot shall inform the controller if they elect not to act on the controller's deconfliction advice, and therefore accepts responsibility for initiating any subsequent collision avoidance against the aircraft in question and any other aircraft affected.

2.6.5 The controller will provide traffic information on conflicting aircraft being provided with a Basic Service and those where traffic information has been passed by another ATS unit; however, there is no requirement for deconfliction advice to be passed, and the pilot is wholly responsible for collision avoidance.

2.6.6 Unless safety is likely to be compromised, a pilot shall not change level, radial, track, route or time restriction without first obtaining approval from the controller. If a level, radial, track, route or time restriction is unacceptable to the pilot, they shall advise the controller immediately.

3 General Flight Procedures

3.1 Position Reporting within the London and Scottish FIR/UIR

3.1.1 Pilots are to make a position report in the following circumstances:

a) After transfer of communication;
b) on reaching the limit of ATS clearance;
c) when instructed by Air Traffic Control;
d) when operating helicopters in the North Sea Low Level Radar Advisory and Flight Information areas of responsibility and on Helicopter Routes within the London Control Zone and London/City Control Zone (see ENR 1.6, subsection 4.5 and AD 2.EGLL 2.22, paragraph 11);
e) when operating flights across the English Channel (see ENR 1.1, paragraph 3.7).

3.1.1.1 The initial call changing radio frequency shall contain only the aircraft identification and flight level. Any subsequent report shall contain aircraft identification, position and time except as provided for in respect of helicopter operations in the areas specified in paragraph 3.1.1 (d) above.

Note: *When changing frequency between the London or Scottish Control Centres, pilots are required to state their callsign and Flight Level/Altitudes only (plus any other details when specifically instructed by ATC). When the aircraft is in level flight but cleared to another FL/ALT, both FL/ALT should be passed.* ***Similarly, when the aircraft is not in level flight, the pilot should state the aircraft identification followed by the FL/ALT to which it is cleared only; it is not necessary to state passing FL/ALT in these circumstances.***

3.1.1.2 Certain Reporting Points on the boundary between the London FIR/UIR and the Amsterdam FIR are designated 'Compulsory' in the Netherlands AIP. Position Reports should therefore be made at these points when in communication with Amsterdam or Maastricht Control.

3.1.2 **Omit Position Report Procedure**

3.1.2.1 In order to reduce RTF communication a pilot may be instructed by Air Traffic Control to omit position reports provided that the aircraft is radar identified.

3.1.3 **DME Distance Reports to ATC**

3.1.3.1 Pilots, when requested by ATC to report their distance from a DME facility which they do not have displayed, should retune their equipment to that DME. If, for any reason, they are unable to report their distance from the requested DME, ATC is to be informed. Pilots should not calculate the distance based on the reading from another DME.

3.2 Climb and Descent

3.2.1 **Vacating (Leaving) Levels**

3.2.1.1 When pilots are instructed to report leaving a level, they should advise ATC that they have left an assigned level only when the aircraft's altimeter indicates that the aircraft has actually departed from that level and is maintaining a positive rate of climb or

descent in accordance with published procedures.

3.2.2 **Level Restrictions**

3.2.2.1 For **all** stages of flight, clearances to climb or descend cancel any previous restrictions or levels, unless they are reiterated as part of the clearance.

3.2.2.2 When a departing aircraft on a SID is required to climb directly to the cleared level without complying with the published vertical restrictions on the SID, ATC will include the word 'now' in climb instructions (e.g. Jet 347 climb now FL 120).

3.2.2.3 **Maximum Rates of Climb and Descent**

3.2.2.3.1 In order to ensure the credible interaction of Airborne Collision Avoidance Systems and ground based safety nets, other than aircraft in emergency and certain specific conditions for military aircraft (as detailed in Military AIP and MAA Regulatory Publication RA 3000 Series), all aircraft when operating under normal circumstances, when inside Controlled Airspace within the London and Scottish FIRs/UIRs should not operate with a climb or descent rate exceeding 8000 FT per minute. Aircraft when first approaching a cleared flight level and/or when changing flight level in Controlled Airspace should ensure that the vertical closure speed is not excessive. It is considered that, with about 1500 FT to go to a cleared level, vertical speed should be reduced to a maximum of 1500 FT per minute and ideally to between 1000 FT per minute and 500 FT per minute. Pilots should ensure that the aircraft neither undershoots nor overshoots the cleared level by more than 150 FT, manually overriding if necessary.

3.2.2.4 **Minimum Rates of Climb and Descent**

3.2.2.4.1 In order to ensure that controllers can accurately predict flight profiles to maintain standard vertical separation between aircraft, pilots of aircraft commencing a climb or descent in accordance with an ATC Clearance should **inform the controller** if they anticipate that their rate of climb or descent during the level change will be less than 500 FT per minute, or if at any time during such a climb or descent their vertical speed is, in fact, less than 500 FT per minute.

3.2.2.4.2 This requirement applies to both the en-route phase of flight and to terminal holding above Transition Altitude.

Note: *This is not a prohibition on the use of rates of climb or descent of less than 500 FT per minute where necessary to comply with other operating requirements.*

3.2.2.5 **Noise Abatement Approach Techniques**

3.2.2.5.1 The use of Continuous Descent Approach (CDA) and Low Power/Low Drag Approach (LP/LD) techniques (as defined at GEN 2.2) is required, subject to compliance with ATC requirements, at certain UK Airports as detailed in the appropriate AD 2 Sections. At other locations, although not required, these techniques are considered to be 'best practice' for the reduction of noise nuisance and emissions and should be adopted by pilots whenever operationally practicable, commensurate with the ATC clearance.

3.3 Speed Control

3.3.1 Pilots shall adhere to the speed limits associated with airspace classifications and the speed restrictions notified in procedures published in AD 2. Pilots shall also adhere to the speed (IAS or Mach Number) approved or assigned by ATC and shall request ATC approval before making any changes thereto. If it is essential to make an immediate temporary change in speed (e.g. due to turbulence), ATC shall be notified as soon as possible that such a change has been made.

3.3.2 Pilots of aircraft unable to maintain the last assigned speed during any particular phase of flight (eg for aircraft performance reasons) shall inform ATC as soon as possible in order that another speed/alternative clearance can be issued.

3.3.3 At levels at or above FL 280, speed adjustments for aircraft in the cruise will be expressed in multiples of 0.01 Mach. At levels below FL 280, speed adjustments will be expressed in multiples of 10 KT based on indicated airspeed (IAS).

3.3.4 For aircraft at or above FL 280 that have been cleared to descend to levels below FL 280, speed adjustments may be based on IAS.

3.4 Radiotelephony, Radio Failure and Loss of Communication Procedures

3.4.1 **General Radiotelephony Procedures**

3.4.1.1 The English Language is used for all communications between aircraft and ATC in the UK.

3.4.1.2 VHF/RTF is used for all air-ground communications throughout the airspace under UK jurisdiction except that HF is also used in the Shanwick Oceanic Control Area and that UHF is also available at London Area Control (Swanwick) and at certain aerodromes (see ENR 1.6, subsection 4.5 and ENR 2.1 sections for details).

3.4.1.3 So far as possible, pilots should make use of the ICAO standard RTF phraseology in ICAO Doc. 4444, Chapter 12 when

communicating with ATC. UK specific differences to ICAO phraseology are notified in GEN 1.7 section.

3.4.1.3.1 As a general principle all messages should be acknowledged by use of the aircraft callsign or 'Roger, (callsign)'.

3.4.1.3.2 Messages containing any of the following items must be read back in full:

a) Taxi/towing instructions;
b) Level instructions;
c) Heading instructions;
d) Speed instructions;
e) Airways or route clearances;
f) Approach clearances;
g) Runway-in-use;
h) Clearance to enter, land on, take-off, backtrack or cross or hold short of an active runway;
i) SSR operating instructions;
j) Altimeter Settings, including units when value is below 1000 hectopascals;
k) VDF information;
l) Frequency changes;
m) Type of ATS surveillance service;
n) Transition level.

3.4.1.3.3 When an estimate for a compulsory or non-compulsory reporting point, flight information boundary, or destination aerodrome is requested by an ATS unit and is in error by in excess of 2 minutes, pilots are required to provide a revised estimate to an appropriate ATS unit as soon as possible.

3.4.1.3.4 Where data link communications are used to facilitate clearance delivery, voice read-back of data link messages shall not be required unless otherwise notified by the appropriate authority.

3.4.1.4 **Operations Normal**

3.4.1.4.1 Pilot transmissions containing the RTF phraseology 'operations normal' are generally associated with aerial activities over mountainous or sparsely populated areas (including sea areas), where the flight receiving an ATS is required to operate within the area of responsibility of a single ATSU for prolonged periods of time. Such transmissions are made by pilots following a period of RT inactivity of 30 minutes.

3.4.1.4.2 The pilot's declaration of 'operations normal' is used to inform the ATSU that the flight is progressing according to plan. Controllers who do not receive an 'operations normal' report when expected will attempt to establish communications with the pilot. After three failed attempts, controllers will initiate overdue action.

3.4.2 **Radio Failure Procedures For Pilots**

3.4.2.1 **Failure of Navigation Equipment**

3.4.2.1.1 If part of an aircraft's radio navigation equipment fails but two-way communication can still be maintained with ATC, the pilot must inform ATC of the failure and report his altitude and approximate position. ATC may, at its discretion, authorize the pilot to continue his flight in or into Controlled Airspace. When radar is available it may, subject to workload, be used to provide navigational assistance to the pilot.

3.4.2.1.2 If no authorization to proceed is given by ATC, the pilot should leave, or avoid Controlled Airspace and areas of dense traffic, and either:

a) Go to an area in which he can continue his flight in VMC or (if this is not possible);
b) select a suitable area in which to descend through cloud, fly visually to a suitable aerodrome and land as soon as practicable.

But before doing so, however, he should consult ATC who may be able to give him instructions or advice. He should also take into consideration the latest meteorological information and terrain clearance and should make full use of ground VHF DF stations. He must at all times keep ATC informed of his intentions.

3.4.2.2 **Failure of Two-way Radio Communications Equipment**

3.4.2.2.1 As soon as ATC know that two-way communication has failed they will, as far as practical, maintain separation between the aircraft experiencing the communication failure and other aircraft, based on the assumption that the aircraft will operate in accordance with radio communication failure procedures described below.

3.4.2.2.2 Flight crews should note that air traffic control might not be aware of the loss of communications, so should not anticipate that appropriate measures to facilitate a landing have been implemented. Flight crews intending to land should therefore be alert to the possibility that vehicles, personnel and or other traffic may be occupying or entering the runway.

3.4.2.2.3 It should be noted that for many aerodromes in the UK, the radio communications failure procedures published in the AD 2 section

ENR 1.1 GENERAL RULES (continued)

differ from, or amplify, the basic procedures published below.

3.4.2.2.4 **For the purposes of these procedures, ATC will expect an IFR flight following the ATS route structure to adopt the IMC procedure in paragraph 3.4.2.4. If there is an overriding safety reason, the pilot may adopt the VMC procedure.**

3.4.2.2.5 Flights operating outside controlled airspace, without reference to ATS, should only use these procedures when the pilot decides that there is a need to alert ATC that two-way radio communications failure has occurred.

3.4.2.2.6 It should be noted that the use of loss of two-way communications procedures may result in aircraft flying outside controlled airspace.

3.4.2.2.7 The procedures detailed in this section apply to two-way radio communications failure. In the event that an additional emergency situation develops, ATC will expect the pilot to select secondary radar transponder on Mode A, Code 7700.

3.4.2.2.8 The expression Expected Approach Time (EAT) will mean either an EAT given by the appropriate ATC Unit or, if the pilot has been given 'No delay expected', the ETA over the appropriate designated landing aid serving the destination aerodrome.

3.4.2.2.9 Pilots are given an EAT of 'Delay not determined' when the destination runways cannot be used for landing and it is not possible to accurately predict when they will become available. In some circumstances an EAT of 'Delay not determined' will also be given when a preceding flight has elected to remain over the holding facility pending an improvement in weather conditions at the destination. If 'Delay not determined' has been given, do not attempt to land at the destination aerodrome, divert to the alternate destination specified in the current flight plan or another suitable airfield.

3.4.2.2.10 The 'current flight plan' is the flight plan, as filed and acknowledged with an ATC Unit, by the pilot or a designated representative.

3.4.2.2.11 The procedure that should be used by Special VFR Flights is detailed at ENR 1.2, paragraph 2.9.

3.4.2.2.12 Essential information may be relayed by ATC using the ACARS/Data Link. Pilots may endeavour to use alternative methods for communicating with ATC such as HF. The Distress and Diversion Cell (D&D) serving the London FIR/UIR and the Scottish FIR/UIR may be contacted by phone by aircraft that have approved installations that can access the UK telephone network. The telephone number is:

London D&D Tel: 01489-612406

3.4.2.3 **Visual Meteorological Conditions (VMC)**

3.4.2.3.1 A VFR flight experiencing communication failure shall:

When VMC can be maintained, the pilot should set transponder on Mode A, Code 7600 with Mode C and land at the nearest suitable aerodrome. Pilots should take account of visual landing aids and keep watch for instructions as may be issued by visual signals from the ground. The pilot should report arrival to the appropriate ATC unit as soon as possible. When VMC cannot be maintained, the pilot should adopt the procedures for IMC detailed below.

3.4.2.3.2 Subject to the provisions of paragraph 3.4.2.2.3, an IFR flight experiencing communication failure in VMC shall:

When VMC can be maintained, the pilot should set transponder to Mode A, Code 7600 with Mode C and land at the nearest suitable aerodrome. Pilots should take account of visual landing aids and keep watch for instructions as may be issued by visual signals from the ground. The pilot should report arrival to the appropriate ATC unit as soon as possible. If it does not appear feasible to continue the flight in VMC, or if it would be inappropriate to follow this procedure, the pilot should adopt the procedures for flights in IMC detailed below.

Note: *Pilots already in receipt of an ATC clearance may enter controlled airspace and follow the procedures referred to above.* ***Those flights, that have not received an ATC clearance, should not enter controlled airspace unless an overriding safety reason compels entry.***

3.4.2.4 **Instrument Meteorological Conditions (IMC)**

3.4.2.4.1 A flight experiencing communications failure in IMC during an approach directed by radar shall:

a) Operate secondary radar transponder on Mode A code 7600 with Mode C.
b) Continue either visually, or by means of promulgated Initial Approach Procedures and an appropriate approved final approach aid, to land. If this is not practical, carry out the missed approach procedure and continue to a holding facility appropriate to the airfield of intended landing for which an instrument approach is notified and then carry out that procedure.

3.4.2.4.2 Except where communications failure occurs during an approach directed by radar, a flight experiencing communication failure in IMC shall:

a) Operate secondary radar transponder on Mode A code 7600 with Mode C.
b)

i. Maintain for a period of seven minutes, the current speed and last assigned level or minimum safe altitude, if this is higher. The period of seven minutes begins when the transponder is set to 7600 and this should be done as soon as the pilot has detected communications failure.
ii. If failure occurs when the aircraft is following a notified departure procedure such as a Standard Instrument Departure (SID) and clearance to climb, or re-routing instructions have not been given, the procedure should be flown in accordance with the published lateral track and vertical profile, including any stepped climbs, until the last position, fix, or waypoint, published for the procedure, has been reached. Then, for that part of the period of seven minutes that may remain, maintain the current speed and last assigned level or minimum safe altitude if this is higher.
iii. Following the period of seven minutes, adjust the speed and level in accordance with the current flight plan and continue the flight to the appropriate designated landing aid serving the destination aerodrome. Attempt to transmit position reports and altitude/flight level on the appropriate frequency when over routine reporting points.

c) If being radar vectored, or proceeding offset according to RNAV, without a specified limit, continue in accordance with ATC instructions last acknowledged for three minutes only and then proceed in the most direct manner possible to rejoin the current flight planned route. Pilots should ensure that they remain at, or above, the minimum safe altitude.
d) Comply with the loss of communications procedures notified for the destination aerodrome in the AD 2 section of the UK AIP.
e)
i. Arrange the flight to arrive over the appropriate designated landing aid serving the destination aerodrome as closely as possible to the ETA last acknowledged by ATC. If no such ETA has been acknowledged, the pilot should use an ETA derived from the last acknowledged position report and the flight-planned times for the subsequent sections of the flight.
ii. Arrange the flight to arrive over the appropriate designated landing aid serving the destination aerodrome at the highest notified Minimum Sector Altitude taking account of en-route terrain clearance requirements.
iii. If following a notified Standard Arrival Route (STAR), after the seven minute period detailed in paragraph (b) (i) has been completed, pilots should arrange descent as close as possible to the published descent planning profile. If no descent profile is published, pilots should arrange descent to be at the minimum published level at the appropriate designated Initial Approach fix.

f) On reaching the appropriate designated landing aid serving the destination aerodrome, begin further descent at the last acknowledged EAT. If no EAT has been acknowledged, the descent should be started at the ETA calculated in (e) (i), above, or as close as possible to this time. If necessary, remain within the holding pattern until the minimum holding level, published for the facility, has been reached. The rate of descent in holding patterns should not be less than 500 FT per minute. If 'Delay not determined' has been given, do not attempt to land at the destination aerodrome, divert to the alternate destination specified in the current flight plan or another suitable airfield.
g) Carry out the notified instrument approach procedure as specified for the designated navigational aid and, if possible, land within 30 minutes of the EAT or the calculated ETA. When practical, pilots should take account of visual landing aids and keep watch for instructions that may be issued by visual signals from the ground.

3.4.3 **Actions taken by ATC**

a) As far as is practical, ATC shall maintain separation between the aircraft experiencing the communication failure and other aircraft based on the assumption that the aircraft will operate in accordance with published radio communication failure procedures. This includes making allowance for the fact that an aircraft following an approach, whether or not it has received a landing clearance, may either land or may carry out the missed approach procedure.
b) ATC will assume that an aircraft's receiver may be functioning and will transmit instructions for routing and other relevant information such as the EAT, weather information, altimeter settings and runway in use at destination (or alternate) aerodromes.
c) ATC will use all means possible to monitor the flight's progress and inform other flights where necessary.
d) ATC will attempt to re-establish communications with the pilot by monitoring standby frequencies (where available) and by contacting the aircraft operator, or handling agent or by use of ACARS/Data Link when available.
e) ATC will co-ordinate the flight with other ATC agencies as required.
f) If the flight re-establishes communications with an ATC unit during flight, or after the aircraft has landed, the ATC unit will relay the pilot's intentions, or that the aircraft has landed, to the ATC Unit that was providing an ATS when the communications failure occurred.
g) If the aircraft's progress cannot be monitored by radar and there has been no other indication of the aircraft's progress, or landing, normal overdue action will commence 30 minutes after the ETA for the destination airfield.

3.5 Use of Airborne Collision Avoidance Systems (ACAS) in the Scottish FIR/UIR and the London FIR/UIR

3.5.1 **General**

3.5.1.1 ACAS indications shall be used by pilots in the avoidance of potential collisions, enhancement of situational awareness, and the active search for, and visual acquisition of, conflicting traffic. The ability of ACAS to fulfil its role of assisting pilots in the avoidance of potential collisions is dependent on the correct and timely response by pilots to ACAS indications.

3.5.1.2 The Traffic Alert and Collision Avoidance System (TCAS) II is accepted by the Civil Aviation Authority (CAA) as a suitable ACAS system provided its installation is certificated by the State of Registry, and that its operation by flight crew is in accordance with

ENR 1.1 GENERAL RULES (continued)

appropriate operating instructions.

3.5.2 **Procedures to be Established**

3.5.2.1 An operator shall establish procedures to ensure that:

a) When ACAS is installed and serviceable, it shall be used in flight in a mode that enables Resolution Advisories (RAs) to be produced unless to do so would not be appropriate for conditions existing at the time, and
b) When undue proximity to another aircraft is detected by ACAS, the commander or the pilot to whom conduct of the flight has been delegated shall ensure that corrective action is initiated immediately to establish safe separation.
c) The circumstances when it is appropriate to operate ACAS in the Traffic Advisory (TA)-only mode are specified in the Flight Operations Manual. This should be limited to particular in-flight failures, during take-offs or landings in limiting performance conditions (for example at high altitude airports), and locations where States have approved specific procedures permitting aircraft to operate in close proximity, only.

3.5.3 **TCAS II Operating Characteristics**

3.5.3.1 TCAS II will issue a TA only when another aircraft with a compatible operating transponder is close in both range and altitude. If the transponder in the potentially conflicting aircraft is providing altitude data, an RA may be issued.

3.5.3.2 TAs and RAs can be issued on the basis of 'time to closest point of approach (CPA)' or 'fixed distance' thresholds being penetrated. On most occasions, TAs and RAs will be issued on the 'time to CPA' basis, but in RVSM penetration of airspace fixed range and altitude thresholds are likely to be a more frequent cause.

Note: *In cases where a vertical speed of closure causes RAs to be issued, TCAS II in the climbing/descending aircraft may advise a reduction in the climb or descent rate, whilst TCAS II in the other aircraft may advise a 'Climb' or 'Descend' RA. If the climbing/descending aircraft in this pair is diverging in range at a slow rate, the 'Climb' or 'Descend' RA issued to the Flight Crew in the other aircraft may remain displayed for several minutes, even though the former has levelled off at its cleared flight level. Although this particular circumstance is likely to be rare, even when it does occur, excessive altitude excursions need not result.*

3.5.4 **Operation of Aircraft When ACAS II is Unserviceable**

3.5.4.1 The current TCAS II Minimum Equipment List permits TCAS II equipped aircraft to operate for up to 10 days with the equipment out of service. This position will be kept under review.

3.5.4.2 Due to the safety benefits arising from TCAS operations and the collaborative way in which it arrives at collision avoidance solutions any aeroplane with an unserviceable transponder as well as an unserviceable TCAS will not be permitted in UK airspace for which mandatory carriage of a transponder is required.

3.5.5 **Operation of TCAS II in RVSM Airspace**

3.5.5.1 Above FL 290, TAs and RAs are most likely to occur in airspace where aircraft change altitude to reduce separation from 2000 FT to 1000 FT: this airspace is described as a 'Transition Area'. Specifically:

a) TAs can be expected when aircraft vertically separated by 1000 FT pass each other. If the speed at which they pass is low, such as when one is overtaking the other, TAs may be intermittent or they may last for long periods.
b) RAs can be expected when the vertical speed of closure, which may be the sum of the vertical speeds of both aircraft or the vertical speed of one of the aircraft, exceeds approximately 1500 FT/min. RAs might also be issued when either aircraft experiences turbulence sufficient to cause TCAS to project the vertical separation between both aircraft to be less than 800 FT at CPA, or when a 'soft altitude hold' function in either aircraft achieves the same result.

3.5.6 **Guidance for Aircraft Operators and Flight Crews**

3.5.6.1 Flight Crews can reduce the likelihood of TAs and RAs occurring above FL 290 where separation is less than 2000 FT vertically and 5 NM horizontally by confining vertical speeds to less than 1500 FT/min. Desirably, the vertical speed should be between 500 and 1000 FT/min.

3.5.6.2 The TCAS II function control selector should not be moved from the 'TA/RA' or 'Normal' position upon entering RVSM Airspace. Although it is implicit that such TAs and RAs as have been described could be termed 'unnecessary', this might not always be the case. For this reason, Flight Crews would be unwise either to disable an effective collision avoidance device without sound reason, or to assume that any TA or RA issued in this airspace is other than genuine.

3.5.6.3 Flight Crews shall not manoeuvre an aircraft solely in response to a TA. TAs are intended to alert the pilot to the possibility of an RA, and to assist in visual acquisition of conflicting traffic. However, visually acquired traffic may not be the same traffic causing a TA, and visual perception of an encounter may be misleading, particularly at night.

3.5.6.4 In the event that an RA is issued, Flight Crews shall:

a) Respond immediately and manoeuvre as indicated by the ACAS unless doing so would jeopardise the safety of the aircraft;
b) follow the RA even if there is a conflict between that RA and an air traffic control (ATC) instruction to manoeuvre;

c) not manoeuvre in the opposite sense or direction to that of the RA;
d) limit RA manoeuvres to the minimum extent necessary to comply with the RA.

3.5.6.5 Flight Crews should note that:

a) Other critical warnings such as Stall Warning, Windshear Warning and Ground Proximity Warning Systems have priority over ACAS.
b) visually acquired traffic may not be that causing an RA, as the visual perception of an encounter may be misleading, particularly at night.
c) ATC may not know when an ACAS system issues an RA. It is possible for ATC to issue instructions to an aircraft that are unknowingly contrary to RA instructions on that aircraft. Therefore, it is essential that ATC be notified when an ATC instruction is not being followed because it conflicts with an RA.
d) a manoeuvre opposite to the sense of an RA may result in a reduction in vertical separation with the 'threat' aircraft and therefore must be avoided at all times; this is particularly true in the case of an ACAS-ACAS co-ordinated encounter, when the RAs complement each other in order to reduce the potential for collision. Manoeuvres, or lack of manoeuvres, that result in vertical rates opposite to the sense of an RA could result in a collision with the threat aircraft.

3.5.6.6 A pilot who has deviated from an air traffic control instruction or clearance in response to an RA shall:

a) As soon as possible, as permitted by flight deck workload, notify the appropriate ATC unit of the RA, including the direction of any deviation from the current ATC instruction or clearance.
b) when they are unable to comply with a clearance or instruction that conflicts with an RA, notify ATC as soon as possible consistent with flying the aircraft.
c) promptly comply with any modified RAs.
d) return to the terms of the ATC instruction or clearance when the conflict is resolved.
e) after initiating a return to, or resuming the current clearance, notify ATC as soon as possible consistent with flying the aircraft.

3.5.6.6.1 Verbal reports should be made to Air Traffic Control at the first practicable moment and written reports submitted to the designated Authority as soon as possible after the flight has ended.

3.5.7 **Guidance for Air Traffic Service Providers and for Air Traffic Controllers**

3.5.7.1 The operation of TCAS II equipment will affect ATC operations to some extent, irrespective of the type of airspace. ATC will expect Flight Crew to react to RAs and to notify any manoeuvres initiated in response to RAs in accordance with standard practice. The Manual of Air Traffic Services Part 1, Section 1, Chapter 9 provides information on TCAS II to Air Traffic Controllers: it reiterates the phraseology that Flight Crews will use and the replies that Air Traffic Controllers should make.

3.5.7.2 It will be apparent from paragraph 3.5.5.1 that TAs will be more frequent in North Atlantic RVSM Airspace than elsewhere. Air Traffic Controllers should be aware of this and, where possible, be prepared to provide requested traffic information to Flight Crews.

3.5.7.3 As pilots are not required to take avoiding action on the basis of TA information alone, ATC does not expect requests for traffic information to be made unless the other aircraft cannot be seen and the pilots believe their aircraft is about to be endangered.

3.5.7.4 ATC expects pilots to respond immediately to an RA. Pilots are expected to restrict their RA manoeuvres to the minimum required to resolve the confliction, advise the Air Traffic Control Unit as soon as is practical thereafter and return to their original flight path as soon as it is safe to do so.

3.5.7.5 Pilots should be aware that any deviation from an ATC clearance has the potential to disrupt the controller's tactical plan and may result in a reduction of standard separation between aircraft other than those originally involved. It is vital that Flight Crew maintain a good look out and return to their original flight path as soon as it is safe and practical to do so.

3.6 Emergency Descents

3.6.1 **General**

3.6.1.1 The requirement to carry out an emergency descent may be necessary to ensure the safety of an aircraft and its occupants, and can sometimes be required with little or no notice. In busy and congested airspace, sudden changes of level can lead to unexpected interactions with other aircraft in the vicinity.

3.6.2 **Turning-off or Remaining on Track in UK Controlled Airspace**

3.6.2.1 UK Controlled Airspace is complex and congested, and traffic is often oriented on ATS routes in certain directions or flows. Therefore, if able, pilots should remain on the assigned route or track whilst carrying out the emergency descent, unless to do so would endanger the aircraft.

3.6.2.2 If a turn away from an assigned route or track is initiated, pilots should note that they may not be aware of traffic in their proximity (especially if flying on an assigned heading); nor of aircraft below them, not on the selected frequency, or in adjacent airspace

ENR 1.1 GENERAL RULES (continued)

sectors. However, it is ultimately the pilot's responsibility to take the action most appropriate in the circumstances.

3.7 Diversion

3.7.1 Diversion is the act of flying to an aerodrome other than the planned destination with the intention of landing there.

3.7.2 Normally diversion is made when one of the following circumstances occurs at the planned destination:

a) The weather is reported to be below the operating company's minima;
b) there are obstacles on the manoeuvring area constituting a hazard to landing aircraft which cannot be cleared within a reasonable time;
c) there is a failure of an essential ground aid which is required for the landing;
d) there is likely to be an unacceptable delay to landing.

3.7.3 Diversion may be originated by either the pilot or his operating company, or exceptionally by ATC.

3.7.3.1 When a pilot decides to divert he should inform ATC. ATC will, if possible, advise his operating company or a nominated addressee of his diversion when this is specifically requested by the pilot.

3.7.3.2 An operating company proposing to divert one of its aircraft should consult ATC before any decision on diversion is passed to the pilot. The message to the pilot will be in this form:

'Company advise divert to . . . . . (aerodrome). Weather at . . . . . (diversion aerodrome) . . . . . Reason for diversion . . . . . (clearance instructions). Acknowledge'.

The pilot should either follow this advice or if he is unable to do so, give his reasons and state what he intends to do.

3.7.3.3 In exceptional circumstances, it may be necessary for ATC to advise a pilot to divert before being able to consult his operating company. In such a case, the company will be told as soon as possible and the message to the pilot will be in the form:

'Request divert to . . . . . (aerodrome). Weather at . . . . . (diversion aerodrome) . . . . . Reason for diversion . . . . . (clearance instructions). Acknowledge'.

If the pilot is unable to comply with this request, he should give his reasons and state his intention.

3.8 Low Level Cross-Channel Operations - UK/France

3.8.1 Pilots undertaking Cross-Channel flights are reminded that a flight plan **MUST** be filed for all flights crossing FIR boundaries between the UK and France.

3.8.2 When filing the flight plan with the UK and French Authorities, pilots are to ensure that well defined significant points/features, at which the aircraft will cross the UK and French coast-lines, are included in Item 18 (Other Information) of the flight plan form (eg Beachy Head, Berck-sur-Mer, Lydd, Boulogne, Dover, Cap Gris Nez, etc). This is for Search and Rescue purposes but will also assist ATC.

3.8.3 Pilots should plan their flights, where possible, at such altitudes which would enable radio contact to be maintained with the appropriate ATC Unit whilst the aircraft is transitting the Channel. In addition, the French Authorities have requested that aircraft fly at altitudes which will keep them within Radar cover. The carriage of Secondary Surveillance Radar (SSR) equipment is recommended.

3.8.4 Position reports are required when crossing the coast outbound, inbound and when crossing the FIR Boundary.

3.8.5 Pilots undertaking Cross-Channel flights under IFR, are reminded that the normal IFR Rules will apply particularly regarding altitudes and flight levels. Pilots are also reminded that the IMC rating is not recognized by the French Authorities.

4 Arrangements for Particular Types of Flight (Non-Standard, Non-Deviating, Unusual, Royal, Observation, Special, VFR Access to Class C Airspace Above FL 195, and Civilian Formation Flights)

4.1 Non-Standard Flights (NSFs) in Controlled Airspace

4.1.1 A Non-Standard Flight (NSF) in Controlled Airspace is an aerial task that may not necessarily follow published routes or notified procedures; a formation flight of civil aircraft other than for VFR transit of CTA/CTR/TMA; or flights to and from a temporary landing site for multiple short term operations. For test flights which take place within CAS and use the ATS route network, please see section 4.9.

4.1.1.1 Applications for NSFs within Controlled Airspace should primarily be made via the NATS Non-Standard Flight Application website (www.nats.co.uk/nsf) with the minimum 21 or 28 days notice (see paragraphs 4.1.2 and 4.1.6).

See Swanwick (Mil) Sector Dimensions chart at ENR 6-12.

ENR 1.1 GENERAL RULES (continued)

4.1.1.2 Applicants using the website based application should ensure that the file sizes do not exceed 5MB. Zipped files are acceptable.

4.1.2 New applications or a renewal of a previously approved application shall give a minimum of **21 days** notice and include the information listed below (Any modification to a previously approved NSF application, without a change to the validity date, shall give a minimum of 10 days notice from the date of modification):

a) Purpose of flight;
b) the area of operation and proposed tracks to be flown, to include graphical depiction on a suitable **aeronautical chart** plus a list of National Ordnance Survey Grid and/or WGS84 co-ordinates detailing the requested areas of operation in relation to Controlled Airspace;
c) estimated duration of aerial task;
d) operating levels;
e) aircraft type, callsign and registration letters on any aircraft likely to be used;
f) aerodrome of departure;
g) planned date of operation and requested validity period;
h) communications equipment (including transponder fit).

4.1.2.1 Those applications which are agreed will be allocated a non-standard flight reference number. This is only an approval in principle and prior clearance must be obtained from the appropriate ATC Watch Supervisor on the day. This is normally obtained by telephone 1 hour prior to departure. However, since many tasks are weather-dependent, some have to be abandoned after the aircraft is airborne. To overcome the particular difficulty of having to land and co-ordinate another detail by telephone, the following procedures may be adopted by pilots of those NSFs which have been previously allocated a NSF number by London Area Control (Swanwick) or London Terminal Control (Swanwick), and who wish to abandon the original task co-ordinated prior to take-off and proceed to another location.

4.1.2.1.1 The aircraft commander will establish RTF contact on the London FIS frequency (callsign 'London Information') appropriate to the area of the country over which the new task is required to be flown, prefixing the message with the phrase 'Non-Standard Flight Request'. The following information will then be passed to the Flight Information Service Officer (FISO):

a) The Non-Standard Flight number;
b) the requested area of activity (this is essential as many NSF numbers refer to several sites);
c) ETA at site;
d) the requested Flight Level or Altitude for the task;
e) the duration of the task;
f) the aircraft callsign.

4.1.2.1.2 The FISO will relay these details to the appropriate ATC Unit and, in due course, will advise the pilot whether or not the NSF is approved, together with any special conditions and a contact frequency for the ATC Unit concerned. Pilots should not call for an approval directly on an operational ATC frequency. This is particularly important in the case of frequencies in use by London Terminal Control (Swanwick) or London Area Control (Swanwick).

4.1.2.1.3 In the case of NSFs affecting Airspace for which London Terminal Control (Swanwick) is responsible, it may sometimes be necessary for the pilot to land at a convenient aerodrome and telephone Terminal Control Senior Watch Assistant to discuss the requirements of the task in detail.

4.1.2.1.4 Operators are to note that in no circumstances can any discussion be entered into on any frequency in the event that permission is refused or withdrawn.

4.1.3 ATC clearance does not imply exemption from the requirements of the Air Navigation Order (ANO) or the Rules of the Air Regulations. Applications for flights which require exemption or written permission under the ANO are to be forwarded to:

Post: The Civil Aviation Authority, Flight Operations Division, Aviation House, Gatwick Airport South, West Sussex, RH6 0YR

4.1.4 Because of the nature of ATC operations (and notwithstanding the requirements of GEN 1.5, paragraph 5.3 concerning the carriage of SSR transponders), the approval of an application for a Non-Standard Flight will depend on the carriage of SSR transponder equipment normally with Mode C.

4.1.5 Due to the inherent difficulties of handling a formation flight in a busy traffic situation, pilots should be aware that it may not always be possible to issue an ATC clearance at the time requested.

4.1.6 **Enhanced Non-Standard Flights (ENSFs) - Entry into EGR156 (Windsor Castle)/EGR157 (Hyde Park)/EGR158 (City of London)/EGR159 (Isle of Dogs) Restricted Areas**

4.1.6.1 For those aircraft not already exempted (see individual entry for Restricted Area at ENR 5.1), ENSFs are required for flights within EGR156, EGR157, EGR158 and EGR159. Requests should be made using the NSF website (www.nats.co.uk/nsf) as detailed at paragraph 4.1.1.1 giving a minimum of 28 days notice. Any modification to a previously approved ENSF application shall give a

ENR 1.1 GENERAL RULES (continued)

minimum of 28 days notice from the date of modification.

4.1.6.2 ENSFs are subject to security considerations by the Metropolitan Police and may be refused on public interest grounds.

4.1.6.3 Once the security process is complete and London Terminal Control (Swanwick) provisional ATC approval in principle is granted, an 'ENSF Notification - Approval' form will be returned to the operator. Details of how to obtain a Metropolitan Police authorisation number for an ENSF and the ATC tactical approval on the day of flight are detailed on the 'ENSF Notification - Approval' form.

4.1.7 **Single-Engine Fixed Wing Aircraft Over Central London**

4.1.7.1 With the exception of the Northolt RMA and the Local Flying Areas at Denham and Brooklands (see AD 2.EGLL AD 2.22), NSF or ENSF permissions will not be granted to single-engine fixed wing aircraft requesting to operate within those parts of the London and London City Control Zones between a North-South line extending through the LON DME and a North-South line extending through the LCY NDB. In accordance with a directive from the CAA Safety and Airspace Regulation Group (SARG), applications which fall within the above criteria will be refused upon application to the NSF Coordinator due to the inability of such aircraft, in the view of the CAA, to be able to comply with SERA.3105 Minimum Heights.

4.1.8 **Unmanned Aircraft Systems (UAS)**

4.1.8.1 Any unmanned aircraft flight within a Flight Restriction Zone (FRZ) requires permission from the relevant ATSU or aerodrome operator using the appropriate process. Permission to operate within an FRZ should be obtained from the aerodrome directly, or through a suitable electronic service.

4.1.8.2 Permission to operate within the FRZ must be issued by either:

a) The ATC Unit; or
b) The Aerodrome Flight Information Service (AFIS), if no ATC or outside the operating hours of ATC; or
c) The Aerodrome Operator, if there is no ATC or AFIS, or outside the operating hours of ATC or AFIS.

4.1.8.3 The FRZ consists of:

a) A zone with the same dimensions as the notified Aerodrome Traffic Zone (ATZ); and
b) The Runway Protection Zones (RPZ); and
c) Any Additional zones, defined in the AIP.

All elements of the FRZ are active H24, regardless of the hours of operation of the aerodrome, or the ATZ activation.

4.1.8.4 Protected Aerodromes are those which are certified, Government, national licensed or otherwise as specifically prescribed. A list of aerodromes which are certified aerodromes and national licensed can be found within the AIP Aerodrome section (Part 3 AD 2).

A list of Government aerodromes can be found in the Military AIP.

4.1.8.5 A permission to operate within an FRZ is given conditionally upon the unmanned aircraft operation remaining entirely within the limits of the stated lateral and vertical operating area and that no safety assurance against other UAA taking place in the same area is given or implied. Compliance with the UK Air Navigation Order is required at all times.

4.1.8.6 Unmanned aircraft flights above 400 FT require a CAA authorisation, including those within an FRZ, which will also require permission from the aerodrome. A CAA authorisation to operate above 400 FT does not guarantee permission will be given by an aerodrome for the operation.

An A/G Radio service operator may not grant permission for an unmanned aircraft to operate within the FRZ.

Government aerodromes retain the right to refuse unmanned aircraft flight above 400 FT. To seek approval for any activity above 400 FT, early liaison with Government aerodromes is advised.

4.1.8.7 Operators are reminded of the applicability of the new UAS regulations, which are applicable from 31 December 2020. Further details can be found in CAP 722.

4.1.8.8 FRZ Permission Requirement Summary.

This table summarises when a permission is required from an aerodrome to operate within an FRZ. Other authorisations from the CAA may also be required.

Within the FRZ	Within Operating Hours of Air Traffic Control Unit (ATC) or Aerodrome Flight Information Service (AFIS)	Outside Operating Hours of ATC/AFIS (or no ATC/AFIS present)
400 FT or Below	Permission required from ATC/AFIS unit	Permission required from aerodrome operator
Above 400 FT	Authorisation required from CAA UAS Unit AND Permission required from ATC/AFIS Unit	Authorisation required from CAA UAS Unit AND Permission required from aerodrome operator

ENR 1.1 GENERAL RULES (continued)

4.1.8.9 It is highly recommended that, when an unmanned aircraft flight takes place at 400 FT or more above aerodrome level, within an FRZ, outside the ATZ, this shall be notified by NOTAM or other appropriate means, which can be requested via the CAA Customer Portal - ACOMS: https://portal.caa.co.uk. This will normally be stated as a condition within the CAA authorisation to operate above 400 FT. Upon application for an unmanned aircraft flight within such an area, the aerodrome operator or ATSU should direct the applicant to the CAA to request a NOTAM, in addition to their own permission. A NOTAM issued for such a flight does not constitute permission to operate within an FRZ, this must still be obtained from the aerodrome operator or ATSU as appropriate. Any NOTAM request for such an operation, submitted to the CAA should include either documentation of the permission to operate within the FRZ, or an agreement in principle, to operate within the FRZ.

4.1.8.10 It is highly recommended that, when any unmanned aircraft flight is permitted anywhere within an FRZ outside the hours of operation of any ATSU at the aerodrome, this shall be notified by NOTAM or other appropriate means which, for the portion of the RPZ outside the ATZ, can be requested via the CAA Customer Portal - ACOMS: https://portal.caa.co.uk.

4.1.8.11 UAS Operators should note that the AROps@caa.co.uk email address is not an H24 service and operates within normal office hours. NOTAMs may be requested by aerodromes for UAS operations within the ATZ portion of the FRZ directly to the NOF. NOTAMs for flights outside the ATZ portion of the FRZ must be requested via the CAA Customer Portal - ACOMS: https:// portal.caa.co.uk. Aerodromes which are not licensed may request NOTAMs from the NOF. All operations should be planned with sufficient notice to achieve a NOTAM where necessary.

4.1.8.12 There may be occasions where, for urgent operational reasons, UAS operations need to occur within an FRZ at short notice, for example, an emergency police response. The requirements outlined in paragraphs 4.1.8.1 to 4.1.8.8 still apply, and permission must be sought. Paragraphs 4.1.8.9 to 4.1.8.11 are advisory, and must be followed where possible. Emergency service operations responding to an incident with little notice, may elect not to issue a NOTAM if it is not possible.

4.1.8.13 FRZ NOTAM Requirement Summary.

	Within Operating Hours of Air Traffic Service Unit (Air Traffic Control, Aerodrome Flight Information Service or Air Ground Radio service)		**Outside Operating Hours of Air Traffic Service Unit** (Air Traffic Control, Aerodrome Flight Information Service or Air Ground Radio service)	
	Below 400 FT	**Above 400 FT**	**Below 400 FT**	**Above 400 FT**
ATZ Portion of FRZ			NOTAM (Requested by aero-drome via NOF)	NOTAM (Requested by aero-drome via NOF)
Portion of FRZ outside the ATZ		NOTAM (requested in advance via the CAA Customer Portal - ACOMS: https://portal.caa.co.uk)		NOTAM (requested in advance via the CAA Customer Portal - ACOMS: https://portal.caa.co.uk)

Note: *There may be occasions other than the circumstances described above, when a NOTAM is required. These should be determined by the UAS operator, the CAA and the aerodrome where appropriate. Such circumstances include the flight of larger unmanned aircraft, or BVLOS operations.*

4.1.8.14 In the event that a UAS operator requests permission to operate within two or more FRZs simultaneously, where they overlap, permission must be requested from all aerodromes concerned. Any one aerodrome may not give unilateral permission for the flight to occur, unless such an agreement is in place between the aerodromes.

4.1.8.15 An aerodrome may only issue a permission to a UAS operator to access their FRZ, and may not issue a permission for an entire UAS operation, which may require additional authorisations from the CAA and other agencies.

4.1.8.16 Flights by unmanned aircraft into Restricted Areas EGR156, EGR157, EGR158 and EGR159 within the London and London City Control Zones require specific approval via the ENSF process (see paragraph 4.1.6).

4.1.9 **Unusual Aerial Activities Both Within and Outside Controlled Airspace**

4.1.9.1 Normally, requests for the approval of Unusual Aerial Activities remaining within Controlled Airspace at all times are treated by the controlling authority as Non-Standard Flights.

4.1.9.2 Requests for the approval of Unusual Aerial Activities (UAA) operating within Controlled Airspace (Class A-E) and Class G airspace are treated differently from the Non-Standard Flight (NSF) type. Such UAAs are more complex and time-consuming to resolve because of the need for additional negotiation needed between ATC and airspace users, and should be notified to ATC at the earliest opportunity. A UAA of this nature is processed by the CAA Airspace Regulation section, which consults all agencies affected, arranges NOTAM action, and publishes an Airspace Coordination Notice (ACN). The ACN details the agreements reached about the activity inside and outside Controlled Airspace and reflects the NSF approval issued by the relevant controlling authority.

4.1.9.3 Details of UAAs/NSFs operating within Controlled Airspace (Class A-E) and Class G airspace are to be submitted as per paragraph

ENR 1.1 GENERAL RULES (continued)

4.1.2 with a copy to:

Post: Airspace Regulation (Utilisation), Aviation House, Gatwick, RH6 0YR
Phone: 01293-983880
Email: arops@caa.co.uk

4.1.10 **VFR Flight in Class C Airspace Above FL 195**

4.1.10.1 VFR flight by civil aircraft above FL 195 shall not be permitted unless it has been accorded specific arrangements by the appropriate ATS authority. VFR flight shall only be authorised:

a) In reserved airspace;
b) Outside reserved airspace up to FL 285, and then only when authorised in accordance with the procedures detailed for Non-Standard Flights in Controlled Airspace.

4.1.10.2 If utilising permanently established reserved airspace, the established booking procedures for that airspace should be followed. If there is a need for the establishment of temporary reserved areas then procedures for conducting Unusual Aerial Activities in Controlled Airspace shall be followed as detailed in paragraph 4.1.9. Standing arrangements for temporary reserved areas for gliding in Class C airspace are shown at ENR 1.1, paragraph 1.11.

4.1.10.3 It is anticipated the demand for VFR access outside of an airspace reservation will be minimal. Such access will be accommodated within the context of safety, capacity and effect on the ATS network as a whole; consequently VFR access to the ATS route structure is only likely to be permitted in exceptional circumstances. In this case the appropriate civil ATC Unit will coordinate provision of ATS. Operators seeking to operate in such areas should contact the appropriate ACC Operations Department as detailed at paragraphs 4.1.1 to 4.1.5. Applications for VFR flight to avoid IFR ATS route flow restrictions will not be granted.

4.1.10.4 Operators seeking localised VFR flight above FL 195 not requiring reserved airspace and clear of the ATS route structure should contact the relevant Military Supervisor located at London Area Control (Swanwick) who will co-ordinate access arrangements and military ATC provision within unit capacity. Contact details are shown at paragraph 4.1.1.1 (d) and (e). Such flights shall only be permitted where procedures are established with the controlling authority.

Note: *Specific arrangements for gliding operations above FL 245 are shown at ENR 1.1, paragraph 1.11.*

4.1.11 **VFR Flight in Class C Areas of Delegated ATS**

4.1.11.1 Charts depicting these areas are detailed at ENR 6-2 pages. These delegated areas of ATS are busy international interfaces. Consequently, approval for VFR flight will only be granted in exceptional circumstances and after co-ordination with and agreement of the respective ATS provider. Applications for VFR access to these areas should in the first instance be made to AUS as detailed in paragraph 4.1.9.

4.2 Non Deviating Status (NDS)

4.2.1 NDS may be agreed by prior arrangement with the appropriate controlling authorities for certain flights within Controlled Airspace excluding in the UIR active Danger and Military Training Areas.

4.2.2 The requirement for NDS may be expressed as all, or part, of a notified flight profile and not merely for a constant heading and, or, flight level. Application for NDS should only be made where an inability to maintain specific track(s) and or flight level(s) could render a task operationally ineffective. NDS would not be appropriate for, nor would it be granted to, GAT aircraft carrying freight or passengers between destinations or GA aircraft general handling etc or in transit.

4.2.3 NDS affords priority of passage over all other OAT and GAT except for: aircraft in emergency; Royal Flights; Air Defence Priority Flights; GAT with higher civil priority category or other higher priority Special flights.

4.2.4 The Airspace Regulation (Utilisation) (AR(U), is the central authority for authorising NDS and is the focal point for NDS applications, inter unit negotiations and approvals.

4.2.5 AR(U) normally requires a minimum of 21 days notice of pre-flight requests for NDS in order to obtain agreement from the affected Air Traffic Service Units (ATSUs) and, or, Airborne Surveillance and Control (ASAC) Units. A request for NDS should include:

a) Operating authority, including a point of contact;
b) type of aircraft operation (e.g. flight trial, calibration etc);
c) reference number or other discrete nomenclature;
d) aircraft registration(s) and/or callsign(s);
e) details of flight(s);
    i. departure aerodrome and destination;
    ii. route or area;
    iii. profiles (if appropriate);
    iv. times;
    v. altitudes or Flight Levels;

vi. facilities to be used (if appropriate);
vii. any non-ATC agencies involved;
viii. any specific requirements eg frequencies to be used etc.

f) details of any specific flexibility, limitation or critical aspect.

Shorter notice applications may be considered on merit, but AR(U) may direct aircraft operating authorities to refer their requests for NDS direct to the appropriate ATSU(s) or ASAC unit(s) involved if the application cannot be processed in time by AR(U).

4.2.6 Units will attempt to agree to short notice requests for NDS but, if given insufficient time, may decline or modify the request. Profile adjustments may, in any event, need to be negotiated if such changes would result in less disruption to other traffic.

4.2.7 Flights granted NDS will remain under radar control or procedural service. If in the interest of flight safety it should become necessary to give NDS flights avoiding action, such instructions from a controller are **Mandatory.**

4.3 Unusual Aerial Activities (UAA) Outside Controlled Airspace

4.3.1 A UAA may constitute a hazard if pilots of non-participating aircraft are not aware that it is taking place. The Civil Aviation Authority and in particular Airspace Regulation (Utilisation) (AR(U)) require appropriate prior notification of a UAA to enable either AR(U) to co-ordinate and notify the event, or for the Authority to issue a Permission or Exemption under the Air Navigation Order (ANO) and the Regulations. Event or display organisers are advised to utilise the CAA Publication CAP 403 'Flying Displays and Special Events: A Guide to Safety and Administrative Arrangements'. The document is available from The Stationery Office (Tel: 0870-6005522) and on the CAA web site: http//www.caa.co.uk/publications

4.3.2 Individual participating pilots are advised to check that the event or display organiser has made proper application for any required Permission or Exemption.

4.3.3 While there are many types of UAA, most fall within one of the following categories:

a) A concentration of aircraft significantly greater than normal, e.g. a Rally or Fly-in;
b) Activities requiring the issue of a Permission or an Exemption from the ANO and the Regulations, e.g. low flying near assemblies of people, the dropping of articles or parachutists, or balloon or kite flying;
c) Air Shows, Displays, Air Races and other aeronautical competitions, aerial surveys and avoidance of ground events and hazards;
d) Activities requiring the establishment and approval of a temporary ATC Unit. (See CAP 670 'ATS Safety Requirements' and CAP 403 for requirements and recommendations). In the case of the provision of a Flight Information Service (FIS) at a temporary FIS Unit refer to CAP 797 'Flight Information Service Officer Manual' and CAP 1032 'Aerodrome Flight Information Service Officer Licensing'. All are available on the CAA web site, as above.

4.3.4 All event or display organisers wishing to arrange a UAA are to use the standard notification forms SRG 1303 (Flying Display Notification Form) or SRG 1304 (Special Events and Unusual Aerial Activity Application Form) as appropriate.

4.3.5 The length of notice required by the Authority and AR(U) is as follows:

a) UAA at a licensed aerodrome or site where a temporary aerodrome licence is required - 60 days;
b) UAA at an aerodrome or a site where an aerodrome licence is not necessary - 42 days;
c) If an activity is intended to attract more than 100 aircraft it is essential that proposals are discussed with both the Aerodrome Standards Department (ASD) and the appropriate Regional Manager - Air Traffic Services (ATS) prior to any firm arrangements being made. These discussions should be initiated at least **90 days** prior to the date of the Activity. If the organiser has any doubt on the level or type of Air Traffic Service that should be provided, he/she is strongly recommended to contact the relevant Regional Manager (ATS) for guidance;
d) If it is intended to establish a Temporary Air Traffic Control Unit (ATCU) at an event, it is essential that organisers refer to the document CAP 670 'ATS Safety Requirements' which contains comprehensive information and requirements for the establishment of such a unit. This document is available on the CAA web site: http//www.caa.co.uk/publications

A provider of Air Traffic Control must be nominated and he/she is required to apply to the appropriate CAA ATSSD Regional Office in advance of the event for unit approval. A copy of the proposed Manual of Air Traffic Services Part 2 (MATS Part 2) should be submitted as soon as possible but no later than 60 days before the event. The format of the MATS Part 2 is laid out in CAP 670 - Part B, Section 2, Annex A to ATC 02 with further information in Part B, Section 1, APP04, Page 3.

Established ATS Units intending to hold a Flying Display or Special Event are required to notify their ATSSD Regional office if the event requires changes to safety related procedures at that unit.

Copies of Form SRG 1417, which also may be used for the application for a temporary VHF frequency, are available from CAA ATSSD Regional Offices or on the CAA web site. A minimum of 90 days notice is required for a temporary assignment of VHF aeronautical channels.

Note: *Air Traffic Services Standards Department (ATSSD) - Regional Offices*

Post: Regional Manager ATS**, Southern Regional Office,** Floor 2W, Aviation House, Gatwick Airport South, West Sussex RH6 0YR.

Phone: 01293-573426.
Fax: 01293-573974.

Post: Regional Manager ATS, **Central Regional Office,** Manchester International Office Centre, Suite 5, Styal Road, Wythenshawe, Manchester M22 5WB.
Phone: 0161-499 3055 x242.
Fax: 0161-499 3048.

Post: Regional Manager ATS, **Northern Regional Office**, 7 Melville Terrace, Stirling, FK8 2ND.
Phone: 01786-431400.
Fax: 01786-448030.

Post: ATS Standards Department, Aviation House, Gatwick Airport South, West Sussex RH6 0YR.
Phone: 01293-573329.
Fax: 01293-573974.

See chart at ENR 6-6 for Area of Responsibility of the ATSD Regional Offices.

4.3.6 Display organisers and pilots are advised that, although every effort will be made to deal with late notification forms, no guarantee can be given that they will be processed in time for the event.

4.3.7 Forms SRG 1303 and SRG 1304 can be obtained from the CAA website, and when completed should be returned to:

Post: Civil Aviation Authority, General Aviation Department, 1W, Aviation House, Gatwick Airport South, West Sussex RH6 0YR
Phone: 01293-573227 / 573517 / 573525
Fax: 01293-573973

To arrive at least 28 days before the event, a copy of the form should be sent to:

Post: Airspace Regulation, Aviation House, Gatwick, RH6 0YR
Phone: 01293-983880
Email: arops@caa.co.uk

4.3.8 Event or display organisers should note that whenever military aircraft participate in a civil aviation event, the Ministry of Defence (MoD) requires the organiser to complete a special questionnaire which is separate from, and additional to, the notification required by the Authority. Event organisers will receive copies of the military questionnaire from the MoD when the military participation is confirmed. The completed questionnaires are to be sent to AR(U).

4.4 Royal Flights

4.4.1 **Introduction**

4.4.1.1 A Royal Flight within UK airspace is defined as the movement of an aircraft specifically tasked to carry one or more members of The Royal Family afforded such status by the Director of Royal Travel, The Royal Household.

4.4.1.2 When so directed by the Civil Aviation Authority (CAA) Group Director, Safety & Airspace Regulation Group (GD SARG) or Head of Airspace, Aerodromes and Air Traffic Management (Hd AAA) certain flights within UK airspace by reigning Sovereigns and Heads of State of foreign countries and, where appropriate, Prime Ministers of Commonwealth countries may also be afforded Royal Flight status.

4.4.2 **Special ATC Arrangements for Royal Flights in Fixed-Wing Aircraft**

4.4.2.1 **Establishment of Temporary (Class D) Controlled Airspace (CAS-T)**

4.4.2.1.1 Royal Flights in fixed-wing aircraft will, whenever possible, take place within the national ATS route structure. Standard ATC procedures shall be applied to Royal Flights when operating in permanent Class A, C and D Airspace. In all other instances, the airspace around the route will be designated CAS-T.

4.4.2.1.2 CAS-T of appropriate height/width bands, and levels, will be established to encompass any portion of the track and flight level of the Royal aircraft that lies **outside** of permanent Class A, C and D Airspace or transits through an active Military TRA. Temporary Control Zones and Control Areas will be established, where not permanent/extant, around airfields, with an appropriate level of service provision, used for the departure or arrival of a Royal Flight.

4.4.2.1.3 Regardless of the prevailing meteorological conditions, aircraft shall only fly within CAS-T when ATC clearance has been obtained from the controlling authorities specified in the following sub-paras:

a) **Temporary Control Zones.** Temporary Control Zones, Class D, will be established, where appropriate, around airfields of departure and destination where no permanent control zones exist. Control Zones for Royal Flights will extend between 5 and 10 NM radius from the centre of the aerodrome from ground level to an upper level designated for each Royal Flight dependent upon the Royal aircraft type and the aerodromes surrounding airspace. The Control Zone will be established for

a period (for outbound flights) of 15 minutes before, until 30 minutes after, the ETD of the Royal aircraft or, for inbound flights, a period of 15 minutes before, until 30 minutes after, the ETA of the Royal aircraft at the airfield concerned. Overall control of these Control Zones is to be exercised, as appropriate, by the Commanding Officer of a military airfield or the appropriate ATS authority of a civil airfield.

b) **Temporary Control Areas.** Temporary Control Areas, dimensions and duration thereof, will be established to meet the specific requirements of a Royal Flight. The controlling authority will be the appropriate civil or military ATCC.

c) **Permanent Control Zones and Areas.** The controlling authority will be the designated controlling authority for the Permanent Control Zone or Area and the duration will be as laid down in sub-paras 4.4.2.1.3 (a) and (b). Where an airfield has its own Control Zone, then the requirement to establish a Temporary Control Zone of the dimensions specified in para 4.4.2.1.3 (a) may be waived. The ATC Supervisor is to ensure that, when a Royal Flight is active or expected in the same airspace, Special VFR clearances stipulate conditions that provide separation standards against the Royal Flight mirroring IFR separation standards (para 4.4.2.2.2 refers).

d) **Temporary Controlled Airways.** Class D airways will be established to join temporary or permanent Control Zones or Control Areas, as appropriate. Class C airways will be established for transit through an active TRA. Such airspace will be established for 15 minutes before ETA at the start point of the temporary airway until 30 minutes after ETD from the end/ departure point of the temporary airway. The lateral dimensions of such airways will be 5 NM each side of the intended track of the Royal Flight and vertical limits will be designated as required. The controlling authority will be the appropriate civil or military ATCC.

4.4.2.1.4 A Temporary Control Zone, Area or airway may be cancelled at the discretion of the Military Commander or Civil ATC Supervisor, as appropriate, when the Royal aircraft has left the temporary zone, area or airway and is established en-route in permanent Class A, C or D Airspace, or has landed.

4.4.2.1.5 Training Flights, including parachute-training flights, by any member of The Royal Family planned and carried out under VFR or IFR, and under the control of an ATCRU or aerodrome radar, will normally be classified as Royal Flights. CAS-T, where required, will be established as agreed by the aircraft operating organisation and CAA Airspace Regulation (Utilisation).

4.4.2.2 **Procedures Applicable to Royal Flight CAS-T**

4.4.2.2.1 CAS-T will be notified as Class C or Class D Airspace; applicable access criteria and separation standards apply.

4.4.2.2.2 Flights may operate in accordance with SVFR as described in ENR 1.2 para 2 of the UK AIP and CAP 493 (Manual of Air Traffic Services) Part 1, Section 1, Chapter 2, Para 8, within CAS-T CTRs.

4.4.2.2.3 CAS-T established outside of existing Class A/C Airspace is hereby notified respectively as either Control Zones or Control Areas (as appropriate) as defined in the UK Air Navigation Order.

4.4.2.3 **Promulgation of Royal Flight Information**

4.4.2.3.1 Dissemination of information concerning a Royal Flight is made via a Notification Message on a Royal Flight Collective, giving full flight details. Information on the establishment of CAS-T, including vertical limits, is promulgated by NOTAM.

4.4.3 **Royal Flights in Helicopters**

4.4.3.1 CAS-T is not normally established for Royal Flights in helicopters, but a degree of protection is provided by the establishment of a Royal Low-Level Corridor (RLLC).

4.4.3.2 A RLLC is marked by a series of waypoints and will be promulgated by Notification Message and are applicable to military aircraft only.

a) Waypoints, approximately 20 minutes flying time apart, will coincide with turning points. The Notification Message will indicate the ETDs/ETAs for given check-points.

b) Within the RLLC, protected sectors, applying to military aircraft only, are established extending 5 NM either side of the helicopter's intended track and from ground level up to 1000 FT above the maximum cruise altitude.

c) In accordance with Military Regulations (RA 3237), prior to entering and when operating inside RLLCs, controllers and pilots of military aircraft should ensure that the military aircraft is in receipt of an ATS (either under Visual Flight Rules (VFR) or Instrument Flight Rules (IFR)) from:

   i. The same Air Traffic Control (ATC) unit that is controlling the Royal Helicopter; or
   ii. Another ATC unit that has established radar contract with the Royal Helicopter.

d) In addition to the requirements at 4.4.3.2(c), standard separation should be applied between military aircraft and the Royal Helicopter in accordance with Military Regulation RA 3228, with the following exceptions:

   i. Light aeroplanes and helicopters operating under VFR with an Indicated Air Speed of 140 KT or less should be provided with sufficient traffic information to assist the military pilots to keep well clear of the Royal Helicopter; or
   ii. Military aircraft operating VFR above 140 KT with the approval of the Royal Helicopter Commander.

4.4.3.3 The Notification Message will include a list of nominated aerodromes from which pilots may obtain information on the progress of

the Royal Helicopter.

4.4.4 **Royal Flight Callsigns**

4.4.4.1 The flight plan aircraft identification and the radiotelephony designators for flights flown in aircraft of No. 32 (The Royal) Squadron, the King's Helicopter Flight (TKHF) or in civilian chartered aircraft are as follows:

a) **Royal Flights.** Royal flight callsigns are as follows:

i. **No. 32 (The Royal) Squadron (See note).** The 3-letter operator designator KRF followed by an identification number and the letter R, eg KRF 1R, and the radiotelephony callsign 'KITTYHAWK' followed by an identification number and the letter R.
ii. **TKHF.** The 3-letter designator TKF followed by an identification number and the letter R, eg TKF 1R, and the radiotelephony callsign 'RAINBOW' followed by an identification number and the letter R.
iii. **Civilian Chartered Aircraft.** The 3-letter designator KRH followed by an identification number and the letter R, eg KRH 1R, and the radiotelephony callsign 'SPARROWHAWK' followed by an identification number and the letter R.

b) **Flights by Passengers entitled to CAA Priority.** Callsigns for flights by aircraft carrying passengers entitled to CAA priority are as follows:

i. **No. 32 (The Royal) Squadron (See note).** The 3-letter operator designator KRF and the radiotelephony callsign 'KITTYHAWK' followed by an identification number.
ii. **TKHF.** The 3-letter operator designator TKF and the radiotelephony callsign 'RAINBOW' followed by an identification number and the letter S.
iii. **Civilian Chartered Fixed-wing Aircraft.** The 3-letter operator designator KRH and the radiotelephony callsign 'SPARROWHAWK' followed by an identification number.
iv. **Civilian Chartered Rotary-wing Aircraft.** The 3-letter operator designator KRH and the radiotelephony callsign 'SPARROWHAWK' followed by an identification number and the letter S.

c) **Positioning Flights.** Callsigns for positioning flights are as follows:

i. **No. 32 (The Royal) Squadron (See note).** The 3-letter operator designator RRF and the radiotelephony callsign 'KITTY' followed by an identification number.
ii. **TKHF.** The 3-letter operator designator will be TKF and the radiotelephony callsign 'RAINBOW' followed by an identification number.
iii. **Civilian Chartered Fixed-wing Aircraft.** The normal aircraft callsign will be used.
iv. **Civilian Chartered Rotary-wing Aircraft.** The 3-letter operator designator KRH and the radiotelephony callsign 'SPARROWHAWK' followed by an identification number.

d) **Other Flights by Aircraft of No. 32 (The Royal) Squadron (See note).** All other flights carried out by No. 32 (The Royal) Squadron will use the 3-letter designator RRR and the radiotelephony callsign 'ASCOT' followed by the required identification number.
e) **Helicopters flown by HRH The Duke of York.** For helicopters of TKHF flown by HRH The Duke of York, the 3-letter operator designator will be LPD and the radiotelephony callsign will be 'LEOPARD'.

Note: *The rule also applies whenever No. 10 Squadron or No. 216 Squadron aircraft are being utilised for Royal/VIP flights.*

4.5 Observation Flights Conducted Under the Treaty on Open Skies

4.5.1 **Introduction**

4.5.1.1 The Treaty on Open Skies was signed on 24 March 1992 by 25 Countries, including the UK, to promote greater transparency in military activities and thereby enhance international security. The Treaty has now been expanded to include 27 Countries. To fulfil its obligations under the terms of the Treaty, the UK is committed to accept Observation Flights by Observation Teams from any of the signatory Countries over **any** part of UK territory, including Controlled Airspace.

4.5.2 **Observation Flights**

4.5.2.1 Observation Flights may be conducted from RAF Brize Norton and Glasgow Prestwick Airport.

4.5.2.1.1 Occasionally, an Observation Flight may overfly several Western European Union (WEU) Countries in one mission – Combined Observation Flight. In this case, the Observation Flight could commence and/or end within the UK, or merely overfly the UK during the mission. Additionally, a refuelling stop within the UK may be required.

4.5.2.1.2 The aircraft used during the Observation Flight may be provided by either the UK or the visiting Country. In either case, a UK Flight Monitor will always be available on the flight deck to act as an interface with ATC agencies.

4.5.2.2 Although His Majesty's Government will receive at least 3 days notice of the arrival of an Observation Team within the UK, the intended route and profile of the Observation Flight (Mission Plan) will not be known until approximately 24 hours prior to commencement. Upon receipt of the Mission Plan, the Airspace Regulation (Utilisation) (AR(U)) will initiate any Danger Area closure action and notify details of the route to the appropriate ATC agencies by means of an Airspace Co-ordination Notice (ACN).

AR(U) will also take NOTAM action to notify other agencies and airspace users.

4.5.2.3 Under the terms of the Treaty, aircraft undertaking Observation Flights are to be afforded due priority over other aircraft, **(see Note 1)** . Observation Flights within UK airspace are therefore granted Category B Status (as detailed in MATS Part 1, Section 1, Chapter 4, para 10C). In addition, when within Controlled Airspace, flights are to be afforded non-deviating status (ENR 1.1.4.2), and when outside of Controlled Airspace, as far as possible flights are to be afforded priority over all other aircraft except those in an emergency or performing roles where the safety of life is involved.

4.5.2.4 All Observation Flights within UK airspace shall be conducted in compliance with published National ATC rules, procedures and guidelines on flight safety, **(see Note 2)** .

4.5.2.5 For flight safety reasons and to assist in affording priority over other traffic, whilst operating in Class G Airspace, Observation Flights are strongly recommended to remain within the bounds of radio and radar coverage. In addition, to enable the UK air traffic control authorities to meet their responsibilities in accordance with the Open Skies Treaty, in particular the preservation of flight safety, and the prioritisation obligation in Article VI, Section I, paragraph 15, Observation Flights operating in the Scottish Highlands Area are to operate under Instrument Flight Rules (IFR) and remain above the IFR Minimum Levels over high terrain as detailed in SERA.5015(b)(1).

4.5.2.6 The Open Skies Scottish Highland Area is within the area bounded by straight lines joining the following coordinates: 555300N 0050000W – 560400N 0045200W – 560100N 0044200W – 565400N 0022900W – 572800N 0025300W – 572600N 0044000W – 573700N 0043100W – 581300N 0032800W – 583500N 0045500W – 571200N 0062100W – 561800N 0061200W.

Note 1: *Treaty on Open Skies – Article VI Section 1, para 15.*

Note 2: *Treaty on Open Skies – Article VI Section 1, para 14.*

4.6 Special Flights

4.6.1 Introduction

4.6.1.1 Special Flight Notifications (SFNs) can be applied to a variety of special aerial tasks which may take place throughout an extended period of time. The most common are Police Authority Air Support Unit (ASU) and Air Operations Unit (AOU) flights, Helicopter Emergency Medical Service (HEMS) flights and HM Government-sponsored flights, (including Ministry of Defence and other flights). The nature of SFN flights is such that they will often require to be afforded priority over most other flights.

4.6.1.2 The purpose of an SFN is to ensure that those ATC agencies likely to provide services to the subject aircraft are aware of any special handling requirements, and that aircraft operators are aware of the conditions under which priority over most other flights is afforded.

4.6.2 Content

4.6.2.1 SFNs will contain details of:

a) The purpose of the subject flight.
b) The priority(ies) of the subject flight, to be in accordance with flight categories defined at CAP 493 Manual of Air Traffic Services Part 1, Section 1, Chapter 4 and as authorised by the CAA as follows:
    i. Police Authority ASU and AOU flights - Category A (Police Emergencies), Category B (the normal operational priority) or Category Z (training, test and other flights involving Police Authority aircraft).
    ii. HEMS flights - A, E or Z as described in AIC Y 9/2014 dated 20 February 2014.
    iii. HM Government-sponsored flights, subject to the nature of the activity but usually Category B for special surveys. Category E applies to time-critical test and training flights, Category Z to all routine training, test and other flights.
c) The period(s) during which flights may take place.
d) The period of validity of the SFN.
    i. A Special Flight Notification should normally be issued for no longer than twelve months from the date of issue.
    ii. Exceptionally, subject to the approval of the NATS SFN Co-ordinator and the CAA, this period may be extended to no longer than fifteen months from the date of issue when the period of operation of the flight is expected to be longer than twelve, but no longer than fifteen months from the date of issue and/or to assist in the timely administration of notices of renewal.
e) The name of the operator and the type of aircraft.
f) The callsign(s) to be used and the main operating base(s).
g) The routine operating area of the activity.
h) The operating level (or levels), where appropriate to include minimum and/or maximum levels and/or level bands.
i) The minimum weather criteria required for the particular operation.
j) Points of contact for the operator and ATC agencies responsible for the area in which the flight is to be undertaken.
k) The rules under which the aircraft captain is to operate the aircraft.
l) Available communications and (if applicable) discrete SSR codes to be used.

m) Pre-flight notification and co-ordination requirements for the flight, to include the minimum pre-notification period where appropriate or possible.
n) The action by the aircraft captain in the event of loss of communications (AIP ENR 1.1, subsection 3 refers to basic national procedures).
o) Any special considerations.

4.6.3 **Promulgation**

4.6.3.1 Responsibility for the drafting, amendment, promulgation and distribution of SFNs is vested in the NATS SFN Co-ordinator. All queries concerning, and requests for, Special Flight Notification are to be submitted to the:

Post: NATS SFN Co-ordinator, Room 3115/Box 3115, London Area Control (Swanwick), Sopwith Way, Swanwick, Hants, SO31 7AY
Phone: 01489-444182 (alternate 01489-444181)
Email: special.flights@nats.co.uk

4.6.4 **Enquiries**

4.6.4.1 All enquiries concerning SFN policy may be addressed to the CAA at:

Post: Airspace Regulation, Aviation House, Gatwick, RH6 0YR
Phone: 01293-983880
Email: arops@caa.co.uk

4.7 Civilian Formation Flights - ATC Procedures

4.7.1 **General**

4.7.1.1 ATC will consider formations to be a single unit for separation purposes provided that:

a) The formation elements are contained within 0.5 NM laterally and longitudinally, and within 100 FT vertically from the formation leader. Within Class G Airspace and subject to ATC approval, these limits may be increased to 3 NM and/or up to 1000 FT vertically.
b) For the purposes of SERA.3135(d) Formation Flights: Military aircraft flying in formation must be flown at a distance not exceeding 1 NM laterally and longitudinally and 30 M (100 FT) vertically from the leading aircraft in the formation.
c) The formation, although operating outside the parameters above, has NSF approval.

4.7.1.2 The formation leader is responsible for ensuring safe separation between aircraft comprising the formation.

4.7.1.3 In making initial contact with the ATC unit, the formation leader shall clearly state the number of aircraft in the formation.

4.7.1.4 Where a flight plan is required, the identification of the formation leader and the number of aircraft in the formation must be shown.

4.7.1.5 All ATC instructions and clearances will be addressed to the leader.

4.7.2 **Controlled Airspace**

4.7.2.1 VFR formation flights by civilian aircraft transiting CTA/CTR/TMA are subject to the normal airspace requirements as detailed at ENR 1.4. All other civilian formation flights in Controlled Airspace are subject to NSF approval.

4.7.2.2 Formations in Controlled Airspace shall be contained within 1 NM laterally and longitudinally and at the same level. Where this is not possible, the formation must be split into individual elements before entering Controlled Airspace. In the event that aircraft within the formation are unable to maintain within these parameters, the formation leader must immediately inform ATC.

4.7.2.3 Prior to entering Controlled Airspace, the formation leader shall confirm that all aircraft within the formation are within 1 NM laterally and longitudinally, and if in level flight, are at the same level.

4.7.2.4 When a formation has been cleared to climb or descend in Controlled Airspace, the formation leader shall confirm that all elements have reached the new assigned level.

4.7.2.5 All aircraft in the formation are to monitor the relevant ATC frequency.

4.8 Air tests with Swanwick(Mil) within the London FIR.

4.8.1 All civil operators wishing to file an airtest using a service provided by Swanwick(Mil) must comply with the following guidance.

4.8.1.1 Ideally, an air test request form is to be sent prior to midnight (local) the day before the test; this is to ensure that Swanwick(Mil) is able to offer a deconfliction service for the civil operator against busy military flying periods. However, should this notice period not be possible, the request to Swanwick(Mil) is to be made no less than 2 hours prior to the airtest commencing. If requests are

ENR 1.1 GENERAL RULES (continued)

made with only 2 hours notice then these must be made as early in the day as possible; this is to enable controller workload planning. Requests made late in the day are at risk of postponement until the following day. All pilots should note that the provision of service to any civil airtest is always subject to potential short notice cancellation or delay in the event of unexpected military activity.

4.8.1.2 Captains of test flights are also requested to call the Swanwick(Mil) Supervisor on 01489-612408 (for flights east of the country) or 01489-612417 (for flights in the west), prior to engine start to ensure that the Unit has the capacity to provide an Air Traffic Service outside of the civil airways structure.

Note: *The above procedure should only be considered as a request for a service to be provided by Swanwick(Mil) and should not be construed as the filing of a flight plan. All normal flight plan procedures should be adhered to.*

ENR 1.1 GENERAL RULES (continued)

ANNEX A TO 3.01.18
CIVIL AIR TEST PROFORMA

Civil aircraft operators, including military contractors, should ideally inform 78 Squadron (78 Sqn), callsign Swanwick(Mil) of their requirements for a test flight at least 24 hours in advance. This is to deconflict between high intensity periods of military fast jet flying. Should this not be possible, the request to 78 Sqn is to be made no less than 2 hours prior to the air test commencing. 78 Sqn has reduced controlling capacity between 1800–0800(1700-0700) Mon to Fri and from 1700(1600) Fri to 0800(0700) Mon (extended until 0800(0700) on Tue following a Public Holiday); during these times operators should be aware they may be required to use the normal ATS network or reschedule their test flight.

This form is to be returned to 78 Sqn plans via email: swk-plans@mod.gov.uk If the request falls within the reduced capacity timings or under 24 hours in advance, please forward to the respective Supervisors inbox: SwanwickMilitary-East@nats.co.uk, SwanwickMilitary-West@nats.co.uk or SwanwickMilitary-North@nats.co.uk Upon approval, the reference number should be annotated on the flight plan.

OPERATORS ARE TO ENSURE THAT FLIGHT PLANS ARE ADDRESSED TO EGWDZQZX - FAILURE TO DO SO MAY RESULT IN A DELAY TO THE FLIGHT

Captains of test flights are requested to call the respective Supervisor, West (01489) 61 2417, East 2408 or North 2493 prior to engine start to ensure that the Sqn has the capacity to provide an Air Traffic Service outside of the ATS network.

CIVIL AIRTESTS ARE ACCEPTED SUBJECT TO MILITARY TRAFFIC LEVELS.

ENR 1.1 GENERAL RULES (continued)

4.9 Civil Air Tests within the London FIR and UIR

A test flight is a flight that takes place within CAS that uses the ATS Route network for purposes such as:
Maintenance flights, Demo flights, Fear of Flying flights, Northern Lights, Santa flights, Charity flights etc. This list is not exhaustive. Requests should be emailed to testflights@nats.co.uk with a minimum of 2 working days' notice. When submitting a request please ensure the following information is included:

1. Date of Flight;
2. Departure / Destination Aerodrome;
3. EOBT;
4. Callsign;
5. Aircraft Type;
6. RFL;
7. Requested Route (if known);
8. Duration required (if applicable);
9. Any special requirements (for example requirement for a block of levels to be reserved, or unusual manoeuvres);
10. Contact details.

Aircraft Operators may be requested to call the operation before EOBT to confirm final details. Approval for test flights will be subject to operational capacity/traffic and changes to FPLs requested after approval may not be accommodated.

For non-standard flights, please see section 4.1.

5 Special Use Airspace and Hazards to Flight

5.1 Special Use Airspace

5.1.1 **Overview**

5.1.1.1 Special Use Airspace (SUA) is defined as an airspace volume designated for specific operations, such as military training, exercises and operations, of a nature such that limitations on airspace access may be imposed on other aircraft not participating in those activities. SUA in the UK can be in the form of Prohibited Areas, Restricted Areas, Danger Areas, Temporary Segregated Areas, Temporary Reserved Areas or Cross Border Areas.

5.1.1.2 SUA adopts the background airspace classification within which it is situated. However, operating procedures inside the SUA may differ from those normally associated with that class of airspace. Pilots of aircraft entering SUA should ensure they are aware of the operating procedures prior to entering.

5.1.1.3 Permanent SUA structures are notified in ENR 5.1 and ENR 5.2. Some may be notified H24 but in the majority of cases will be activated in accordance with Flexible Use of Airspace principles, with fixed times in the AIP and/or activated by NOTAM.

5.1.1.4 Where non-permanent (temporary) SUA structures have been approved for use, these will be notified by NOTAM, AIC or AIP Supplement, and will normally be established for a maximum period of 90 consecutive days. Additional information may be provided in AICs or Briefing Notes. These SUA structures will also be operated in accordance with the flexible use of airspace principles where activation will only occur when needed by the SUA user. Note that this paragraph does not apply to 'temporary' as used in Temporary Reserved Areas or Temporary Segregated Areas which can be permanently established.

5.1.1.5 Airspace Management (ASM) protocols are used to apply differences to the national ASM priorities set out in CAP740 or limitations on the use of SUA. ASM protocols are defined in LoAs between impacted parties and where they apply, will be annotated in the remarks column of ENR 5.

5.1.2 **Special Use Airspace Activities**

5.1.2.1 Danger Areas, Temporary Segregated Areas, Temporary Reserved Areas and some Restricted Areas encompass a variety of activities as annotated in the table below. However, not all activity descriptors are relevant to all SUA (for example, OME should only be conducted in a Danger Area). Details on the activities which may take place within each SUA are contained in the tables at ENR 5.1 and 5.2.

Activity Descriptor	Definition
Ordnance, Munitions and Explosives (OME)	Live or practice OME delivered from the surface or air (including delivery by parachute), including bombing, torpedo dropping, demolition, and explosions, and large rockets capable of operating below the stratosphere as defined in the Air Navigation Order 2016.
High Energy Manoeuvres	Single or multiple aircraft conducting high energy manoeuvres, including supersonic flight, that may result in pilot(s) not being able to comply with the Rules of the Air.
Unmanned Aircraft System (UAS)	Unmanned aircraft operating autonomously or piloted remotely without a pilot on board.

ENR 1.1 GENERAL RULES (continued)

Activity Descriptor	Definition
Para Dropping	Activities involving the dropping of articles or parachutists.
Target Towing	Aircraft towing targets with cable lengths which, although normally 6000 FT, may extend to 24,000 FT. Targets may be anything up to 2500 FT below the towing aircraft.
Balloons	Large Balloons that are either tethered or released.
Electronic/Optical Hazards	Hazards that may interfere with aircraft systems or present a hazard to aircrew, including electronic warfare training and lasers.
Test and Evaluation	Single or multiple aircraft conducting manoeuvres that may not be able to comply with the Rules of the Air.
Spaceflight Activities	Activities as defined in the Space Industry Act 2018.

5.1.2.2 It is emphasized that only the types of activities most likely to be encountered are listed. Areas will not be reserved for one type of activity only and various hazards may be encountered in one area simultaneously. The potential hazards of flying through active SUA without approval cannot be overstressed.

5.1.2.3 Pilots are reminded that aircraft in the towing configuration have right of way over other converging powered aircraft under the provisions of the SERA Section 3 – General Rules and Collision Avoidance for avoiding aerial collisions and pilots must realise that, although the cable and target may not be immediately apparent, this does not absolve them from giving way to the towing aircraft.

5.1.2.4 In the immediate vicinity of SUA in which military aircraft operate, many of those aircraft fly arrival, holding and departure patterns. Pilots of aircraft flying close to SUA are advised to keep an especially sharp lookout for such aircraft and, by taking any necessary evasive action (unless the rules for avoiding aircraft collisions require otherwise) in good time, permit them to continue their manoeuvres.

5.1.3 **Restriction of Flying Regulations**

5.1.3.1 The Secretary of State for the Department for Transport (DfT) is empowered under the UK Air Navigation Order (ANO) to make regulations prohibiting, restricting or imposing conditions on flight by civil aircraft in United Kingdom airspace and by any United Kingdom registered civil aircraft in any other airspace within which the United Kingdom, under international arrangements, has undertaken to provide navigational services to aircraft. Restriction of Flying Regulations are made only when the Secretary of State deems it necessary in the public interest.

5.1.3.2 **Prohibited Area** - airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is prohibited.

5.1.3.3 **Restricted Area** - airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is restricted in accordance with certain specified conditions.

5.1.3.4 Prohibited and Restricted Areas established under these Regulations may be temporary or permanent. When time permits, details of temporary Prohibited and Restricted Areas are promulgated by Supplements to the UK AIP or AIC but in the case of Emergency Restriction of Flying Regulations (see paragraph 5.1.4) the information will be promulgated by NOTAM.

5.1.4 **Emergency Restriction of Flying Regulations**

5.1.4.1 Emergency Controlling Authorities (ECA) are established throughout the United Kingdom to deal with major emergencies, disasters or incidents that might occur anywhere within the boundaries of the two United Kingdom Flight Information Regions. The ECA may find it necessary, for the safety of life and particularly for the protection of the emergency services engaged in air or surface activities, to restrict flights by aircraft over the area concerned.

5.1.4.2 The first action normally taken will be the establishment of a Temporary Danger Area (TDA) around the scene of the incident. It should be noted that TDAs covering emergency incidents may be established only by the 78 Squadron Swanwick Military Distress and Diversion (D&D) Controller, on telephone number 01489-612691. Any request received by ATSUs for emergency flying restrictions to be established must be re-directed to the 78 Squadron Swanwick Military D&D Controller.

If the TDA fails to achieve the objective, statutory Restriction of Flying Regulations made under Article 239 of the Air Navigation Order 2016, which make it an offence for an aircraft to be flown in the designated area without the appropriate permission, may be brought into operation through the establishment of a Restricted Area (Temporary) (RA(T)). Such restrictions will be implemented through the UK Civil Aviation Authority's Airspace Regulation section. Details of the TDA and any subsequent RA(T) will be notified as quickly as possible by NOTAM. Under certain circumstances, Restriction of Flying Regulations may be brought into operation without the prior establishment of a TDA.

5.1.4.3 The ECA, which will be identified in the relevant NOTAM, is the only authority that may grant permission for an aircraft to be flown within the designated area. Subject to any overriding considerations of safety, flights by aircraft directly associated with emergency action will invariably be given priority over those seeking to overfly the area for any other reason. Whenever possible, ATSUs in the vicinity of emergency incidents are requested to inform aircraft already airborne of the introduction of a TDA or RA(T). Details

ENR 1.1 GENERAL RULES (continued)

of RA(T)s will also be included on the NATS Aeronautical Information Service Freephone telephone number 08085-354802. Notification of the withdrawal of airspace restrictions will be published by NOTAM at the appropriate time.

5.1.4.4 Should a pilot see an emergency incident, which they believe may not have been previously notified, they should report the details to any ATSU by the quickest means possible.

5.1.4.5 To avoid any confusion between Air Traffic Controllers and Pilots, only the phrases 'Temporary Danger Area' or 'Restricted Area (Temporary)' are to be employed when describing temporary airspaces associated with the handling of emergency incidents.

5.1.5 **Danger Areas, Temporary Segregated Areas and Temporary Reserved Areas**

5.1.5.1 The publication of the policy for the Establishment and Operation of Special Use Airspace has changed some of the requirements for Danger Areas and Temporary Reserved Areas meaning some of the information in this section is no longer aligned with current policy. However, operations remain extant until reviewed and updated to align with the policy.

5.1.5.2 **Danger Area** - airspace of defined dimensions within which activities dangerous to the flight of aircraft may exist at specified times.

5.1.5.3 **Temporary Segregated Area** - a defined volume of airspace, temporarily segregated and allocated for the exclusive use of a particular user during a determined period of time and through which other traffic will not be allowed to transit.

5.1.5.4 **Temporary Reserved Area** - airspace that is temporarily reserved and allocated for the specific use of a particular user during a determined period of time and through which other traffic may or may not be allowed to transit in accordance with the air traffic management arrangements notified for that volume of airspace.

5.1.5.5 **Cross Border Area** - an Airspace Restriction or Reservation established over international borders for specific operational requirements. Cross Border Areas may come in the form of a Danger Area, Temporary Segregated Area or Temporary Reserved Area.

5.1.5.6 Danger Areas, Temporary Segregated Areas and Temporary Reserved Areas are established to provide protection for or from specific operations that are taking place within them. Certain aircraft operating within some of these areas may be unable to comply with certain elements of SERA (such as SERA.3135 Formation Flights, SERA.3201 General, SERA.3205 Proximity and SERA.3210 Right-of-Way). Pilots should not enter these areas unless they have approval to do so and are strongly advised to make use of an Air Traffic Service when operating in the vicinity.

5.1.5.7 Approved Agencies are units that are permitted to request the reservation of Special Use Airspace from an AMC and are referenced in the Remarks column of the relevant area in ENR 5.1 and ENR 5.2 as the ‘Contact: Booking’. Where the MAMC is described as the Approved Agency, the MAMC is responsible for ensuring only authorised users can reserve the Special Use Airspace. Entities not listed as an Approved Agency who wish to reserve AMC Managed Areas must seek approval from the relevant SUA Authority.

5.1.5.8 Permanent Danger Areas are tabulated at ENR 5.1. Temporary Segregated and Temporary Reserved Areas established on a permanent basis are tabulated at ENR 5.2.

5.1.6 **Danger Area Byelaws**

5.1.6.1 Unauthorised entry into many Danger Areas is prohibited within the period of activity of the Danger Area as listed at ENR 5.1 by reason of Byelaws made under the Military Lands Act 1892 and associated legislation. For those Danger Areas where Byelaws which prohibit entry apply, the Remarks column of ENR 5.1 includes the year and number of the relevant Statutory Instruments (SI). It should be noted that the geographical area of the Danger Area as presented in ENR 5.1 may not coincide with the areas defined within the associated SI. Information on the MOD SIs can be found at https://www.gov.uk/guidance/ministry-of-defence-byelaws or by contacting the MOD on 01276-412471.

5.1.6.2 ENR 5.1 contains details only of those UK Danger Areas that have an upper limit in excess of 500 FT above ground level. There are many ranges (rifle, small arms etc) with upper limits of 500 FT or less above ground level, see paragraph 5.3.1 Small Arms Ranges and details as listed at ENR 5.3. Pilots should therefore satisfy themselves that they are clear of such Small Arms Ranges when flying at or below 500 FT.

5.1.7 **Obtaining Information Regarding the Status of Special Use Airspace**

5.1.7.1 **Pre-flight information**
Pre-flight information on the status (active/not active) of SUA can be obtained from several sources such as the AIP ENR 5.1 and 5.2 and NOTAMs. Obtaining pre-flight information can help pilots plan their flight safely and efficiently. Pre-flight information is not classified as a SUA Activity Information Service, which can be used to obtain information regarding the status of SUA while in flight, as described below. The existence of an SUA Activity Information Service does not absolve pilots from the responsibility of obtaining as much information as possible on a relevant SUA as part of normal pre-flight briefing procedures.

5.1.7.2 **SUA Activity Information Service**
A SUA Activity Information Service allows pilots to obtain an airborne update of the notified status (active/not active) of a SUA. Information obtained from a SUA Activity Information Service does not imply permission to enter SUA, but it can assist a pilot in

ENR 1.1 GENERAL RULES (continued)

determining if it safe to proceed where the SUA is established but not active. It is strongly emphasized that information obtained from a SUA Activity Information Service provider is only pertinent to the notified status (active/not active) of a SUA structure and is not a permission to cross that SUA, whether or not it is active. Phraseology to obtain a SUA Activity Information Service can be found in CAP 413.

5.1.7.3 Pilots are advised to assume that a SUA is active and remain outside if no reply is received from the appropriate SUA Activity Information Service provider.

5.1.7.4 A SUA Activity Information Service is not available to aircraft operating on ATS Routes and Upper Air Routes where such Routes cross SUA. For these situations procedures exist which are specifically detailed in relevant ATC Unit instructions.

5.1.7.5 **SUA Crossing Service**
A SUA Crossing Service allows pilots, when real time SUA activity or entry requirements permit, to obtain approval to enter or cross a SUA structure when it is notified as active. It should be noted that a SUA Crossing Service may be provided without reference to surveillance derived information. As such, the crossing/entry approval is only in relation to SUA activity and does not imply any coordination or aim to achieve separation minima. Separation minima and the provision of traffic information in relation to other traffic, either inside or operating close to the SUA, shall be in accordance with the classification of airspace and the specific ATS agreed between the pilot and ATC unit.

5.1.7.6 To obtain a SUA Crossing Service pilots should call the appropriate SUA Crossing Service provider on the relevant frequency. Where possible, the pilot should provide the ID or name of the SUA they wish to enter and an estimated entry time and level/ altitude. An entry approval will be dependent on the real time status of the activity within the active SUA and may include limitations, such as times or altitude, to ensure the aircraft remains outside of the SUA activity. Phraseology to obtain an SUA Activity Information Service can be found in CAP 413.

5.1.7.7 Details of SUA Activity Information Service and SUA Crossing Service providers, including frequencies, are included in the Remarks column of ENR 5.1 and ENR 5.2, as well as on the legend to chart ENR 6-75 (United Kingdom Airspace Restrictions and Hazardous Areas). The contact frequencies are printed on the legend of the 1:500,000 UK ICAO Aeronautical Charts.

5.1.8 **Pilotless Target Aircraft/Unmanned Aerial Targets**

5.1.8.1 Pilotless Target Aircraft/Unmanned Aerial Targets are operated and manoeuvred within certain SUA as indicated in the list at ENR 5.1.

5.1.8.2 Pilotless Target Aircraft/Unmanned Aerial Targets may be painted in a variety of colours including orange, black, or red and yellow and may be flown day and night in all weather conditions. Navigation lights are not always displayed and the aircraft occasionally trail smoke as a method for visual acquisition. They often trail flares and other decoys and may or may not be equipped with transponders depending upon type and mission profile. The size and speed of these aircraft/targets vary considerably ranging from 20 KG to hundreds of KG and speeds between 50 and 650 KT.

5.1.8.3 Within the EGD201 Aberporth Danger Areas, Pilotless Target Aircraft/Unmanned Aerial Targets are operated under the control of MoD Aberporth and the aircraft are flown in accordance with the instructions of ground based intercept controllers. Similar arrangements are in place at EGD701 Hebrides Danger Areas under the control of MoD Hebrides. Pilotless Target Aircraft/ Unmanned Aerial Targets are also flown within EGD115 Manorbier.

5.1.9 **Temporary Reserved Areas (TRA) established FL 195 - FL 245**

5.1.9.1 **Introduction**
The air traffic management arrangements vary for each TRA. The information contained in the following paragraphs (5.1.9.1 – 5.1.9.8) relate to TRAs 001 – 008.

5.1.9.1.1 In complying with the EC Regulation lowering Class C Airspace to FL 195, TRA between FL 195 and FL 245 have been established to accommodate various VFR airspace users, including military autonomous operational requirements, above FL 195. These TRAs may be used simultaneously by both civil and military aircraft, including aircraft in transit through the TRA. Operations will be conducted in accordance with the Rules of the Air and relevant requirements for equipment carriage and operation, or as agreed via the Unusual Aerial Activities regulations. Although the background classification between FL 195 and FL 245 within UK airspace is Class C, to avoid operational restrictions military aircraft may operate autonomously or be in receipt of an ATS from an approved unit.

5.1.9.1.2 Where other airspace structures, such as Controlled Airspace (ATS Routes), Danger Areas, etc, overlap a TRA the airspace structure with the more restrictive criteria is to take precedence.

5.1.9.1.3 The requirement for VFR operations by civil aircraft above FL 195 has been assessed to be very small. Therefore, other than the schematic charts included at ENR 6-13, details of these TRAs will not be included in the CAA 1:500,000 chart series, but are represented on the military En-Route Low Altitude chart series, available from RAF AIDU, Customer Services Department, Tel: 020-8833 8587 or 020-8833 8209.

5.1.9.2 **ATS Routes**

5.1.9.2.1 Some ATS Routes exist within the lateral limits of TRAs 001, 002, 007 and 008 and are available during certain weekday periods

and throughout weekends and PHs. Airspace users are to ensure they remain clear of these ATS routes unless they are in receipt of an appropriate Radar Control service. Details of such ATS routes are detailed in ENR 3.3.

5.1.9.3 **Air Traffic Services and Separation Requirements**

5.1.9.3.1 Class C requirements for the provision of ATS do not apply within these TRAs. ATS will be provided in accordance with UK Flight Information Services (UK FIS) by the appropriate military or civil Air Traffic Service Providers. Autonomous operations are permitted in TRAs in accordance with paragraph 5.1.9.7.

5.1.9.3.2 Airspace users are to note that the lateral limits of TRAs are coincident with adjacent Lower ATS routes. Aircraft operating within a TRA receiving a UK FIS will be advised of the proximity of aircraft operating within adjacent Class C Airspace and offered appropriate advice.

5.1.9.3.3 ATS above FL 195 will be provided by existing ACCs/ATCCs, approved military ATS and ASACS units and autonomous radar units in accordance with established operating limitations. Specified military ATS units may be authorised by the CAA to provide ATS within an active TRA to below FL 245 in accordance with the approval conditions. Unless approved by the CAA, provision of ATS by ATC Approach Units/Military ATC Terminal Units will be restricted to below FL 195.

5.1.9.4 **Operational Procedures**

5.1.9.4.1 Operations should normally be conducted on SPS (1013.2 mb).

5.1.9.4.2 IFR flights within a TRA should conform to the semicircular cruising levels at ENR 1.7 paragraph 6.1 within an active TRA.

5.1.9.4.3 Aircraft in receipt of a radar service may operate to the extremities of the TRAs and will be provided with advice from the controller that is appropriate to the service being received in order to remain clear of aircraft operating in adjacent Controlled Airspace.

5.1.9.4.4 Details for autonomous operations are included in the access requirements at paragraph 5.1.9.7.

5.1.9.4.5 Military airspace users and ANSPs should note that transponder equipped Gliders are permitted to enter TRA under appropriate ATS. However, gliders without transponders are only permitted to enter TRA (G) that have been specifically designed to cater for non-transponder equipped gliders. Airspace users and ANSPs should note that due to a CAA Safety Regulatory Requirement, no IFR traffic is permitted to enter a TRA (G) (except aircraft in emergency or Air Defence Priority Flights).

5.1.9.4.6 Glider access requirements to a TRA are detailed in ENR 1.1, paragraph 1.11.

5.1.9.4.7 Derogations from airborne carriage obligations of 8.33 KHz in Controlled Airspace above FL195 may be approved. Specific exemptions and arrangements for military aircraft operations in 8.33 KHz airspace are detailed separately in the Military AIP and ENR 1.8.

5.1.9.5 **VFR Weather Minima**

5.1.9.5.1 Unless pilots' licensing privileges impose more restrictive criteria, pilots are to maintain 1500 M horizontally, and 1000 FT vertically from cloud, and a flight visibility of 8 KM.

5.1.9.6 **Access Requirements**

5.1.9.6.1 **IFR**

a) A flight plan must be filed. Abbreviated flight plans are permissible in accordance with AIP ENR 1.10 and CAP 493, MATS Pt 1, Section 1, Chapter 2, Paragraph 10. Abbreviated Flight Plans will only be acceptable for military aircraft operating under the control of a military ATS or ASACS unit.
b) An ATC clearance must be obtained to fly within the airspace.
c) Radio contact must be maintained on the appropriate frequency.
d) The flight must be conducted in accordance with ATC instructions.
e) Aircraft in IFR transit through a TRA from/to adjacent CAS will be in receipt of an ATC service and will not require to obtain an additional ATC clearance to transit the TRA.
f) Traffic operating under the IFR shall not be cleared to transit through an activated TRA (G) (except aircraft in emergency or Air Defence Priority Flights). Aircraft in receipt of a Traffic Service or Deconfliction Service will be offered a re-route in these circumstances.

5.1.9.6.2 **VFR**

a) File a flight plan (when specified an abbreviated flight plan will be acceptable).

Note: *Not applicable to gliders operating within TRA (G) under LoA conditions.*

b) Obtain an ATC clearance to enter the TRA.
c) Select SSR Code A/C as directed by ATC.
d) Monitor ATC frequency.

ENR 1.1 GENERAL RULES (continued)

5.1.9.7 **Military Autonomous Operations**

5.1.9.7.1 Autonomous operations are to be conducted under VFR and pilots are responsible for the avoidance of collision in accordance with SERA and the Rules of the Air Regulations 2015.

5.1.9.7.2 Pilots are to select SSR code 7006 with Mode C prior to entering a TRA. This code is to be retained when vertical profiles result in operations above and below FL 195 until such time as flight within the TRA is complete.

5.1.9.7.3 Pilots should aim to operate no closer than 3 NM to the lateral boundary or within 500 FT of the vertical limit of the TRA.

5.1.9.7.4 Military aircraft do not require a clearance to operate autonomously within an active TRA. Autonomous operations are not permitted when BVLOS UAS activity is notified within an active TRA. The Mil AIP ENR 5.1 provides detail of the activity notification process.

5.1.9.8 **Booking Procedures Outside Promulgated Hours of Activity**

5.1.9.8.1 For booking the TRAs outside published operating hours, military pilots are to submit requirements by fax or e-mail to the MAMC - Managed Airspace by 1100 (1000), D-1. Bookings for Mondays (or the first working day after a stand-down period) should be submitted by 1100 (1000) on the Friday before (or the last working day prior to a stand-down period). Note TRA 005 has no published hours and is activated only by NOTAM and therefore this process should be followed for all required bookings. This requirement is in accordance with the MoDs commitment to FUA.

5.1.9.8.2 Bookings are non-exclusive, and there is no limit on the number of bookings accepted for each TRA.

5.1.9.8.3 Late notice bookings may be accepted on D-Day, provided that another user has already booked the TRA at D-1.

5.1.9.8.4 Outside the promulgated hours of the MAMC - Managed Airspace the Duty Air Traffic Control Officer at nominated military area units will have responsibility for airspace management of the TRA. Full details are in the Military AIP, ENR 5.

5.2 Hazards to Flight

5.2.1 **Military Training Area (MTA)** - An area of Upper Airspace of defined dimensions within which intense military flying training takes place.

5.2.1.1 In the Upper Airspace, intense military flying training normally takes place in delineated Military Training Areas. Because of the random nature of the activity within these areas it is not possible to provide civil air traffic control service in an MTA during the published hours of activity. Details are at ENR 5.2 and further information is contained at ENR 1.1, paragraph 1.6.3.5.

5.2.2 **Area of Intense Air Activity (AIAA)** - Airspace within which the intensity of civil and/or military flying is exceptionally high or where aircraft, either singly or in combination with others, regularly participate in unusual manoeuvres.

5.2.2.1 Intense civil and/or military air activity takes place within the areas listed in ENR 5.2. Pilots of non-participating aircraft who are unable to avoid AIAAs are to keep a good lookout and are strongly advised to make use of a radar service if available; these areas are depicted at ENR 6-76.

5.2.3 **Aerial Tactics Area (ATA)** - Airspace of defined dimensions designated for air combat training within which high energy manoeuvres are regularly practiced by aircraft formations. Autonomous operations are only permitted within ATAs above FL 195 when the overlying TRA is active.

5.2.3.1 Air combat training by military aircraft practicing high energy manoeuvres regularly takes place in the areas listed in ENR 5.2. Pilots unable to avoid these areas are strongly advised to make use of a radar service; these areas are depicted at ENR 6-76.

5.2.4 **Air-to-Air Refuelling Area (AARA)** - Airspace of defined dimensions within which air-to-air-refuelling takes place under radar service.

5.2.4.1 Areas in which air-to-air refuelling under radar service takes place are listed in ENR 5.2. Refuelling aircraft will not necessarily conform with the semicircular cruising levels at ENR 1.7 paragraph 6.1 and are unable to take rapid avoiding action.

5.2.5 **Boscombe Down Advisory Radio Area** (As depicted at ENR 6-76)

5.2.5.1 Test flight aircraft are routinely flown from MoD Boscombe Down in the Advisory Radio Area as shown at ENR 5.2. A test profile involves manoeuvres that are required to take place overland but which may place the aircraft at the limits of its flight envelope. Consequently, whilst the test pilot remains responsible for the safe conduct of the flight, there could be occasions when the pilot would be unable to manoeuvre the aircraft in compliance with SERA and the Rules of the Air Regulations 2015.

5.2.5.2 Pilots of other aircraft flying in the area are strongly advised to call Boscombe Down (ENR 5.2), who will provide pilots with information on any relevant test flight activity and, if requested, advice on arranging a detour of the test area.

5.2.5.3 Participation in the Advisory Radio Area, which is highly recommended, is designed to enhance flight safety. It does not afford any

form of increased separation or right of way for the test flights and is not intended to inhibit the passage of other aircraft in the area.

5.2.6 **Warton Advisory Radio Area** (As depicted at ENR 6-76)

5.2.6.1 Test flight aircraft are routinely flown from BAe Warton in the Advisory Radio Area as shown at ENR 5.2. A test profile involves manoeuvres that are required to take place overland, or sea, but which may place the aircraft at the limits of its flight envelope. Consequently, whilst the test pilot remains responsible for the safe conduct of the flight, there could be occasions when the pilot would be unable to manoeuvre the aircraft in compliance with SERA and the Rules of the Air Regulations 2015.

5.2.6.2 Pilots of other aircraft flying in the area are strongly advised to call Warton (ENR 5.2), who will provide pilots with information on any relevant test flight activity and, if requested, advice on arranging a detour of the test area or provision of an air traffic service subject to controller workload.

5.2.6.3 Participation in the Advisory Radio Area, which is highly recommended, is designed to enhance flight safety. It does not afford any form of increased separation or right of way for the test flights and is not intended to inhibit the passage of other aircraft in the area.

5.2.7 **UK Military Low Flying System**

5.2.7.1 Military low flying occurs in most parts of the United Kingdom at any height up to 2000 FT above the surface. However, the greatest concentration is between 250 FT and 500 FT and civil pilots are advised to avoid flying in that height band whenever possible. See also ENR 1.10, subsection 7 Military Low Flying Training in the UK.

5.2.7.2 Military aircraft are considered to be low flying when:

a) Fixed-wing aircraft, except light propeller-driven aircraft, are flying below 2000 FT above the surface;
b) Light propeller-driven aircraft and helicopters are flying below 500 FT above the surface.

5.2.7.3 **Military helicopter operations in the Salisbury Plain Area**

5.2.7.3.1 A considerable number of helicopters operate to and from the military establishments in, and around, the Salisbury Plain Area.

5.2.7.3.2 In addition to the intensive daytime activities, military helicopters may be encountered operating during the hours of darkness without, or with restricted, navigation lights within the area enclosed by the following co-ordinates:

513000N 0014200W - 513600N 0011336W thence anti-clockwise by an arc of a circle radius 5 NM centred on 513654N 0010543W - 513324N 0010000W - 513000N 0010000W - 513000N 0010600W - 512400N 0010600W - 511821N 0010036W thence clockwise by an arc of a circle radius 5 NM centred on 511403N 0005634W - 511114N 0005000W - 505336N 0005000W - 505654N 0011305W - 510115N 0011039W thence anti-clockwise by an arc of a circle radius 8 NM centred on 505701N 0012124W (EGHI ATZ) - 510459N 0012017W - 510123N 0012722W - 505512N 0013047W - 505003N 0020205W - 505027N 0020549W - 505718N 0021200W - 511109N 0021749W - 512036N 0020922W - 512224N 0020257W - 512909N 0014402W - 513000N 0014200W.

5.2.7.4 Geographical details of military low flying activities within the United Kingdom are shown on the chart ENR 6-76, copies of which may be obtained from:

NATS AIS Supervisor

Phone: 01489-887462
Email: aissupervisor@nats.co.uk

5.3 Activities of a Dangerous Nature

5.3.1 **Small Arms Ranges**

5.3.1.1 Small arms ranges in the UK with a vertical hazard height of 500 FT AGL do not attract UK Danger Area status. However, firing at some ranges can take place across open areas of ground over which an aircraft might legally be flown below 500 FT AGL.

5.3.1.2 Listed at ENR 5.3 are the details of the small arms ranges notified to the Authority which might pose a hazard to flight below 500 FT AGL. The small arms ranges may be in use at any time and pilots are strongly advised to avoid these areas. The list includes small arms ranges, located within the lateral boundaries of UK Danger Areas, which may be in use outside the activity hours of those Danger Areas.

5.3.2 **High Intensity Radio Transmission Area (HIRTA)** - Airspace of defined dimensions within which there is radio energy of an intensity which may cause interference with and on rare occasions damage to communications and navigation equipment.

5.3.2.1 Areas within which there is radio energy of an intensity which could cause interference with and on rare occasions, cause damage to, communications and navigation equipment such as Radio Altimeter, VOR, ILS and Doppler are listed at ENR 5.3. The intensity may be sufficient to detonate electrically initiated explosive devices carried or fitted in aircraft.

5.3.2.2 Only the most significant sources are listed and in some of these areas the intensity of the radio energy may be such that it would

be injurious to remain for more than one minute in the immediate vicinity of the energy source. This is especially relevant to helicopter operations and the list contains appropriate warnings; however it would be prudent for helicopter pilots to avoid lingering closer than 100 M to any radar aerial. Pilots approaching oil production platforms on which dish aerials can be observed should, wherever possible, approach from a direction out of the general line-of-shoot of such aerials.

5.3.2.3 Airborne Early Warning (AEW) aircraft operate within United Kingdom airspace. Due to possible radiation hazards all aircraft should maintain a minimum separation of 1000 M lateral and 1000 FT vertical from AEW aircraft. AEW aircraft operate in pre-designated areas; these areas are non-segregated. ATC will issue direction to ensure minimum separation distances are maintained between civilian aircraft and AEW aircraft. UK Orbit Areas and Operating Areas are listed at ENR 5.3.

5.3.3 **Gas Venting Operations**

5.3.3.1 Severe turbulence and power fluctuations in turbine engines could be experienced over gas venting sites during venting of natural (methane) gas under high pressure. Locations of gas venting sites are listed at ENR 5.3.

5.3.4 **Laser Sites**

5.3.4.1 Laser sites, as listed at ENR 5.3, are locations where laser sources are located permanently and which have been notified to the Airspace Regulation (Utilisation) (AR(U)). Only those sites which radiate sufficient power to cause distraction or eye damage, and which intentionally emit laser beams into airspace or are likely to in the event of a malfunction, are included.

5.3.5 **Radiosonde Balloon Ascents**

5.3.5.1 The Met Office releases helium or hydrogen filled balloons from a number of locations throughout the United Kingdom which are listed at ENR 5.3. These balloons carry a small radio transmitter which sends back atmospheric information about temperature, pressure and humidity; by way of a tracking system the balloons also provide data on wind speed and direction at various levels. A typical installation consists of a balloon, diameter at launch approximately 1.5 metres, to which is attached a small parachute. The radiosonde is attached underneath the parachute on a suspension string of approximately 33 metres in length. The distance the balloons travel away from the launch site is dependant on the wind strength, but they can attain altitudes of over 80000 FT.

5.3.5.2 Balloon launches from all other sites by organisations and members of the public require written permission from the CAA in accordance with the UK Air Navigation Order before releasing meteorological balloons into notified airspace. The ANO specifies the requirements for notification and permission for the launch of balloons; such permission may be conditional. Organisations and members of the public wishing to obtain permission for the above activity shall submit an application via the CAA Customer Portal - ACOMS: https://portal.caa.co.uk at least 28 days in advance, to allow AR(U) to take appropriate notification action.

5.3.5.3 Radiosondes, minus the balloon, may also be air dropped; this activity will be promulgated by NOTAM.

5.4 Air Navigation Obstacles

5.4.1 **List of Air Navigation Obstacles**

5.4.1.1 The majority of air navigation obstacles listed in ENR 5.4 are solely identified by a combined Area Code and Reference Number e.g. UK0105A052F. These obstacles do not meet the accuracy requirements of original field work as specified in ICAO Annexes 11 and 14. Those obstacles identified additionally with an aerodrome ICAO identification code followed by the survey reference number are derived from aerodrome surveys and do meet the accuracy requirements of the original field work. The current Data Management Process does not provide assurance of the integrity of air navigation obstacles listed in ENR 5.4.

5.4.1.2 Air Navigation Obstacles listed in ENR 5.4 with an elevation but no height indicated are Off-Shore obstacles.

5.4.1.3 The Civil Aviation Authority (CAA) does not guarantee that the list of Air Navigation Obstacles in ENR 5.4 is complete.

5.4.2 **Aerodrome Obstacles**

5.4.2.1 An aerodrome obstacle is one that is located on an area intended for the surface movement of aircraft or that extends above a defined surface intended to protect aircraft in flight. Obstacle limitation surfaces can extend to distances greater than 15 KM from the runway thresholds. Details of aerodrome obstacles selected as significant are listed in the AD Section and are shown on Aerodrome and Instrument Approach Charts where these have been published. Obstacle data is provided to AIS in accordance with CAP 232 'Aerodrome Survey Information' or CAP 1732 'Aerodrome Survey Guidance'. By December 2023 all certificated aerodromes and aerodromes with Instrument Flight Procedures should be fully compliant with CAP 1732. The method of lighting aerodrome obstacles is detailed in CAP 168 'Licensing of Aerodromes' and is briefly described in CAP 637 'Visual Aids Handbook'.

5.4.3 **Land Based Air Navigation Obstacles**

5.4.3.1 Article 225A of the Air Navigation Order 2016 mandates the requirement for the CAA to be notified of any existing or proposed en-route obstacles (permanent or temporary) which (or will) attain or exceed a height of 100 M (328 FT) AGL. Proposed changes to any existing en-route obstacles which (or will) attain or exceed a height of 100 M (328 FT) AGL must also be notified. This requirement is applicable to any building or work, including waste heaps, which attains or exceeds the above-stated height. Details of those obstacles of which the CAA has been notified are listed in ENR 5.4. In cases where a number of structures form the

obstacle, the position of the highest is given. In the case of masts, the position of the centre of the mast is given (but it should be noted that the stays or guys may spread out for a considerable distance). Article 222 of the Air Navigation Order 2016 imposes mandatory lighting requirements on en-route obstacles that are 150 M (492 FT) AGL or more in height. For en-route obstacles that are less than 150 M (492 FT) AGL in height, the CAA recommends that such structures should be lit if, by virtue of their nature or location, they are considered to present a significant hazard to air navigation.

5.4.3.2 The process for notifying en-route obstacles to the CAA is detailed in AIC P 067/2021 dated 29 July 2021. Guidance is also available on the CAA website: https://www.caa.co.uk/Commercial-industry/Airspace/Event-and-obstacle-notification/Obstacle-notification/Obstacle-notification/

5.4.3.3 Details of un-serviceability and return to service of lights on such obstacles, when notified to UK AIS, will be promulgated by NOTAM. Land based air navigation obstacles with a height of less than 150 M are sometimes lit, but details of un-serviceability of lights on these obstacles are not normally promulgated. Obstacles listed in ENR 5.4 annotated 'FLR' in Column 2 are those that burn off high pressure gas; the flame, which may not be visible in bright sunlight, can extend for 600 FT.

5.4.3.4 Details of all land based air navigation obstacles known at the date of the chart's preparation are shown on certain Aeronautical Charts published by NATS Ltd on behalf of the CAA. These charts indicate whether or not the obstacle is normally lighted. Pilots should be aware that obstacle lighting is not necessarily located at the structure's highest point.

5.4.4 **Off-shore Air Navigation Obstacles**

5.4.4.1 Numerous fixed installations related to off-shore exploration of oil/gas from the Continental Shelf sea bed and a significant number of wind turbine generators and associated meteorological masts exist within the Scottish and London FIRs and the UK Exclusive Economic Zone (EEZ). A part of the UK EEZ lies within the Polaris FIR and parts of some other States' EEZs lie within the Scottish and London FIRs.

5.4.4.2 Oil and gas exploration installations vary in elevation and typically display navigation warning lights. Most of the installations are equipped with a helideck, which comes within the definition of an aerodrome. Many installations burn off high pressure gas and the flame, which may not be visible in bright sunlight, can extend for 600 FT. Pilots should be aware that even if no flame is visible there is still danger from the venting of high pressure gas. Pilots should also be aware of high intensity radio transmissions from some installations (see paragraph 5.3.2).

5.4.4.3 Wind turbines typically display a navigation warning light on the top of the supporting structure. Pilots should be aware that the rotor blades of some wind turbines rotate in excess of 200 FT above the nacelle mounted light. Where wind turbines are located together as a group, only those on the periphery are fitted with obstacle lighting.

5.4.4.4 Article 225A of the Air Navigation Order 2016 mandates the requirement for the CAA to be notified of any existing or proposed off-shore obstacle (permanent or temporary) in UK territorial waters which attains or exceeds an elevation of 100 M (328 FT) AMSL. Proposed changes to any existing off-shore obstacles in UK territorial waters which (or will) attain or exceed an elevation of 100 M (328 FT) AMSL must also be notified. Persons in charge of existing or proposed off-shore obstacles outside UK territorial waters, but within the Scottish and London FIRs and the UK EEZ within the Polaris FIR are also advised to notify the CAA in accordance with Article 225A. See paragraph 5.4.3.2 for more details of the notification process. Details of those obstacles of which the CAA has been notified which attain or exceed an elevation of 100 M (328 FT) AMSL within the Scottish and London FIRs and UK EEZ within the Polaris FIR are listed in ENR 5.4.

5.5 Aerial Sporting and Recreational Activities

5.5.1 **Glider Launching Sites**

5.5.1.1 Glider launching may take place from designated sites which are regarded as aerodromes. The sites are listed at ENR 5.5. Where launching takes place within the Aerodrome Traffic Zone of an aerodrome listed within the AD section, details are also shown at AD 2 and AD 3.

5.5.1.2 Gliders may be launched by towing (T) aircraft, or by winch (W) and cable or ground tow up to a height of 2000 FT AGL. At a few sites the height of 2000 FT may be exceeded (see paragraph 5.5.3).

5.5.1.3 Sites are listed primarily to identify hazards to other airspace users and listing does not imply any right for a glider or powered aircraft to use the sites.

5.5.2 **Hang Gliding, Paragliding and Parascending Sites**

5.5.2.1 Hang Gliding and/or parascending may take place from sites which, because of the low speed characteristics of hang gliders, paragliders and parascenders and the difficulty of seeing them in certain conditions, are listed as hazards to other airspace users.

5.5.2.2 The locations of cable-launched hang/paragliding sites are listed at ENR 5.5. Foot launched activity sites are severely affected by wind speed and direction existing at the time. Although activity is usually at a peak during weekends, hang-gliding and/or parascending may take place at any time, particularly in the summer months. Airspace users should be aware that single or groups of soaring and motorised hang/para-gliders can be found flying anywhere in Class G airspace up to 15,000 FT, and are therefore

ENR 1.1 GENERAL RULES (continued)

not listed.

5.5.2.3 At certain sites hang gliders and/or parascenders may be launched by winch/auto-tow and cables may be carried up to 2000 FT AGL. At a few sites the height of 2000 FT may be exceeded (see paragraph 5.5.3). The cable launching of the aircraft may be encountered within the airspace contained in a circle radius 1.5 NM of the notified position of the site.

5.5.3 **Cable Launching of Gliders, Hang Gliders and Parascending Parachutes**

5.5.3.1 The launching of gliders, hang gliders and parascending parachutes by winch and cable or by ground tow to above 200 FT (60 M) AGL requires permission in writing under the UK Air Navigation Order from the Civil Aviation Authority.

5.5.3.2 At sites where cable launching is permitted, cables may be carried up to heights of 2000 FT AGL. At a few sites the heights of 2000 FT may be exceeded. It is a condition of the permission that when cable launching is taking place, a white ground conspicuity signal as described in SERA Appendix 1 Signals paragraph 3.2.8.1 shall be displayed.

5.5.3.3 Sites which have permission to cable launch above 200 FT AGL are listed at ENR 5.5.

5.5.4 **Free-fall Parachuting Drop Zones**

5.5.4.1 Intensive free-fall parachuting may be conducted up to FL 150 at any of the Drop Zones listed at ENR 5.5 and in several Danger Areas. Listing of a Drop Zone does not imply any right to a parachutist to use that Drop Zone. Some Government and licensed aerodromes where regular parachuting takes place are included in the list but parachuting may also take place during daylight hours at any Government or licensed aerodrome. Drop Zone activity information may be available from certain Air Traffic Service Units (ATSUs) but pilots are advised to assume a Drop Zone is active if no information can be obtained.

5.5.4.2 Parachuting also takes place at temporary sites, e.g. for display purposes, and will normally be notified by NOTAM as Temporary Navigation Warnings. Night parachuting may take place at any Drop Zone: Club Chief Instructors will notify in writing all forthcoming night parachuting, at least five working days in advance to Airspace Regulation (Utilisation) (AR(U)), Airspace Regulation, Aviation House, Gatwick, RH6 0YR, to allow AR(U) to take appropriate notification action.

5.5.4.3 Visual sighting of free-falling bodies is virtually impossible and the presence of an aircraft within the Drop Zone may be similarly difficult to detect from the parachutists' point of view. Parachute dropping aircraft and, on occasions, parachutists may be encountered outside the notified portion of airspace. Pilots are strongly advised to give a wide berth to all such Drop Zones where parachuting may be taking place.

5.5.4.4 Where permission is obtained for drops within Controlled Airspace, dropping aircraft are to have serviceable SSR with Mode C.

5.5.5 **Microlight Flying sites**

5.5.5.1 Those Microlight Flying Sites where flying is known to take place are listed at ENR 5.5 and are regarded as aerodromes. Sites are listed primarily as hazards to other airspace users and the listing does not imply any right for aircraft to use the sites. Microlight aircraft might be encountered at sites not included in the listing (See also AD Section).

5.5.6 **Captive and Free Flight Manned Balloon Launch Sites**

5.5.6.1 Frequent launchings by free flight and captive passenger carrying balloons take place at sites identified in ENR 5.5.

5.5.7 **Kites**

5.5.7.1 High flying kites may be hazardous to aircraft because of the possibility of collision with the towline. Kite flying sites are identified in ENR 5.5.

5.5.8 **Training and Unusual Activity Aerodromes**

5.5.8.1 Training Aerodromes - Designated Training Aerodromes are listed in ENR 5.5 and are regarded as an aerodrome. Flight Training including circuit practice is known to take place from these sites, the list and chart symbol are published to identify the hazards to other airspace users and the listing does not imply any right for an aircraft to use these aerodromes. Where training takes place at a licensed aerodrome and within the defined Aerodrome Traffic Zone, the aerodrome will be listed within the AD section.

5.5.8.2 Unusual Activity Aerodromes - Designated Unusual Activity aerodromes are listed in ENR 5.5 and are regarded as an aerodrome. Activities such as aerobatic, formation flights and other aerial activities are known to take place from these sites, the list and chart symbol are published to identify the hazards to other airspace users and the listing does not imply any right for an aircraft to use these aerodromes. Where flights takes place at a licensed aerodrome and within the defined Aerodrome Traffic Zone, the

ENR 1.1 GENERAL RULES (continued)

aerodrome will be listed within the AD section.

6 Other Temporary Hazards

6.1 Hazards of a temporary nature will be notified, whenever time permits, by NOTAM as Temporary Navigation Warnings.

6.2 Activity of a hazardous nature may occur without notification within the Aerodrome Traffic Zones of active aerodromes not normally available to civil aircraft (see ENR 2.2).

ENR 1.2 VISUAL FLIGHT RULES

1 VFR Flight

1.1 VFR flights shall be conducted so that the aircraft is flown in conditions of visibility and distance from clouds equal to or greater than those specified in Table 1.

Table 1

Altitude Band	Airspace Class	Flight Visibility	Distance from Cloud
At and above FL 100	A B C D E F G (See Note 1)	8 KM	1500 M horizontally 300 M (1000 FT) vertically
Below FL 100 and above 900 M (3000 FT) AMSL, or above 300 M (1000 FT) above terrain, whichever is the higher.	A B C D E F G (See Note 1)	5 KM	1500 M horizontally 300 M (1000 FT) vertically
At and below 900 M (3000 FT) AMSL, or 300 M (1000 FT) above terrain, whichever is the higher	A B C D E (See Notes 1 & 2)	5 KM	1500 M horizontally 300 M (1000 FT) vertically
	F G (See Note 3)	5 KM	Clear of cloud and with the surface in sight

Note 1: *The VMC minima in Class A Airspace are included for guidance to pilots and do not imply acceptance of VFR flights in Class A Airspace.*

Note 2: *Alternatively, an aircraft in Class D airspace shall also be deemed to have complied with Table 1 if it is flown:*

a) During day only;
b) At and below 900 M (3000 FT) AMSL, or 300 M (1000 FT) above terrain, whichever is the higher;
c) At an indicated airspeed of 140 KT or less to give adequate opportunity to observe other traffic or any obstacles in time to avoid collision;
d) Remaining clear of cloud and with the surface in sight; and

i. For aircraft other than helicopters, a flight visibility of at least 5 KM;
ii. For helicopters, a flight visibility of at least 1500 M.

Note 3: *Alternatively, an aircraft in Class F or G airspace shall also be deemed to have complied with Table 1 if it is flown:*

a) During day only;
b) At and below 900 M (3000 FT) AMSL, or 300 M (1000 FT) above terrain, whichever is the higher;
c) At an indicated airspeed of 140 KT or less to give adequate opportunity to observe other traffic or any obstacles in time to avoid collision;
d) Remaining clear of cloud and with the surface in sight; and
e) With a flight visibility of at least 1500 M.

1.2 For the purposes of an aeroplane taking off from or approaching to land at an aerodrome within Class B, C or D Airspace, the visibility, if any, communicated to the commander of an aeroplane by the appropriate air traffic control unit shall be taken to be the flight visibility for the time being.

1.3 The minimum heights at which aircraft may be flown are detailed at SERA.3105 Minimum Heights. For the purposes of SERA.3105, SERA.5005(c)(5) Visual Flight Rules at night, SERA.5005(f) Visual Flight Rules by day and SERA.5015(b) Instrument Flight Rules (IFR) — Rules Applicable to all IFR Flights, exceptions to the minimum height requirements are permitted for specific operations. See CAA Official Record Series 4 (www.caa.co.uk/ors4) for the current ORS4 'Standardised European Rules of the Air - Exceptions to the Minimum Height Requirements).

1.4 Except where otherwise indicated in air traffic control clearances or specified by the appropriate ATS authority, it is not mandatory in the United Kingdom for VFR flights in level cruising flight when operated above 3000 FT (900 M) from the ground or water, or a higher datum as specified by the appropriate ATS authority, to adopt any particular cruising level system. Such flights are advised to adopt the table of cruising levels for IFR flights as given at ENR 1.7, paragraph 6.1.

1.5 VFR flights shall comply with the provisions of ICAO Annex 2, paragraph 3.6, when operating in Class B, C and D Airspace. Flight Planning requirements and Air Traffic Control Clearances are detailed at SERA.4001-SERA.4020, SERA.5005-SERA.5025, SERA.6001, SERA.8015 and SERA.8020.

Note: *A Special VFR clearance may be requested without the submission of a filed flight plan. Brief details of the proposed flight should be passed to the appropriate Air Traffic Control Unit.*

1.6 ICAO Annex 2 and SERA precludes authorisation for VFR flights to operate above FL 290 where a vertical separation minimum of 300 M (1000 FT) is applied above FL 290. Therefore, for aircraft operating as General Air Traffic (GAT), VFR flights shall not be authorised within the London and Scottish UIRs above FL 290, as described in ENR 2.1.

1.7 For the purposes of SERA.5005(c) Visual Flight Rules, VFR flight is permitted at night in accordance with the following criteria:

a) if leaving the vicinity of an aerodrome, a flight plan shall be submitted;
b) flights shall establish and maintain two-way radio communication on the appropriate ATS communication channel, when available;
c) The VMC visibility and distance from cloud minima as specified in Table 1 shall apply except that:

i. the ceiling shall not be less than 1500 FT;

ii. in airspace classes B, C, D, E, F and G, at and below 3000 FT AMSL or 1000 FT above terrain, whichever is the higher, the pilot shall maintain continuous sight of the surface.

d) In accordance with SERA.5005 (c)(5), VFR flights in the United Kingdom at night may be flown below a level which is at least 1000 FT above the highest obstacle located within 8 KM of the estimated position of the aircraft subject to the conditions at paragraph (e).
e) The conditions specified in paragraph (d) are that the aircraft is flown:

i. at a height not less than 1000 FT above the highest obstacle within a radius of 600 M from the aircraft when over the congested areas of cities, towns or settlements or over an open-air assembly of persons; and
ii. elsewhere than as specified in sub-paragraph (i), at a height of more than 500 FT above the ground or water, or 500 FT above the highest obstacle within a radius of 150 M from the aircraft.

2 Special VFR Flight

2.1 Clearance for Special VFR flight in the UK is an authorization by ATC for a pilot to fly within a Control Zone although he is unable to comply with IFR. In exceptional circumstances, requests for Special VFR flight may be granted for aircraft with an all-up-weight exceeding 5700 KG and capable of flight under IFR. Special VFR clearance is only granted when traffic conditions permit it to take place without hindrance to the normal IFR flights. For meteorological limitations relating to the issuance of SVFR clearances, see SERA 5010.

2.2 When operating on a Special VFR clearance, the pilot must comply with ATC instructions and remain at all times in flight conditions which enable him to determine his flight path and to keep clear of obstacles. Therefore, it is implicit in all Special VFR clearances that the aircraft remains clear of cloud and in sight of the surface. It may be necessary for ATC purposes to impose a height limitation on a Special VFR clearance which will require the pilot to fly either at or not above a specific level.

2.3 A full flight plan, Form CA48/RAF2919, is not required for Special VFR flight but ATC must be given brief details of the call sign, aircraft type and pilots intentions. These details may be passed either by RTF or, at busy aerodromes, through the Flight Clearance Office. A full flight plan must be filed if the pilot wishes the destination aerodrome to be notified of the flight.

2.4 Requests for Special VFR clearance to enter a Control Zone, or to transit a Control Zone, may be made to the ATC authority whilst airborne. Aircraft departing from aerodromes adjacent to a Control Zone boundary and wishing to enter may obtain Special VFR clearance either prior to take-off by telephone or by RTF when airborne. In any case, all such requests must specify the ETA for the selected entry point and must be made 5-10 minutes beforehand.

2.5 ATC will provide standard separation between all Special VFR flights and between such flights and other aircraft under IFR.

2.6 A Special VFR clearance within a Control Zone does not absolve the pilot from the responsibility for avoiding an Aerodrome Traffic Zone unless prior permission to penetrate the ATZ has been obtained from the relevant ATC Unit.

2.7 Because Special VFR flights are made at the lower levels, it is important for pilots to realise that a Special VFR clearance does not absolve them from the need to comply with the relevant low flying restrictions of SERA.3105 Minimum Heights and SERA.5005 Visual Flight Rules (unless permitted otherwise by the CAA). In particular, it does not absolve pilots from the requirement that an aircraft, other than a helicopter, flying over congested areas must fly at such a height as would enable it to clear the area and alight without danger to persons or property on the ground in the event of an engine failure and that a helicopter, whether flying over a congested area or not, must fly at such a height as would enable it to alight without danger to persons or property on the ground in the event of an engine failure. In addition there are special rules applicable to flight by helicopters over London (see AD 2.EGLL AD 2.22, paragraphs 9, 11 and 12).

2.8 For the purposes of SERA.5010(b) Special VFR in Control Zones, special VFR flight within a control zone is permitted at night in the UK FIRs.

2.9 **Radio Communication Failure Procedures**

2.9.1 The procedures to be adopted by pilots experiencing two-way radio communication failure are:

a) If the aircraft is suitably equipped, operate the Transponder on Mode A, Code 7600 and Mode C;
b) If it is believed that the radio communication transmitter is functioning, transmit blind giving position reports and stating intentions;
c) If, when radio communication failure occurs, the aircraft is not yet in the CTR, the pilot must in all cases remain clear even if Special VFR clearance has been obtained;
d) If Special VFR clearance has been obtained and the aircraft is in the CTR when the radio communication failure occurs, proceed as follows:

i. Aircraft inbound to an aerodrome in the CTR - proceed in accordance with Special VFR clearance to the aerodrome and land as soon as possible. When in aerodrome traffic circuit watch for visual signals;
ii. Aircraft transiting a CTR - continue flight not above the cleared altitude to leave the CTR by the most direct route, taking into account weather limitations, obstacle clearance and areas of known dense traffic.

Note: *In (i) and (ii), if flying on a heading advised by radar, when radio communication failure occurs, resume own navigation and carry out the appropriate procedure described.*

In all cases, notify the ATC Unit concerned as soon as possible after landing.

ENR 1.2 VISUAL FLIGHT RULES (continued)

3 VFR and Special VFR Flight in EGR160

3.1 Within EGR160, aircraft operating below 2500 FT AMSL are subject to the requirements of the Air Navigation (Restriction of Flying) (Specified Area) (Restricted Area EGR160) Regulations 2026.

3.2 Aircraft operating under VFR or Special SVFR within EGR160 below 2500 FT AMSL may do so only when:

a) Operating with an in-flight visibility of not less than 3000 M; and
b) Operating with a cloud ceiling of:

i. 1200 FT AMSL or greater; or
ii. 1000 FT AGL or greater.

4 Following Line Features

4.1 An aircraft which is flying within the United Kingdom with the surface in sight and following a road, railway, canal or coastline, or any other line of landmarks, should fly to the right of the line feature unless flying within controlled airspace in accordance with instructions given by the appropriate air traffic control unit.

4.2 'With the surface in sight' means with the flight crew being able to see sufficient surface features or surface illumination to enable the flight crew to maintain the aircraft in a desired attitude without reference to any flight instrument and 'when the surface is not in sight' is to be construed accordingly. (Air Navigation Order 2016 Schedule 1 'Interpretation').

5 Visual Reference Points

5.1 A Visual Reference Point (VRP) is an easily distinguishable fixed feature on the ground such as a windmill, pier etc. or a geographical feature such as a lake, hill and so on, which a pilot flying in good flight conditions should be easily able to identify. VRPs are established to assist Air Traffic Services (ATS) in routeing VFR traffic and to integrate VFR flights with IFR flights. Where VRPs are established outside controlled airspace, ATS staff should not instruct aircraft to hold over such VRPs. This does not apply to VRPs established within controlled airspace where a known traffic environment exists. ATS staff should not direct VFR traffic to fly directly over VRPs unless the IFR traffic situation specifically demands this.

5.2 VRPs are to be depicted in charts supporting aerodrome entries at UK AIP AD 2; they may also be depicted in Terminal Controlled Airspace charts at ENR 6. In addition, they are to be depicted on the CAA's 1:250000 and 1:500000 VFR charts by a blue box surrounding the name which is linked to the location identified by a cross within a circle.

5.3 Details of VRPs established at individual aerodromes are available in the consolidated 'Visual Reference Point List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

INTENTIONALLY BLANK

ENR 1.3 INSTRUMENT FLIGHT RULES

1 IFR Flight

SERA.2005 Compliance with the Rules of the Air and SERA.5015 Instrument Flight Rules (IFR) — Rules Applicable to All IFR Flights as applied within UK Airspace.

1.1 **Aircraft Equipment**

1.1.1 Aircraft shall be equipped with suitable instruments and with navigation equipment appropriate to the route to be flown.

1.2 **Minimum Levels**

1.2.1 Except when necessary for take-off or landing, or except when specifically authorized by the appropriate authority, an IFR flight shall be flown at a level which is at least 1000 FT (300 M) above the highest obstacle located within 8 KM of the estimated position of the aircraft.

Note 1: *When determining which are the highest obstacles within 8 KM of the estimated position of the aircraft, the estimate will take account of the navigational accuracy which can be achieved on the relevant route segment, having regard to the navigational facilities available on the ground and in the aircraft.*

Note 2: *See also SERA.3105 Minimum Heights and SERA.5015 Instrument Flight Rules (IFR) — Rules Applicable to All IFR Flights.*

1.3 **Change from IFR flight to VFR flight**

1.3.1 An aircraft electing to change the conduct of its flight from compliance with the instrument flight rules to compliance with the visual flight rules shall, if a flight plan was submitted, notify the appropriate air traffic services unit specifically that the IFR flight is cancelled and communicate thereto the changes to be made to its current flight plan.

1.3.2 When an aircraft operating under the instrument flight rules is flown in or encounters visual meteorological conditions it shall not cancel its IFR flight unless it is anticipated, and intended, that the flight will be continued for a reasonable period of time in uninterrupted visual meteorological conditions.

Note: *See also ENR 1.10, paragraph 1.14.1.*

2 Rules applicable to IFR flights within Controlled Airspace

2.1 IFR flights shall comply with the provisions of SERA.8015 Air Traffic Control Clearances when operated in controlled airspace.

2.2 As specified in the ICAO EUR Regional Supplementary Procedures (DOC 7030/5-EUR), flights shall be conducted in accordance with Instrument Flight Rules when operated within or above the EUR RVSM airspace. Therefore, flights operating as General Air Traffic (GAT) within the London and Scottish UIRs at or above FL 290, as described in ENR 2.1, shall be conducted in accordance with the Instrument Flight Rules.

2.3 An IFR flight operating in cruising flight in controlled airspace shall be flown at a cruising level, or, if authorized to employ cruise climb techniques, between two levels or above a level, selected from the Tables of cruising levels at ENR 1.7 paragraph 6.1, except that the correlation of levels to track prescribed therein shall not apply whenever otherwise indicated in air traffic control clearances or specified by the appropriate ATS authority in Aeronautical Information Publications.

2.4 For TRA Access Requirements see ENR 1.1.5, paragraph 1.5.6.

3 Rules applicable to IFR flights outside Controlled Airspace

3.1 **Cruising Levels**

3.1.1 An IFR flight operating in level cruising flight outside of controlled airspace shall be flown at a cruising level appropriate to its track as specified in the Tables of cruising levels at ENR 1.7 paragraph 6.1.

Note: *This provision does not preclude the use of cruise climb techniques by aircraft in supersonic flight.*

3.2 **Communications**

3.2.1 An IFR flight operating outside controlled airspace but within or into areas, or along routes, designated by the appropriate ATS authority in accordance with SERA.4001(b) Submission of a Flight Plan and incorporating UK Differences (GEN 1.7 refers), shall maintain a listening watch on the appropriate radio frequency and establish two-way communication, as necessary, with the air traffic services unit providing flight information service.

Note 1: *See notes following ICAO Annex 2, paragraph 3.6.5.1.*

Note 2:

a) In a HF environment, SELCAL or similar automatic signalling devices satisfy the requirement to maintain an air-ground voice communication watch;

b) An aircraft may be permitted to communicate temporarily with a control unit other than the unit controlling the aircraft.

ENR 1.3 INSTRUMENT FLIGHT RULES (continued)

3.3 **Position Reports**

3.3.1 An IFR flight operating outside controlled airspace and required by the appropriate ATS authority to:

- submit a flight plan,
- maintain a listening watch on the appropriate radio frequency and establish two-way communication, as necessary, with the air traffic services unit providing flight information service, shall report position as specified in SERA.8025 Position Reports for controlled flights.

shall report position as specified in SERA.8025 Position Reports for controlled flights.

4 Free Route Airspace - General Procedures

4.1 **Area of Application**

4.1.1 FRA is available within a specified areas of UK airspace as detailed in ENR 2.2 within which free route flight planning is available H24.

4.2 **Eligible Flights**

4.2.1 Flights eligible to operate within FRA are all flights equipped to at least RNAV 5 that intend to operate within the vertical and lateral limits of the UK FRA as specified in ENR 2.2. This includes traffic arriving and departing airfields situated below the lateral area of UK FRA or in its proximity and have a requested flight level within FRA.

4.3 **Flight Procedures**

4.3.1 **General**

4.3.1.1 No ATS routes are published within the defined UK FRA and operators should flight plan user-preferred trajectories via published FRA Significant Points as defined in ENR 4.1 and ENR 4.4.

4.3.1.2 Within UK FRA there is no limit to the length of DCT segments that can be flight planned.

4.3.2 **FRA Procedures**

4.3.2.1 Flights shall operate within FRA in accordance with the procedures detailed in the tables at Para 4.3.2.2 / 3 / 4.

4.3.2.2 **Overflying Traffic**

4.3.2.2.1 It is mandatory to enter/exit UK FRA via FRA Horizontal Entry/Exit Points.

4.3.2.2.2 Eligible flights transiting from the ATS route network to FRA:

From	To	Remark
FRA Horizontal Entry Point (E)	FRA Horizontal Exit Point (X)	If required flights may include FRA (I) points in accordance with ENR 4.1/ENR 4.4 in their FPL route.
	FRA Arrival Connecting Point (A)	If required flights may include FRA (I) points in accordance with ENR 4.1/ENR 4.4 in their FPL route.
	FRA Intermediate Point (I)	If required flights may transition vertically in or out of FRA from or to the underlying ATS route network at a published FRA (I) point that is common to an ATS route below the defined FRA.

4.3.2.3 **Access to/from Terminal Airspace**

4.3.2.3.1 It is mandatory for arrivals and departures to and from airfields in the vicinity of UK FRA to enter via a FRA Arrival Connecting Point (A) or a FRA Departure Connecting Point (D) as defined in ENR 4.4.

4.3.2.3.2 Details of FRA arrival and departure connecting routes to and from airfields beneath and adjacent to FRA within UK airspace can

ENR 1.3 INSTRUMENT FLIGHT RULES (continued)

be found in the UK & Ireland Standard Route Document (SRD).

4.3.2.3.3 Flights transitioning vertically into UK FRA from departure airfield:

From	To	Remark
FRA Departure Connecting Point (D)	FRA Horizontal Exit Point (X)	If required flights may include FRA (I) points in accordance with ENR 4.1/4.4 within FRA in their FPL route.
	FRA Arrival Connecting Point (A)	If required flights may include FRA (I) points in accordance with ENR 4.1/4.4 within FRA in their FPL route.

4.3.2.4 **Vertical Transition to/from the underlying ATS Route Network**

4.3.2.4.1 It is mandatory for flights wishing to transit vertically between FRA and the underlying ATS route network and vice versa, to do so by including a level change in the flight plan at a published FRA Intermediate Point (I).

From	To	Remark
FRA Intermediate Point (I)	FRA Horizontal Exit Point (X)	Flights may enter FRA from the underlying ATS route network vertically by changing level at a common published FRA (I) point.
	FRA Arrival Connecting Point (A)	Flights may enter FRA from the underlying ATS route network vertically by changing level at a common published FRA (I) point.

4.3.3 **Cross-Border Application**

4.3.3.1 Cross border UIR DCT requirements are detailed within the Route Availability Document (RAD): See ENR 1.10 Sect 3.

4.4 **Airspace Reservation – Special Use Airspace**

4.4.1 **Re-routing - Special Use Areas**

4.4.1.1 Special Use Airspace (SUA) is permitted within FRA and managed under the Flexible Use of Airspace (FUA) concept. SUA shall be segregated to exclude GAT traffic when activated and protected in flight planning terms within FRA by the application of a Flight Plan Buffer Zone (FBZ) around the edge of the SUA.

4.4.1.2 GAT operators are expected to flight plan through FRA avoiding active SUA and associated FBZs at their discretion using published FRA (I) Points in accordance with ENR4.1/4.4 unless specific routings are mandated in accordance with the Route Availability Document (RAD): See ENR 1.10 Sect 3.

4.4.1.3 SUA activity within FRA will be published via NOTAM and via the Airspace Use Plan (AUP) and Updated Use Plan (UUP).

4.4.1.4 Details of vertical and lateral boundaries of SUAs and FBZs within FRA are contained within ENR 5.1/5.2.

4.5 **Additional FRA Procedures**

4.5.1 **General Provisions**

4.5.1.1 It is not permissible to flight plan a route along the UK FRA boundary or within 3 NM of the UK FRA boundary, except when crossing the UK FRA boundary to an adjacent UIR.

4.5.1.2 It is not permissible to flight plan a route that crosses a ‘Non-standard Planning Zone’ (NPZ) as defined in ENR 2.2.

4.6 **Route Availability Document**

4.6.1 All UK FRA constraints, exemptions and restrictions will be published via the Route Availability Document (RAD) and promulgated in accordance with ENR 1.10.

INTENTIONALLY BLANK

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION

1 ATS Airspace Classification

1.1 UK Airspace may be classified as A, B, C, D, E, F and G in accordance with ICAO Annex 11, subject to the Differences notified at GEN 1.7. The airspace classifications are described in subsequent paragraphs.

1.2 Where controlled airspace is vertically adjoined by Class G airspace, aircraft operating at the base (lower limit) of a control area or at the upper limit of a control zone or control area should comply with the requirements of Class G airspace. With the exception of VFR flights operating into or out of Class E airspace and where appropriate, complying with any applicable TMZ requirement, flights without an ATC clearance that are observed operating immediately above the base (lower limit) of a control area or immediately below the upper limit of a control zone or control area will be considered to have infringed controlled airspace. →

1.3 When considering the vertical profile of a flight within Class G airspace, pilots are reminded to select a level that is compliant with SERA.5025(a) and ORS4 No 1578. To mitigate the risk of penetrating notified airspace structures without complying with the conditions associated with those structures, pilots are recommended to plan their flights to operate:

- not closer than 2 NM from the boundary of the notified airspace structure.
- at least 200 FT above the upper limit of the notified airspace structure.
- at least 200 FT below the lower limit of the notified airspace structure.

1.4 When operating proximate to control areas in turbulent, or in ascending or descending air masses, as part of effective Threat and Error Management, when able to, pilots may wish to consider increasing the 200 FT recommended spacing to mitigate inadvertent vertical deviations that could result in an infringement.

1.5 Pilots are further reminded that, when operating within Class G airspace within 500 FT of the base of controlled airspace, they should consider the risk of encountering wake turbulence generated by aircraft operating at the lowest available level within the controlled airspace above.

1.6 Pilots operating in Class G airspace are encouraged to obtain an appropriate air traffic service (see ENR 1 sections 2.3 and 2.4 or CAP 774 – UK Flight Information Service) from the designated air traffic service unit. Pilots who operate within Class G airspace, especially those who operate proximate to the boundary of controlled airspace, and have chosen not to obtain a suitable ATS in an aircraft fitted with a serviceable transponder are reminded to:

- monitor the appropriate ATS frequency whilst displaying the corresponding frequency monitoring code; or
- display the appropriate conspicuity code.

2 ATS Airspace Description

2.1 Class A - Controlled Airspace

	IFR	VFR
Service	Air Traffic Control Service.	VFR FLIGHT
Separation	Separation provided between all IFR flights by ATC.	
ATC Rules	Flight Plan required **(See Note 1)**; ATC clearance required; Radio Communication required; ATC instructions are mandatory.	NOT
VMC Minima	**At and above FL 100:** 8 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Below FL 100:** 5 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **(See Note 2)**	PERMITTED
Speed Limitation	As published in procedures or instructed by ATC.	

Note 1: *In certain circumstances, Flight Plan requirements may be satisfied by passing flight details on RTF (detailed at ENR 1.10).*

Note 2: *For the purposes of:*

a) Climbs and descents maintaining VMC;
b) Powered aircraft - Airways crossings (ENR 1.1, paragraph 1.6.1.6.1);
c) Powered aircraft - other penetrations of Airways (ENR 1.1, paragraph 1.6.1.6.2).

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.1.1 **Notifications**

2.1.1.1 The following airspace is notified as Class A:

a) **All Control Areas and TMAs below FL 195 within the London and Scottish FIRs** except those listed in ENR 1.4 Para 2.3.1.2, 2.4.1.1 and 2.5.1.1.

b) **Channel Islands Terminal Control Area (North and South);**

Outside the notified hours of watch of the Jersey Air Traffic Control Unit:

i. Those parts of the Channel Islands TMA (South), which lie within the Brest FIR are notified as Class E and are controlled by Brest ACC.
ii. Those parts of the Channel Islands TMA (North) which lie within the London FIR and are located below the lower limits of the Berry Head and Portsmouth CTAs are notified as Class G.

c) **Shanwick Oceanic Control Area;**

The Shanwick Oceanic Control Area is notified as Class A.

2.1.2 **Glider operations in Class A Airspace**

In certain notified portions of Class A airspace, gliders are permitted to operate without reference to ATC in accordance with specified conditions and neither separation nor traffic information will be provided in respect of such flights. When such activity occurs, such airspace will be segregated from other traffic, which is provided with at least standard separation from the segregated airspace. Such segregated activities are undertaken in accordance with the flexible use of airspace provisions contained within Commission Regulation (EC) 2150 of 2005.

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.2 Class B - Controlled Airspace

	IFR	VFR
Service	Air Traffic Control Service.	
Separation	Separation provided between all flights by ATC.	
ATC Rules	Flight Plan required **(See Note)**; ATC clearance required; Radio Communication required; ATC instructions are mandatory.	
VMC Minima	Not applicable.	**At and above FL 100:** 8 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Below FL 100:** 5 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud.
Speed Limitation	As published in procedures or instructed by ATC.	

Note: *In certain circumstances, Flight Plan requirements may be satisfied by passing flight details on RTF (detailed at ENR 1.10).*

No UK Airspace is currently designated Class B.

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.3 Class C - Controlled Airspace

	IFR	VFR
Service	Air Traffic Control Service.	
Separation	Separation provided between all IFR flights by ATC.	All VFR flights separated from all IFR flights by ATC. Traffic information provided on other VFR flights and traffic avoidance advice on request.
ATC Rules	Flight Plan required **(See Note);** ATC clearance required; Radio Communication required; ATC instructions are mandatory.	
VMC Minima	Not applicable.	**At and above FL 100:** 8 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Below FL 100:** 5 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud.
Speed Limitation	As published in procedures or instructed by ATC.	**Below FL 100:** 250 KT IAS; **OR** lower when published in procedures or instructed by ATC.

Note: *In certain circumstances, Flight Plan requirements may be satisfied by passing flight details on RTF (detailed at ENR 1.10).*

2.3.1 **Notifications**

2.3.1.1 Above FL 195 all airspace in the London and Scottish FIRs/UIRs is notified as Class C.

2.3.1.2 Below FL 195 the following Airspace is also notified as Class C Airspace:

a) Clacton CTAs 10, 11, 12;
b) Cotswold CTAs 2, 15, 16, 17, 18;
c) Daventry CTAs 21, 22, 23, 24, 25;
d) Holyhead CTA (excluding CTAs 15 and 16);
e) Londonderry/Eglinton CTA;
f) North Sea CTA;
g) Portsmouth CTA 3;
h) Severn CTA.

2.3.2 **VFR Flight in Class C Airspace**

2.3.2.1 General arrangements for VFR flight in Class C airspace are specified at ENR 1.1, sub-section 4.

2.3.2.2 Specific arrangements for glider operations within Temporary Reserved Areas in Class C airspace above FL 195 are detailed at ENR 1.1, paragraph 1.11 (Charts see ENR 6-64 and ENR 6-65).

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.4 Class D - Controlled Airspace

	IFR	VFR
Service	Air Traffic Control Service.	
Separation	Separation provided between all IFR flights by ATC. Traffic information provided on VFR flights and traffic avoidance advice on request.	ATC separation not provided. Traffic information provided on IFR flights and other VFR flights; traffic avoidance advice on request.
ATC Rules	Flight Plan required **(See Note 1)**; ATC clearance required; Radio Communication required; ATC instructions are mandatory.	
VMC Minima	Not applicable.	**At and above FL 100:** 8 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Below FL 100:** 5 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Alternatively, during day only, at and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher (See Note 2):** a) **For aircraft other than helicopters, flying at 140 KT IAS or less:** 5 KM flight visibility Clear of cloud and with the surface in sight. b) **For helicopters, flying at 140 KT IAS or less:** 1500 M flight visibility Clear of cloud and with the surface in sight.
Speed Limitation	**Below FL 100:** 250 KT IAS; **OR** lower when published in procedures or instructed by ATC.	

Note 1: *In certain circumstances, Flight Plan requirements may be satisfied by passing flight details on RTF (detailed at ENR 1.10).*

Note 2: *The VMC criteria stated in the table above for flight by day at and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher, reflect changes from SERA.5001 Table S5-1, as enabled through the Aviation Safety (Amendment) Regulation 2021.*

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.4.1 **Notifications**

2.4.1.1 The following airspace is notified as Class D Airspace during the notified hours of watch of the appropriate Air Traffic Control Unit.

Aberdeen Control Zone/Control Area **(Notes 1 and 2(a))**;
Balder Control Area **(Note 3)**;
Belfast Control Zone;
Belfast Terminal Control Area;
Belfast/City Control Zone/Control Area;
Birmingham Control Zone/Control Area;
Borders Control Area 5, 9, 10, 11, 12, 13 & 14;
Bournemouth Control Zone **(Note 1)**;
Bristol Control Zone/Control Area;
Brize Norton Control Zone;
Cardiff Control Zone/Control Area;
Channel Islands Control Zone/Control Area;
East Midlands Control Zone/Control Area;
Edinburgh Control Zone/Control Area **(Notes 1 and 2(b))**;
Ekofisk Control Area **(Note 3)**;
Farnborough Control Zone/Control Area **(Note 1);**
Glasgow Control Zone/Control Area **(Notes 1 and 2(b))**;
Isle of Man Control Zone/Control Area **(Note 1)**;
Leeds Bradford Control Zone/Control Area **(Note 1)**;
Liverpool Control Zone/Control Area;
London Control Zone;
London/City Control Zone/Control Area;
London Gatwick Control Zone/Control Area;
London Luton Control Zone/Control Area;
London Stansted Control Zone/Control Area;
Manchester Control Zone/Control Area;
Newcastle Control Zone/Control Area **(Notes 1 and 2(b))**;
Norwich Control Zone/Control Area **(Note 1)**;
Prestwick Control Zone/Control Area **(Note 2(b))**;
Scottish Terminal Control Area as shown at ENR 6-37;
Solent Control Area **(Note 1)**;
Southampton Control Zone **(Note 1)**;
Southend Control Zone/Control Area;
Strangford Control Area below FL 195;
Sumburgh Control Zone/Control Area **(Note 2(c))**;
Tay Control Area 10, 11, 12 & 13;
Teesside International Control Zone/Control Area;
Yorkshire Control Area 17.

Note 1

Notified as Class D Airspace for the purposes of SERA.6001 Classification of Airspaces, during the notified hours of watch of the appropriate Air Traffic Control Unit subject to the conditions in Note 2.

Note 2

a) An aircraft without radio equipment must not fly in Class D Airspace during the notified hours of watch of the appropriate air traffic control unit unless it has been otherwise authorised by the appropriate air traffic control unit and is subject to the conditions at paragraph (c).
b) An aircraft without radio equipment and flown in accordance with the Instrument Flight Rules must not fly in Class E Airspace during the notified hours of watch of the appropriate air traffic control unit unless it has been otherwise authorised by the appropriate air traffic control unit and is subject to the conditions at paragraph (c).
c) For the purposes of paragraphs (1) and (2), the conditions are that the aircraft must:

   i. only fly during the day;
   ii. only fly within notified controlled airspace notified for the purpose of this paragraph;
   iii. remain at least 1500 M horizontally and 1000 FT vertically away from cloud and in a flight visibility of at least 5 KM;
   iv. comply with any electronic conspicuity requirements specified by the air traffic control unit; and
   v. comply with any other conditions specified by the appropriate air traffic control unit. (As applied to the Isle of Man by the Civil Aviation (Subordinate Legislation) (Application) (No 2) Order 1996).

Note 3

a) Balder CTA, Ekofisk CTA and Ekofisk RMZ.

   At Polaris ACC (SG West), Sector Offshore is manned with Air Traffic Controllers and a Flight Data Operator (FDO), working channels 125.555, 134.205 and 125.880, for Ekofisk RMZ 130.550 MHz. The operation of ADS-B is mandated in those volumes of the Balder and Ekofisk CTA where the provision of air traffic services has been delegated by the UK to Norway. The following procedures outline the access arrangements for these volumes of airspace:

   i. The UK MOD reserves the right of access to such airspace for State aircraft regardless of their equipage or ability to comply with the requirements set out by the delegated service provider; for:

      - Aircraft in an emergency;
      - Aircraft involved in National Security tasks, where possible under the positive control of either: Land, Maritime or Airborne Units;
      - Aircraft engaged in Maritime operations, under positive control;
      - For Ekofisk RMZ; unless in an emergency, when an emergency squawk may be required, aircraft under positive control will wear a listening squawk of 0455 whilst monitoring 130.550 MHz when inside the RMZ. The Queen Elizabeth (QE) Class aircraft carriers may wish to utilise dedicated squawks subject to co-ordination with Offshore Sector 20 Ekofisk as per para (c).

   Under such circumstances UK State aircraft will operate within the subject airspace under ‘due regard’ procedures in accordance with Article 3d to the Convention of International Civil Aviation.

   ii. Specific procedures to enable UK MOD (including UK based USAFE) aircraft to conduct normal operational training sorties are detailed below.

b) **Procedures for Coordination of Operational Air Traffic (OAT).**

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

i. **Coordination of Planned OAT Exercises.** Planned military OAT exercises within the Area of Common Interest (see relevant section of LOA) should be coordinated with Polaris ACC SG West at least 24 hours prior to the start of the exercise, with a request for Special Use Airspace (SUA) for the planned exercise. In a normal offshore helicopter traffic situation (priorities may need to be defined) Polaris ACC SG West will give an approval for the SUA request.

The SUA request shall contain:

1. The lateral and vertical limits of the Exercise Area;
2. The time for start and finish of the Exercise, including means of activation and deactivation of the Exercise Area;
3. Contact information for the Exercise Coordination Unit;
4. Other operational information related to the Exercise, such as number of aircraft involved, if applicable.

ii. **Special Procedures for Coordination of OAT Operations.**

1. **Purpose.** Outwith Exercise scenarios, when MOD OAT requires to operate within the Area of Common Interest (ACI), the OAT will normally require to be controlled by a MOD Operational Control Unit (OCU) during the operations. OAT operations within the ACI are to remain outside of the lateral limits of Helicopter Traffic Zones (HTZ).
2. The following coordination procedures are to be applied between UK MOD units and Polaris ACC SG West in respect of OAT carrying out operations and training within the ACI when prior co-ordination of the OAT operations is not applicable. The procedures are designed to ensure safe operations for both civil offshore helicopters and OAT operating simultaneously within the ACI.
3. **Procedures for OAT Coordination.** When OAT operations are required within the ACI, the appropriate UK MOD OCU or the OAT planning to enter the ACI, shall contact the appropriate sector at Polaris ACC SG West, on the appropriate frequency or telephone line, prior to entering the ACI, with the following information, where applicable:

(aa) MOD OCU or OAT callsign;

(bb) The estimated position and a time for the OAT entering the ACI;

(cc) Expected direction and estimated period of time for the OAT operations within ACI;

(dd) The lateral and vertical limits of the Operating Area;

(ee) Maximum altitude for the OAT operations within ACI;

(ff) Radar transponder status, including SSR code, if applicable (aircraft may not be ADS-B-out equipped);

(gg) Other information, such as contact information to the MOD OCU.

When OAT operations within the ACI are finished, the appropriate MOD OCU or the OAT shall contact the appropriate sector at Polaris ACC SG West, on the allocated frequency or telephone line, to deactivate the OAT operations within the ACI and release the airspace for civil helicopter operations.

c) **Communications.**

i. Exchange of Operational Air Traffic Information.

1. Means of Communication.

(aa) Equipment.

Fixed Communication with Polaris ACC SG West via public telephone lines (see para (c)(2)) or Mobile VHF Communication with Polaris ACC SG West (see para (c)(3)).

2. **Telephone Coordination.** Exchange of Airspace Requests, flight plan data, estimates and other OAT-messages by telephone shall be carried out in accordance with the tables below:

(aa) **Messages to Polaris ACC SG West.**

Switchboard: +47 51 65 8000
Supervisor: +47 51 65 8142
Sector Offshore (FDO): +47 51 65 8155
Sector Offshore (ATCO): +47 51 65 8232
Telefax: +47 51 65 8154

3. **VHF RX/TX Communication**

ATC Sector	R/T Callsign	Channel	Hours of Operation
Offshore Sector 20 Ekofisk	Polaris Control	125.880	0600-2030 Mon-Fri*
Offshore Sector 21 Balder	Polaris Control	134.205	0600-2030 Mon-Fri*
Offshore Sector 22 Statfjord	Polaris Control	125.555	H24

Note: **Published opening hours are in UTC. During summer time period 1 hour earlier.*

ATS Offshore is provided by Polaris ACC SG West Sector South (Sector 20 and 21) and Sector North (Sector 22) outside Sector Offshore opening hours.

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.5 Class E - Controlled Airspace

	IFR	VFR
Service	Air Traffic Control Service.	Traffic information in accordance with UK FIS (Basic Service or Traffic Service) - see ENR 1.1, ENR 1.6 and Civil Aviation Publication (CAP) 774 - UK Flight Information Services.
Separation	Separation provided between all flights by ATC. Whenever practicable, traffic information is provided on VFR flights and if requested by the pilot or if deemed necessary by the controller, traffic avoidance advice will be suggested **(See Note 3 and 4)**.	None.
ATC Rules	Flight Plan required **(See Note 1 and 2)**; ATC clearance required; Radio Communication required; ATC instructions are mandatory.	None. However, pilots are encouraged to contact ATC and comply with instructions.
VMC Minima	Not applicable.	**At and above FL 100:** 8 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Below FL 100:** 5 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud.
Speed Limitation	**Below FL 100:** 250 KT IAS; **OR** lower when published in procedures or instructed by ATC.	

Note 1: *In certain circumstances, Flight Plan requirements may be satisfied by passing flight details on RTF (detailed at ENR 1.10).*

Note 2: *Pilots of IFR flights will be advised when they enter and leave Class E airspace if the flight is an unplanned diversion or no flight plan has been filed prior to requesting a clearance to enter controlled airspace.*

Note 3: *Pilots of IFR flights and VFR flights receiving an ATS should be aware of the existence of factors that might adversely affect the ability of a controller to detect a collision hazard and provide timely and accurate traffic information and/or traffic avoidance advice within class E airspace. Such factors include:*

- *The inability of an ATSU to restrict the volume of VFR flights operating within class E airspace;*
- *The inability of an ATSU to anticipate changes in the flightpath of every VFR flight;*
- *The inability of an ATSU to detect collision hazards on every occasion because of surveillance clutter;*
- *The inability of an ATSU to provide timely transmissions on every occasion because of RTF congestion;*
- *The expectation that pilots receiving an ATS will respond appropriately following receipt of traffic information; and*
- *The requirement for the provision of an air traffic control service to have precedence over the provision of flight information service (SERA.9001(c)).*

Note 4: *Pilots must consider the need for traffic avoidance advice upon receipt of traffic information. Pilots who require traffic avoidance advice must make a corresponding request as soon as is practicable.*

2.5.1 Notifications

2.5.1.1 Airspace below FL 195 and notified as Class E Airspace is published in ENR 2.1. Class E airspace may also have an associated Transponder Mandatory Zone and/or Radio Mandatory Zone, as detailed in ENR 2.2.

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.6 Class F - Advisory Airspace

	IFR	VFR
Service	Air Traffic Advisory Service.	UK Flight Information Services as required (Basic Service, Traffic Service).
VMC Minima	Not applicable.	**At and above FL 100:** 8 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Below FL 100:** 5 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **At and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher:** 5 KM flight visibility Clear of cloud and with the surface in sight. **Alternatively, during day only, at and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher, for all aircraft, flying at 140 KT IAS or less (See Note)**: 1500 M flight visibility Clear of cloud and with the surface in sight.
Speed Limitation	**Below FL 100:** 250 KT IAS; **OR** lower when published in procedures or instructed by ATC.	

Note: *The VMC criteria stated in the table above for flight by day at and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher, reflect changes from SERA.5001 Table S5-1, as enabled through the Aviation Safety (Amendment) Regulation 2021.*

No UK Airspace is currently designated Class F.

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

2.7 Class G Airspace

	IFR	VFR
Service	UK Flight Information Services as required (Basic Service, Traffic Service, Deconfliction Service or Procedural Service)	
Separation	ATC Separation cannot be provided due to the nature of the unknown Class G traffic environment. Deconfliction advice is provided against participating aircraft under a Procedural Service or against participating and non-participating traffic (unknown traffic) under a Deconfliction Service. Both the Procedural Service and Deconfliction Service aim to achieve planned deconfliction minima.	
ATC Rules	Instructions issued by controllers to pilots operating outside controlled airspace are not mandatory; however, the services rely upon pilot compliance with the specified terms and conditions so as to promote a safer operating environment for all airspace users.	
VMC Minima	Not applicable.	**At and above FL 100:** 8 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **Below FL 100:** 5 KM flight visibility 1500 M horizontal and 1000 FT vertical distance from cloud. **At and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher:** 5 KM flight visibility Clear of cloud and with the surface in sight. **Alternatively, during day only, at and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher, for all aircraft, flying at 140 KT IAS or less (See Note):** 1500 M flight visibility Clear of cloud and with the surface in sight.
Speed Limitation	**Below FL 100:** 250 KT IAS; **OR** lower when published in procedures or instructed by ATC.	

Note: *The VMC criteria stated in the table above for flight by day at and below 3000 FT AMSL, or 1000 FT above terrain, whichever is the higher, reflect changes from SERA.5001 Table S5-1, as enabled through the Aviation Safety (Amendment) Regulation 2021.*

2.7.1 **Designation**

2.7.1.1 All UK Airspace, including that above FL 660, not included in Classes A to F.

2.7.2 **Aerodrome Traffic Zones and Notification for Rule 11**

2.7.2.1 Aerodrome Traffic Zones (ATZs) are not included in the Airspace Classification System. An ATZ assumes the conditions associated with the Class of Airspace in which it is situated.

2.7.2.2 Every aerodrome at which an ATZ is established is notified for the purposes of Rule 11 of the Rules of the Air Regulations 2015. As a minimum therefore, when flying within an ATZ the requirements of Rule 11 must be complied with.

2.7.2.3 ATZs at civil licensed aerodromes are notified in the UK AIP within individual aerodrome entries. ATZs at other than civil licensed aerodromes are notified in the UK AIP at ENR 2-2.

2.7.2.4 Where the requirements of the Class of Airspace of which an ATZ forms a part are more stringent than Rule 11 then those must be complied with in addition to the requirements of Rule 11 to enter the ATZ.

2.7.2.5 Aerodromes at which ATZs may be established are those which:

a) A government aerodrome, at such times as are notified; or
b) An aerodrome having an air traffic control unit or flight information service centre, during the notified hours of watch of the air traffic control unit or the flight information service centre; or

ENR 1.4 ATS AIRSPACE CLASSIFICATION AND DESCRIPTION (continued)

c) A national licensed aerodrome or an EASA certificated aerodrome having an air/ground communications service unit with aircraft, during the notified hours of watch of the air/ground communications service unit.

2.7.2.6 An aircraft must not fly, take off or land within the Aerodrome Traffic Zone of an aerodrome unless the commander of the aircraft has complied with the following paragraphs, where appropriate,

a) If the aerodrome has an air traffic control unit the commander must obtain the permission of that unit to enable the flight to be conducted safely within the aerodrome traffic zone.
b) If the aerodrome provides a flight information service the commander must obtain information from the flight information centre to enable the flight to be conducted safely within the aerodrome traffic zone.
c) If there is no flight information centre at the aerodrome the commander must obtain information from the air/ground communication service to enable the flight to be conducted safely within the aerodrome traffic zone.

2.7.2.7 The commander of an aircraft flying within the aerodrome traffic zone of an aerodrome must,

a) Cause a continuous watch to be maintained on the appropriate radio frequency notified for communications at the aerodrome; or
b) If this is not possible, cause a watch to be kept for such instructions as may be issued by visual means; and
c) If the aircraft is fitted with means of communication by radio with the ground, communicate the aircraft's position and height to the air traffic control unit, the flight information centre or the air/ground communications service unit at the aerodrome (as the case may be) on entering the aerodrome traffic zone and immediately prior to leaving it.

2.7.2.8 Permanent or temporary changes/extensions to ATZ hours may be notified by United Kingdom NOTAM. Pilots should exercise caution, however, since some airfields may continue to operate outside of those notified and published hours.

INTENTIONALLY BLANK

ENR 1.5 HOLDING, APPROACH AND DEPARTURE PROCEDURES

1 General

1.1 UK Holding, Approach and Departure Procedures have been established in accordance with the ICAO Document 8168 (PANS-OPS), except for those UK differences shown at GEN 1.7 and in UK CAA CAP 785 B.

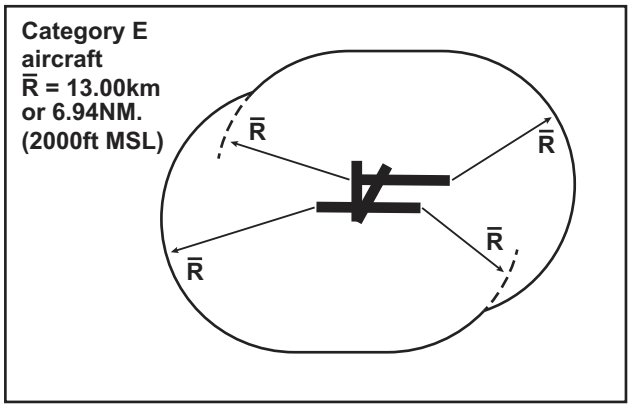
1.2 The UK Instrument Flight Procedures are listed in AD 2.24.

1.3 PANS-OPS vol I and III stresses the need for flight crew and operational personnel to adhere strictly to the published procedures to achieve and maintain an acceptable level of safety in operations.

1.4 Continuous Descent Final Approach 'CDFA technique' is the preferred method for non-precision approaches in the UK where practicable.

2 Arriving Flights

2.1 Introduction



2.1.1 Aerodrome specific arrival procedures can be found in the relevant AD 2.22 Flight Procedures and AD 2.24 charts.

2.2 Visual Manoeuvring (Circling) VM(C) in the Vicinity of the Aerodrome after Completing an Instrument Approach

2.2.1 Visual Manoeuvring (Circling) VM(C) is the term used to describe the visual phase of flight, after completing an Instrument Approach, where an aircraft is manoeuvred into position for a landing on a runway which is not suitably located for a straight-in approach.

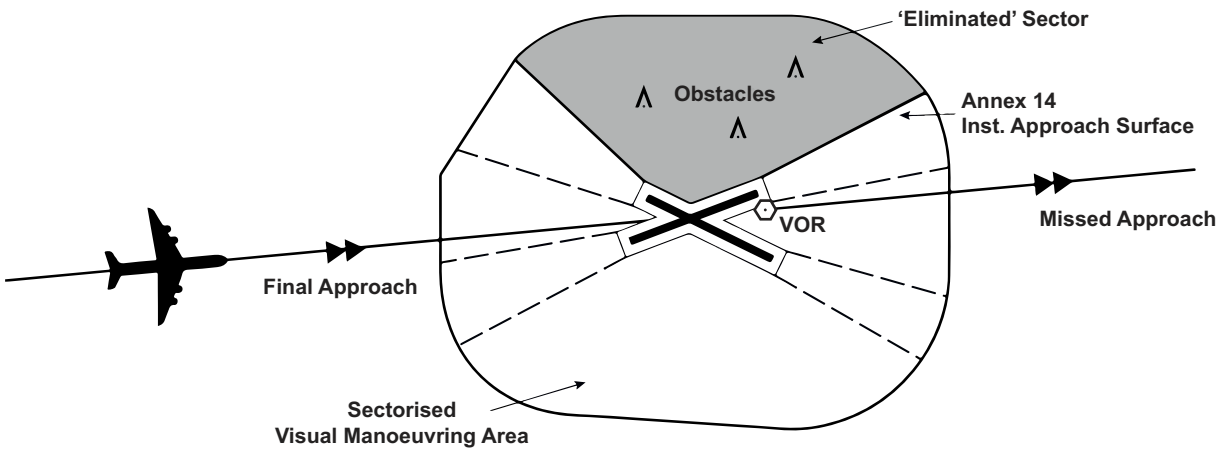
2.2.2 The VM(C) area is the area in which obstacle clearance has been considered for aircraft manoeuvring visually before landing. Aircraft performance has a direct effect on the airspace and visibility needed to perform the circling manoeuvre; since the most significant factor in performance is speed, the size of the VM(C) area varies with the category of the aircraft. The limits of the area applicable to each category of aircraft are defined by combining arcs centred on the threshold of each usable runway; the total area thus enclosed is the VM(C) area - see example at Figure 1.

Figure 1. Construction of Visual Manoeuvring (Circling) Area for a Category E Aircraft

2.3 Obstacle Clearance

2.3.1 When the VM(C) area has been established, the Obstacle Clearance Height (OCH) is determined for each category of aircraft. The criteria used to determine the OCH is as follows:

Aircraft Category	Maximum Speeds for Circling (KT)	Circling Area Maximum radii from RWY THR (NM)	Minimum Obstacle Clearance (FT)	Lowest Permissible OCH AAL (FT)
A	100	1.68	300	400
B	135	2.66	300	500
C	180	4.20	400	600
D	205	5.28	400	700
E	240	6.94	500	800



2.4 Sectorization of Visual Manoeuvring (Circling) Area

2.4.1 It is permissible to eliminate from obstacle clearance consideration a particular sector, within the total VM(C) area, where the sector lies outside the final approach and missed approach areas; this 'eliminated' sector is determined by the dimensions of the ICAO

ENR 1.5 HOLDING, APPROACH AND DEPARTURE PROCEDURES (continued)

Annex 14 instrument approach surfaces - see example at Figure 2.

Figure 2. Sectorized Visual Manoeuvring (Circling) Area

2.5 **Obstacle Clearance Heights for Aerodromes with Published Instrument Approach Procedures**

2.5.1 Visual Manoeuvring (Circling) (VM(C)) OCHs are listed for the total VM(C) area, and where operational advantage can be gained by sectorization, for the relevant sectorized VM(C) area also.

2.5.2 When the principle of sectorization has been applied to a particular aerodrome, two OCA(H) values for VM(C) will be promulgated at AD 2.24. The first OCA(H) will allow a pilot to manoeuvre safely within the total VM(C) area and the second OCA(H) is for the pilot who exercises the option to avoid manoeuvring within the eliminated sector and restricts his visual manoeuvring to the remaining sectorized area.

Aircraft Category		A	B	C	D
OCA (OCH)	CAT I	**369**(164)	**376**(171)	**385**(180)	**395**(190)
VM(C)OCA (OCH AAL)	Total Area	**1150**(935)	**1320**(1105)	**1420**(1205)	**1420**(1205)
	East of RWY 16/34	**720**(505)	**940**(725)	**1050**(835)	**1070**(855)

2.5.3 The OCA(H) for the visual manoeuvring (circling) shall not be less than the OCA(H) calculated for the instrument approach procedure which leads to the circling manoeuvre.

2.6 **Summary of Holding and Approach to Land Procedures at Individual Aerodromes**

2.6.1 Instrument approach procedures with both precision and non-precision straight in Obstacle Clearance Heights will be heights above the published threshold elevation.

2.6.2 VM(C) Obstacle Clearance Heights will be heights above published aerodrome elevation.

2.6.3 Where the term 'straight ahead' is used in missed approach procedures, pilots should maintain Final Approach Track (FAT) unless a different track is given.

2.6.4 For availability of Instrument Approach Charts, see GEN 3.2.

2.7 **Descent Gradient**

2.7.1 To permit the approximate rates of descent required in the intermediate and final approach segments of non-precision Instrument Approach Procedures to be calculated, whenever an Intermediate Fix (IF) or Final Approach Fix (FAF) is included in a non-precision procedure, the descent path required in the corresponding approach segment will be specified, as a percentage gradient.

2.8 **Procedure Turns**

2.8.1 Except where an 80°/260° procedure turn is specifically prescribed, procedure turns specified in instrument approach procedures may be flown as 45°/180° or 80°/260° type, at pilots' discretion.

2.8.2 Since the 80°/260° procedure turn occupies less airspace along track than the 45°/180° type, aircraft completing an 80°/260° manoeuvre will normally return to the extended Final Approach Track approximately 1 NM closer to the FAP or FAF (when provided) than if a 45°/180° manoeuvre had been used; pilots using an 80°/260° manoeuvre should allow for this factor when preparing for any subsequent inbound descent. Where an 80°/260° procedure turn is specifically prescribed, due allowance for

this factor will already be provided in the procedure design.

2.9 **Race-track Procedure**

2.9.1 Extensions to holding patterns may be specified in some cases as alternative procedures for use after holding. Where such alternative procedures are joined without first entering the hold, they should be joined and flown as race-track procedures. However, because of the requirement to intercept the inbound track before returning to the facility following a Sector 1 parallel entry in such procedures, and its effect on the distance available for any subsequent descent, aircraft joining a race-track procedure from Sector 1 are recommended to join the hold prior to entering the racetrack.

2.10 **Established**

2.10.1 Aircraft are considered to be 'established' when they are within half full-scale deflection for the ILS and VOR, or within ± 5° of the required bearing for NDB(L).

2.11 **Missed Approach Climb Gradient**

2.11.1 Unless otherwise specified, the normal climb gradient upon which Missed Approach Procedures are based is 2.5% (1 in 40).

2.11.2 Where an operational advantage can be gained from an increased missed approach climb gradient, an additional OCA(H) associated with the increased missed approach climb gradient will also be published.

2.12 **Radar Approach Procedures**

2.12.1 During the Intermediate phase of the procedure the pilot will be asked to check both his Minima and the Missed Approach Point (MAPt); he will not be given the OCA(H) for his category of aircraft nor the location of the MAPt unless he specifically requests this information.

2.12.2 SRA procedures designed to ICAO PANS-OPS criteria permit descent on final approach to the OCA(H) (subject to any specified height/distance (Step Down Fix (SDF) limitation), without regard to the 'advisory altitudes/ heights' given by the Controller. These 'advisory altitude/heights' are not essential for obstacle clearance and are only provided as a guide to pilots wishing to maintain a constant angle descent path.

2.12.3 Pilots flying an SRA requiring the alternative datum profile, will be passed advisory altitudes/heights based on the appropriate datum and rounded up to the nearest 10 FT.

2.12.4 Pilots are recommended to fly to the radar advisory altitude/heights. However, where an SDF is specified as part of the procedure the SDF 'not-below' altitude/height is mandatory. Adherence to the nominal descent gradient defined by advisory altitude/ heights will ensure compliance with SDF minimum altitude/height requirements.

2.12.5 A MAPt is designated for each procedure; it is normally located at the point where the radar approach terminates (Radar Termination Range (RTR)). However, where operationally advantageous, the MAPt for the 2 NM SRA may be designated as 1 NM after RTR (i.e., 1 NM before touch down zone).

Note: *Where the MAPt is designated as 1 NM after RTR, talkdown will still cease at 2 NM (RTR), and it will be the pilot's responsibility to determine when the MAPt has been reached.*

3 Departing Flights

3.1 Aerodrome specific departure procedures can be found in the relevant AD 2.21 Noise Abatement Procedures, AD 2.22 Flight Procedures and AD 2.24 charts.

4 Other Relevant Information and Procedures

4.1 **FM Broadcast Interference**

4.1.1 Aircraft ILS/VOR equipment may experience interference from high powered FM broadcast stations in the radio frequency band 88 - 108 MHz (GEN 3.4 refers). Pilots are warned that instrument approach procedures based on ILS/VOR may not be available.

4.2 **Protection of Instrument Approach Procedures at Aerodromes outside Controlled Airspace**

4.2.1 Aerodromes located outside Controlled Airspace, for which Instrument Approach Procedures (IAP) are published, are identified by a 'feathered arrow' symbol on the Aeronautical Charts ICAO Scale 1: 500 000 United Kingdom and the Topographical Air Charts of the United Kingdom Scale 1: 250 000. Portrayal on these charts is provided to assist pilots of VFR flights to avoid confliction with IFR traffic at these aerodromes. Pilots are urged to take this information into account in their pre-flight planning.

ENR 1.5 HOLDING, APPROACH AND DEPARTURE PROCEDURES (continued)

4.2.2 For further information relating to Air Traffic Services at Aerodromes outside Controlled Airspace, please refer to GEN 3.3 Air Traffic Services.

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES

1 Primary Radar

1.1 General

1.1.1 Generally, the UK subscribes to the procedures for the use of ATS surveillance systems in the provision of ATS which are detailed within PANS-ATM (Doc 4444). Exceptions are the ATS surveillance service provided to VFR flights in class E airspace, and to all flights in class G airspace. These arrangements are described in ENR 1.1 paragraph 2 and summarised in ENR 1.6 paragraph 1.2.

1.2 Types of ATS Surveillance Service

1.2.1 **ICAO References**

Doc 4444, paragraph 8.

1.2.2 The provision of an Air Traffic Service is dependent upon specific types of airspace. Details of the services provided are stated in the table below.

Table (see also map at ENR 6-70).

Type of Airspace	Type of Service	ATC action with regard to Unknown Aircraft that may be in Unsafe Proximity to the Aircraft in Receipt of an Air Traffic Service
Class A, C and D Airspace.	Radar Control Service	If ATS surveillance system derived, or other information, indicates that the unknown aircraft is lost, has experienced radio failure or is making an unauthorised penetration of the airspace - avoiding action shall be given and traffic information shall be passed.
Class E Airspace, Controlled Airspace in which VFR flight without ATC clearance is permitted.		Pass traffic information unless the controller's primary function of sequencing and separating IFR flights is likely to be compromised. Avoiding action will be given at the request of pilots but to limits decided by the controller or if information has been received which indicates that a position indication/symbol may be a particular aircraft that is lost or experiencing radio failure.
Class G Airspace and Temporary Reserved Areas and all other airspace.	Deconfliction Service or Traffic Service	Traffic information will be passed followed by advice on avoiding action. or Traffic information will be passed but no avoiding action is to be given. The pilot is responsible for his own separation.

1.3 ATS Surveillance Service Outside Controlled Airspace

1.3.1 **London Control - Requests for Deconfliction Service or Traffic Service**

1.3.1.1 In order to avoid excessive RTF conversations on the frequencies used by 'London Control', pilots who intend to request such a service from 'London Control' are to make their initial request on the London Information frequency appropriate to their geographical position. The FISO will co-ordinate with the appropriate Radar Sector and subsequently inform the pilot whether or not a Deconfliction Service or Traffic Service can be provided and, if so, on what frequency.

1.3.1.2 Pilots should note that no Deconfliction Service or Traffic Service will be available on any London Control Frequency below FL 70. In any case a serviceable transponder will be a pre-requisite for either service.

1.4 Radar Vectoring — Controlled Airspace

1.4.1 At certain aerodromes where the associated Controlled Airspace does not encompass the Surveillance Minimum Altitude Area (SMAA), aircraft may be vectored outside the notified airspace for approaches to certain runways. The aerodromes and runways to which this procedure may apply are listed below:

Aerodromes	Runways	Aerodromes	Runways
Bournemouth	08	Prestwick	20
Leeds Bradford	14	Southend	05/23
London/City	27	Teesside International	05/23

1.5 Radar Vectoring for ILS Approach

1.5.1 **ICAO Reference**

Doc 4444, Chapter 8, paragraph 8.9.4.

1.5.2 Aircraft being positioned for final approach will be given a heading to close with the localizer at a range of at least 5 NM from the runway threshold and at a level below the glide path. The pilot will be told to complete the turn on and to report established on ILS, but at this point if he requests it, ATC will give another vector to bring the aircraft on to the localizer. If the pilot wishes to lock himself on to the localizer, he must ask permission from ATC when there is still time for the action to take place without crossing the

localizer.

1.5.3 On occasions in order to maintain the correct spacing between aircraft, ATC will deliberately vector the aircraft through the localizer for approach from the other side. Pilots will be warned when this manoeuvre is being given.

1.6 Terrain Clearance

1.6.1 **ICAO Reference**

Doc 4444, Chapter 8, paragraphs 8.6.5.2 and 8.6.5.3.

1.6.2 Controllers will ensure that levels assigned to IFR flights when in receipt of a Radar Control Service will provide at least the minimum terrain clearances given below:

1.6.2.1 Within 30 NM of the radar antenna but excluding the Final and Intermediate Approach Area: 300 M above any fixed obstacle which is closer than 5 NM to the aircraft or which is situated within the area 15 NM ahead of and 20 degrees either side of the aircraft's track. These distances may be reduced to 3 NM and 10 NM respectively where official CAA approval has been promulgated. Levels assigned to aircraft during initial approach will also provide this terrain clearance.

1.6.2.2 Outside 30 NM from the Radar Antenna, for flights on Airways, 300 M above any fixed obstacle within 15 NM of the centre-line; otherwise 300 M above any fixed obstacle within 30 NM of the aircraft.

1.6.2.3 Radar Controllers have no responsibility for the terrain clearance of, and will not assign levels to, aircraft operating Special VFR or VFR within controlled airspace which accept radar vectors.

Note: *In sections of ATS Routes where the base is defined as a Flight Level, the lowest usable level normally provides not less than 1500 FT Terrain Clearance.*

1.6.3 Within Class G Airspace, regardless of the service being provided, pilots are ultimately responsible for terrain clearance.

1.6.3.1 A Deconfliction Service shall only be provided to aircraft operating at or above the ATC unit's terrain safe level, unless on departure from an aerodrome when climbing to the ATC unit's terrain safe level, or when following notified instrument approach procedures.

1.6.3.2 Subject to ATS surveillance system coverage, a Traffic Service may be provided below ATC unit terrain safe levels. However, levels allocated by controllers shall be terrain safe unless an agreement is reached with the pilot, or such levels form part of VFR clearances for aerodrome arrival or to enter controlled airspace that by necessity require flight below the unit terrain safe levels. Controllers shall only instigate heading allocations when the aircraft is at or above an ATC unit's terrain safe level. However, if pilots request a heading from the controller whilst operating below the ATC unit terrain safe level, this may be provided as long as the controller reminds the pilot that he remains responsible for terrain clearance.

1.6.4 **ATC Surveillance Minimum Altitude Charts**

1.6.4.1 In November 2007, ICAO introduced new charting requirements for the depiction of minimum altitudes issued by a controller providing an ATC Surveillance service under the title ATC Surveillance Minimum Altitude Chart (ATCSMAC). The purpose of the ATCSMAC is to provide information that will enable flight crews to monitor and cross check altitudes assigned whilst receiving vectoring instructions from air traffic controllers.

1.6.4.2 In the UK, the ATCSMAC depicts the Surveillance Minimum Altitude Area(s) in the vicinity of a designated aerodrome. For the purposes of the UK application of ATCSMACs, the following definition of a Surveillance Minimum Altitude Area (SMAA) will apply:

'A Surveillance Minimum Altitude Area is a defined area in the vicinity of an aerodrome, in which the minimum safe levels allocated by a controller vectoring IFR flights with Primary and/or Secondary Radar equipment have been predetermined.'

1.6.4.3 Charts for individual aerodromes appear in the AIP Aerodrome Section (AD 2-EGXX-5-1). Each chart includes the following:

a) Outline of the Surveillance Minimum Altitude Area(s);
b) significant obstructions and spot heights;
c) minimum initial altitudes within the Surveillance Minimum Altitude Area(s) and detailed geographic delineation;
d) Final Approach Tracks;
e) Intermediate Approach Areas (where appropriate);
f) aerodrome elevation;
g) Transition Altitude;
h) Missed Approach instructions;
i) loss of communication procedures.

1.6.4.4 Further information about the criteria used in the design of ATCSMACs will be included in CAP 777 - ATC Surveillance Minimum Altitude Charts in UK Airspace, Policy and Design Criteria.

CAP 777 is available at: www.caa.co.uk (Publications).

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

1.7 Navigational Assistance

1.7.1 **ICAO Reference**

Doc 4444, Chapter 8, paragraph 8.6.6.

1.7.2 In order that a controller may provide the most appropriate advice/instructions, the pilot of an aircraft requesting navigational assistance when in receipt of an ATS surveillance service shall state the reason (eg to avoid areas of adverse weather or unreliable navigational instruments) and giving as much information as possible in the circumstances.

1.7.3 Identified aircraft operating within controlled airspace are deemed to be separated from unknown aircraft flying in adjoining uncontrolled airspace. However, whenever practicable the controller will aim to keep aircraft under his control at least 2 NM within the boundary of controlled airspace.

1.8 Weather Avoidance

1.8.1 **ICAO Reference**

Doc 4444, Chapter 8, paragraph 8.6.9.

1.8.2 In order to avoid weather, if a controller considers it expedient for the aircraft to leave controlled airspace, the pilot will be advised and will be responsible for accepting the detour into uncontrolled airspace.

1.8.3 In controlled airspace, a pilot using an aircraft radar and intending to detour around observed weather, must obtain a clearance from the controller before doing so. Under these circumstances, if it is necessary to leave controlled airspace the pilot must request permission to re-join.

2 Secondary Surveillance Radar (SSR)

2.1 General

2.1.1 In accordance with the Air Navigation Order, a SSR Mode S transponder shall be operated within the airspace notified at GEN 1.5, paragraph 5.3.1. In all other airspace, when a serviceable SSR transponder is carried, a pilot shall operate the transponder at all times during flight, regardless of whether the aircraft is within or outside airspace where SSR is used for ATS purposes in accordance with SERA.13001(a) and should enable pressure-altitude reporting if available, in order to facilitate detection of their aircraft by collision avoidance systems and ATS surveillance equipment.

2.1.2 Except for flight in airspace designated by the CAA for mandatory operation of transponder, aircraft without sufficient electrical power supply are exempted from the requirement to operate the transponder at all times.

2.1.3 In airspace where the operation of transponders is not mandatory, pilots of suitably equipped aircraft shall comply with paragraph 2.2.2.1.2.

2.1.4 With the exceptions detailed in paragraph 2 pilots **shall:**

a) If proceeding from an area where a specific Mode A code has been assigned to the aircraft by an ATS Unit, maintain that code setting unless otherwise instructed;
b) select or reselect Mode A codes, or switch off the equipment when airborne only when instructed by an ATS Unit;
c) acknowledge Mode A code setting instructions by reading back the code to be set;
d) select Mode C pressure-altitude reporting mode of the transponder simultaneously with Mode A unless otherwise instructed by an ATS Unit;

Note: *Where the term Mode C pressure-altitude reporting is used, the information and requirements also apply to pressure-altitude reporting employed by Mode S transponders in response to interrogations from Mode S radars.*

e) when reporting levels under routine procedures or when requested by ATC, state the current altimeter reading to the nearest 100 FT. This is to assist in the verification of Mode C pressure-altitude reporting data transmitted by the aircraft.

Note: *If, on verification there is a difference of more than 200 FT between the level readout and the reported level, the pilot will normally be instructed to switch off the Mode C pressure-altitude reporting mode of the transponder. If independent switching of Mode C pressure-altitude reporting is not possible, the pilot will be instructed to select Mode A code 0000 to indicate a transponder malfunction.*

2.2 Special Purpose Mode A Codes

2.2.1 Some Mode A codes are reserved internationally for special purposes and should be selected as follows:

a) Code 7700. To indicate an emergency condition, this code should be selected as soon as is practicable after declaring an emergency situation, and having due regard for the over-riding importance of controlling aircraft and containing the emergency. However, if the aircraft is already transmitting a discrete code and receiving an air traffic service, that code may be retained at the discretion of either the pilot or the controller;

b) Code 7600. To indicate a radio failure;
c) Code 7500. To indicate unlawful interference with the planned operation of a flight, unless circumstances warrant the use of Code 7700;
d) Code 1000. To indicate an aircraft conducting IFR flight as GAT, where the downlinked aircraft identification is validated as matching the aircraft identification entered in the flight plan;
e) Code 2000. When:

i. entering United Kingdom airspace from an adjacent region where the operation of transponders has not been required; or
ii. when operating within United Kingdom airspace in accordance with IFR and is either not receiving an ATS or has not received a specific instruction from ATS concerning the setting of the transponder; or
iii. unless instructed otherwise by ATS, Mode S transponder equipped aircraft on the aerodrome surface when under tow, or parked and prior to selecting Off or STBDY.

f) Code 7007. This code is allocated to aircraft engaged on airborne observation flights under the terms of the Treaty on Open Skies. Flight Priority Category B status has been granted for such flights and details will be published by NOTAM.

Note: *The Mode C pressure-altitude reporting mode of the transponder should be selected with all of the above Mode A codes.*

2.2.2 **Mode A Conspicuity Codes**

2.2.2.1 Conspicuity codes are annotated in the SSR Code Allocation List with an asterisk (*).

2.2.2.2 **Caution**

2.2.2.2.1 Caution is required when selecting Mode A conspicuity codes in the 70xx series due to the proximity of the Special Purposes Mode A codes.

2.2.2.2.2 Mode A and associated Mode C pressure-altitude reporting data of conspicuity codes must be considered unvalidated and unverified.

2.2.2.3 **General Conspicuity Codes**

2.2.2.3.1 When operating at and above FL 100 pilots of aircraft shall select the relevant Mode A conspicuity code (see paragraph 2.2.2.3.3) **and** the Mode C pressure-altitude reporting mode of the transponder except:

a) When receiving a service from an ATS Unit or Air Surveillance and Control System Unit which requires a different setting;
b) When circumstances require the use of one of the Special Purpose Mode A codes or one of the other specific Mode A conspicuity codes assigned in accordance with the UK SSR Code Allocation Plan.

2.2.2.3.2 When operating a SSR equipped aircraft below FL 100 in circumstances where the operation of SSR transponders is not mandatory, pilots shall select the relevant Mode A conspicuity code (see paragraph 2.2.2.3.3) with Mode C pressure-altitude reporting if available, except:

a) As in sub-paragraphs 2.2.2.3.1 (a) and 2.2.2.3.1 (b); or
b) When selecting a Frequency Monitoring Code (see paragraph 2.2.5).

2.2.2.3.3 Types:

*7000 – VFR conspicuity code: when operating within United Kingdom airspace in accordance with VFR and have not received a specific instruction from ATS concerning the setting of the transponder.

*2000 – IFR conspicuity code: when operating within United Kingdom airspace in accordance with IFR and have not received a specific instruction from ATS concerning the setting of the transponder.

2.2.2.4 **Other Conspicuity Codes**

2.2.2.4.1 In addition to Special Purpose Codes and the General Conspicuity Codes detailed above, other conspicuity codes are allocated in the UK SSR Code Allocation Plan, available as a digital dataset on the NATS AIS website at http://www.nats.aero/ais/datasets.

2.2.2.4.2 The use of aerodrome-specific conspicuity codes detailed in the UK SSR Code Allocation List should be strictly in accordance with local operating instructions/procedures as published by the relevant aerodrome.

2.2.3 **Transponder Testing**

2.2.3.1 Transponder testing has the potential to generate false SSR returns, thereby incorrectly triggering safety nets such as TCAS and short term conflict alert, with consequential disruption to flight crews and ATC and potential to cause an adverse safety impact. Therefore, individuals or Organisations intending to conduct ground-based transponder testing and maintenance shall take necessary precautions to ensure transponder transmissions cannot be erroneously identified as valid replies by airborne or ground

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

interrogator systems that may detect them. Consequently, the following steps are strongly recommended:

a) Set the Mode A code to *0002 (UK-specific ground transponder testing code);
b) Use effective screening or absorption devices on the antennas or physically connect the ramp test set to the antenna system;
c) Where possible, conduct the testing inside a hangar, as this may provide additional shielding;
d) Manually set the Mode C pressure-altitude data to either a high value (eg over 60000 FT) or an unrealistically low value (eg 2000 FT below ground);
e) Select the transponder(s) to 'OFF' or 'STANDBY' when testing is complete.

2.2.3.2 Additional guidance on transponder testing can be found in ICAO Annex 10 Vol IV, JAA TGL 13 and EUROCAE ED-73C.

2.2.4 **SSR Site Monitors/Far Field Monitors**

2.2.4.1 SSR site monitors, sometimes referred to as Far Field Monitors (FFMs) for Mode S radars, shall use Mode A codes *7776 and *7777, along with Mode C pressure-altitude data set to either a high value (eg over 60000 FT) or an unrealistically low value (eg 2000 FT below ground).

2.2.4.2 Mode S FFMs will also require an ICAO 24-bit address to uniquely identify them. These addresses shall be allocated as part of the National IFF/SSR Committee approval process. For further details contact: nisc@caa.co.uk

2.2.5 **Frequency Monitoring Codes**

2.2.5.1 In order to both prevent and mitigate the consequences of airspace infringements, pilots operating close to the peripheries of certain controlled airspace and monitoring the relevant frequency (but not requiring an Air Traffic Service) should select a local SSR conspicuity code and the Mode C pressure-altitude mode (if available) as specified to indicate they are monitoring the promulgated ATC frequency. This facility also exists for aircraft routing close to certain airfields outside controlled airspace to advise ATC that pilots are monitoring their frequency.

2.2.5.2 This will allow the appropriate Air Traffic Control Unit to attempt to establish contact with an aircraft which is displaying such a code and which is considered to be infringing, or is likely to infringe, controlled airspace in order to resolve an actual or potential infringement quickly and efficiently. For units outside controlled airspace, this will allow Air Traffic Control to attempt to establish contact with pilots in order to resolve potential conflictions. Selection of such codes does not imply the provision of any form of Air Traffic Service and the use of such codes does not prevent a pilot from requesting an Air Traffic Service at any time should they subsequently decide they require one.

2.2.5.3 In such circumstances, blind transmissions will be made by Air Traffic Control on the appropriate frequency including the code, position, level (if appropriate) and direction of flight of the observed contact. The Mode S-derived callsign may also be used. A pilot monitoring the frequency who suspects, on the basis of the information provided, that theirs is the aircraft being referred to should contact Air Traffic Control accordingly. At this point a discrete code may be assigned to confirm identity. The controller will establish the requirements of the pilot and will confirm the type of Air Traffic Service available. Exceptionally, Air Traffic Control may issue immediate instructions or advice to resolve a particular situation. For aircraft outside controlled airspace, Air Traffic Control may request the pilot’s compliance to achieve coordination. If, after positive identification or on the basis of additional information provided by the pilot it is felt that the aircraft responding is not the aircraft concerned, the pilot will be informed accordingly and may continue to monitor the frequency and if necessary revert to the appropriate monitoring code.

2.2.5.4 Use of monitoring codes does not imply that any form of Air Traffic Service is being provided. The code and any associated Mode C pressure-altitude reporting data is considered to be unvalidated and unverified. Pilots remain responsible for their own navigation and in particular for obtaining permission to enter controlled airspace and Aerodrome Traffic Zones from the appropriate agency.

2.2.5.5 Any pilot who believes they are flying in the vicinity of the aerodromes listed below who is lost or temporarily uncertain of position should immediately seek navigational assistance from the appropriate radar unit. Alternatively, they should select code 0030 and contact London Centre on 121.500 MHz for assistance.

2.2.5.6 **Codes in Use**

Refer to the UK SSR Code Allocation Plan, available as a digital dataset on the NATS AIS website at

http://www.nats.aero/ais/datasets.

2.3 Mode S Aircraft Identification

2.3.1 To comply with ICAO airborne equipment requirements, all Mode S transponder equipped aircraft engaged in international civil aviation must incorporate an Aircraft Identification Feature (sometimes referred to as Flight Identity or Flight ID). Correct setting of Aircraft Identification is essential for the correlation of radar tracks with flight plan data in Air Traffic Management (ATM) and Airport Operator ground systems. Data analysed by the Eurocontrol AMP has shown that many Mode S compliant aircraft are transmitting an incorrect Aircraft Identification, for example, incorrectly setting ABC_123 instead of ABC123.

2.3.2 **Incorrect Aircraft Identification settings compromise the safety and ATM benefits of Mode S and will prohibit automatic**

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

flight plan correlation, which could affect subsequent ATC clearances and sequencing.

2.3.3 In accordance with ICAO Doc 8168 (PANS-OPS) Vol III, Section 4, Chapter 1, paragraph 1.3, flight crew of aircraft equipped with Mode S having an Aircraft Identification Feature shall set the Aircraft Identification in the transponder. This setting shall correspond to the Aircraft Identification specified in item 7 of the ICAO flight plan, or if no flight plan has been filed, the aircraft registration or as detailed in paragraph 2.3.4.1.

2.3.4 Aircraft Identification, not exceeding 7 alphanumeric characters, is to be entered in item 7 of the flight plan and set in the aircraft as follows:

2.3.4.1 Either,

a) The ICAO three letter designator (not the IATA two letter designator) for the aircraft operating agency followed by the flight identification, for example, BAW213 or JTR25, when:

   i. In radiotelephony, the callsign used consists of the ICAO telephony designator for the operating agency followed by the flight identification, for example, SPEEDBIRD 213 or HERBIE 25.

   Or,

b) The registration marking of the aircraft, for example, G-INFO or EIAKO, when:

   i. In radiotelephony, the callsign used comprises the registration marking alone, for example, G-INFO, or is preceded by the ICAO telephony designator for the operating agency, for example, SVENAIR EIAKO;
   ii. the aircraft is not equipped with radio.

   Or,

c) The callsign determined by the military authorities if this will be used to identify the aircraft in radiotelephony during flight.

Note 1: *When the Aircraft Identification consists of less than 7 characters, no zeros, dashes or spaces are to be added, either before or between the characters. Only alphanumeric characters are to be used. Nothing should be added after the final character of the registration. For example, an aircraft registered 'G-INFO' would be input as 'GINFO'.*

Note 2: *Appendix 2 to ICAO Doc 4444 (PANS-ATM) refers. ICAO designators and telephony designators for aircraft operating agencies are contained in ICAO Doc 8585.*

2.3.5 Flight crew of aircraft which have the capability to change the downlinked aircraft identification feature when airborne shall not change the downlinked aircraft identification feature during the flight unless requested by the air navigation service provider.

2.4 Transponder Failure

2.4.1 Failure before intended departure

2.4.1.1 If the transponder fails before intended departure and cannot be repaired pilots shall:

a) Plan to proceed as directly as possible to the nearest suitable aerodrome where repair can be made;
b) inform ATS as soon as possible preferably before the submission of a flight plan. When granting clearance to such aircraft, ATC will take into account the existing and anticipated traffic situation and may have to modify the time of departure, flight level or route of the intended flight;
c) insert in item 10 of the ICAO flight plan under SSR the letter N for complete unserviceability of the transponder or in the case of partial failure, the letter corresponding to the remaining transponder capability, including unserviceability of any Mode S functionality, as specified in ICAO Doc 4444, Appendix 2.

2.4.2 Failure after departure

2.4.2.1 If the transponder fails after departure or en-route, ATS Units will endeavour to provide for continuation of the flight in accordance with the original flight plan. In certain traffic situations this may not be possible particularly when the failure is detected shortly after take-off. The aircraft may then be required to return to the departure aerodrome or to land at another aerodrome acceptable to the operator and to ATC. After landing, pilots shall make every effort to have the transponder restored to normal operation. If the transponder cannot be repaired then the provisions in paragraph 2.4.1.1 apply.

2.4.3 At present the temporary failure of Mode C alone would not restrict the normal operation of the flight.

2.5 Radio Telephony Phraseology For Use With SSR.

This is in accordance with ICAO Doc 4444, Chapter 12, para 12.4.3.

2.6 UK SSR Code Allocation Plan

The UK SSR Code Allocation Table is maintained as a digital dataset on the NATS AIS website at

http://www.nats.aero/ais/datasets.

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

Requests for changes to the UK Code Allocation Table should be submitted to ModeS@CAA.co.uk.

2.7 Centralised Code Assignment and Management System (CCAMS)

2.7.1 The UK is part of the Centralised Code Assignment and Management System (CCAMS). CCAMS optimises the efficiency of European SSR code management by centrally selecting a SSR Mode A code for each flight based on its area of applicability and distributing it to the appropriate ATS unit. The Originating Region Code Assignment Method (ORCAM) will continue to be used by those nations which are not participating in CCAMS for international flights. For participating nations CCAMS will allocate ORCAM compatible codes.

2.7.2 To mitigate against the risk of CCAMS failure or in the event of a potential confliction with a CCAMS allocated code, states are allocated blocks of codes that can be used in place of CCAMS if necessary. In the UK, these blocks of codes are managed by NATS and are articulated in Section 2.6 as “Allocated to NATS as CCAMS redundancy”.

3 Automatic Dependent Surveillance - Broadcast (ADS-B)

3.1 Commission Regulation (EU) No. 1207/2011, as amended, requires aircraft with a maximum certified take-off mass exceeding 5,700 KG or having a maximum cruising true airspeed capability greater than 250 KT, operating as GAT under IFR, to be equipped with ADS-B version 2, typically pairing of a 1090 MHz Mode S “Extended Squitter” (ES) Level 2 transponder with an approved GNSS navigation source to provide the required data items as per Annex II Part B of that regulation. This applies to transport-type State aircraft (military, customs or police fixed-wing aircraft operated for the purpose of transporting persons and/or cargo) unless notified to the UK CAA.

3.2 Aircraft that are unable to transmit ADS-B for technical or operational reasons will be accommodated by UK ANSPs through conventional surveillance e.g. Mode S. See section GEN 1.5.3.

3.3 The UK’s preferred national system to improve electronic conspicuity for general aviation is ADS-B using 1090 MHz. It is also likely that ADS-B will become more prevalent as a source of surveillance data for all aircraft types and to providers of ATS.

3.4 Extended Squitter devices using uncertified GPS sources may require the Surveillance Integrity Level to be set to zero.

4 Other Relevant Information and Procedures

4.1 Lower Airspace Radar Service (LARS)

4.1.1 **Availability of Service**

4.1.1.1 The service is available to all aircraft flying outside Controlled Airspace up to FL 100, in accordance with the table shown in 4.1.6 ATS Units Participating in the Lower Airspace Radar Service.

4.1.1.2 Pilots intending to operate at or above FL 100 may be advised to contact an appropriate ATCRU and request a Deconfliction Service or a Traffic Service. However, as VHF frequencies at Military ATCRU are not continuously monitored, unless in use, civil pilots may ask controllers to arrange a frequency on which to call the appropriate Unit.

4.1.2 **Description of Service**

4.1.2.1 The service provided will be a Deconfliction Service or Traffic Service as detailed at ENR 1.1, subsection 2 (UK Flight Information Service) and CAP 774 UK Flight Information Services. A Basic Service may be requested however as this is a non-radar service it does not form part of the LARS provision.

4.1.3 **Procedures**

4.1.3.1 Pilots intending to use the LARS should note the participating ATS Units close to their intended track and establish two-way RTF communication on the appropriate frequency using the phraseology in Chapter 3 of CAP 413 Radiotelephony Manual.

4.1.3.2 Aircraft will be identified and pilots so informed before radar service is given.

4.1.3.3 Whenever possible, aircraft will be handed over from controller to controller in an area of overlapping radar cover and pilots told to 'Contact' the next Unit. When this cannot be effected, pilots will be informed of their position and advised which Unit to call for further service.

4.1.3.4 If a pilot wishes to enter notified airspace, even though he may be in receipt of a LARS beforehand, he remains responsible for obtaining the required clearances or permissions before entry. LARS Controllers may assist in obtaining a clearance or permission, if workload permits, but pilots must be prepared to carry out this task independently.

4.1.4 **Terrain Clearance**

4.1.4.1 Terrain clearance will be the responsibility of pilots. However, LARS Units will set a level or levels below which a Deconfliction

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

Service is to be refused or terminated.

4.1.5 **Advice to Pilots**

4.1.5.1 The provision of LARS is at the discretion of the controllers concerned because they may be fully engaged in their primary tasks. Therefore, occasionally, the service may not be available.

4.1.5.2 Boscombe Down Service Limitations

4.1.5.2.1 Limited Traffic Service - At and below FL 40.

4.1.5.3 Cardiff Radar Service Limitations

4.1.5.3.1 Due to limits of surveillance cover, a LARS may not be available below altitude 3000 FT. Pilots will be advised if LARS is not available and an alternative ATS may be offered.

4.1.5.4 Farnborough Service Limitations

4.1.5.4.1 Limited Traffic Service - At all altitudes/Flight Levels. Aircraft inbound to Farnborough should contact Farnborough Radar on 134.355. Traffic inbound to Odiham should contact Odiham Approach on 131.305.

4.1.5.4.2 Traffic Service is not available below altitude 1500 FT.

4.1.5.5 Warton Service Limitations

4.1.5.5.1 Warton PSR is suppressed in certain sectors to mitigate interference from ground clutter and wind turbines. Pilots will be advised of reduced service by Warton Radar.

4.1.6 **ATS Units Participating in the Lower Airspace Radar**

Unit	Position	Frequency (MHz)/ Channel	Service Radius (NM)	Availability/ Remarks
Boscombe Down	510912N 0014504W	126.705	30	Mon-Thu 0900-1700 (0800-1600), Fri 0900-1600 (0800-1500). Opening hours may vary subject to operational flying requirements.
Bournemouth	504648N 0015033W	119.480	30	0800-2000 (0700-1900).
Brize Norton	514500N 0013459W	124.280	40	0900-1700 (0800-1600).
Cardiff	512348N 0032036W	119.155	40	0600-2300 (0500-2200).

4.1.7 **Farnborough LARS**

4.1.7.1 The co-ordinates of the Farnborough Radar Sectors are detailed below. The boundaries shown purely indicate the extent of the available service and DOES NOT infer that Farnborough LARS will be the controlling Authority for the crossing of either CAS or Military ATZs.

a) **LARS North**

520742N 0001825W - 520729N 0000708W - 520755N 0000723E - 520457N 0002608E - 520157N 0003808E - 515031N 0004700E – 514654N 0003118E – 513759N 0001801E – 513421N 0001707E – 513534N 0001246E – 513612N 0002639W - 513611N 0004133W - 514401N 0010541W thence clockwise by the arc of a circle radius 30 NM centred on 511631N 0004639W (Farnborough ARP) to 514550N 0005638W - 515411N 0004452W - 520742N 0001825W.

b) **LARS East**

511814N 0003550E - 505613N 0003110E - 504354N 0001455E - 504325N 0003247W - 504846N 0003247W - 510054N 0002700W - 511030N 0002352W thence clockwise by the arc of a circle radius 8 NM centred on 510853N 0001125W to 511118N 0002332W - 511242N 0001323W - 512013N 0001255W - 513611N 0001253W - 513534N 0001246E – 513421N 0001707E – 511833N 0002531E - 511814N 0003550E

c) **LARS West**

514401N 0010541W - 513611N 0004133W - 513612N 0002639W - 513611N 0001253W - 512013N 0001255W - 511242N 0001323W - 511118N 0002332W thence an arc radius 8 NM centred on 510853N 0001125W to 511030N 0002352W - 510054N 0002700W - 504846N 0003247W - 504325N 0003247W - 504313N 0004727W - 504957N 0010837W thence an arc 30 NM radius centred on 511631N 0004639W (Farnborough ARP) to 514401N 0010541W.

4.2 Radar Service - FL 100 and Above (Outside CAS)

4.2.1 **Availability of Service**

4.2.1.1 This service is available to all aircraft flying outside CAS in the London and Scottish FIRs between FL 100 and FL 190, and within active TRAs, subject to Unit capacity.

4.2.1.2 The military Units providing this service together with their boundaries are depicted on the chart at ENR 6-12. The table below shows their hours of operation, the RTF operating frequency on which this service is normally provided and a telephone number for pre-flight contact.

Unit and Callsign	Operating Hours	Initial Contact Frequency (ICF)	Telephone Number
78 Squadron Swanwick (Swanwick Mil)	H24 (Subject to 4.2.3)	North West Sector 134.300 MHz, North Sector 136.375 MHz, North East Sector 135.075 MHz, East Sector 133.325 MHz, Central Sector 128.700 MHz, West Sector (Northern) 127.450 MHz, West Sector (Southern) 133.900 MHz & South West Sector 135.150 MHz.	01489-612943 01489-612408 01489-612417
Western Radar	0645-1930 (0545-1830)	132.300 MHz	Admin: 01489-445560

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

4.2.1.3 Participating aircraft must be equipped with a serviceable transponder.

4.2.2 **Type of Service**

4.2.2.1 The service provided will be a Deconfliction Service or Traffic Service (See ENR 1.1.2).

4.2.3 **Availibility of Service**

4.2.3.1 Swanwick (Mil) will only provide an ATS 2300-0700 (2200-0600) Mon to Thu, and 2300-0700 (2200-0600) Fri to Mon subject to 2 weeks notification and associated approval. A request is to be sent to: SWK-Plans@mod.gov.uk and contain the details laid out in 4.2.4.1 (b). Swanwick (Mil) also have reduced staffing between the hours of 1800-2300 (1700-2200) Mon to Fri, provision of service will be prioritised in accordance with RAF Battlespace Management Orders.

4.2.4 **Procedures**

4.2.4.1 In order to comply with the requirements of the FPPS at 78 Squadron (Swanwick Mil), captains of aircraft requiring a radar service in the Upper or Lower Airspace within the Swanwick(Mil) area of responsibility are to pre-notify their intended flight details to Swanwick(Mil) by one of the following methods:

a) Pre-flight Notification - Flight Plans. As the preferred method of notification flight plans (F2919/CA48) should be submitted as far in advance of ETD as possible and in any case not less than 30 minutes before service is required. The Swanwick(Mil) signals address - EGZYOATT - must be included on the flight plan. When appropriate these additions to the standard flight plan format must also be included:

i. Item 18. The point and the time at which a radar service is required to commence;
ii. Item 15. The point of entry into the area and the point of exit.

Note: *Item 15. If a flight is planned to enter any CAS within the Swanwick(Mil) area of responsibility and a service is required before joining or after leaving CAS, both parts of the route may be entered in Item 15 of the same flight plan. In this case both IFPS - EGZYIFPS - and Swanwick(Mil) EGZYOATT must appear as addressees.*

b) Pre-Flight Notification - Military Prenote. When it has not been possible to file a flight plan, as sub-paragraph (a), relevant details of the intended flight should be telephoned by the pilot or by his aerodrome operations or ATC to Swanwick(Mil), Main Flight Plan Reception Section, (ATOTN Telephone Ext 6710) at least 15 minutes before service is required. Flight details should be passed in this order:

i. Callsign;
ii. number of aircraft (if more than 1) and aircraft type(s);
iii. position and time at which service is required to commence;
iv. speed and flight level at commencement of service;
v. route (including any required speed or level changes);
vi. position of leaving the delineated area (if applicable); and
vii. destination (ICAO Location Indicator).

c) In-Flight Notification (Air Filing). Exceptionally, when neither form of pre-flight notification has been made the flight details listed in sub-paragraph (b) above, may be notified in flight (Air Filed) by radio to:

i. ATCRU. Airfile with the ATCRU, currently providing a service for onward transmission by them to Swanwick(Mil) at least 15 minutes in advance of service being required;
ii. Swanwick(Mil). Request radar service by calling Swanwick(Mil) on the appropriate (ICF), at least 5 minutes before service is required passing the details listed in sub-paragraph (b) above.

d) In order to comply with the requirements of the FPPS for Western Radar, pilots and operators of aircraft leaving or joining Controlled Airspace within the Western Radar Area of Operation, who wish to receive an ATS from Western Radar are advised to file all flight plans (CA48) to both EUCHZMFP and EUCBZMFP not less than 30 minutes before the ATS is required.

The flight plan should include the following information:

i. Item 18. The point and time at which a UK FIS radar service will be required within the Western Radar Area of Operation.
ii. Item 15. The point of entry into and exit from the Western Radar Area of Operation.

Note: *An ATS is available to aircraft entering or leaving CAS within the Western Radar Area of Operation; therefore, to secure an ATS, Flight Plan Item 15 is to be fully completed.*

4.2.4.1.1 **Changes to Flight Details**

a) Pre-Flight Notification. Changes to pre-flight notifications are to be passed to Swanwick(Mil) as soon as possible by:

i. Amended flight plan if time permits (as in paragraph 4.2.3.1 (a)); otherwise
ii. by telephone (as in paragraph 4.2.3.1 (b)).

b) In-Flight Notification (Air Filing). By RTF as soon as possible (as in paragraph 4.2.3.1 (c)).

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

4.3 (Former) Pennine Radar Area of Responsibility

4.3.1 Area of Responsibility

4.3.1.1 Provision of ATS outside of controlled airspace within the area defined below is a NATS licensed task which is provided, subject to unit workload, by Swanwick(Mil):

a) 550000N 0015420W - 550000N 004444W - 534153N 0002245E - 534134N 0010443W - 534007N 0011937W - 535348N 0013100W - 535955N 0014027W - 540236N 0014900W - 535557N 0020827W - 541113N 0021858W - 541201N 0021700W - 545127N 0023916W - 550000N 0015420W.
b) But excluding:

i. Aerodrome Traffic Zones (ATZ);
ii. Danger Areas;
iii. Newcastle CTR/CTA;
iv. Teesside International CTR/CTA

4.3.1.2 Vertical limits between FL 55 and FL 195. Deconfliction Service will not be provided below 4000 FT Regional Pressure Setting (RPS). Exceptionally, a Traffic Service may be provided below 4000 FT RPS, however, radar vectors will not be provided. (If there are high traffic levels in the Vale of York AIAA this may preclude standard separation from being maintained and a Traffic Service or a re-route may be offered).

4.3.1.3 Core operating hours are Mon-Fri 0700-2030 (Summer 1hr earlier). However, outside of these hours a service may still be provided H24 subject to unit capacity.

4.3.1.4 The area of responsibility is depicted on chart ENR 6-14.

4.3.1.5 Other ATSUs providing a radar service, within the Area of Responsibility, are:

a) Lower Airspace Radar Service (LARS) areas of Warton, Teesside International, Newcastle, Leeming and Humberside;
b) Anglia Radar Area of Responsibility (ENR 6-25).

4.3.2 Flight Plan Requirements

4.3.2.1 Pilots wishing to receive an ATS from Swanwick(Mil) within the Former Pennine Radar Area are to include within their Flight Plan the Swanwick(Mil) address EGZYOATT, in addition to any other IFPS address requirements. This requirement also applies to aircraft wishing to join or leave L602 at ERKIT routing in or outbound from EGNT or EGNV. Failure to address Flight Plans to Swanwick(Mil) may result in the refusal of service.

4.3.3 Radio Communication

4.3.3.1 Pilots receiving a service who wish to leave the frequency temporarily (for example to listen to VOLMET), and as a result will be unable to maintain two-way communication, must inform the controlling unit (ordinarily Swanwick(Mil)) of their intentions to leave the frequency and also of their return to it.

4.3.3.2 The Initial Contact Frequency for Swanwick(Mil) is 135.075 MHz.

4.3.3.3 If radio communication is lost, attempts should be made to establish contact with either Newcastle, Teesside International, London or Scottish Control as appropriate to the planned route.

4.3.3.4 If complete radio failure occurs, pilots should follow the standard radio failure procedure detailed at ENR 1.1, paragraph 3.4.

4.4 Western Radar Area of Operation

4.4.1 Area of Operation

4.4.1.1 Provision of ATS outside of controlled airspace within the area defined below is a NATS licensed task provided on a full-time basis by Swanwick(Mil) and by Western Radar depending on the time of day and the flight profile.

a) 492840N 0045516W - 493146N 0060840W - 510000N 0080000W - 522000N 0053000W - 524406N 0053000W - 525704N 0053000W - 524318N 0050508W - 525038N 0045358W - 531042N 0053000W - 531500N 0053000W - 532315N 0051017W - 532019N 0033502W - 531855N 0031650W - 530313N 0024434W - 521902N 0014707W - 513536N 0012124W - 511623N 0012049W - 510122N 0012720W - 504944N 0013439W - 495813N 0020959W - 495427N 0023012W - 492840N 0045516W.
b) But excluding:

i. Danger Areas*;
ii. North Wales MTA.

Note: ** Western Radar may be able to obtain crossing clearance from the appropriate agency.*

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

4.4.2 Vertical limits between FL 100 and FL 195 (FL 245 within active TRAs). The service from Western Radar is intended for (although not exclusively restricted to) aircraft wishing to join or leave Controlled Airspace within the Area of Operation.

4.4.3 Western Radar core operating hours are daily 0645-1930 (0545-1830). Swanwick(Mil) will continue to provide an ATS on a full-time basis subject to unit workload.

4.4.4 Other ATSU's providing a radar service, within the Area of Operation, are:

a) Lower Airspace Radar Service (LARS) areas of Boscombe Down, Bournemouth, Brize Norton, Cardiff, Culdrose, Exeter, Farnborough North/West, Newquay, Plymouth Military, Shawbury, Valley and Yeovilton;
b) Swanwick(Mil);
c) Solent Radar.

4.4.5 **Flight Plan Requirements**

4.4.5.1 Pilots wishing to receive an ATS from Western Radar are to include within their Flight Plan the Western Radar address EGTTZFZC in addition to any other IFPS address requirements. Failure to address Flight Plans to Western Radar may result in the refusal of service.

4.4.6 **Radio Communication**

4.4.6.1 Pilots receiving a service who wish to leave the frequency temporarily (for instance to listen to VOLMET), and as a result will be unable to maintain two-way communication, must inform the controlling authority of their intentions to leave the frequency and also of their return to it.

4.4.6.2 The primary frequency for Western Radar is 132.300 MHz.

4.4.6.3 If radio communication is lost, attempts should be made to establish contact with either Swanwick(Mil), Newquay, Exeter, Bournemouth, Brize Norton, London Control or Scottish Control as appropriate to the planned route.

4.4.6.4 If complete radio failure occurs, pilots should follow the standard radio failure procedure detailed at ENR 1.1, paragraph 3.4.

4.5 Off-Shore Operations

4.5.1 **Southern North Sea Low Level Air Traffic Services and Helicopter Operating Procedures**

4.5.1.1 **Introduction**

4.5.1.1.1 To enhance flight safety and expedite Search and Rescue in the Southern North Sea Airspace, a Deconfliction Service, Traffic Service, Basic Service and Alerting Service is available from the Air Traffic Service Unit (ATSU) at Aberdeen Airport (Anglia Radar). These services are available to helicopters operating in support to the off-shore oil, gas and renewable industries and to civil and military aircraft transiting the area at and below FL 65.

4.5.1.2 **Description**

Lateral Limits	Vertical Limits	Controlling Authority Callsign and frequencies Hours
Anglia Radar Area of Responsibility 550000N 0010000W - 550000N 0030301E - 543715N 0025349E - 542245N 0024543E - 535745N 0025155E - 534003N 0025719E - 533503N 0025913E - 532809N 0030055E - 531803N 0030319E - 525551N 0030936E - 523606N 0025307E - 523612N 0014423E then following the coastline to 525655N 0010856E to Strubby (531836N 0001034E) to Easington (533919N 0000706E) - 550000N 0010000W.	FL 65 ——— SFC	Anglia Radar (Aberdeen ATSU). 'Anglia Radar' Primary: 125.275 MHz Secondary: 128.925 MHz **Hours:** 0630-2200 daily Winter (Summer 1hr earlier).

4.5.1.3 The ATSU will provide, within its specified area of responsibility, Deconfliction Service or Traffic Service within the limits of surveillance cover. Outside surveillance cover or in the event of surveillance failure, a Basic Service and Alerting Service will be provided within the limits of VHF cover. Outside the hours of service notified above, a Basic Service and Alerting Service is available within the limits of VHF RTF cover from the FIR Sector at London ACC, callsign 'London Information' on 124.600 MHz or 125.475 MHz. These services will be provided to helicopter pilots routing:

a) To off-shore installations, until the time that the pilot is in contact with the destination rig/platform;
b) from off-shore installations, from the time two-way communications is established with the ATSU, until the time that the pilot is in contact with the destination landing pad or other agency.

Note: *Under the terms of a Memorandum of Understanding between NATS Limited and the off-shore helicopter companies, aircraft operated by these companies will be provided with modified Flight Information Services, which are prefixed by the term 'Off-shore', eg 'Off-shore Deconfliction Service'.*

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

4.5.1.4 **Airspace Structure**

4.5.1.4.1 **Helicopter Main Routing Indicators (HMRI)**

4.5.1.4.1.1 Helicopter Main Routing Indicators are indicators of routes typically and routinely flown by helicopters operating to and from off-shore destinations and are promulgated for the purpose of signposting concentrations of helicopter traffic to other airspace users. HMRI promulgation does not predicate the flow of helicopter traffic. Whilst HMRIs have no airspace status and assume the background airspace classification within which they lie (in the case of the Southern North Sea, Class G), they are used by the air navigation service provider (NATS Ltd/Anglia Radar) and helicopter operators for flight planning and management purposes.

4.5.1.4.1.2 HMRIs have no lateral dimensions. Vertically the HMRIs over the Southern North Sea extend from 1500 FT AMSL to FL 60 (inclusive) except that:

a) Anglia Radar will not normally allocate cruising levels above FL 40 in the Southern North Sea beneath EGD323D, EGD323E and EGD323K. Where helicopter icing conditions or other flight safety considerations dictate, helicopters may be forced to operate below 1500 FT AMSL.

4.5.1.4.1.3 Compliance with the HMRI structure is not compulsory. In the general interests of flight safety, however, civil helicopter pilots are strongly encouraged to plan their flights using HMRIs wherever possible.

4.5.1.4.1.4 Other traffic operating in proximity of these routes are advised to maintain an alert look out, especially in the Off-shore Safety Area.

4.5.1.4.2 The Southern North Sea HMRI Structure is as follows:

HMRI 1	SORER (524815N 0013445E) to Indefatigable '23A' (*531924N 0023428E);
HMRI 2	SORER (524815N 0013445E) to Windermere (*534954N 0024617E) **(Note 1)**;
HMRI 3	BAGPA (525338N 0012421E) to Munro (*542602N 0021755E) **(Note 1)**;
HMRI 4	BAGPA (525338N 0012421E) to Trent (*541755N 0013930E) **(Note 1)**;
HMRI 5	Waveney (*532109N 0011811E) to Leman '27A' (*530313N 0021358E);
HMRI 6	LAGER (533640N 0000849W) to Viking 'B' (*532648N 0021954E);
HMRI 7	LAGER (533640N 0000849W) to Hyde (*534828N 0010144E) **(Note 1)**;
HMRI 8	LAGER (533640N 0000849W) to Rough 'A' (*534928N 0002811E) to Ravenspurn North (*540150N 0010603E) to Munro (*542602N 0021755E) **(Note 1)**;
HMRI 9	Rough 'A' (*534928N 0002811E) to Cleeton 'PQ' (*540159N 0004336E) **(Note 1)**;
HMRI 10	Cleeton 'PQ' (*540159N 0004336E) to Hyde (*534828N 0010144E) **(Note 1)**;
HMRI 20	Lowestoft (522824N 0014519E) to Inner Gabbard (515450N 0015636E) to Galloper (514710N 0015729E) **(Note 2)**;
HMRI 435	IRDUK (533327N 0025937E) to Carrack (*533444N 0024727E);
HMRI 440	INDEV (531720N 0030331E) to Indefatigable '49/24N' (*531717N 0024316E);
HMRI 445	KUSON (531141N 0030508E) to Indefatigable '49/24N' (*531717N 0024316E);
HMRI 446	KOPAD (530746N 0030615E) to Hewitt '52/5A' (*525956N 0015045E);
HMRI 447	LUVOR (524823N 0030321E) to Hewitt '52/5A' (*525956N 0015045E);
HMRI 450	LUVOR (524823N 0030321E) to RIKPU (524235N 0014227E).

Note 1: *The maximum cruising level beneath EGD323D, EGD323E and EGD323K is restricted to FL 40 unless cleared by Anglia Radar.*
Note 2: *HMRI 20 lies outside the Anglia Area of Responsibility and extends vertically from 500 FT AMSL to 2000 FT AMSL inclusive. There are no ATS service provision arrangements to support operations on this HMRI.*

4.5.1.4.3 **Off-shore Safety Areas (OSAs).** The Anglia OSA consists of the Airspace from surface to 3500 FT ALT within the area bounded by straight lines joining in succession:

533544N 0015732E - 533328N 0021621E - 532200N 0023900E - 531143N 0025505E - 523612N 0014423E then following the coastline to 525242N 0012618E - 532132N 0013545E - 532838N 0014150E - 533544N 0015732E.

4.5.1.4.4 **Helicopter Traffic Zones (HTZ).** HTZs are established as notification of helicopters engaged in platform approaches, departures and extensive unco-ordinated inter-platform transit flying. Inter-platform flying by civil helicopters within HTZs contained within the OSA will be conducted on the company or field discrete frequency. HTZs consist of the airspace from sea level to 2000 FT ALT contained within tangential lines, not exceeding 5 NM in length, joining the neighbouring circumferences of circles 1.5 NM radius

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

around each individual platform helideck.

4.5.1.4.4.1 The position of individual platforms, together with their maximum height AMSL and helideck height AMSL, within their parent field complex are detailed at paragraph 5.2.

4.5.1.5 **Operating Procedures**

4.5.1.5.1 **General**

4.5.1.5.1.1 **Helicopter Procedures.** Helicopter pilots wishing to use this service must establish two way RTF communication with the ATSU. For flights within the same or adjacent field complex, helicopter pilots should remain on the field frequency. Pilots should advise ATC before changing frequency and/or altitude.

4.5.1.5.1.2 **Fixed-Wing Procedures.** Pilots of civil and military fixed-wing aircraft intending to fly within the area of responsibility of Anglia Radar are strongly advised to make use of the services provided. Crews of wildlife and aerial survey aircraft should consider utilising notification procedures detailed at ENR 1.1.4 as well as contacting Aberdeen ATSU prior to commencing operations. Whenever possible civil aircraft should be flown above the Transition Altitude at the appropriate level. Pilots are also advised that the helicopters on inter-platform flights in the same field complex normally operate at 500 FT AMSL and frequently carry underslung loads which limit the pilot's ability to take sudden avoiding action.

4.5.1.5.2 **Position Reporting; ATC Reports**

4.5.1.5.2.1 Position reports on initial contact will include the following information:

a) Callsign;
b) Type;
c) Point of departure;
d) Point of next landing;
e) Altitude/requested Altitude;
f) Total number of people on board.

4.5.1.5.2.2 Subsequent position reports if requested by the ATSU will include the following abbreviated information:

a) Callsign;
b) Position;
c) Altitude.

4.5.1.5.2.3 Helicopter pilots will, prior to leaving a frequency, inform the ATSU of the next off-shore sector to be flown.

4.5.1.5.3 **Off-shore Safety Area (OSA)**

4.5.1.5.3.1 Pilots of helicopters entering the Anglia OSA should contact Anglia Radar.

4.5.1.5.3.2 **Fixed-Wing Procedures.** Military and civil pilots of fixed-wing aircraft are recommended to avoid the Anglia OSA, however, if penetration is essential, contact should be made with Anglia Radar no later than 10 NM before entering the area giving their position, altitude, squawk, heading and intentions. When unable to maintain contact with Anglia Radar, and where not previously allocated a squawk by Anglia Radar, pilots should squawk A0007 with ALT (or mode C) selected. Maritime patrol aircraft (MPA) and fisheries protection aircraft should squawk A7300 with ALT (or mode C) selected.

4.5.1.5.4 **Cruising Altitudes**

4.5.1.5.4.1 Helicopters will normally plan to fly at the following en-route altitudes:

a) Outbound (land to sea) 2000 FT and 3000 FT AMSL;
b) Inbound (sea to land) 1500 FT and 2500 FT AMSL;
c) Inter-field:

i. Northbound (270° to 089° MAG track) 1000 FT, 2000 FT and 3000 FT AMSL;
ii. Southbound (090° to 269° MAG track) 500 FT, 1500 FT and 2500 FT AMSL.

Above the Transition Altitude (3000 FT AMSL) all aircraft should conform to the Semicircular Rule.

4.5.1.5.5 **Altimeter Setting Procedures**

4.5.1.5.5.1 En-route altitudes of 3000 FT AMSL and below will be flown with reference to the appropriate Regional Pressure Setting (RPS). Anglia Radar will give the appropriate pressure setting on first contact. Helicopters operating in this area crossing from one Altimeter Setting Region (ASR) to another, and when in contact with Anglia Radar will not change the RPS datum until instructed

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

to do so. This procedure is to enable the Controller to plan and control vertical separation in the vicinity of an ASR boundary and beneath EGD323D, EGD323E, EGD323K and the Lakenheath ATA North.

Note: *When instructed by Anglia Radar to squawk the allocated code, helicopter pilots are requested to state their level to the nearest hundred feet in order that the Mode C transponder information can be verified.*

4.5.1.5.6 **Use of GPS for North Sea Operations**

4.5.1.5.6.1 UK AOC Holders intending to use GPS for en-route navigation for North Sea flight operations are to use GPS equipment that meets or exceeds CAA Specification 22. AOC holders requiring further information should contact their assigned flight operations Inspector. Non UK AOC holders are recommended to operate to at least the Specification 22 standard.

4.5.1.6 **Out of Hours Helicopter Operations**

4.5.1.6.1 Helicopter off-shore support activity is not confined to published ATS hours and helicopters may be operating in VMC or IMC at all levels and times.

4.5.2 **Northern North Sea and Atlantic Rim Low Level Air Traffic Services and Helicopter Operating Procedures**

4.5.2.1 To enhance flight safety and expedite Search and Rescue in the Northern North Sea Airspace, including Atlantic Rim Airspace and the East Shetland Basin, a Deconfliction Service, Traffic Service, Basic Service and Alerting Service is available from the Air Traffic Service Unit (ATSU) at Aberdeen Airport. These services are available to helicopters operating in support to the off-shore oil, gas and renewable industries and to civil and military aircraft transiting the area at and below FL 100.

4.5.2.2 **Description.** Within the areas of responsibility specified below, a Deconfliction Service or Traffic Service within the limits of surveillance cover and, outside surveillance cover or in the event of surveillance failure, a Basic Service and Alerting Service within the limits of VHF cover will be provided. Outside the hours of service notified above, a Basic Service and Alerting Service is available within the limits of VHF RTF cover from the FIR Sector at Scottish ACC, callsign 'Scottish Information' on 129.225 MHz. The above services will be provided to helicopter pilots routing:

a) To off-shore installations until two-way communication is established with their destination; and
b) from off-shore installations from the time two-way communication is established with the appropriate Sector.

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

Lateral Limits (A chart depicting the sectors is at ENR 6-23)	Vertical Limits	Controlling Authorities Callsign and frequencies Hours
Sumburgh Radar Sector — Cormorant QNH Area This area of responsibility is enclosed by straight lines joining in succession the following points: 602856N 0004429W - 610000N 0002000W - 610000N 0000000E - 605109N 0000000E thence clockwise by the arc of a circle radius 70 NM centred on 595243N 0011712W (SUM VOR) to 600453N 0010000E – 600000N 0010000E - 600000N 0000059E thence anti-clockwise by the arc of a circle radius 40 NM centred on 595243N 0011712W (SUM VOR) to 602856N 0004429W.	FL 85 SL	Sumburgh Radar (Aberdeen ATSU) 'Sumburgh Radar' – 131.300 MHz and 124.900 MHz (west of meridian 3 degrees West) **Hours:** (all Sumburgh Areas) 0630-2200 (0530-2100)
Sumburgh Radar Sector — Shetland QNH Area This area of responsibility is enclosed by straight lines joining in succession the following points: 602856N 0004429W thence anti-clockwise by the arc of a circle radius 40 NM centred on 595243N 0011712W (SUM VOR) to 593000N 0022203W - 593000N 0050000W - 610000N 0050000W - 610000N 0002000W - 602856N 0004429W. Sumburgh Radar Sector—Sumburgh QNH Area This area of responsibility, excluding the portion of the MORAY CTA contained within the area, is enclosed by straight lines joining in succession the following points: 600000N 0000059E thence anti-clockwise by the arc of a circle radius 40 NM centred on 595243N 0011712W (SUM VOR) to 593000N 0022203W - 590000N 0021602W – 590000N 0000319W - 594421N 0010000E – 600000N 0010000E - 600000N 0000059E.	FL 85 SL	
Sumburgh Radar Sector—Aberdeen QNH Area This area of responsibility, excluding the portion of the MORAY CTA contained within the area, is enclosed by straight lines joining in succession the following points: 590000N 0021602W - 590000N 0000319W – 583242N 0004037W – thence anti-clockwise by the arc of a circle radius 90 NM centred on 571838N 0021602W (ADN VOR) to 584825N 0021817W - 590000N 0021602W.	FL 85 SL	
Sumburgh Radar Sector — North Sea Area IV **(Delegated ATS, see ENR 2-2-1-1)** This area of responsibility is enclosed by straight lines joining in succession the following points: 610000N 0000000E - 610000N 0040000W - 630000N 0012637W - 630000N 0000000E - 610000N 0000000E.	FL 85 SL	
Aberdeen Sectors The area of responsibility, excluding the portion of the MORAY CTA and the Aberdeen CTR/CTA contained within the area, is enclosed by straight lines joining in succession the following points: 584825N 0021817W - 582000N 0024600W - 580946N 0031432W thence anti-clockwise by the arc of a circle radius 5 NM centred on 580539N 0030912W (Beatrice C) to 580313N 0031725W - 572100N 0023356W - 571838N 0021602W (ADN VOR) - 560000N 0013000W - 560000N 0000000E - 560510N 0031455E - 563540N 0023642E - 573628N 0020654E - 575416N 0015748E - 582546N 0012854E - 591722N 0014236E - 595346N 0020430E - 600000N 0020320E - 600000N 0010000E - 594421N 0010000E - 583242N 0004037W - thence anti-clockwise by the arc of a circle radius 90 NM centred on 571838N 0021602W (ADN VOR) to 584825N 0021817W.	FL 85 SL	Aberdeen ATSU. 'Aberdeen Radar' 134.100 MHz – within the defined sector, out to ADN 90 DME from the northwestern boundary to the 038 HMRI, and then out to ADN 80 DME clockwise from the 038 HMRI. 135.175 MHz - on and north of 065 HMRI 132.550 MHz - south of 065 HMRI within the Aberdeen sector outwith the areas described above. **Hours:** 0630-2200 (0530-2100).
Brent Radar Sector Area enclosed by straight lines joining in succession the following points: 605109N 0000000E - 620000N 0000000E - 620000N 0012222E - 612122N 0014718E (ALLOY) - 600000N 0020320E - 600000N 0010000E - 600453N 0010000E - thence anti-clockwise by the arc of a circle radius 70 NM centred on 595243N 0011712W (SUM VOR) to 605109N 0000000E.	FL 85 SL	Aberdeen ATSU. 'Brent Radar' - 122.250 MHz is the primary ATC frequency. **Hours:** Mon-Fri 0630-2200 (0530-2100), Sat & Sun 0700-2100 (0600-2000).
East Shetland Basin (ESB) To co-ordinate the inter-platform and transit helicopter traffic within the ESB, an ATS is established in the area which will provide Flight Information Services. Pilots intending to overfly the ESB below FL 85 are strongly recommended to contact Brent Radar before penetrating the Airspace.		

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

Lateral Limits (A chart depicting the sectors is at ENR 6-23)	Vertical Limits	Controlling Authorities Callsign and frequencies Hours
Area enclosed by arcs of circles joining in succession the following points: 614410N 0003900E - 612412N 0003900E (Gate Golf) - 610807N 0004319E (Gate Hotel) - 605828N 0004555E (Gate Juliet) - 604846N 0010430E (Gate Lima) - 604116N 0011454E (Gate Mike) - 603808N 0012042E (Gate November) - 603300N 0014257E (Gate Oscar) - 603300N 0015659E - 612122N 0014718E (ALLOY) - 614410N 0013329E - 614410N 0003900E.	FL 85 ——— SL	Aberdeen ATSU. 'Brent Radar' - 122.250 MHz is the primary ATC frequency. **Hours:** 0630-2200 Mon-Fri, 0700-2100 Sat & Sun, Winter (Summer 1hr earlier).

4.5.2.3 **Helicopter Main Routing Indicators (HMRI) - En-Route Structure**

4.5.2.3.1 Helicopter Main Routing Indicators are indicators of routes typically and routinely flown by helicopters operating to and from off-shore destinations and are promulgated for the purpose of signposting concentrations of helicopter traffic to other airspace users. HMRI promulgation does not predicate the flow of helicopter traffic. Whilst HMRIs have no airspace status and assume the background airspace classification within which they lie (in the case of the Northern North Sea, Class G), they are used by the air navigation service provider (NATS Ltd/ Aberdeen) and helicopter operators for flight planning and management purposes.

4.5.2.3.2 HMRIs have no lateral dimensions. Vertically the HMRIs over the Northern North Sea (55°N to 62°N) extend from 1500 FT AMSL to FL 85 (inclusive), except that:

Where helicopter icing conditions or other flight safety considerations dictate, helicopters may be forced to operate below 1500 FT AMSL.

4.5.2.3.3 Compliance with the HMRI structure is not compulsory. In the general interests of flight safety, however, civil helicopter pilots are strongly encouraged to plan their flights using HMRIs wherever possible.

4.5.2.3.4 Other traffic operating in proximity of these routes are advised to maintain an alert look out, especially in the Off-shore Safety Area (OSA).

4.5.2.3.5 **Off-shore Safety Areas (OSAs).** The Aberdeen OSA consists of the Airspace from surface to FL 100 within the area bounded by straight lines joining in succession:

590000N 0013755E following the North Sea Median Line (eastern limit of published Aberdeen Sector) to 560510N 0031455E - 560441N 0024328E - 571227N 0015238W then anti-clockwise around eastern boundary of the Aberdeen CTR/CTZ to HACKLEY HD (571948N 0015717W) then following the coastline anti-clockwise to 574044N 0015652W - 590000N 0013930W - 590000N 0013755E.

4.5.2.3.6 The HMRI track structure between Sumburgh and the East Shetland Basin is as follows:

a) HMRI 'Golf' (eastbound) - from 40 DME SUM on HMRI 'Hotel' direct to Gate 'Golf';
b) HMRI 'Hotel' (eastbound) - from Gate 'Hotel' parallel to HMRI 'Juliet' to 40 DME SUM thence to Sumburgh VOR;
c) HMRI 'Juliet' (westbound) - from Gate 'Juliet' direct track to Sumburgh VOR;
d) HMRI 'Lima' (eastbound) - from Sumburgh VOR direct to Gate 'Lima';
e) HMRI 'Mike' (westbound) - from Gate 'Mike' parallel to HMRI 'Lima' to 40 DME SUM thence to Sumburgh VOR.

4.5.2.3.7 **Aberdeen** based pilots use HMRIs, a track system centred on 571838N 0021602W (ADN VOR). The system is keyed to the outbound master HMRI 029 commencing at 575506N 0014423W and terminating at Gate 'Lima' (604846N 0010430E) on the ESB boundary. The other HMRIs, spaced at 3 degree intervals, are designated alternately 'inbound' or 'outbound' and are identified by three figures. They terminate at either the appropriate Gate on the ESB boundary or the Median Line. The table below shows co-ordinates for the Gates and the points at which the HMRIs intercept the Median Line. When operating to or from permanent off-shore installations or mobile vessels, pilots normally plan along the nearest HMRI. In the Aberdeen area, HMRIs 023 to 086 (inclusive) are joined to two parallel bi-directional 'feeder/funnel' HMRIs, HMRIs Whiskey and Echo. The direction of use of HMRIs Whiskey and Echo is dependent upon the runway in use at Aberdeen. VANOR (571408N 0020304W) and NOBAL (571518N 0020336W) are used as reporting points within the Aberdeen CTR.

HMRI 023	612412N 0003900E (G Gate)	HMRI 074	580248N 0015004E
HMRI 026	605828N 0004555E (J Gate)	HMRI 077	575606N 0015608E
HMRI 029	604846N 0010430E (L Gate)	HMRI 080	574904N 0020028E
HMRI 032	603808N 0012042E (N Gate)	HMRI 083	574153N 0020408E
HMRI 035	603300N 0014257E (O Gate)	HMRI 086	573435N 0020749E
HMRI 038	602326N 0015851E	HMRI 089	572709N 0021133E
HMRI 041	600658N 0020200E	HMRI 092	571931N 0021521E
HMRI 044	595102N 0020249E	HMRI 095	571139N 0021915E
HMRI 047	593014N 0015015E	HMRI 098	570328N 0022316E
HMRI 050	591341N 0014136E	HMRI 101	565455N 0022726E
HMRI 053	590103N 0013811E	HMRI 104	564556N 0023147E
HMRI 056	584942N 0013510E	HMRI 107	563633N 0023535E

HMRI 059	583924N 0013227E	HMRI 110	562416N 0025108E
HMRI 062	582958N 0012959E	HMRI 113	560957N 0030900E
HMRI 065	582221N 0013204E	HMRI 116	555535N 0032034E
HMRI 068	581553N 0013804E		
HMRI 071	580923N 0014403E		

4.5.2.3.7.1 HMRI Whiskey is aligned along the axis MOCHA (593256N 0012159W) to PETOX (573333N 0014902W) thence to Hackley Head (571949N 0015717W). When Runway 16 is in use at Aberdeen, HMRI Whiskey is the designated inbound track and when Runway 34 is in use HMRI Whiskey is the designated outbound track for traffic planning to operate at 2000 FT and above.

4.5.2.3.7.2 HMRI Echo is aligned along the axis GORSE (571037N 0015351W) to SPIKE (573226N 0013953W) to TYSTI (592224N 0011440W) to TIRIK (593219N 0011214W). When Runway 34 is in use at Aberdeen, HMRI Echo is the designated inbound track but will also be used by outbound traffic planning to operate below 2000 FT. When Runway 16 is in use at Aberdeen, HMRI Echo is the designated outbound track for traffic at all levels.

4.5.2.3.7.3 Helicopter traffic inbound to Aberdeen planning along HMRIs 026 to 086 (inclusive) will be required to maintain the inbound HMRI until intercepting either HMRI Whiskey (Runway 16 in use at Aberdeen) or HMRI Echo (Runway 34 in use at Aberdeen) and then follow the designated inbound track as directed by Aberdeen ATC. Inbound HMRIs south of the HMRI 086 terminate at 30 DME ADN, from whence helicopter traffic will be directed by Aberdeen ATC.

4.5.2.3.7.4 Outbound helicopter traffic utilising the HMRIs 023 to 113 (inclusive) will be directed by Aberdeen to join the desired outbound HMRI via either HMRI Whiskey/Echo or as directed to a specific position on the required HMRI, dependent upon the runway in use at Aberdeen. (Outbound HMRIs south of HMRI 086 commence at 40 DME ADN).

4.5.2.3.7.5 Within the Aberdeen sectors, Aberdeen ATC will allocate ALTs or FLs tactically to participating flights.

Pilots on inter-rigging flights should plan to fly at the following ALTs:

a) Northbound (270˚ to 089˚ MAG track) 1000 FT, 2000 FT and 3000 FT AMSL;
b) Southbound (090˚ to 269˚ MAG track) 500 FT, 1500 FT and 2500 FT AMSL.

Note: *Under certain operating and meteorological conditions civil helicopters may operate below the base of the HMRIs.*

4.5.2.3.8 **Aberdeen - Atlantic Rim (West of Shetland Operations)**

4.5.2.3.8.1 The HMRI tracks between Aberdeen and the Atlantic Rim (as depicted at ENR 6-27) are as follows:

a) HMRI X-Ray (Outbound) - ADN VOR (571838N 0021602W) to SMOKI (574637N 0023556W) to WIK VOR (582732N 0030601W) to SODKI (584751N 0033753W) to VAMLA (600000N 0040000W);
b) HMRI Yankee (Inbound) - NESTA (600000N 0041000W) to MADOX (584343N 0034639W) to WIK VOR (582732N 0030601W).

Note: HMRI X-Ray is bi-directional between Aberdeen and Wick.

4.5.2.3.8.2 Altimeter Setting:

a) Within 30 DME ADN - Aberdeen QNH, or as directed by ATC;
b) Outside 30 DME ADN - The appropriate Regional Pressure Setting (RPS), or as directed by ATC.

Note: To enable controllers to plan and control vertical separation near the boundaries of Altimeter Setting Regions (ASR), helicopters approaching an ASR boundary, and in radio contact with ATC, are not to change RPS until instructed to do so.

4.5.2.3.8.3 Cruising altitudes:

Within the Aberdeen sectors, Aberdeen ATC will allocate ALTs or FLs tactically to participating flights.

Note: *Under certain operating and meteorological conditions civil helicopters may operate below the base of the HMRIs.*

4.5.2.3.8.4 Moray Firth TMZ Phase 1 Controlling Authority Lossie Departures (119.575 MHz), active H24, see ENR 2.2 paragraph 4.

4.5.2.3.9 Charts depicting the Aberdeen Area HMRI track structure are at AD 2-EGPD-3-1/2. The chart at ENR 6-26 depicts the en-route HMRI track structure and shows the bi-directional HMRI established between the Ekofisk Hotel platform and platform P37/4, a route normally used by Norwegian helicopters.

4.5.2.4 **Operating Procedures**

4.5.2.4.1 **General**

4.5.2.4.1.1 **Helicopter Procedures.** Helicopter pilots wishing to use the service specified in paragraph 4.5.2.2 must file a flight plan. Pilots who have established two-way communication with the appropriate Sector and subsequently do not receive acknowledgement of a scheduled position report, should make every effort to relay the report via another aircraft or agency. For flights within the same

or adjacent field complexes, helicopter pilots should maintain RTF contact on the field, company or Traffic Area frequency. Position reports by civil helicopter pilots operating on HMRIs are to be based on distance from either Aberdeen or Sumburgh VORs, according to the departure or destination aerodrome. Position reports are only required if the flight is not receiving a radar service from the ATSU. In this instance, unless otherwise specified by the ATSU, an initial report is to be made on outbound HMRIs at 40 NM and then at 20 NM intervals, subject to the limitations of VHF cover. For inbound flights subsequent to the initial call, reports are to be made at the same 20 NM intervals according to the destination aerodrome. If the elapsed time between two reporting points exceeds 15 minutes, an additional report is to be made after 15 minutes elapsed time since the last report.

En-route position reports are to include the following information:

a) Callsign;
b) Position (HMRI and range);
c) ALT or FL;
d) Position of next intended report.

On lifting from an installation or ship off-shore, the initial report is to include:

a) Callsign;
b) Actual position and altitude;
c) Requested HMRI and point of joining;
d) Requested altitude;
e) Total persons on board.

4.5.2.4.1.2 **Fixed-Wing Procedures.** Pilots of civil and military fixed-wing aircraft intending to fly within the areas of responsibility of the above Sectors are strongly advised to make use of the services provided. Crews of wildlife and aerial survey aircraft should consider utilising notification procedures detailed at ENR 1.1.4 as well as contacting Aberdeen ATSU prior to commencing operations. Whenever possible civil aircraft should be flown above the Transition Altitude at the appropriate level. Pilots are advised that helicopters engaged on inter-platform flights within the same field complex normally operate at about 500 FT AMSL and frequently carry underslung loads which limit the pilot's ability to take sudden avoidance action.

4.5.2.4.2 **Off-shore Safety Area (OSA)**

4.5.2.4.2.1 Pilots of helicopters entering the Aberdeen OSA should follow procedures detailed in paragraph 4.5.2.4.1.1.

4.5.2.4.2.2 **Fixed-Wing Procedures** . Where penetration of the Aberdeen OSA is essential, contact should be made on the appropriate Aberdeen frequency (paragraph 4.5.2.2) no later than 10 NM before entering the OSA giving their position, altitude, squawk, heading and intentions. Military pilots not previously in contact with the ASACS should call Boulmer ICF (259.225) or the appropriate Aberdeen frequency. Where pilots are unable to maintain contact on the appropriate Aberdeen frequency or the ASACS, and when not previously allocated a squawk, they should squawk A0007 with ALT (or mode C) selected. Maritime patrol aircraft (MPA) and fisheries protection aircraft should squawk A7300 with ALT (or mode C) selected.

4.5.2.4.2.3 **General Procedures.** Within the Sumburgh Radar and Brent Radar sectors, Aberdeen ATC will allocate ALTs or FLs tactically to participating flights.

4.5.2.4.2.4 **Off-shore Operations.** Helicopter off-shore support activity is not confined to published ATS hours and helicopters may be operating in VMC or IMC at all levels and times.

4.5.2.4.2.4.1 The positions of individual platforms within their parent field complex are detailed at paragraph 4.5.5.2.

4.5.2.4.2.5 Within the Aberdeen ATSU Areas of Responsibility as described in paragraph 4.5.2.2, during the published hours of operation, the following QNH values will be used:

a) Brent Radar Sector and northern area of the Sumburgh Radar Sector - Cormorant QNH. If the actual Cormorant QNH data is lost, the Puffin or Marlin will be used as appropriate.
b) Central and eastern area of the Sumburgh Radar Sector - Sumburgh QNH.
c) Western area of the Sumburgh Radar Sector - Shetland Regional QNH.
d) Southern area of the Sumburgh Radar Sector, south of 59N – Aberdeen QNH.
e) Aberdeen Sector out to ADN DME 90 - Aberdeen QNH.
f) Aberdeen Sector beyond ADN DME 90 and north of HMRI 086 - Brae QNH. (If Brae QNH data is lost the Weller QNH will be used, this being the lower of the Rattray or Petrel RPS.)
g) Aberdeen Sector beyond ADN DME 90 and south of HMRI 086 - Fulmar QNH. (If Fulmar QNH data is lost the McCabe QNH will be used, this being the lower of the Rattray or Skua RPS.)
h) Aircraft routing on HMRI 086 will be instructed to set the most appropriate QNH for the traffic situation.

Note: *See chart at ENR 6-23 for areas.*

4.5.2.4.2.5.1 Transition level within the above areas will be determined with reference to the above pressure settings.

4.5.2.4.2.6 **Use of GPS for North Sea Operations**

4.5.2.4.2.6.1 UK AOC Holders intending to use GPS for en-route navigation for North Sea flight operations are to use GPS equipment that

meets or exceeds CAA Specification 22. AOC holders requiring further information should contact their assigned flight operations Inspector. Non UK AOC holders are recommended to operate to at least the Specification 22 standard.

4.5.2.5 **Sumburgh CTR Helicopter Procedures**

4.5.2.5.1 **Standard Arrival and Departure Routes**

4.5.2.5.1.1 The Standard Arrival and Departure Routes are established for use in conjunction with the HMRIs and are shown at AD 2-EGPB-3-1/2. The route orientation is dependant on the runway-in-use as follows:

a) Westerly Operation (Runways 27 and 33 in use):

Departures for the East Shetland Basin are to route via BODAM (595506N 0011606W) and those for HMRIs Whiskey/Echo are to route via SILOK (594612N 0012900W);

Arrivals from the East Shetland Basin are to route via IZACK (595327N 0010113W) and those from HMRIs Whiskey/Echo are to route via BENTY (594615N 0010810W).

b) Easterly Operation (Runways 09 and 15 in use):

Departures for the East Shetland Basin are to route via IZACK and those for HMRIs Whiskey/Echo are to route via BENTY;

Arrivals from the East Shetland Basin are to route via BODAM and those from HMRIs Whiskey/Echo are to route via SILOK.

4.5.2.5.1.2 Additionally, to assist in the integration of flights operating under VFR or, at night, in accordance with a Special VFR clearance, VFR/SVFR flights may be instructed to route via Mousa Lighthouse Visual Reference Point. (See AD 2-EGPB-2.22 paragraph 2).

4.5.2.5.2 **Helicopter Holding Patterns**

4.5.2.5.2.1 **IFR Holding Patterns.** IFR holding patterns are established at Juliet 20, Mike 20, MOCHA and TIRIK. The holds are 1-minute left-hand patterns aligned on the HMRI inbound track.

4.5.2.5.2.2 **Visual Holding Patterns.** Visual holding patterns are established at BODAM, Mousa Lighthouse VRP, IZACK, BENTY and SILOK. Holding is to be conducted clear of cloud and in sight of the surface and helicopters will adopt a 2 minute left-hand orbit, except at BENTY which is right-hand. Maximum holding altitude 1000 FT AMSL.

4.5.3 **Morecambe Bay and Liverpool Bay Gas Fields - Helicopter Support Flights**

4.5.3.1 Permanent platforms positioned on the Morecambe Bay and Liverpool Bay Gas Fields are shown at ENR 6-28.

4.5.3.2 **Helicopter Traffic Zone (HTZ)**

4.5.3.2.1 A Helicopter Traffic Zone (HTZ), established as notification of helicopters engaged in platform approaches, departures and extensive unco-ordinated inter-platform transit flying, is established around the Morecambe Bay and Liverpool Bay Gas Fields. A HTZ consists of the airspace from sea level to 2000 FT AMSL contained within the tangential lines, not exceeding 5 NM in length, joining the neighbouring circumferences of circles 1.5 NM radius around each individual platform helideck.

4.5.3.3 **Airspace Structure - Morecambe Bay**

4.5.3.3.1 The helicopter support land base is Blackpool Airport. Low level flights, normal operating height 1000 FT AMSL or above on the Blackpool QNH, operate daily between Blackpool Airport and the helidecks. Under certain operating and meteorological conditions civil helicopters may operate below 1000 FT AMSL on the Blackpool QNH.

4.5.3.3.2 The route structure is:

Blackpool to Point 'N' (534922N 0030858W) to DP4.

Note 1: *Point 'N' may be used as a holding point.*

Note 2: *Route is bi-directional.*

4.5.3.3.3 Helicopter traffic information is available from Blackpool Approach during published hours of operation.

4.5.3.3.4 Pilots are warned that gas release and burn-off operations may take place at any time without prior notification from off-shore gas installations.

4.5.3.4 **Airspace Structure - Liverpool Bay**

4.5.3.4.1 The helicopter support land base is Blackpool Airport. Low level flights, normal operating height 1000 FT AMSL on the Blackpool QNH, operate daily between Blackpool Airport and the helidecks. Transit height to/from the Lennox platform is 500 FT AMSL.

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

Flights between helidecks are normally conducted between 500 FT and 1000 FT.

4.5.3.4.2 The route structure is:

a) Blackpool to Gate G (534449N 0030441W) to Hamilton (533357N 0032716W);
b) Blackpool to Gate G to Lennox (533719N 0031037W).

Note: *Routes are bi-directional.*

4.5.3.4.3 Helicopter traffic information is available from Warton Approach during the Warton ATC published hours of operation. Outside these hours, information is available from Blackpool Approach.

4.5.3.4.4 Gas release and burn-off operations may take place at any time without prior notification from off-shore gas installations.

4.5.3.4.5 Burbo Bank TMZ Controlling Authority Warton, (APP 129.530 MHz), active Mon-Thu 0730-1900 (0630-1800), Fri 0730-1700 (0630-1600). See ENR 2.2.

4.5.3.4.6 Walney TMZ Controlling Authority Warton, (APP 129.530 MHz), active Mon-Thu 0730-1900 (0630-1800), Fri 0730-1700 (0630-1600). See ENR 2.2.

4.5.3.5 **Altimeter Setting**

4.5.3.5.1 The Blackpool QNH will be used by helicopter support flights in transit to and from Blackpool Airport, and within the Morecambe Bay and Liverpool Bay Gas Fields.

4.5.4 **Flight Plan Procedures for Helicopter Operations over Sea Areas around the United Kingdom**

4.5.4.1 Pilots are warned of the need to consider application of the procedures detailed at ENR 1-10-4 paragraph 1.11, when operating under both VFR and IFR in support of off-shore facilities (particularly over the Southern and Northern North Sea, Atlantic Rim and Morecambe and Liverpool Bays). When flying to a location without an ATSU or AFTN link, nomination of a responsible person is vital to guarantee the initiation of alerting action in the event of non-arrival.

4.5.5 **RTF and NDB Frequencies Used on Off-shore Installations**

4.5.5.1 **General**

4.5.5.1.1 All Operators wishing to establish an aeronautical radio station within the UK Off-shore Areas under concession are required to obtain regulatory approval from the Civil Aviation Authority prior to operating that radio station.

4.5.5.1.1.1 Application for approval to establish and operate an aeronautical radio station on fixed or mobile installations must be made to Ofcom:

Post: Spectrum Licensing, PO Box 1285, Warrington, WA1 9GL.
Phone: 020-7981 3131.
Email: spectrum.licensing@ofcom.org.uk
Http: www.ofcom.org.uk/manage-your-licence

This application will then be passed to the Civil Aviation Authority (CAA) for approval. Following the approval process, operators of radio stations should hold the following:

a) An equipment approval under the Air Navigation Order (ANO), issued by the CAA;
b) A frequency assignment, issued by the CAA;
c) An aeronautical radio licence under the Wireless Telegraphy Act 2006 ('the WT Act'), issued by Ofcom.

Applicants should note that coordination with other European states may be necessary before a frequency assignment can be made; applications for approval should be made as early as possible and can be made up to six months before operationally required.

4.5.5.1.2 Frequencies listed for fixed installations and the frequency plan for mobile installations in UK Areas Under Concession.

a) Information on frequencies in use by the off-shore helicopter community can be obtained from the Helideck Certification Agency at http://www.helidecks.org/index.php/helideck-certificates;
b) Mobiles must operate in accordance with the frequency plan shown in paragraph 4.5.5.3;
c) Aeronautical RTF operations for all installations north of 56°N and east of 5°W and within the UK Off-shore Areas Under Concession, with the exception of the East Shetland Basin – that is Off-shore RTF Areas A to I **(Note 1)** – have each been provided with two RTF frequencies, one for Traffic **(Note 2)** RTF calls and the other for Logistics **(Note 3)** RTF calls, as listed in paragraph 4.5.5.3.1. No suffix will be added to the Civil Aviation Authority approved callsign when traffic information is to be passed by the operator of the aeronautical radio station. When logistics information is to be passed the suffix 'LOG' shall be added to the approved callsign.

ENR 1.6 ATS SURVEILLANCE SERVICES AND PROCEDURES (continued)

Simultaneous operation of the traffic and the LOG frequencies may be required, installations are therefore required to carry radio facilities to support this.

Note 1: *Operators wishing to operate installations in Area X on the RTF frequency allocations chart should contact the Authority at least 90 days before operation is required in order to obtain a temporary RTF frequency assignment.*

Note 2: *The Traffic frequency is to be used for giving information on aircraft positions, obtaining deck clearance, and for lifting calls.*

Note 3: *The logistics (LOG) frequency should be used for all other calls permitted within the terms of an OPC service such as, departure messages, in-field routings, payload information, and ordering fuel and refreshments.*

RTF Operation - Areas A to P: *RTF frequency assignments for off-shore installations may only be used for communication between installations and aircraft that are both within the same off-shore RTF frequency assignment area. The Traffic frequencies may be used for communication with aircraft that are below 2000 FT and the LOG frequencies may be used for communication with aircraft that are below 7000 FT*

Published Air Traffic Service procedures should be followed where available. A listening watch should be maintained with the Air Traffic Service Unit (ATSU) where possible. Prior to leaving the ATSU's operating area, pilots should advise the ATSU of the aircraft's movement intentions. Where maintaining a listening watch with the ATSU is not possible and at all times when the aircraft is below 1500 FT a listening watch on the RTF Area Traffic Frequency shall be maintained.

Outbound - To the off-shore installation: *Pilots who are in communication with the ATSU should, once established in the descent and still above 1500 FT, establish contact with their destination on the Area Traffic Frequency, and hand over the flight watch. They should then advise the ATSU on passing 1500 FT. Landing clearances should be obtained from the HLO who will be operating on the Traffic frequency.*

Inbound - From the off-shore installation: *Lifting calls should be made on the Traffic frequency. Once airborne establish communication with the appropriate ATSU whilst below 1000 FT or as soon practical. Published Air Traffic Service procedures should be followed where available.*

The appropriate LOG frequency should be used as required to exchange information with the destination. When operating below 1500 FT or outside the ATSU's area of operation pilots should retune the ATSU radio to the LOG frequency for passing Logistics information. When not being used for LOG messages the radio should be retuned to monitor the appropriate ATSU's frequency.

4.5.5.1.3 Offshore installation's VHF RTF facilities and aeronautical Non Directional Beacons operate by arrangement only; the unserviceability of these facilities will **NOT** be promulgated by NOTAM.

4.5.5.1.4 **NDBs on both fixed and mobile installations generally operate on shared frequencies.** NDBs that share frequencies should only be switched on if requested by the helicopter pilot and then only after the frequency has been monitored by the pilot and found to be vacant immediately prior to switching on. The pilot should advise the NDB operators as soon as they no longer require the use of the NDB. When no longer required the NDB should be switched off. Additionally, in order to assist helicopters transiting fields a small number of NDBs on fixed installations have been assigned frequencies that enable them to operate as close to H24 as practical. Pilots may find these NDBs already on and that they remain on after they have advised the installation that they no longer require their use.

4.5.5.1.5 Flight Information Services are provided by NATS Limited from Aberdeen in the Aberdeen ATSU Off-shore Areas of Responsibility (ENR 6-23 and 6-25).

4.5.5.2 **RTF and NDB Frequencies/Channels for Fixed Installations**

4.5.5.2.1 Data on RTF and NDB frequencies/channels in use by the off-shore helicopter community can be obtained from the Helideck Certification Agency at http://www.helidecks.org/index.php/helideck-certificates.

4.5.5.3 **RTF and NDB Frequencies/Channels used on Off-shore Installations in the UK Areas under Concession**

4.5.5.3.1 RTF Frequencies/Channels for Off-shore Installations.

Note 1: *Simultaneous operation of NDBs on the same frequency by more than one mobile installation is likely to result in incorrect navigational information being displayed to pilots. For this reason it is essential that NDB operators read and comply with Notes regarding off-shore radio facilities. CAA Doc 446 is available from the department detailed at paragraph 4.5.5.1.1.1.*

Note 2: *Alternative arrangements may be desirable for flight safety reasons when working adjacent to a permanent installation. These will be agreed by the CAA in consultation with the parties concerned. Where the mobile installation temporarily uses the RTF frequency assigned to the permanent installation, helicopters will not normally use the mobile NDB because of the difficulty in co-ordinating with other users of the same NDB frequency.*

Note 3: *If NDB operation does become necessary the appropriate NDB frequency shown in the diagram at ENR 6-31 is to be used and the helicopter company involved is requested to co-ordinate use with other mobiles on the appropriate area frequency.*

INTENTIONALLY BLANK

ENR 1.7 ALTIMETER SETTING PROCEDURES

1 Notification

1.1 The Selected Transition Altitudes listed in paragraph 4 are notified for the purposes of SERA.3110 Cruising Levels, SERA.5005 Visual Flight Rules and SERA.5020 IFR - Rules Applicable to IFR Flights within Controlled Airspace.

1.2 For the purpose of SERA.5005(g), aircraft in level cruising flight and operated in accordance with the visual flight rules above 3000 FT AMSL are not required to be flown at a cruising level appropriate to its magnetic track unless flying in conformity with the conditions specified by the appropriate air traffic control unit.

1.3 For the purposes of SERA.5025(a), an aircraft in level flight outside controlled airspace at or below 3000 FT AMSL and operated in accordance with the instrument flight rules is not required to be flown at a cruising level appropriate to its magnetic track if it flies:

a) in conformity with the instructions of the appropriate air traffic service unit; or
b) in accordance with holding procedures notified in relation to an aerodrome.

2 Introduction

2.1 The Altimeter Setting Procedures in use in the UK generally conform to those contained in ICAO Doc 8168-PANS OPS/611 and Doc 4444-PANS ATM/501. Differences are in bold.

2.2 The purpose of these procedures is to provide pilots with suitable pressure information which will assist them in maintaining adequate terrain clearance and also to ensure a safe standard of flight separation by the general use of altimeters set at 1013.2 hPa.

3 General Procedures

3.1 The Transition Altitude within the UK is 3000 FT except in, or beneath, that Airspace specified at paragraph 4.1.

3.2 Transition Altitudes are shown in the aerodrome directory in AD 2.17 as well as on aerodrome Approach and ATC Surveillance Minimum Altitude Charts.

3.3 The vertical position of aircraft at, or below, any Transition Altitude will normally be expressed in terms of Altitude. The vertical position at, or above, any Transition Level will normally be expressed in terms of Flight Level. When descending through the Transition Layer the vertical position will be expressed by pilots in terms of Altitude, and when climbing in terms of Flight Level. The Transition Altitude and the Transition Level may be used concurrently in cruising flight, with vertical separation ensured.

3.4 Flight Levels are measured with reference to the Standard Pressure datum of 1013.25 hPa. In the UK, the first available Flight Level above the Transition Altitude is separated from the Transition Altitude by a minimum pressure interval corresponding to a nominal 1000 FT in the ISA. Consecutive IFR cruising Flight Levels above the Transition Level are separated by pressure intervals corresponding to 1000 FT in the ISA up to and including FL 410 and by pressure intervals corresponding to 2000 FT in the ISA above FL 410. Cruising level requirements are detailed at ENR 1.7, paragraph 6.1. FL 195 will not be allocated as a cruising level.

3.5 QNH reports should be obtained from an ATS Unit. These QNH values are rounded down to the nearest whole hectopascal but are available at certain aerodromes in tenths of hectopascals for landing aircraft on request.

3.6 Altimeter setting procedures at military aerodromes may vary from those detailed in this section.

3.7 **Altimeter Setting Regions (ASR).** To make up for any lack of stations reporting actual QNH, the UK has been divided into a number of ASRs for each of which the National Meteorological Office calculates the lowest forecast QNH (Regional Pressure Setting) for each hour. These values are available hourly for the period H+1 to H+2 and may be obtained from all aerodromes having an Air Traffic Service, from London AC (Swanwick) and Scottish AC (Prestwick), or by telephone.

3.8 The ASRs are listed below together with the MET Office Codes. The area covered by the Regions are shown on the combined Flight Information Region (FIR) and ASR Chart at ENR 6-18.

Skerry (01)	Holyhead (07)	Chatham (12)	Orkney (17)
Portree (02)	Barnsley (08)	Portland (13)	Marlin (18)
Rattray (03)	Humber (09)	Yarmouth (14)	Petrel (19)
Tyne (04)	Scillies (10)	Cotswold (15)	Skua (20)
Belfast (05)	Wessex (11)	Shetland (16)	Puffin (21)

3.9 Airspace within all Control Zones (CTRs), and within and below all Terminal Control Areas (TMAs), Control Areas (CTAs) except Airways and the Worthing and Clacton Control Areas, during their notified hours of operation, does not form part of the ASR Regional Pressure Setting system.

3.10 When flying in Airspace below TMAs and CTAs detailed above, pilots should use the QNH of an adjacent aerodrome when flying at or below the Transition Altitude. It may be assumed that for aerodromes located beneath such Areas, the differences in the QNH values are insignificant. When flying beneath Airways whose base levels are expressed as Altitudes pilots are recommended to use the QNH of an adjacent aerodrome in order to avoid penetrating the base of Controlled Airspace.

3.11 Pilots operating north of 6130N within the Airspace detailed at ENR 2.2, paragraph 1.1 when not receiving a service from Sumburgh Radar are advised to set the Puffin Regional Pressure Setting as the pressure datum whilst flying at or below 3000 FT.

ENR 1.7 ALTIMETER SETTING PROCEDURES (continued)

3.12 The QNH settings to be used within the Northern North Sea Radar Service Areas are shown at ENR 6-23.

4 Selected Transition Altitudes

4.1 The following Transition Altitudes apply to flights within or beneath the following Airspace:

Aberdeen CTR/CTA	6000 FT
Belfast CTR/TMA	6000 FT
Birmingham CTR/CTA	6000 FT
Bristol CTR/CTA	6000 FT
Cardiff CTR/CTA	6000 FT
Channel Islands CTR/CTA	5000 FT
Clacton CTA	6000 FT
Daventry CTA	6000 FT
East Midlands CTR/CTA	6000 FT
Edinburgh CTR/CTA	6000 FT
Glasgow CTR/CTA	6000 FT
Leeds Bradford CTR/CTA	5000 FT †
Liverpool CTR/CTA	5000 FT
London TMA	6000 FT
Manchester TMA	5000 FT
Newcastle CTR/CTA	6000 FT
Norwich CTR/CTA	5000 FT †
Scottish TMA	6000 FT
Solent CTA	6000 FT †
Sumburgh CTR/CTA	6000 FT †
Teesside International CTR/CTA	6000 FT †
Worthing CTA 1, 2, 3 and 5	6000 FT

Note: *† Outside the notified hours of operation the Transition Altitude is 3000 FT.*

5 Detailed Procedures

5.1 **Take-off and climb**

5.1.1 A QNH altimeter setting is given with the taxiing clearance prior to take-off.

5.1.2 At UK aerodromes the designated location for pre-flight altimeter checks is the apron.

5.1.3 For all major UK aerodromes, the apron elevation (or the elevation of various parts of an apron where there is significant variation between them) has been determined and the value is displayed in the flight clearance office at the aerodrome concerned. It is also given at AD 2.8.

5.1.4 Within Controlled Airspace a pilot should set one altimeter to the latest Aerodrome QNH prior to take-off. While flying at, or below, the Transition Altitude vertical position will be expressed in terms of altitude based upon the Aerodrome QNH. When cleared for climb to a Flight Level, vertical position will be expressed in terms of Flight Level, unless intermediate altitude reports have been specifically requested by Air Traffic Control.

5.1.5 Outside Controlled Airspace, a pilot may use any desired setting for take-off and climb. However, when under IFR, vertical position must be expressed in terms of Flight Level on climbing through the Transition Altitude.

5.1.6 Pilots taking-off at aerodromes beneath Terminal Control Areas and Control Areas should use aerodrome QNH when flying below the Transition Altitude and beneath these Areas, except that the aerodrome QFE may be used when flying within the circuit. It may be assumed that for aerodromes beneath the same TMA or CTA the differences in their QNH values are insignificant.

5.2 **En-route**

5.2.1 **Within Controlled Airspace**

5.2.1.1 At and above the transition level and during en-route flight the aircraft should be flown at Flight Levels. The latest and most appropriate Regional Pressure Setting value is to be used for checking terrain clearance in flight. Aircraft flying in a Control Zone or TMA at an Altitude at or below the Transition Altitude will be given the appropriate QNH setting in their clearance to enter the

ENR 1.7 ALTIMETER SETTING PROCEDURES (continued)

Zone/TMA.

5.2.2 **Outside Controlled Airspace and within Active TRAs**

5.2.2.1 In flight at or below 3000 FT AMSL, pilots may use any desired setting. However, pilots flying beneath a TMA or CTA should obtain the QNH from an aerodrome situated beneath that area when flying below the Transition Altitude. It may be assumed that for aerodromes beneath the same TMA or CTA, the differences in the QNH values are insignificant. References to vertical position in flight plans and communications with ATC are to be expressed in terms of altitude.

5.2.2.2 **Outside Controlled Airspace**

a) **IFR**. When flying under IFR above the Transition Altitude, pilots must have 1013.2 hPa selected on an altimeter and conform to the cruising levels at ENR 1.7 paragraph 6.1. An aircraft in level flight operated in accordance with the instrument flight rules outside controlled airspace at or below 3000 FT AMSL is not required to conform with the cruising levels at ENR 1.7 paragraph 6.1 if it is flown in conformity with the instructions of the appropriate air traffic service unit; or in accordance with holding procedures notified in relation to an aerodrome.
b) **VFR**. When flying under VFR, aircraft in level cruising flight and operated in accordance with the visual flight rules above 3000 ft amsl are not required to conform with the cruising levels at ENR 1.7 paragraph 6.1 unless flying in conformity with the conditions specified by the appropriate air traffic control unit. The latest and most appropriate lowest forecast Regional Pressure Setting value should be used for checking terrain clearance.

5.2.2.3 **Flight within Active TRAs**

a) **IFR**. When flying under IFR above the Transition Altitude, pilots must have 1013.2 hPa selected on an altimeter and conform with the cruising level requirements at ENR 1.7, paragraph 6.1.
b) **VFR**. When flying under VFR, pilots are recommended to conform with the cruising level requirements at ENR 1.7, paragraph 6.1. The latest and most appropriate lowest forecast Regional Pressure Setting value should be used for checking terrain clearance.

5.3 **Approach and Landing**

5.3.1 When an aircraft is descended from a Flight Level to an Altitude preparatory to commencing approach for landing, ATC will pass the appropriate aerodrome QNH. In addition, ATC will also pass the Transition Level in due time prior to reaching it during descent either by voice communications, ATIS broadcast or if available, data link. On vacating the Flight Level, the pilot will change to the aerodrome QNH unless further Flight Level vacating reports have been requested by ATC, in which case, the aerodrome QNH will be set following the final Flight Level vacating report. Thereafter, the pilot will continue to fly on the aerodrome QNH until established on final approach. When requested by the pilot or local procedures require, the appropriate QFE and aerodrome or threshold elevation shall also be given.

5.3.2 **When carrying out a radar approach, ATC will assume that an aircraft is using QNH on final approach and will include a reminder of the appropriate QNH setting in the RTF phraseology. If the pilot requests to undertake the approach using QFE, then ATC will pass the appropriate QFE and 'height' will be substituted for 'Altitude' in the RTF phraseology. It should be noted that the Obstacle Clearance Height is always given with reference to the aerodrome or threshold elevation.**

5.3.3 Pilots landing at aerodromes beneath Terminal Control Areas and Control Areas should use aerodrome QNH when flying below the Transition Altitude and beneath these Areas, except that the aerodrome QFE may be used when flying within the circuit. It may be assumed that for aerodromes within the boundary of the same TMA or CTA, differences in their QNH values are insignificant.

5.3.4 The threshold elevation of each instrument runway that is 7 ft or more below the aerodrome elevation is given at AD 2.12. The barometric pressure setting to be used for landing on such a runway will be passed by ATC as QNH . . . . threshold elevation . . . . , or QFE . . . . threshold . . . . .

Note: *At USAF operated aerodromes QFE is not used. All procedures below the Transition Altitude will be based on aerodrome QNH, and all vertical displacements given as altitudes. Aerodrome QFE will be available on request.*

5.4 **Missed Approach**

5.4.1 In the event of a missed approach, pilots may continue to use the altimeter setting selected for final approach, but reference to the vertical position of the aircraft exchanged in communication with ATC should be expressed in terms of altitude on aerodrome QNH, unless otherwise instructed by ATC.

5.5 **Flight Planning**

5.5.1 The levels at which a flight is to be conducted are to be specified in the flight plan:

a) In terms of flight level numbers for that part of the flight to be conducted at or above the transition level; and
b) in terms of altitudes (ft) for that part of the flight at or below the Transition Altitude.

5.5.2 The flight level or levels selected for a flight should ensure adequate terrain clearance at all points along the route to be flown,

should meet Air Traffic Service requirements and comply with the cruising levels at ENR 1.7, paragraph 6.1, where applicable.

5.5.3 The information required to determine the lowest flight level to ensure adequate terrain clearance may be obtained from the appropriate Air Traffic Service Unit or Meteorological Office. A chart for converting QNH values to flight levels for this purpose is shown at ENR 1.7-5.

5.5.4 The Transition Altitude applicable to the aerodromes of departure and destination and for alternate aerodromes should be noted.

5.5.5 Flight levels are to be specified in the flight plan by number and not in terms of ft as is the case with altitudes.

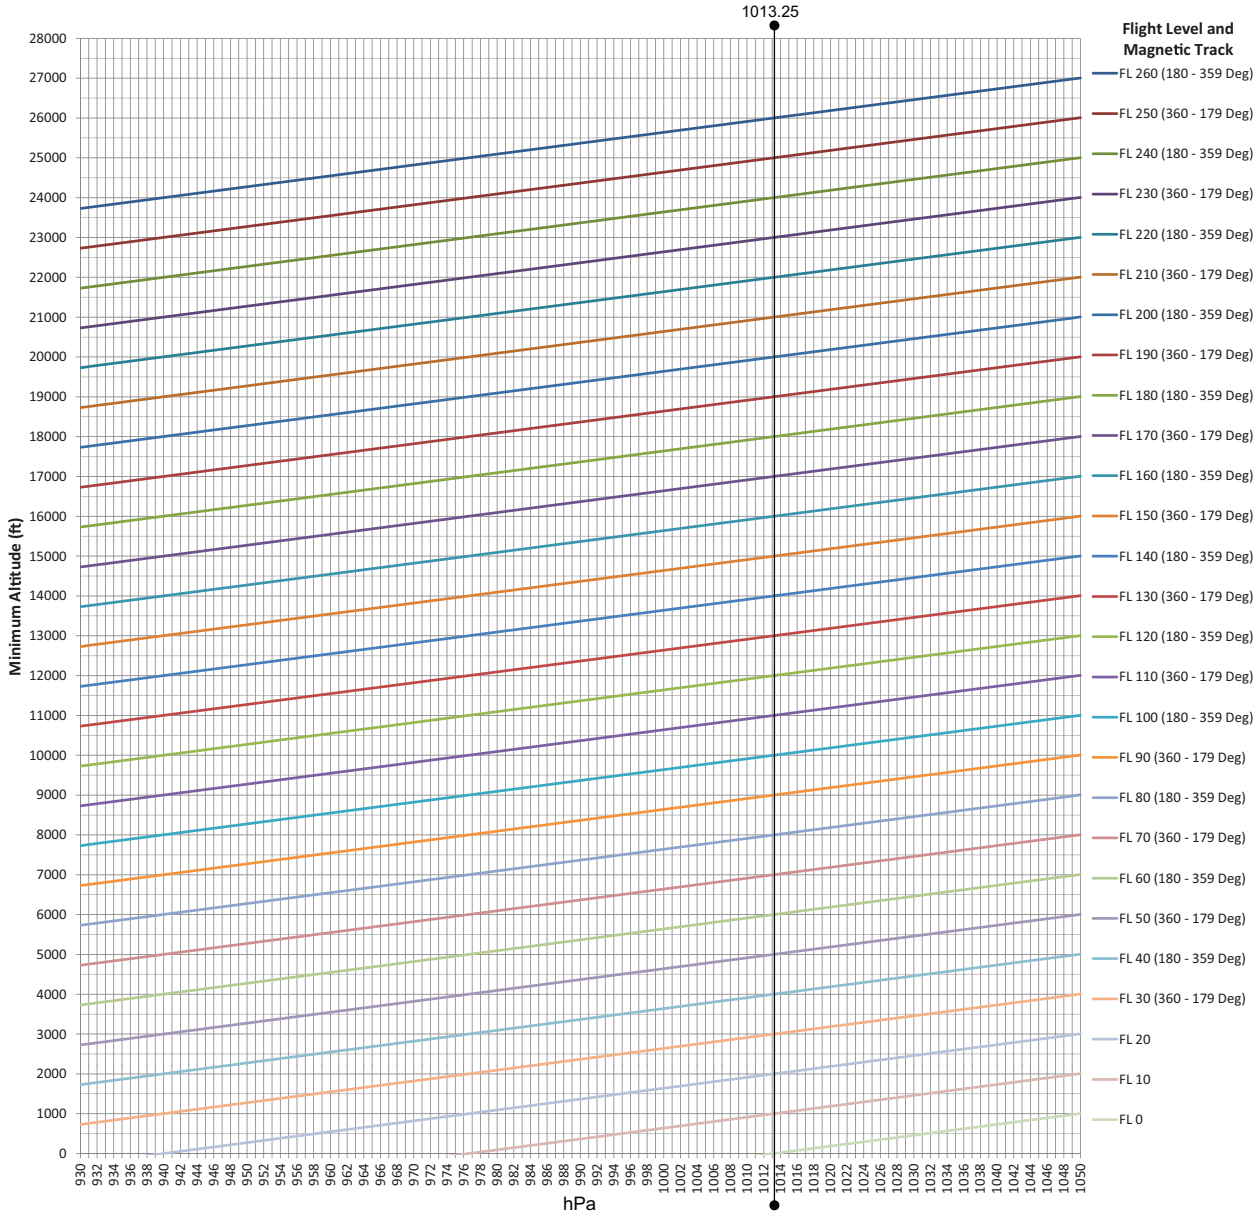
5.5.6 When flight plans are filed for IFR flights above 3000 FT AMSL outside Controlled Airspace in the UK, the cruising level must be selected from the appropriate table at paragraph 6.1.

6 Tables of Cruising Levels

6.1 The cruising levels to be observed when so required are as follows:

Within Controlled Airspace in areas where, on the basis of regional air navigation agreement and in accordance with conditions specified therein, a vertical separation minimum (VSM) of 1000 FT (300 M) is applied between FL 290 and FL 410 inclusive (†);

Magnetic track°			
From 000 degrees to 179 degrees		**From 180 degrees to 359 degrees**	
IFR Flights	**VFR Flights**	**IFR Flights**	**VFR Flights**
Level	**Level**	**Level**	**Level**
1000 FT and above at intervals of 2000 FT. 41000 FT and above at intervals of 4000 FT.	Odd thousands plus 500 FT to 27500 FT (FL 275).	2000 FT and above at intervals of 2000 FT. 43000 FT and above at intervals of 4000 FT.	Even thousands plus 500 FT to 28500 FT (FL 285).



(†) Except when, on the basis of regional air navigation agreements, a modified table of cruising levels based on a nominal vertical separation minimum of 300 M (1000 FT) is prescribed for use, under specified conditions, by aircraft operating above FL 410 within designated portions of the airspace.

Note: *VFR flight by civil aircraft above FL 195 shall not be permitted unless it has been accorded specific arrangements by the appropriate ATS authority. VFR flight shall only be authorised:*

i. In reserved airspace;
ii. Outside reserved airspace up to FL 285, and then only when authorised in accordance with the procedures detailed for Non-Standard Flights in Controlled Airspace. See ENR 1.1 paragraph 4.1.9.

ENR 1.7 ALTIMETER SETTING PROCEDURES (continued)

FLIGHT LEVEL GRAPH

INTENTIONALLY BLANK

ENR 1.8 REGIONAL SUPPLEMENTARY PROCEDURES

(DOC 7030)

Regional supplementary procedures are applied in accordance with ICAO Doc 7030/5 Regional Supplementary Procedures.

1 RVSM

1.1 The airspace within the London and Scottish UIRs between FL 290 and FL 410 inclusive is an element of EUR RVSM airspace. Furthermore, the airspace within the London and Scottish UIRs between FL 290 and FL 410 inclusive is designated for the purpose of transitioning non-RVSM approved aircraft operating to/from the North Atlantic Region.

1.2 Within this airspace, the vertical separation minimum shall be:

a) 300 M (1000 FT) between RVSM approved aircraft;
b) 600 M (2000 FT) between:

i. **non-RVSM approved State aircraft** and any other aircraft operating within RVSM airspace;
ii. all formation flights of State aircraft and any other aircraft operating within RVSM airspace; and
iii. non-RVSM approved aircraft and any other aircraft operating in the EUR RVSM airspace.

2 Aircraft Not Equipped With 8.33 kHz Capable Radios

2.1 State aircraft which are permanently exempted from the requirement of having radio equipment with the 8.33 kHz channel spacing capability shall be able to communicate on the remaining VHF 25 kHz frequencies or on UHF, where available. Before departure, and prior to embarking the aircraft, pilots of non-8.33 kHz equipped State aircraft shall contact ATC by telephone in order to confirm their non-equipped status, and where the initial Tower is 8.33 kHz State aircraft shall be provided with the appropriate 25 kHz VHF or UHF frequency.

2.2 Aircraft (other than State aircraft) flying VFR are explicitly exempted from compliance with the provisions of articles 4.5 and 5.4 of the Regulation (EU) Article 14 of (EU) (IR) No. 1079/2012 as described below;

a) The following ATS Units participating in the Lower Airspace Radar Service only:

Location	25 kHz Frequency (MHz)
FARNBOROUGH EAST	123.225
FARNBOROUGH NORTH	132.800
LOSSIEMOUTH	119.575

→

Note: *The dates on which the conversions to 8.33 kHz will take place at these airports will be published in the appropriate AIRAC amendments.*

INTENTIONALLY BLANK

ENR 1.9 AIR TRAFFIC FLOW MANAGEMENT AND AIRSPACE MANAGEMENT

1 Introduction

1.1 Air Traffic Flow Management is a service established with the objective of contributing to a safe, orderly and expeditious flow of air traffic by ensuring ACC capacity is utilised to the maximum extent possible and the traffic volume is compatible with the capacities declared by the appropriate ATC authority.

1.2 A Centralised Air Traffic Flow Management (ATFM) service is established within the ICAO (EUR) Region to optimise the use of air traffic system capacity. The Eurocontrol Network Management Directorate (NMD) in Brussels provides this service in conjunction with Flow Management Positions (FMPs) established at each ACC.

1.3 The NMD includes the Flow Management Division (FMD), responsible for the planning, co-ordination and implementation of ATFM measures within the FMD ATFM area and the Flight Data Operations Division (FDOD), responsible for collecting, maintaining and providing data on all flight operations and the air navigation infrastructure. FDOD includes the Integrated Flight Planning System (IFPS). A description of the ATFM area and information on the Network Operations Systems can be found in the Network Operations HANDBOOK.

2 ATFM Documentation

2.1 **ICAO European Region ATFM Procedures**

2.1.1 The general ATFM procedures which apply throughout the ICAO European Region are published in the ICAO Doc 7030, Regional Supplementary Procedures (Europe).

2.2 **Network Operations Technical Procedures and Information**

2.2.1 Specific Network Operations Technical procedures and information can be found in the Network Operations HANDBOOK published by the NMD and available from:

Post: Eurocontrol Library, Rue de la Fusée, 96, B-1130 Brussels, Belgium.
Phone: 00-32-2-729-3639/3023
Fax: 00-32-2-729-9109

or from the NMD website at:

Http: https://www.public.nm.eurocontrol.int/PUBPORTAL/gateway/spec/index.html

2.2.2 Basic Network Operations HANDBOOK sections include:

a) **General and Network Operations Systems:** this contains details of the NMD organisation, area of responsibility and a description of Network Operations systems;
b) **The ATFM Users Manual:** this is a self-contained users manual for aircraft operators and ATC units describing Network Operations procedures in the context of the NMD TACTICAL (TACT) and Computer Allocated Slot Allocation (CASA) systems;
c) **IFPS Users Manual:** this is a self-contained users manual describing operating procedures for flight plan filing in the IFPS area.

2.2.3 Only a limited selection of Network Operations Technical procedures are reproduced in the UK AIP. Reference should be made to the Network Operations HANDBOOK for comprehensive information and procedures.

3 ATFM Processes

3.1 The emphasis for ATFM measures is changing from regulation (delaying aircraft on the ground) towards capacity management. Only when no other option is available will a regulation be applied and delays issued (Slot Allocation).

3.2 Alternative ATFM measures include the re-routing of aircraft both strategically and tactically. Permanent Strategic routing requirements are published in the Route Availability Document (RAD). The RAD enables ATC to maximise capacity by defining restrictions that prevent disruption to the organised system of major traffic flows through congested areas.

3.3 In addition, routing 'scenarios' may be applied by the NMD to help resolve particular problems on particular days. These involve recommended or mandatory routes for particular groups of flights or selected individual flights. Re-routes for groups of flights will be published by the NMD in an AIM (Air Traffic Flow and Capacity Management Information Message) or ANM (ATFM Notification Message).

3.4 Re-routing may include restricting the level of an aircraft to keep it out of a particular ATC sector. This is known as level capping. Level capping scenarios are published for groups of aircraft.

3.5 A list of available re-routing and level capping scenarios is promulgated on the NMD website:

Http: https://www.public.nm.eurocontrol.int/PUBPORTAL/gateway/spec/index.html

3.6 Aircraft Operators (AOs) complying with a re-route or level capping requirement shall cancel any existing flight plan and re-file on the new route in accordance with the Replacement Flight Plan procedure published in the IFPS Users Manual section of the Network Operations HANDBOOK.

ENR 1.9 AIR TRAFFIC FLOW MANAGEMENT AND AIRSPACE MANAGEMENT (continued)

4 Slot Allocation Process

4.1 When no other option is available, a regulation will be applied by NMD and departure times will be issued in the form of a Calculated Take Off Time (CTOT). This is facilitated by Computer Assisted Slot Allocation (CASA) algorithm within the Enhanced Tactical Flow Management Systems (ETFMS).

4.2 The ETFMS is largely automated and functions from an Aircraft Operators point of view in a passive mode. There is, therefore, no requirement to request a slot as the act of filing a flight plan effectively constitutes a request.

4.3 Pre-planned or strategic ATFM regulations are promulgated by the NMD one day in advance by ATFM Notification Messages (ANM). All changes and tactical additions are promulgated by ANM revision messages.

4.4 For flights subject to a regulation, ETFMS will send a Slot Allocation Message (SAM) containing a CTOT at Estimated Off- Block Time (EOBT) -2 hours. This will be sent to the aerodrome of departure as well as the Aircraft Operator via AFTN or SITA.

4.5 Revisions to, or cancellations of, the last issued CTOT may be initiated by FMD, the Aircraft Operator, or the FMP/ATC unit on behalf of the AO. AOs requiring assistance should contact either the FMD Central Flow HELPDESK (Tel: 00-32-2-745-1901) or the UK FMP (see paragraph 6.3).

4.6 All CTOT revisions or cancellations are to be made using the ATFM message exchange procedures described in the Network Operations HANDBOOK.

4.7 Full details of the Slot Allocation Process are published in the ATFM Users Manual section of the Network Operations HANDBOOK.

5 Flight Planning

5.1 The ATFM rules for flight planning, as defined in ICAO Doc 7030, are:

a) For flights likely to be subject to ATFM measures Aircraft Operators shall submit Flight Plans to IFPS at least 3 hours before the EOBT;
b) AOs filing flight plans for flights within the NMD ATFM area or from within the ATFM adjacent area and entering the ATFM area shall assume their flight is subject to ATFM measures and subject to the requirement to submit a flight plan at least 3 hours before EOBT;
c) AOs should be aware that late filing of a flight plan may lead to a disproportionate delay;
d) Full details of flight planning requirements within the NMD ATFM area are included in the NMD ATFM Users Manual;
e) It is also important that the EOBT of a flight is as accurate as possible. It is a European requirement that all controlled flights departing, arriving or overflying Europe subject to a change in an EOBT of more than + or - 15 minutes shall notify the change to the NMD through IFPS. Modification procedures to enable Aircraft Operators to meet this requirement are described below.

5.2 In all cases, it is in the best interest of Aircraft Operators to initiate prompt revisions or cancellations, thus permitting the system to maximise use of available capacity and minimise delay. The later the revision is made the greater the probability of a delay .

5.3 The correct application of the STS/ATFMX procedure will ensure that approved flights are not unnecessarily delayed. (See paragraph 12 for details of the ATFM exemption procedures).

5.4 **Jet aircraft with a total sector length exceeding 220 NM**

5.4.1 In order to reduce complexity in the London Area Control (Swanwick) airspace, and thus provide greater capacity for all airspace users, the following flight planning restriction applies to all aircraft operators filing flight plans, repetitive flight plans and subsequent change messages for jet aircraft planning to operate in UK airspace.

5.4.2 Where the total sector length (including any portion outside the London/Scottish UIR/ FIR) exceeds 220 NM operators are to file a requested flight level for the entire route at FL 250 or above unless prior approval has been given by the UK FMP.

5.4.3 Requests for such approval are to be made to the UK FMP on 00-44-(0)1489-588150.

6 UK FMP Tactical Operations

6.1 The Network Manager (NM) at the UK FMP is responsible for the day to day monitoring, planning and co-ordination of all ATFM measures affecting traffic entering, leaving, overflying or remaining within the UK. The FMP is responsible for all co-ordination between ATC and the FMD and for providing ATFM support to Aircraft Operators.

6.2 The Network Management Specialist (NMS) is responsible to the Network Manager for monitoring delays and FMD regulations to optimise traffic flow through UK sectors. The NMS will also undertake message exchanges with the FMD on behalf of ATC or Aircraft Operators when required.

ENR 1.9 AIR TRAFFIC FLOW MANAGEMENT AND AIRSPACE MANAGEMENT (continued)

6.3 **Responsibilities of the FMP**

6.3.1 The UK has established a single H24 FMP to provide liaison between UK ATC and the FMD as shown in the table below:

FMP	Location	Area of Responsibility	ACC Served
UK FMP	London Area Control (Swanwick)	London and Scottish FIRs/UIRs Shanwick OCA	London Control (Swanwick) Scottish and Oceanic AC (Prestwick)

6.3.2 Operational ATFM enquires should normally be addressed to the UK FMP as shown in the table below:

FMP	Telephone	Fax	AFTN	SITA
UK FMP	**Flowline:** 01489-588150 **ATC use only:** Primary point of contact: Network Management Specialist: ATOTN 7-500-5030 PSTN: 01489-612427 Secondary point of contact: Network Manager: ATOTN 7-500-5027	01489-612437	EGTTZDZX	SOUSCXH
CEU Brussels	**Hot Position:** 00-32-2-745-1910	00-32-2-729-9028	EBBDCEUW	BRUEC7X

6.4 **General ATFM Enquiries**

Post: Head of Network Planning and Interface, Box 23, London Area Control (Swanwick), Sopwith Way, Swanwick, Hampshire SO31 7AY
Phone: 01489-612426
AFS: EGTTZDZX
Email: robert.pearson@nats.co.uk

7 Responsibilities of Aircraft Operators

7.1 Aircraft Operators shall inform themselves of and adhere to:

a) General ATFM procedures including flight plan filing and message exchange requirements;
b) strategic ATFM measures (including Route Availability Document (RAD));
c) current ATFM measures (including specific measures applicable on the day of operation, as promulgated by ANM or Flight Suspension (FLS) messages);
d) departure slots (CTOTs) issued by the FMD and procedures related to changes to CTOTs;
e) The NMD requirement for the modification or delay of EOBT. This is particularly important with the progressive implementation of NMD Flight Activation Monitoring (FAM) whereby flights not notified as being airborne within 30 minutes of the notified ETOT or CTOT will receive a flight suspension message;
f) the sole responsibility to obtain a new CTOT if there is no RTF contact with the TWR at CTOT;
g) the correct procedure to be followed to obtain approval for the use of STS/ATFMX.

7.2 In order to comply with a CTOT, Aircraft Operators need to plan the departure of a flight so that the aircraft will be ready for start up in sufficient time to comply with a CTOT taking into account the taxi time shown in the Slot Allocation Message (SAM). A slot window is available to ATC to optimise the departure sequence. This is not for use by AOs who should plan an EOBT consistent with the CTOT.

7.3 Where a flight departs from an aerodrome with an ATSU, the Aircraft Operator or pilot should obtain information, prior to start up from ATS as to whether a CTOT or FLS affects their flight.

7.4 Where a flight departs from an aerodrome without an ATSU, or when the FPL has been filed with a Parent Unit, it is the Aircraft Operator or pilot's responsibility to determine whether a CTOT or FLS affects their flight. In this case, the Aircraft Operator or pilot should contact the NMD or FMP before the aircraft departs.

8 Responsibilities of UK Air Traffic Services

8.1 NATS Ltd provides a UK Flow Management Position at London Area Control (Swanwick) to liaise between ATC, Aircraft Operators and the FMD.

8.2 ATC have the following responsibilities:

a) ATC is responsible for departure slot monitoring at departure aerodromes. The exact procedures to be followed will depend on the way that ATS is organised at each aerodrome;

b) ATC units responsible for departure slot monitoring shall be provided with the necessary information concerning the restrictions in force and slots allocated;
c) ATC shall ensure that an ATFM slot, if applicable, is included as part of the ATC clearance;
d) ATC shall take account of an applicable slot or flight suspension when a clearance is issued;
e) ATC shall provide all possible assistance to Aircraft Operators to meet a CTOT or to co-ordinate a revised CTOT;
f) ATC may deny start up clearance to flights unable to meet their slots until co-ordination with the FMP/FMD has been effected and a revised CTOT issued.

8.3 ATC is also responsible for monitoring flights compliance with departure slots (CTOTs) issued by the FMD as detailed in the ATFM Handbook. A slot window of -5 to +10 minutes is available to ATC to optimise the departure sequence.

8.4 In accordance with the provision of the Regional Supplementary Procedures, Europe (ICAO Doc 7030), flights which do not adhere to their slot shall be denied start-up clearance. However, ATC shall make all efforts to enable departing flights to comply with the slot. ATC shall liaise with the UK FMP to co-ordinate extensions to CTOTs.

8.5 With the progressive introduction of the Enhanced Tactical Flight Management System (ETFMS) and Flight Activation Monitoring (FAM), flights that are not notified as being airborne within 30 minutes of the notified ETOT or CTOT will receive a Flight Suspension (FLS) message. If a flight is suspended during the taxiing phase, then ATC is responsible for sending a DLA message. (Further details on ETFMS and FAM can be found at paragraph 11).

8.6 **ATC assistance to Aircraft Operators**

8.6.1 UK aerodromes may be able to assist Aircraft Operators in message exchange with the NMD, provided that the pilot is in RTF contact with the TWR and if:

a) it is a maximum of 30 mins prior to current CTOT; and
b) the revision to the CTOT is for no more than 30 minutes.

Note 1: *The TWR may co-ordinate message action on behalf of the Aircraft Operator or contact the UK FMP.*

Note 2: *Departures from the Jersey Zone should contact either the UK or Brest FMP according to the route of the flight after departure.*

8.6.2 If there is no RTF contact with the TWR at CTOT, the Aircraft Operator/Handling Agent will be solely responsible for obtaining a new CTOT.

9 Inbound Flow Management

9.1 In congested terminal areas serving busy airports, holding can often occur at short notice through the need for the tactical integration of arrival traffic flows to achieve optimum airspace and runway utilisation.

9.2 In the United Kingdom, Area Control Centres (ACC) will not issue Expected Approach Times (EAT) to aircraft when the terminal area delay is likely to be less than 20 minutes.

9.3 Where radar sequencing of traffic from the appropriate terminal holding facility is in operation, Approach Control will not normally calculate or issue EATs to aircraft when the delay is expected to be less than 20 minutes.

9.4 If a pilot requests information on the expected delay they will be given a general indication of the delay, eg 'Delay less than 20 minutes', based on the best information available to the controller at that time.

9.5 Additionally, for London Gatwick, London Heathrow, London Stansted and London Luton arrivals, when London TMA inbound delays are likely to exceed 20 minutes, inbound aircraft will be given a general statement concerning the anticipated delay based on the best information available to the controller at the time. Subsequently, when the aircraft is within 20 minutes of its original ETA for the appropriate terminal holding facility, an EAT will be issued. London Area Control (Swanwick) will endeavour to frequently update this data to ensure that the information provided to pilots is as accurate as possible. These procedures will remain applicable when ground equipment unserviceability or traffic demand requires the use of an alternative to the main holding facility.

9.6 Operators should consider the carriage of an extra fuel allowance when the flight includes operation in a congested traffic area or where ATC delays are likely.

10 Modification of Estimated Off Block Time (EOBT)

10.1 It is a requirement for both ATC and ATFM that the EOBT of a flight shall be an accurate EOBT. This applies to all flights, whether subject to ATFM or not. Any change to the EOBT of more than 15 minutes (+ or -) for any IFR flight within the NMD Initial Flight Planning Zone (IFPZ) (see the IFPS users manual for details) shall be communicated to IFPS.

10.2 An Aircraft Operator (AO) should not modify the EOBT to a later time simply as a result of an ATFM delay. When an AO submits an amendment message (eg DLA or CHG) to IFPS, they must always give as an EOBT the earliest EOBT they may comply with. This time is not directly related to the CTOT provided in the Slot Allocation Message (SAM) or Slot Revision Message (SRM). The EOBT should always reflect the time the AO wants to be off-blocks. The EOBT should always be changed if the original EOBT established by the AO cannot be met by the AO for reasons other than ATFM delay.

10.3 There are two categories of controlled flights covered by this procedure. Those that have an ATFM Calculated Take-Off Time

(CTOT), issued by the NMD, and those that do not. AOs should not modify the EOBT simply as a result of an ATFM delay.

10.4 The procedure to be followed to modify the EOBT of a flight that has not received an ATFM CTOT is as follows:

a) To amend the EOBT to a **later** time, a DLA or CHG message shall be sent to IFPS;
b) To amend the EOBT to an earlier time, a CNL message must be sent to IFPS followed five minutes later by a new flight plan with new EOBT indicated.

Note: *The replacement flight plan procedure shall not be used.*

10.5 The procedure to be followed to modify the EOBT of a flight that has received an ATFM CTOT is as follows:

a) If the EOBT established by the AO has changed or is no longer realistic for reasons other than ATFM then the following procedure shall be used:

i. If a flight has a CTOT that cannot be met, then the AO shall send a DLA message to IFPS with the new EOBT of the flight. This may trigger a revised CTOT;
ii. If a flight has a CTOT with some delay and the AO is aware that the original EOBT cannot be met but the existing CTOT is acceptable, then a message shall be sent to IFPS with the new EOBT of the flight. However, in order not to trigger a new CTOT, the following formula must be used:

Take the current CTOT minus the taxi-time, minus 10 minutes. The new EOBT must not be after this time.

Example:

Original EOBT 1000, CTOT 1100, but the flight cannot go off blocks until 1025. The taxi-time is say 15 minutes. 1100 minus 15, minus 10 = 1035. The new EOBT must be earlier than 1035. If it is, then this action will not trigger a revised CTOT.

However, as Network Operations systems are continuously seeking to give zero delay, the CTOT of the flight will never be earlier than the new EOBT plus the taxi-time.

b) If a flight has had a CTOT and now receives a Slot Cancellation Message (SLC), but the original EOBT can no longer be met, then the AO shall communicate the new EOBT by use of a DLA message. ATC/ATFM will now have the 'true' EOBT of the flight.

10.6 Some states outside the NMD area of responsibility still require AOs to update the EOBT, regardless of why the flight's original EOBT may have changed. AOs should bear in mind the formula explained above when doing this. Where it is known that ATC send Departure messages (DEP) for all flights, then this DEP message will suffice.

10.7 It is not possible to amend (via CHG or DLA) the EOBT to an earlier time than the EOBT given in the flight plan. However, if a flight is ready to go off blocks earlier than the current EOBT, then there are two options available:

a) The AOs may ask the local ATC Unit (TWR), or the FMP, to send a Ready (REA) message. In this case, the flight is considered as 'ready to depart' from the filing time of the REA message; or
b) The AOs may contact the Central Flow Help Desk who has the ability to input an earlier EOBT into the TACT system (max - 30 minutes). Each case is treated on its merits and may be refused if it is considered that the request is not justified.

10.8 Whilst the ultimate responsibility for the sending of flight plan related messages, particularly those applicable to the management of EOBT, lies with the operator, it is acceptable for this to be carried out by an ATS unit suitably equipped to do so if such a request is made by the operator. For the purposes of this statement the 'operator' can include the pilot-in-command of the affected flight.

11 Enhanced Tactical Flow Management System (ETFMS) and Flight Activation Monitoring (FAM)

11.1 The development of the Enhanced Tactical Flow Management System (ETFMS), enables the NMD to receive live time data on departing flights using Flight Activation Monitoring (FAM). This data is provided by the ATC systems and is derived from ATC radar information and flight plan messaging. There are advantages with improved knowledge of the traffic situation and this further assists ATFM tactical planning. FAM is being progressively introduced across the FMD ATFM area.

11.2 Flight Activation Monitoring:

a) monitors flights which should have departed;
b) Takes action on these flights (through internal messaging to NMD) to update the take-off time in order to improve the forecast of traffic demand;
c) suspends flights after the designated time parameter (30 minutes after CTOT or ETOT), unless a message is received to confirm that the flight is airborne or delayed and;
d) informs AOs and ATC at the departure aerodrome of any flight suspensions enabling these agencies to react accordingly.

11.3 The expected benefits of FAM are:

a) to provide a better forecast of the actual and expected traffic situation;
b) to release slots 'occupied' by flights that have not yet departed;
c) to create an incentive for the AOs to update their flights promptly;
d) to improve traffic load assessment; and
e) to enable a more efficient use of the available and projected airspace capacity.

11.4 ETFMS expects flights to be airborne, based on the filed EOBT or the ATFM slot departure time issued by the NMD (CTOT). Those flights that are not notified as being airborne through ATC update messages within 30 minutes of the notified ETOT or CTOT time

ENR 1.9 AIR TRAFFIC FLOW MANAGEMENT AND AIRSPACE MANAGEMENT (continued)

will receive a Flight Suspension (FLS) message from ETFMS and will remain suspended until signal action is taken. The comment **'NOT REPORTED AS AIRBORNE'** will be identified in the text.

11.5 Unless an aircraft is taxiing it is the responsibility of the AO to send a DLA message. If a flight is suspended during the taxiing phase then ATC will be responsible for sending a DLA message.

11.6 A flight is considered to be active in ETFMS (TACT) following reception of any of the following messages:

DEP	-	Departure Message
FSA	-	Flight System Activation Message
CPR	-	Correlated Position Report
APL	-	ATC Flight Plan
ACH	-	ATC Flight Plan Change
APR	-	Aircraft Operator Position Report
ARR	-	Arrival Message

11.7 Flights that have been suspended by FAM, will receive a FLS message with the comment 'Not reported as airborne'. An example of FLS message sent due to FAM:

- TITLE **FLS**
- ARCID ABC1234
- ADEP LPPR
- ADES LFPG
- EOBD 020514
- EOBT 0500
- COMMENT **NOT REPORTED AS AIRBORNE**
- TAXITIME 0012

11.8 Any changes of EOBT for both regulated and non-regulated flights must be notified only by means of a DLA/CHG message to IFPS.

11.9 Flight Plan originators are reminded that all changes to EOBT of more than 15 minutes must be notified to IFPS. This will become increasingly more important to prevent Flight Suspension (FLS) messages being activated. UK AIP ENR 1.10 refers.

11.10 **Flight Suspension - Procedures**

11.10.1 When the AO and ATC at the aerodrome of departure receive an FLS due to the process, as described earlier, the following cases may occur:

a) The flight is still effectively on the ground either on stand or already taxiing:

i. The AO (aircraft on stand) or ATC (aircraft already taxiing) should ensure that the flight plan is re-initiated by sending a DLA message with a correct EOBT.

ETFMS (TACT) will then respond with a De-Suspension Message (DES) or Slot Revision Message (SRM) depending whether the flight is non-regulated or regulated, respectively.

ii. ATC should not let the aircraft start-up/depart before such a message (DES or SRM) is received.

Note: *All effort shall be made by ATC to ensure that all flights, regulated or not, comply with their ETOT/CTOTs, taking into account the respective taxiing/holding/sequencing requirements. Any exception to permit aircraft to continue for departure, following taxi delays caused by airfield congestion, is not applicable unless the aircraft can depart and be airborne within the time frame ETOT/CTOT+30 minutes.*

b) The flight is already flying:

i. No action is needed from the AO or from the Tower of departure. The flight will automatically be de-suspended at the reception of one of the above messages (DEP, CPR, FSA etc).

Note: *The continuous re-occurrence of the above may mean a lack of proper information sent to NMD. One possible solution would be a requirement to initiate DEP messages sent by the departure aerodrome but this will be determined by the NMD through the national flow management office. In the UK this will be the NATS Area Control Service Traffic Management Organisation situated at London Area Control (Swanwick).*

11.11 **Area of Application**

11.11.1 All users will be notified by NMD/FMD by means of Air Traffic Flow and Capacity Management Information Message (AIM) whenever an area becomes FAM enabled.

11.11.2 The effect of these areas being FAM-enabled means that all flights that are departing from or arriving at these areas will be affected by Flight Activation Monitoring.

ENR 1.9 AIR TRAFFIC FLOW MANAGEMENT AND AIRSPACE MANAGEMENT (continued)

11.11.3 For flights departing from these areas and going to any other area, FAM will start at ETOT/CTOT.

11.11.4 For flights departing from non FAM-enabled and landing at aerodromes in FAM-enabled areas, the process will rely on the entry point of the first safely covered CPR-covered area. FLS may be sent to these flights landing inside, although departing outside.

12 ATFM Exemption Procedures

12.1 Since the introduction of the NMD it has been possible for Flight Plan (FPL) originators to obtain exemptions from ATFM restrictions for certain flights through the use of STS/indicators in FPLs.

12.2 The following principles apply:

a) The insertion of a STS/… indicator in Field 18 of a Flight Plan will identify that a flight may require special handling. This indicator is for use by all parties that may have to handle the flight;
b) The current list of STS indicators recognised for ATFM purposes comprises STS/HEAD, STS/SAR, STS/MEDEVAC, STS/FFR, STS/STATE, STS/HUM, STS/HOSP;
c) Additionally, STS/ATFMX may be used if that particular flight has received specific approval from the Office established by the National Administration for processing such requests.

It should be noted that:

i. Only STS/HEAD, STS/SAR, STS/MEDEVAC, STS/FFR and STS/ATFMX qualify for automatic exemption from ATFM measures;
ii. The indicator STS/ATFMX is only used for ATFM purposes. It is subject to strict application of the rules of usage and is additional to any other special handling notification that may be required to be shown for ATC purposes as STS/… in Field 18 of the flight plan.

12.3 Further information on the use of STS/indicators for ATFM purposes may be found in the ATFM Users Manual published by the NMD.

12.4 **Rules of Application for the use of STS/ATFMX**

12.4.1 The following Rules of Application shall be applicable to all flights seeking to gain exemption from ATFM measures within the area of responsibility of the NMD. It is intended to ensure that flights, which by the nature of their mission, cannot under any circumstances be delayed due to ATFM. It is based on the ICAO SARPS (ICAO EUR DOC 003, ATFM-HB/2) and existing material in the Network Operations HANDBOOK.

12.4.2 It should be noted by all users that any flight which obtains exemption, and which may have otherwise been delayed, will have that delay passed on to other flights. It is essential, therefore, that use of the exemption facility shall be properly controlled and monitored so that genuine flight priorities may continue to operate without ATFM delay.

12.4.3 Any flight meeting the criteria established to warrant exemption status may, provided the necessary approval procedure has been followed and the flight duly authorised by the Office established by the National Administration for processing such requests, use STS/ATFMX for that flight and that flight only.

12.4.4 Each flight shall require specific approval to use STS/ATFMX.

12.5 **Criteria for Determining the Application of STS/ATFMX for an Individual Flight**

12.5.1 **STS/HOSP or STS/HUM:**

a) The NMD criteria affords ATFM exemption for flights where the safety of human life is involved. That is, if the flight does not operate without delay a human life or lives may be lost. Such flights shall require specific medical/UNHCR authorisation to support their request.
b) Following consultation with Air Ambulance operators in the UK, the CAA has determined that the term ‘safety of human life’ is not always easy to define and, indeed, there are other urgent medical flights that also require to operate without delay. Such flights may include patients with threat of loss of limbs, transfer of human organs and the transportation of medical teams.
c) Additionally, the CAA has agreed that positioning flights may also warrant exemption when they are required to undertake an urgent medical flight from another aerodrome.
d) If the flight fulfils the requirements, as stated above, then the flight may apply for approval to use STS/ATFMX through the procedure specified in paragraph 12.7.

12.5.2 **STS/STATE:**

a) The NMD guidelines recommend that ATFM exemption may only be approved for flights if the person or persons on board a flight on State business are of such importance that the flight cannot accept any delay. Additionally, approval may be given if the mission of the flight is being carried out by, or on behalf of, the State and is of such importance that any delay will jeopardise the success of the mission.
b) If the flight fulfils the requirements, as stated above, then the flight may apply for approval to use STS/ATFMX through the procedure specified in paragraph 12.7.

ENR 1.9 AIR TRAFFIC FLOW MANAGEMENT AND AIRSPACE MANAGEMENT (continued)

12.6 **Flight Priority**

12.6.1 It should be noted that the use of STS/ATFMX does not itself afford the flight any additional flight priority status for special handling by ATS. It is the other STS/indicators that indicate the need for special handling by ATS.

12.6.2 A STS/STATE flight may be afforded appropriate UK ATS handling priority because of the importance of the mission, or the person on board the flight.

12.6.3 The combined use of STS/HOSP with STS/ATFMX will indicate to ATS that the flight is required to operate without delay and so justify exemption from ATFM. Such flights may be afforded additional priority that the traffic situation allows.

12.6.4 Non-urgent flights will continue to use STS/HOSP indicating that special handling is required. Additional information may be included in item 18 of the FPL using RMK/ or the pilot may advise ATS exactly what special handling is required.

12.6.5 However, if any STS/HOSP flight experiences a medical emergency in flight, then the appropriate radiotelephony message(s) should be used to express the urgency of the condition to ATS.

12.6.6 It should be noted that the procedures detailed here are for ATC Flow Management purposes. The table of flight priorities for UK ATC purposes, as detailed in CAP 493 Manual of Air Traffic Services (MATS) Part 1, is not affected.

12.7 **UK Procedure for the Approval of use of STS/ATFMX**

12.7.1 The UK has established two processes for the approval of certain qualifying flights to use STS/ATFMX:

a) a **Manual Approval** process applies to AOs who make irregular flights and are able to provide prior notice for approval;
b) a **Self Regulation Approval** process applies to AOs who are regularly engaged in Air Ambulance flights and, by the urgent nature of the flight, may not have sufficient time to undertake the Manual Approval process.

12.8 **Manual Approval Process**

12.8.1 The operator of a flight seeking an individual approval to insert the indicator STS/ATFMX in Item 18 of a flight plan, for a flight departing from an aerodrome within the UK, shall obtain prior permission from the relevant authority, when practicable, at least 24 hours and not more than 48 hours in advance of the flight.

12.8.2 The attached pro-forma to CAP 694 The UK Flight Planning Guide at Annex D must be completed and faxed with appropriate supporting documentation.

Note: *Copies of CAP 694 can be downloaded from the UK CAA website: http://www.caa.co.uk/CAP694*

12.8.3 Application for approval of STS/HOSP, STS/HUM or STS/STATE flights to use STS/ATFMX should be submited via the CAA Customer Portal - ACOMS: https://portal.caa.co.uk

12.8.4 Outside the hours notified in paragraph 12.8.3, application for approval for STS/HOSP or STS/HUM only should be made to the UK FMP FLOLINE, as follows:

Phone: 01489-588150
Fax: 01489-612437

12.9 **Self Regulation Approval Process**

12.9.1 In recognition of the specific requirements of Air Ambulance flights, the CAA has established a process by which an AO can determine whether their own flights meet the requirements for ATFM exemption. Subject to compliance with a set of formal conditions, the CAA may grant AOs an Approval to apply STS/ATFMX to specific flights meeting the conditions of the Approval.

12.9.2 AOs wishing to apply for CAA Approval for Self Regulation should contact:

Post: Airspace Regulation, CAA, 1 NE Aviation House, Beehive Ring Road, Crawley, West Sussex, RH6 0YR.
Email: airspace@caa.co.uk

12.10 **Compliance Monitoring**

12.10.1 The NMD provides the CAA with a list of all flights departing the UK using STS/ATFMX, on a monthly basis. The CAA undertakes to verify that all such flights operated with an appropriate approval for ATFM exemption.

12.10.2 With regard to those AOs that have been granted an Approval for Self Regulation, the CAA will, from time to time, conduct an audit of randomly selected flights and will require proof that the flights met the requirements of the NMD and the conditions of the CAA Approval.

12.10.3 Additionally, the AO will be required to retain, and supply on demand, all appropriate documentation to support the use of STS/

ENR 1.9 AIR TRAFFIC FLOW MANAGEMENT AND AIRSPACE MANAGEMENT (continued)

ATFMX.

13 Provision of Information on Events Affecting Air Traffic Movements

13.1 Airport Operators at all UK airports (including military airfields) are to provide, at the earliest opportunity, but at least 14 days in advance, details of any event that may lead to an hourly increase in demand, eg football match, trade fair, European Minister meeting, etc.

Note: *The above activity is in addition to any ATC to ATC co-ordination processes.*

13.2 The following information is required:

a) Name of airport;
b) airport contact;
c) ATC contact;
d) nature of the event;
e) the expected nature of increase in demand.

13.3 Event information is to be sent to:

Email: ATFMEventsPlanner@nats.co.uk
Fax: 01489-612497

13.4 Following the provision of the notice of an event, NATS Traffic Management Operations will assess the impact and co-ordinate any necessary ATFCM response.

14 NATS Traffic Regeneration Plan

14.1 In the event of prolonged and significant loss of capacity affecting all or part of the UK airspace, a UK Traffic Regeneration Plan will be implemented. This plan is intended to provide a framework for the management of demand and capacity during such an event.

14.2 The UK Traffic Regeneration Plan includes the following measures which will be implemented in order to make maximum use of the available airspace capacity:

a) UK FMP will declare the capacity available and a proportional reduction in the number of flights permitted by individual operators may be applied;
b) All operators intending to fly within the affected airspace must file a flight plan for flights that they intend to operate in accordance with a flight list approved by UK FMP and NMD. Any flights not on the approved list will be rejected through IFPS. This flight list will be requested by UK FMP once the available capacity has been determined. Procedure will be published by NOTAM and communication with airspace users will be managed via the NATS Air Traffic Incident Coordination Communication Cell (ATICCC);
c) Additionally, UK FMP may implement mandatory re-route scenarios to increase the demand accommodated.

f) CAP 694 The UK Flight Planning Guide.
g) North Atlantic Operations and Airspace Manual.
h) CAP 493 Manual of Air Traffic Services (MATS) Part 1.
i) AFPEx Help Guide.
j) Standardised European Rules of the Air (SERA).

1.2 **Flight Rules and Categories of FPL**

1.2.1 Subject to the mandatory requirements of airspace classification shown in paragraph 1.3, a pilot may file a **VFR** or **IFR** Flight Plan for any flight. When flying in different types of airspace, a pilot may indicate if the aircraft will fly VFR first, then change to IFR; or vice versa.

1.2.2 There are three categories of FPL:

a) **Full** Flight Plans - the information filed on the FPL Form (CA48/RAF F2919);
b) **Repetitive** Flight Plans - see paragraph 3.7;
c) **Abbreviated** Flight Plans - the limited information required to obtain a clearance for a portion of flight, filed either by telephone prior to take-off or by radiotelephony (RTF) when airborne. See paragraph 1.4.

Note: *The destination aerodrome will be advised of the flight only if the flight plan information covers the whole route of the flight.*

1.3 **Submission of a Flight Plan**

1.3.1 Information relative to an intended flight or portion of a flight, to be provided to air traffic services units, shall be in the form of a flight plan. The term 'flight plan' is used to mean variously full information on all items comprised in the flight plan description covering the whole route of a flight or limited information required, inter alia, when the purpose is to obtain a clearance for a minor portion of a flight such as to cross an airway or to take-off from/land at a controlled aerodrome.

Note: *An Abbreviated Flight Plan fulfils the historical requirement for 'Booking Out' which is no longer applicable.*

1.3.2 A flight plan shall be submitted prior to operating:

a) any flight or portion thereof to be provided with an air traffic control service;
b) any IFR flight within advisory airspace;
c) any flight within or into areas, or along routes designated by the competent authority, to facilitate the provision of flight information, alerting and search and rescue services;
d) any flight within or into areas, or along routes designated by the competent authority to facilitate coordination with appropriate military units or with air traffic services units in adjacent States in order to avoid the possible need for interception for the purpose of identification;
e) any flight across international borders, unless otherwise prescribed by the States concerned. In the UK this requirement includes any flight that will cross the combined London and Scottish FIR/UIR boundary;
f) any flight planned to operate at night if leaving the vicinity of an aerodrome.

1.3.3 A flight plan shall be submitted before departure to an air traffic services reporting office or, during flight, transmitted to the appropriate air traffic services unit or air-ground control radio station unless arrangements have been made for the submission of repetitive flight plans.

Note: *In the UK, where no air traffic services reporting offices have been established, the flight plan should be submitted to the ATS unit performing the functions of such an office, or direct to the Integrated Initial Flight Plan Processing System (IFPS).*

1.3.4 Unless a shorter period of time has been prescribed by the Competent Authority for domestic VFR flights, a flight plan for any flight planned to operate across international borders or to be provided with an air traffic control service or an air traffic advisory service shall be submitted at least 60 minutes before departure or, if submitted during flight, at a time that will ensure its receipt by the appropriate air traffic services unit at least 10 minutes before the aircraft is intended to reach:

a) the intended point of entry into a control area or advisory area; or
b) the point of crossing an airway or advisory route.

Note: *For submission parameters for flights subject to air traffic flow management (ATFM) and North Atlantic flights see paragraph 3.4.1.*

1.3.5 It is **advisable** to submit a flight plan (VFR or IFR) if the flight involves flying:

ENR 1.10 FLIGHT PLANNING (continued)

a) Over the sea, more than 10 nm from the UK coastline;
b) over sparsely populated areas where search and rescue operations would be difficult;
c) into an area in which search and rescue operations are in progress. The flight plan should include the expected times of entering and leaving the area and the details must also be passed to the appropriate ACC. The ACC will notify the ARCC.

1.3.6 A flight plan **may** be submitted for any flight.

1.4 **Abbreviated Flight Plans**

1.4.1 An Abbreviated Flight Plan is the limited information required to obtain a clearance for a portion of flight, filed either by telephone prior to take-off or by radiotelephony (RTF) when airborne. This might apply in the case of a required clearance to fly in a Control Zone (CTR) or crossing an Airway. No flight plan form is submitted and the destination aerodrome will not be informed. An abbreviated flight plan transmitted in the air by radiotelephony for the crossing of controlled airspace or any other areas or routes designated by the competent authority normally contains as a minimum: call sign, aircraft type, point of entry, point of exit and level.

1.4.2 In the case of a departure from an aerodrome within a CTR an Abbreviated FPL may be sufficient to obtain clearance to depart the aerodrome and route to the appropriate CTR/CTA boundary. However, some aerodromes require aircraft to follow designated noise preferential routes which may be identified as Standard Departure Routes (SDRs) depending on the outbound track of the flight.

1.4.3 A Full flight plan must be filed if the pilot requires the destination aerodrome to be notified of the flight.

1.5 **Submission Time Parameters**

1.5.1 The general ICAO requirement is that FPLs should be filed on the ground at least 60 minutes before clearance to start-up or taxi is requested. The 'Estimated Off Block Time' (EOBT) is used as the planned departure time in flight planning, not the planned airborne time. Exceptionally, in cases where it is impossible to meet this requirement, pilots or Aircraft Operators (AOs) should give as much notice as possible, but never less than 30 minutes.

1.5.2 In order to comply with the requirements of the Integrated Initial Flight Plan Processing System (IFPS), FPLs for IFR flights should be filed a minimum of **60 minutes** before Estimated Off Block Time (EOBT) (see paragraph 3).

1.5.3 IFR flights on the North Atlantic and on routes subject to Air Traffic Flow Management, should be filed a minimum of 3 hours before EOBT (see paragraph 3).

1.5.4 The Date of Flight (DOF) must be included in Item 18 of the FPL for all flights planned for the following day or beyond.

Note: *IFPS will not accept FPLs submitted more than 120 hours in advance of the flight taking place.*

1.5.5 An Abbreviated or Full FPL can be filed on RTF when airborne with any ATSU but normally with the appropriate FIR controller. If the FPL contains an intention to enter Controlled Airspace or certain Control Zones/Control Areas, at least 10 minutes prior warning of entry must be given. In all cases, the message should start with the words 'I wish to file an airborne FPL'. However, the filing of Full FPLs on the RTF is to be discouraged due to the delay likely to be caused by controller workload and congestion on the frequency.

1.5.6 The requirements for the submission of a Repetitive FPL are detailed in paragraph 3.7.

1.6 **Mechanisms for Filing a FPL**

1.6.1 NATS provides the AFTN within the UK and in addition, an internet based service called 'flightplanningonline'. This internet service uses an application called AFPEx, which provides a gateway via the internet into the AFTN and allows pilots, Airline Operators, Flight Handlers or small aerodromes access to file their own flight plans and other related messages anywhere within the UK or abroad.

1.6.2 The following categories describe the method which should be adopted by each group to file a FPL within the UK:

a) Airline Operators, Flight Handlers and Aerodromes must use the AFTN or 'flightplanningonline';
b) GA pilots should use 'flightplanningonline'.

1.6.3 Foreign pilots and UK based GA pilots (who have no access to the internet) may Fax the FPL to the Parent AFTN Unit.

1.6.4 Applications for 'flightplanningonline' may be made via the website www.flightplanningonline.co.uk or through the following contacts. Approval is required from 'flightplanningonline' prior to connection to the AFPEx system.

AFPEx/Parent AFTN Unit	Telephone Number(s)	Fax/AFTN address/E-mail
24hr Helpdesk	01489-612792	01489-612793 EGGGYFAJ flightplanningonline@nats.co.uk

←

Note: *Applications for AFTN, refer to UK AIP GEN 3-4-2.*

ENR 1.10 FLIGHT PLANNING (continued)

1.6.5 **Submitting a FPL through the Departure Aerodrome ATSU**

1.6.5.1 A written FPL, which is filed through the ATSU at the departure aerodrome, must be submitted on the FPL form CA48/RAF F2919. The local ATSU may assist in compiling FPLs and checking them. However, the ultimate responsibility for filing an accurate FPL rests with the pilot or AO.

1.6.6 **Submitting a FPL via 'flightplanningonline'**

1.6.6.1 FPL may be submitted through this system by account holders by using the on-line forms and technical assistance is available from the AFPEx Helpdesk. Responsibility for filing an accurate FPL still rests with the pilot.

1.6.7 **Submitting a FPL via Parent AFTN Unit**

1.6.7.1 A written, or preferably typewritten, FPL should be submitted to the Parent AFTN Unit for transmission over AFTN using Fax number 01489-612793.

1.6.7.2 A copy of the transmitted data will be faxed back to the pilot for checking. The checking for accuracy of the transmitted information is the responsibility of the pilot and if there are any discrepancies, contact the Helpdesk number in the table at paragraph 1.6.4.

1.7 **Addressing Flight Plans**

1.7.1 Increasingly the responsibility for originating the FPL and its associated messages is being delegated by ATC to airlines and AOs. In such instances the responsibility for completing all parts of the form, including the addressing, rests with them. Although the ultimate responsibility for filing an accurate FPL rests with the pilot or operator, those who file through 'flightplanningonline' will be given assistance by the AFPEx Helpdesk. Those who submit FPL by fax to the Parent AFTN Unit will still be responsible for completing all parts of the form. However, if they do not know the correct addresses then as a minimum they should indicate which countries their intended flight will be operating through.

1.7.2 The UK is a participating State in the Integrated Initial Flight Plan Processing System (IFPS). IFPS is the only system for the distribution of IFR General Air Traffic (GAT) flight plans and associated messages to Air Traffic Service Units (ATSUs) within the participating European States - the IFPS Zone. The roles and responsibilities of IFPS, with regard to addressing FPL, are detailed in paragraph 3.

1.7.2.1 Although IFPS handles IFR flight plans, it will not process the VFR portions of any mixed VFR/IFR flight plan.

1.7.2.2 An incident involving a mixed IFR/VFR flight highlighted the importance of the FPL and all associated messages being correctly addressed, especially when departure or destination aerodromes are omitted.

Example:

An aircraft is planned to depart under VFR from an aerodrome in the UK with the intention of later joining controlled airspace flying under IFR. It is then planned to leave controlled airspace and proceed under VFR to a destination in France.

In this example, IFPS will process the IFR portion of the flight (notifying appropriate ATSUs along the route), but it will not distribute the flight plan information to either the departure or destination aerodromes, as they are included in the VFR portion of the FPL. Therefore, in order to ensure that all relevant ATSUs are included in the flight plan message distribution, pilots or Aircraft Operators should make certain that whenever a flight plan contains portions of the flight operated under VFR, in addition to IFR, the FPL must be addressed to:

- IFPS (EGZYIFPS);
- Aerodrome of departure;
- Aerodrome of destination;
- All FIRs that the flight will route through under VFR (in UK address to EGZYVFRP for Scottish FIR, EGGXZOZX for Shanwick/Oceanic FIR and/or EGZYVFRT for London FIR).

1.7.3 Additional VFR FPL addressing is detailed in paragraph 2.

1.7.4 Additional IFR FPL addressing is detailed in paragraph 3.

1.7.5 Further addressing information is available on the 'flightplanningonline' system, in UK AIP ENR 1.11, AFPEx Help Guide and in the 'Random FPL AFTN Address Book' available in electronic format at: www.nats.aero/ais (Links).

1.8 **Parent AFTN System**

1.8.1 The Parent AFTN Unit based at Swanwick ACC will provide a Faxing service to visiting foreign pilots and UK pilots who have no access to the internet as detailed in paragraph 1.6.7.

1.8.2 Where there is no ATSU at the departure aerodrome, the pilot is responsible for ensuring that the **departure time** is passed to the Parent AFTN Unit or AFPEx Helpdesk, so as to activate the FPL and to enable the DEP message to be sent to the appropriate addressees. Arrangements should be made for a 'responsible person' on the ground to telephone the departure time to the

ENR 1.10 FLIGHT PLANNING (continued)

Helpdesk. Failure to pass the departure time will result in the FPL remaining inactive. Consequently, this could result in the destination aerodrome not being aware that the aircraft is airborne and any necessary alerting action may not then be taken.

1.8.3 Exceptionally, the Flight Information Region (FIR) Controller at the ACC will accept departure times on RTF from pilots who have departed from aerodromes where there is no ATSU, or it is outside the hours of operation. The pilot is to request the Controller to pass the departure time to the AFPEx Helpdesk. However, controller workload may cause a delay in forwarding such departure messages.

1.9 Action When the Destination Aerodrome has no ATSU or AFTN Link

1.9.1 If a pilot has filed a FPL to a destination that does not have an active ATSU, and is not connected to the AFTN, they are required to pass the ETA, prior to departure, to a 'responsible person' at the destination aerodrome. In the event of the aircraft failing to arrive at the destination aerodrome within 30 minutes of the notified ETA, the 'responsible person' must **immediately** advise the AFPEx Helpdesk in order that alerting action may be commenced by ATC.

1.9.2 The AFPEx Helpdesk will commence Overdue Action on behalf of a nominated 'responsible person', but will not act as the responsible person on behalf of the pilot. It is advisable to include contact details of the responsible person in Item 18 RMK/ of the FPL form for reference.

1.10 Flight Planning in Remote Areas

1.10.1 Introduction

1.10.1.1 Pilots may file a flight plan for any flight, but it is most advisable to file a FPL if flying over the sea more than 10 nm from the UK coast, or over sparsely populated areas where search and rescue operations may be difficult.

1.10.2 Flight Planning and Alerting Action

1.10.2.1 Filing a Full or Repetitive FPL makes the ATSU at the destination aerodrome aware of an inbound aircraft's planned flight details. Once the FPL DEP message has been received, the destination aerodrome calculates the aircraft's estimated time of arrival (ETA). If the aircraft fails to arrive or make communication, the ATSU will start overdue action 30 minutes after the calculated ETA. Preliminary action will be taken to confirm the flight plan details and departure time. The supplementary flight plan information (which is not normally transmitted with the FPL) will be requested from the departure aerodrome. If the FPL has been filed for a departure from an aerodrome not connected to the AFTN, the pilot should indicate in Item 18 where the Supplementary FPL information can be obtained (such as the NATS Helpdesk if the FPL has been filed through them).

Note: *A destination aerodrome will not be aware of an inbound flight that has filed an Abbreviated Flight Plan.*

1.10.2.2 If a Full or Repetitive FPL has not been filed, the destination aerodrome may not know that the aircraft is inbound to them, and will not be able to calculate an ETA, nor will they be prepared to initiate alerting action - unless additional information comes to their notice that an aircraft is in difficulties.

1.10.2.3 Searching for an aircraft that may have forced landed in difficult terrain or a sparsely populated area, or ditched in a large expanse of water, can be a difficult and lengthy process. The sooner an ATSU can detect that an aircraft needs assistance and alerts search and rescue services, the better for all concerned.

1.10.2.4 It is also important that if a pilot does file a Full or Repetitive FPL and then lands elsewhere, that they notify the original destination without delay. When landing at an alternate aerodrome with an ATSU, it can be expected that the ATSU will send an arrival message on the pilot's behalf. However, it is important that the pilot informs the ATSU that they have diverted from the planned destination. Failure to notify the original destination may cause unnecessary search and rescue action to be initiated.

1.10.2.5 Specific FPL addressing requirements are detailed in paragraph 2.

1.11 Low Level Cross-Channel Operations - UK/France

1.11.1 Pilots undertaking Cross-Channel flights are reminded that a flight plan **MUST** be filed for all flights to or from the United Kingdom which will cross the United Kingdom/France FIR Boundary.

1.11.2 Specific FPL addressing requirements are detailed in paragraph 2 VFR Flight Planning.

1.11.3 For further details see ENR 1.1, paragraph 3.7.

1.12 Action in the Event of Diversion

1.12.1 If a pilot lands at an aerodrome other than the destination specified in the Full or Repetitive FPL, they must ensure that the ATSU at the original destination is informed within 30 minutes of the ETA (calculated from the Full FPL and departure time). This will avoid unnecessary search and rescue action being taken by the Alerting Services.

ENR 1.10 FLIGHT PLANNING (continued)

1.13 **Delays, Departures, Modifications and Cancellations to a Filed Flight Plan**

1.13.1 **General**

1.13.1.1 Having filed a Full or Repetitive FPL, pilots or AOs may be required to change the existing FPL details. In most cases, a standard modification message can be sent. However, in the case of a change to departure, destination or aircraft call sign the original FPL must be cancelled and a new FPL submitted. A second FPL cannot simply be used to amend the first.

1.13.2 **Delays**

1.13.2.1 ICAO requires that an appropriate delay message (DLA) must be sent if the EOBT is more than 30 minutes later than that already shown in the Full or Repetitive FPL.

1.13.2.2 It is important that, in the event of a delay of 30 minutes or more to the EOBT, the pilot advises the departure aerodrome ATSU/ Parent AFTN Unit so that a DLA message can be sent.

1.13.2.3 In order to meet the requirements of ATFM, all IFR aircraft operating within Europe must have any changes to their EOBT of +/- 15 minutes notified to the Integrated Flight Plan Processing System (IFPS). Full details are shown in paragraph 3.

1.13.3 **Departures**

1.13.3.1 It is also important that the DEP message is sent, as this activates the Full or Repetitive FPL. Although the ATSU at the departure aerodrome has the responsibility to send the FPL and DEP message by AFTN, the pilot should check that this has been done, especially when departing from a non-UK aerodrome. If there is no ATSU at the departure aerodrome, or the ATSU is not connected to the AFTN, the pilot must ensure that the departure time is passed to the appropriate agency who will ensure a departure message has been passed.

1.13.3.2 A DEP message is not required if an IFR FPL has been filed with IFPS and the flight will operate solely within the IFPS Zone. (See also paragraph 3).

1.13.3.3 DEP messages must always be sent for VFR FPLs and IFR FPLs operating outside Controlled Airspace (CAS) or outside the IFPS Zone.

1.13.3.4 **Failure to activate the FPL could result in the destination aerodrome not being aware that alerting action should be taken.**

1.13.4 **Modifications**

1.13.4.1 Other modifications to a filed FPL, such as a change in aircraft type, speed, level, route, etc, can be notified using a change (CHG) message.

1.13.4.2 It is also important that when any changes or modifications are made to the original Full or Repetitive FPL, that a change (CHG) message is transmitted to all the addressees that will be affected by the change or modification. In the case of Full or Repetitive FPLs filed with IFPS, and as long as the CHG message is sent to them, IFPS will do this automatically for the IFR portions of the FPL.

1.13.5 **Cancellations**

1.13.5.1 Any changes to aircraft call sign, point of departure and/or destination will require the original Full or Repetitive FPL to be cancelled and a new FPL submitted.

1.13.5.2 Should the flight be cancelled, for any reason, it is equally important to ensure that a cancellation (CNL) message is transmitted to all the original FPL addressees. In the case of FPLs filed with IFPS, and as long as the CNL message is sent to them, IFPS will do this automatically for the IFR portion of the FPL.

1.14 **Cancelling an IFR FPL in Flight**

1.14.1 If a pilot has begun a flight in Controlled Airspace under an IFR FPL he may decide on encountering VMC that he wishes to cancel his IFR FPL and fly under VFR. However, it must be stressed that a pilot cannot exercise this choice when operating a flight:

a) In Controlled Airspace which is notified as Class A Airspace.
b) Above FL 195 in Controlled Airspace which is notified as Class C Airspace.
c) Along an ATS Route which is notified as Class C Airspace.

In these circumstances all flights in all weather conditions are subject to IFR procedures.

1.14.2 In classes of Controlled Airspace where a choice of Flight Rules is possible in VMC, the pilot may cancel an IFR FPL by transmitting the following message to the ATSU:

'(Identification) - Cancelling my IFR flight.'

ENR 1.10 FLIGHT PLANNING (continued)

1.14.3 ATC cannot approve or disapprove cancellation of an IFR FPL but, when in possession of information that IMC is likely to be encountered along the intended route of flight, will advise the pilot accordingly as follows:

'IMC reported (or forecast) in the vicinity of.....'

1.14.4 The fact that a pilot reports that he is flying in VMC does not in itself constitute cancellation of an IFR FPL. Unless cancellation action is taken, the flight will continue to be regulated in relation to other IFR traffic.

1.15 **Persons On Board**

1.15.1 The number of persons on board a flight for which a FPL has been filed must be available to ATC for search and rescue purposes for the period up to the ETA at the destination aerodrome plus one hour. If this information has been sent to the AO' s handling agency at destination, no further action is required. Otherwise, the information is to be made available as follows:

a) Where the AO or handling agency at the departure aerodrome closes before the ETA plus one hour, the AO or handling agency must lodge the number on board with the ATSU serving the aerodrome of departure;
b) where the departure aerodrome ATSU closes down before the ETA plus one hour, that ATSU must lodge the number directly with the appropriate Area Control Centre (ACC);
c) at aerodromes without an ATSU, where the aerodrome closes before ETA at destination plus one hour, the aerodrome operator or handling agency must lodge the name and address of officials who have access to flight departure records with the appropriate ACC, so that they can be contacted as necessary, either direct or through the local police.

Note: *The procedure above only applies if 'TBN' (or similar) has been inserted in Item 19 to indicate that the total number of persons on board was not known at the time of filing the FPL.*

2 VFR Flight Plans

2.1 **When to File a VFR Flight Plan** see paragraph 1.3.

2.2 **Highland and Island Airports Limited**

2.2.1 Highland and Island Airports Limited have highlighted the specific remoteness of some of their airports and the CAA considers it appropriate to emphasise the advice to pilots to file a flight plan when flying to or from the following HIAL aerodromes:

Barra (EGPR)
Benbecula (EGPL)
Campbeltown
(EGEC)
Inverness (EGPE)
Islay (EGPI)
Kirkwall (EGPA)
Stornoway (EGPO)
Sumburgh (EGPB)
Tiree (EGPU)
Wick (EGPC)

2.3 **Submission Time Parameters**

2.3.1 VFR flight plans should be submitted to the ATSU at the departure aerodrome at least 60 minutes before clearance to start up or taxi is requested. The local ATSU, if required, will assist in compiling the flight plan. If the departure aerodrome is not connected to the AFTN, and the pilot has no AFPEx account, the pilot is responsible for arranging the dispatch of the completed flight plan to the AFPEx Helpdesk/Parent AFTN Unit by Fax.

2.4 **Addressing VFR Flight Plans**

2.4.1 When addressing a VFR flight plan it is important to note that in addition to addressing the Destination Aerodrome, and when applicable the appropriate adjacent foreign FIRs, it **must** also be addressed to the appropriate FIRs, when entering or remaining within them, as listed below:

(a)	EGZYVFRP	Scottish FIR
(b)	EGZYVFRT	London FIR
(c)	EGGXZOZX	Shanwick Oceanic FIR

2.4.2 For addressing Cross-Channel flight plans see paragraph 2.7.2.4.

2.4.3 Further addressing information is available on the 'flightplanningonline' system, in UK AIP ENR 1.11, AFPEx Help Guide and in the 'Random FPL AFTN Address Book' available in electronic format at: www.nats.aero/ais (Links).

2.5 **VFR Flight Plans with Portion(s) of Flight Operated as IFR**

2.5.1 IFPS is the only source for the distribution of IFR/General Air Traffic (GAT) flight plans and associated messages to ATSUs within

ENR 1.10 FLIGHT PLANNING (continued)

the participating European States - the IFPS Zone. Although IFPS handles IFR flight plans, **it will not** process the VFR portions of any mixed VFR/IFR flight plan. Therefore, in order to ensure that all relevant ATSUs are included in the flight plan message distribution, pilots or Aircraft Operators should make certain that whenever a flight plan contains portions of the flight operated under VFR, in addition to IFR, the FPL must be addressed to:

a) IFPS (EGZYIFPS);
b) aerodrome of departure;
c) aerodrome of destination and alternate;
d) all FIRs that the flight will route through as VFR (in UK address to EGZYVFRP for Scottish FIR and/or EGZYVFRT for London FIR);
e) Shanwick/Oceanic FIR to EGGXZOZX (for VFR);
f) any additional addressees specifically required by State or Aerodrome Authorities.

2.6 **Airborne Time**

2.6.1 The pilot is responsible for ensuring that the airborne time of the flight is passed to the ATSU with whom the flight plan has been filed. The ATSU will ensure that the departure (DEP) message is sent to the appropriate addressees. The pilot should try to arrange for a 'responsible person' on the ground to telephone the airborne time to the ATSU/AFPEx Helpdesk, as passing it over the RTF may, due to controller workload, lead to a delay in sending a departure message. Failure to pass the airborne time will result in the flight plan remaining inactive; consequently, this could result in the destination aerodrome not being aware that alerting action should be taken.

2.7 **Cross-Channel Flight Planning**

2.7.1 **Introduction**

2.7.1.1 The CAA have received reports that some VFR flight plans, filed for flights between France and the United Kingdom, have not been received at the UK destination aerodrome. Although these reports are infrequent, they nevertheless identify a significant safety aspect of cross-channel flight planning. The ability of the Air Traffic Service Unit at the destination aerodrome to be aware of an inbound flight is a key factor to alert search and rescue services, when appropriate.

2.7.2 **Pilots' Responsibilities**

2.7.2.1 The pilot is responsible for submitting (filing) a FPL to the Air Traffic Service Unit (ATSU) at the departure aerodrome at least 60 minutes before clearance to start up or taxi is requested. The local ATSU will, if required, assist the pilot to complete the FPL. If there is no ATSU at the departure aerodrome, or the ATSU is not connected to the Aeronautical Fixed Telecommunication Network (AFTN), the pilot must ensure that the FPL is passed to the Parent AFTN Unit for onward transmission (see paragraph 1.8).

2.7.2.2 If pilots send their FPLs by Fax, or make use of a non-UK computer based FPL system, they should assure themselves that the FPL has been accepted and has been transmitted by AFTN on their behalf. A telephone call to the ATSU receiving the FPL, or contact with the ATSU at the aerodrome of departure, will enable pilots to confirm that their FPL has been received, accepted and transmitted.

2.7.2.3 Pilots submitting a FPL via Fax to the Parent AFTN Unit, will receive a faxed copy of the transmitted FPL as proof of filing and to check for accuracy as detailed in paragraph 1.6.

2.7.2.4 **VFR Flight Plan Addressing**

2.7.2.4.1 The FPL should be addressed to:

a) The departure aerodrome;
b) the destination aerodrome and alternate;
c) all interested ATSUs en-route;
d) the London FIR - EGZYVFRT;
e) the Scottish FIR - EGZYVFRP (when necessary);
f) the Shanwick/Oceanic FIR - EGGXZOZX (when necessary);
g) all foreign FIRs that the aircraft will fly through or land/depart from.

2.7.2.5 **Flight Plan Route**

2.7.2.5.1 Pilots must ensure that well defined, significant points are included in the FPL to indicate where the aircraft will cross the UK or near continent coastlines. This information should be shown in Item 15 (Route) or Item 18 (Other information: EET/).

2.7.2.5.2 Routing information will NOT be given by the Parent AFTN Unit/AFPEx Helpdesk. For assistance with routing pilots should refer to the AIP and/or local ATSU in the vicinity of intended flight.

2.7.3 **Flight Plan Route - Flights to/from France**

2.7.3.1 Additionally, for flights to/from France, the French Authorities require the frontier crossing point (the UK/France FIR boundary position) to be included in Item 15 (Route) of the FPL. To assist pilots, the UK now includes the ATS route reporting points on the Southern England and Wales 1:500 000 chart. These can be used as a frontier crossing point. A position may also be shown as

LAT/LONG, or as a bearing and distance from a route reporting point or navigation aid.

Example:
Cap Gris Nez - RINTI
Cap Gris Nez - 51N00130E
Cap Gris Nez - RINTI23005
Cap Gris Nez - DVR16010

2.7.3.2 The EET for this position should be shown in Item 18 of the FPL (Other information) in the format EET/LFFF(elapsed time) or EET/EGTT (elapsed time), depending on flight direction.

Example: EET/LFFF0145 (UK/France) or EET/EGTT0020 (France/UK).

2.7.4 **Flight Plan Route - Flights to/from Channel Islands**

2.7.4.1 Recommended VFR routes from the Solent CTA to the Channel Islands are shown in the UK AIP Aerodrome Section - Jersey, page AD 2-EGJJ-3-1.

2.7.5 **Return Flight Plans Filed from the UK**

2.7.5.1 Pilots may elect to file their return FPLs at the same time as they file their outbound FPL. The normal requirement is to address the FPL solely to the aerodrome of departure. However, if the pilot also adds the addressee of the destination aerodrome, then this will ensure that the return destination in the UK is aware of the intended return flight, just in case the return FPL is not transmitted from the non-UK country. If the return flight occurs on a different day, pilots must ensure that the date of flight (DOF) is shown in Item 18 of the FPL.

Example: DOF/060922 (DOF/year/month/day = Date of flight 22 September 2006).

2.8 **Flight Planning in Remote Areas** - see paragraph 1.10.

2.9 **Special VFR Flight** - see ENR 1.2, paragraph 2.

3 IFR Flight Planning

3.1 **Introduction**

3.1.1 The UK is a participating State in the **Integrated Initial Flight Plan Processing System (IFPS),** which is an integral part of the Eurocontrol centralised **Air Traffic Flow Management (ATFM)** system.

3.1.2 IFPS is the **sole** source for the distribution of **IFR** /General Air Traffic (GAT) FPL information to ATSUs within the participating European States, which collectively comprise the **IFPS Zone**. A list of participating States is available in Section 13 of the IFPS Users Manual.

3.1.3 IFPS will not handle VFR flight plans or Military Operational Air Traffic (OAT) flights but will process the GAT portions of a mixed OAT/GAT FPL and the IFR portions of a VFR/IFR FPL.

3.2 **IFPS**

3.2.1 IFPS comprises two Units (IFPU) sited within the Eurocontrol facilities at Haren, Brussels and at Bretigny, Paris. The IFPS Zone is divided into two separate geographical areas, each IFPU having a primary responsibility for one area and a secondary role, for contingency purposes, for the other. Consequently all IFR/GAT flight plans and associated messages **must** be addressed to both IFPUs (see paragraph 3.5). Following successful processing, the FPL will be delivered, at the appropriate time, to all the ATSU addressees on the flight-profiled route within the IFPS Zone.

3.2.2 As all IFR/GAT flight plans within the IFPS Zone are addressed to both IFPUs, the effect of one unit being out of action will be transparent to flight plan originators. The likelihood of a simultaneous outage of both IFPUs is considered to be extremely low. In such an event, flight plan originators will be alerted, by NOTAM, to reinstate the filing of messages, for flight plan and RPL operations, to all appropriate addresses, both within and outside the IFPS Zone.

3.3 **ATFM**

3.3.1 Additionally, IFPS provides accurate flight data to the ATFM elements of the **Network Management Directorate (NMD),** located at Haren, Brussels. The day-to-day ATFM activities in the participating states are managed by the NMD, supported by the UK Flow Management Position (FMP) established at London Area Control (Swanwick), and Flight Data Operations (FDO). Overall authority for the provision of ATFM in the London and Scottish FIRs/UIRs is delegated to the Eurocontrol NMD.

3.3.2 NATS has provided an FMP at London Area Control (Swanwick) to liaise between the NMD, local AOs and ATS.

3.3.3 ATS is responsible for monitoring a flight's compliance with any **Calculated Take-Off Time (CTOT)** that may be issued by the

ENR 1.10 FLIGHT PLANNING (continued)

NMD in response to the filing of a FPL on a route that is regulated. In accordance with agreed procedures, flights that cannot adhere to their CTOT will be denied start-up clearance. However, ATS will make all efforts to enable departing flights to comply with the CTOT and flights will not be prevented from departing due to small taxiing delays.

3.3.4 In some cases, due to specific restrictions in enroute airspace, or at aerodromes, flights will need to be stopped from departing. In this event, a Flight Suspension (FLS) message may be issued after a CTOT has been issued.

3.3.5 Where a flight departs from an aerodrome with an ATSU, the Aircraft Operator or pilot should obtain information, prior to start up from ATS as to whether a CTOT or FLS affects their flight.

3.3.6 Where a flight departs from an aerodrome **without** an ATSU, or when the FPL has been filed with a Parent AFTN Unit, it is the Aircraft Operator or pilot's responsibility to determine whether a CTOT or FLS affects their flight. In this case, the Aircraft Operator or pilot should contact the NMD or FMP before the aircraft departs.

3.3.7 For additional information see ENR 1.9.

3.4 **Submission Time Parameters**

3.4.1 FPLs should be filed a minimum of **3 hours** before Estimated Off Block Time (EOBT) for North Atlantic flights and those subject to ATFM measures, and a minimum of **60 minutes** before EOBT for all other flights.

3.4.2 IFPS always calculates the Date of Flight (DOF) if none is given in the FPL. In doing so it will assume the EOBT to be within the next 24 hours after the filing time. If a FPL is filed more than **24 hours** in advance of the EOBT, the **DOF** must be indicated in **Item 18** of the FPL.

3.4.3 IFPS will not accept flight plans submitted more than 120 hours in advance of the flight taking place.

3.5 **Addressing IFR Flight Plans**

3.5.1 **Flights Wholly Within the IFPS Zone**

3.5.1.1 FPLs and associated messages must be addressed to both IFPUs. This can be achieved by using either the standard collective AFTN address, or the individual AFTN or SITA addresses:

		AFTN	SITA
Collective		EGZYIFPS	
Individual	Haren	EUCHZMFP	BRUEP7X
	Bretigny	EUCBZMFP	PAREP7X

3.5.2 **Flights Entering or Overflying the IFPS Zone**

3.5.2.1 For that part of the flight within the IFPS Zone, only the two IFPUs need to be addressed as shown above.

3.5.3 **Flights Departing from an Aerodrome Within, and then Exiting, the IFPS Zone**

3.5.3.1 For that part of the flight within the IFPS Zone, only the two IFPUs need be addressed as shown above. For any parts of the flight outside the IFPS Zone, the FPL and associated messages must also be addressed to the appropriate ATSUs outside the Zone.

3.5.3.2 FPL originators filing directly to IFPS are responsible for ensuring that any modifications made to the FPL, either by IFPS or through subsequent messages, are distributed to the relevant ATSUs outside the Zone. This is achieved by use of the 'Re-addressing Function' which is described fully in the IFPS User's Manual.

3.5.3.3 Operators are reminded that IFPS does not forward mixed IFR/VFR FPL to VFR addresses.

3.5.4 **IFR Flight Plans with Portion(s) of Flight Operated as VFR**

3.5.4.1 IFPS is the only source for the distribution of IFR/General Air Traffic (GAT) flight plans within the participating European States - the IFPS Zone. Although IFPS handles IFR flight plans, **it will not** process the VFR portions of any mixed VFR/IFR flight plan. Therefore, in order to ensure that all relevant ATSUs are included in the flight plan message distribution, pilots or Aircraft Operators should make certain that whenever a flight plan contains VFR, in addition to IFR, the FPL must be addressed to:

a) IFPS (EGZYIFPS);
b) aerodrome of departure;
c) aerodrome of destination and alternate;
d) all FIRs that the flight will route through as VFR (in UK address to EGZYVFRT for London FIR);
e) any additional addressees specifically required by State or Aerodrome Authorities.

ENR 1.10 FLIGHT PLANNING (continued)

3.5.5 **Oceanic Flights**

3.5.5.1 For Oceanic flights it should be noted that Shanwick is within the IFPS Zone and FPLs should also be addressed as per ENR 1.11-1.

3.6 **Filing of Flight Plans and Associated Messages**

3.6.1 **Flight Plans**

3.6.1.1 Filing flight plans under IFPS involves an automatic interface with the computer database. Consequently, a rigid protocol for message exchange is needed, especially when delays or modifications are required to the planned route.

3.6.1.2 AOs are ultimately responsible for the complete filing of their FPLs and all associated messages. This encompasses compilation (including addressing), accuracy and submission of FPLs and also for the reception of the Acknowledgement (ACK) message from IFPS.

3.6.1.3 In the UK, AOs who have the facilities (AFTN or 'flightplanningonline' account) may file their own flight plans and associated messages directly with IFPS and any other non-IFPS states. This is the standard IFPS IFR/GAT FPL filing procedure and is termed ' **direct filing** '.

3.6.1.4 **AOs and pilots who, for whatever reason, are unable to conform to the direct filing procedure** should make local arrangements to file their IFR/GAT flight plans through the ATSU at the aerodrome of departure. The ATSU will, when appropriate, assist in the compilation of flight plans and interpreting the associated messages. It is essential for reasons indicated below that the flight crew remains contactable by the ATSU prior to departure.

3.6.1.5 **Adherence to Airspace Utilization Rules and Availability.** No flight plans shall be filed via the airspace of the London and Scottish FIRs/UIRs deviating from the state restrictions defined within the Route Availability Document (RAD). This common European reference document contains all airspace utilisation rules and availability for participating states and any reference to them shall be made via https://www.nm.eurocontrol.int/RAD/index.html.

3.6.2 **Associated Messages**

3.6.2.1 The compilation of Departure **(DEP)**, Arrival **(ARR)**, Modification **(CHG)**, Delay **(DLA)** and Cancellation **(CNL)** messages is detailed in ICAO Doc 4444. Their use for the exchange of information with the automatic IFPS database is strictly governed by the instructions given in the IFPS Users Manual. For example, to change the information in certain Items of the FPL, it is necessary to cancel the original FPL and refile with the amended data after a time lapse of at least 5 minutes.

3.6.2.2 The occasions when an **ARR** message must be sent are minimal, mainly when an aircraft has diverted or when a controlled flight has experienced radio failure. In each instance it is the responsibility of the ATSU at the landing aerodrome to send an ARR message. Submission of an arrival report is not required after landing at an aerodrome where air traffic services are provided on condition that radio communication or visual signals indicate that the landing has been observed.

3.6.2.3 A pilot flying to a destination without an ATS or AFS facility should, prior to departure, notify a responsible person at the destination of his ETA. The responsible person is required to inform the Parent ATSU if the aircraft fails to arrive within 30 minutes of the ETA. In the event of a pilot being unable to find a responsible person at his destination he may request the Parent ATSU to act in this capacity. Should this occur the pilot is required to inform the Parent ATSU within 30 minutes of his arrival at destination. This ensures that prompt alerting and overdue action is initiated if necessary.

3.6.2.4 Certain FPL messages are exclusive to the IFPS process, and are named Operational Reply Messages **(ORM).** They are:

a) The FPL Acceptance Acknowledgement Message **(ACK)**;
b) Referred for Manual Repair **(MAN)**;
c) FPL Message Rejected **(REJ)**.

3.6.2.5 The **ACK** message will be automatically received from IFPS when the FPL has been automatically accepted into the system. Alternatively, a **MAN** message will indicate that the FPL has not been accepted and is awaiting manual intervention by an IFPS operator. Manual repair of a failed FPL is often carried out in conjunction with the FPL originator. Where FPLs are filed directly to IFPS, it is strongly advised that the originator's contact details be included in Item 18 where this is not obvious from the flight details. Dependant upon the success or otherwise of the manual 'repair' to the message, an **ACK** or **REJ** will be received. An ACK message will include the 'repaired' message so that the changes can be checked by the originator, and it is essential that the **flight crew are informed** of the accepted FPL route.

3.6.2.6 Receipt of a **REJ** message will indicate that the FPL has not been accepted by IFPS. The REJ message will indicate the errors in the message which need to be resolved and will also include a copy of the message received by IFPS; this will enable the originator to determine if the message has been corrupted during transmission. If a FPL or associated message is rejected by IFPS, a corrected message must be sent without delay.

3.6.2.7 It is a European ATFM requirement that all controlled flights that are departing, arriving or overflying Europe that have a change (+ or -) in an EOBT of more than 15 minutes shall be notified to the NMD through IFPS. Modification procedures are, therefore,

ENR 1.10 FLIGHT PLANNING (continued)

necessary to enable Aircraft Operators (AOs) to meet this requirement whenever they know that a flight will not meet its EOBT.

Note 1: AOs should not modify the EOBT simply as a result of an ATFM delay. The EOBT is to be modified only if the original EOBT established by the AOs cannot be met. It is not possible to amend the EOBT to an earlier time than the EOBT given in the flight plan.

The procedure to be followed to modify the EOBT of a flight is shown in ENR 1.9 and full details are contained in the IFPS Users Manual, pages 4.1 and 4.2.

Some states outside the NMD area of responsibility still require AOs to update the EOBT, regardless of why the flight's original EOBT may have changed. AOs should bear in mind the formula (as shown in ENR 1.9) for calculating the new EOBT when doing this. Where it is known that ATC send departure messages (DEP) for all flights, then this DEP message will suffice.

***Note 2:** Extreme care should be exercised when compiling a DLA message; the time specified in the message must be the EOBT, not the planned airborne time or the Calculated Take-Off Time (CTOT).*

3.6.2.8 **Until an ACK message has been received by the message originator, the requirement to submit a valid FPL for an IFR/GAT flight intending to operate within the IFPS Zone will not have been satisfied.** In this case the flight details will not have been processed by IFPS and consequently the flight data will not have been distributed to the relevant ATSUs within the IFPS Zone. Similarly, processed data will not have been sent to the database of the NMD to be considered for ATFM purposes.

3.6.2.9 Therefore, **errors in the FPL or associated messages may result in the flight concerned being delayed.**

3.6.3 To indicate the necessity for 'special handling', the appropriate Status Indicator (STS) should be inserted in Field 18 of the flight plan.

3.6.3.1 The following standard abbreviations should be used:

STS/ALTRV	for flights operated in accordance with an altitude reservation;
STS/ATFMX	for a flight approved for exemption from ATFM measures by the appropriate ATS authority;
STS/FFR	fire fighting;
STS/FLTCK	flight check for calibration of navaids;
STS/HAZMAT	for a flight carrying hazardous material;
STS/HEAD	for a flight with Head of State status;
STS/HOSP	for a medical flight declared by medical authorities;
STS/HUM	for a flight operating on a humanitarian mission;
STS/MARSA	for a flight for which a military entity assumes responsibility for separation of military aircraft;
STS/MEDEVAC	for a life critical medical emergency evacuation;
STS/NONRVSM	for a non-RVSM capable flight intending to operate in RVSM airspace;
STS/SAR	for a flight engaged in a search and rescue mission;
STS/STATE	for a flight engaged in military, customs or police services.

Other reasons for special handling by ATS shall be declared under the designator RMK/.

3.6.3.2 The following STS/indicators will be recognised by the NMD and will be provided with automatic exemption from flow regulation:

STS/HEAD, STS/SAR, STS/MEDEVAC, STS/FFR and STS/ATFMX.

3.6.3.3 The following STS/indicators require approval for exemption from flow regulation from the appropriate State authorities, in accordance with the requirements detailed in the ATFM Users Handbook and in ENR 1.9:

STS/HUM, STS/HOSP and STS/STATE.

3.6.3.4 In addition to military operations, operators of customs or police aircraft shall insert the letter M in Item 8 of the Flight Plan Form.

3.6.3.5 For formation flights that intend to operate - for any part - as GAT, it is essential for en-route ATC Providers to have as much notification as possible in order for planning to take place. Although use of FPL Item 9 in the current ICAO standard Flight Plan Proforma provides for indication of the number of aircraft (if more than one operating under the same callsign), the ability of some ATC Flight Data Processing Systems to detect and highlight this to control staff may not be robust; this is especially the case where Air-to-Air refuelling tanker aircraft file as singleton, only to include a FPL Item 18 remark that it will be joined by other aircraft which have filed separate flight plans.

3.6.3.6 Commanders of all planned GAT formation flights are requested to enter RMK/Formation flight in FPL Item 18 of their flight plan to ensure that ATC Flight Data Processing Systems can detect and promulgate such information correctly to control staff. Any queries should be directed to London Control (Swanwick) Flight Planning and Airspace Data (Tel: +44-(0)1489-612590/612040).

3.6.3.7 Civil formation flights in Controlled Airspace, other than for VFR transit of CTA/CTR/TMA are considered to be Non-Standard Flights (NSFs) requiring the issuing of a NSF number/authorisation in advance of the intended date of flight. A formation's NSF

ENR 1.10 FLIGHT PLANNING (continued)

number/authorisation is to be included in FPL Item 18 and prior clearance must be obtained from the appropriate ATC Watch Supervisor on the day (See ENR 1.1.4 - Arrangements for Particular Types of Flight (Non-Standard, Non-Deviating, Unusual, Royal, Observation, Special, VFR Access to Class C Airspace Above FL 195, and Civilian Formation Flights) paragraph 1 (Non-Standard Flights (NSFs) in Controlled Airspace).

3.6.3.8 For Military formation flights that intend to operate - for any part - as GAT, it is essential for en-route ATC Providers to have as much notification as possible in order for planning to take place.

3.6.4 **Supplementary Flight Plan Information**

3.6.4.1 As an alternative to ICAO procedure that Supplementary Information should not be transmitted in a flight plan message (ICAO Doc 4444: Appendices 2 and 3) it should be noted that IFPS is able to process and store Field 19 - Supplementary Flight Plan Information. Where such information is supplied as part of a flight plan submission to IFPS it will be extracted and stored for later retrieval, if required, in the event of an emergency situation arising. Supplementary flight plan information will not be included in the normal flight plan distribution by IFPS.

Note: *If the FPL has been filed via 'flightplanningonline' this information will be held by the system, but will not be transmitted. Should this information be required contact the AFPEx Helpdesk.*

3.6.4.2 Whilst the ICAO procedure should normally be followed by flight plan originators in the UK, they may avail themselves of the IFPS facility if they so wish.

3.6.4.3 ATS Authorities, or other relevant bodies, requiring Supplementary flight plan information on a particular flight and for urgent operational reasons may contact the Supervisor at the appropriate IFPU; assistance will be provided by either:

a) giving information on Field 19 where such information has been submitted to and stored by IFPS;
b) giving advice on a contact name/Tel No. of the AO and/or originator of the flight plan, which may be stored in the NMD database;
c) giving any additional information which may be contained in Field 18.

3.6.5 **Replacement Flight Plan Procedure.** If, within 4 hours of the EOBT, an alternative routing is selected between the same points of departure and destination, the procedure shall be as follows:

a) The original Flight Plan **must be cancelled** by submitting a CNL message using the DD priority indicator;
b) the replacement Flight Plan shall be filed **not less than 5 minutes** after the CNL message (It is recommended that the replacement Flight Plan is not submitted until the ACK for the CNL message has been received);
c) the replacement Flight Plan shall contain in Field 18 the indication RFP/Qn where:
    i. **RFP/Q** refers to the replacement Flight Plan; and
    ii. **n** corresponds to the sequence number relating to the replacement Flight Plan.

Example: First replacement Flight Plan - ICAO Field 18 - **RFP/Q1**;
Second replacement Flight Plan - ICAO Field 18 - **RFP/Q2**.

3.7 **Repetitive Flight Plans (RPLs)**

3.7.1 As part of the continuing development of the NMD, Eurocontrol will assume full responsibility for the reception, processing and distribution of Repetitive Flight Plan (RPL) data within the IFPS Zone. Flights within the IFPS Zone shall be filed solely with Eurocontrol at the NMD, Brussels, in accordance with the requirements and procedures detailed below.

3.7.2 Operators who fly routes on a regular or scheduled basis within the IFPS Zone are able to file Repetitive Flight Plans on the Eurocontrol database. These plans are activated automatically at the appropriate time before each flight. RPLs for flights within the IFPS Zone, but which have a route portion outside the Zone, have to be **filed** to the National Authorities of those external states. All external states on the route must have agreed to the use of RPLs; a mixture of RPLs and FPLs is not permitted for an individual flight.

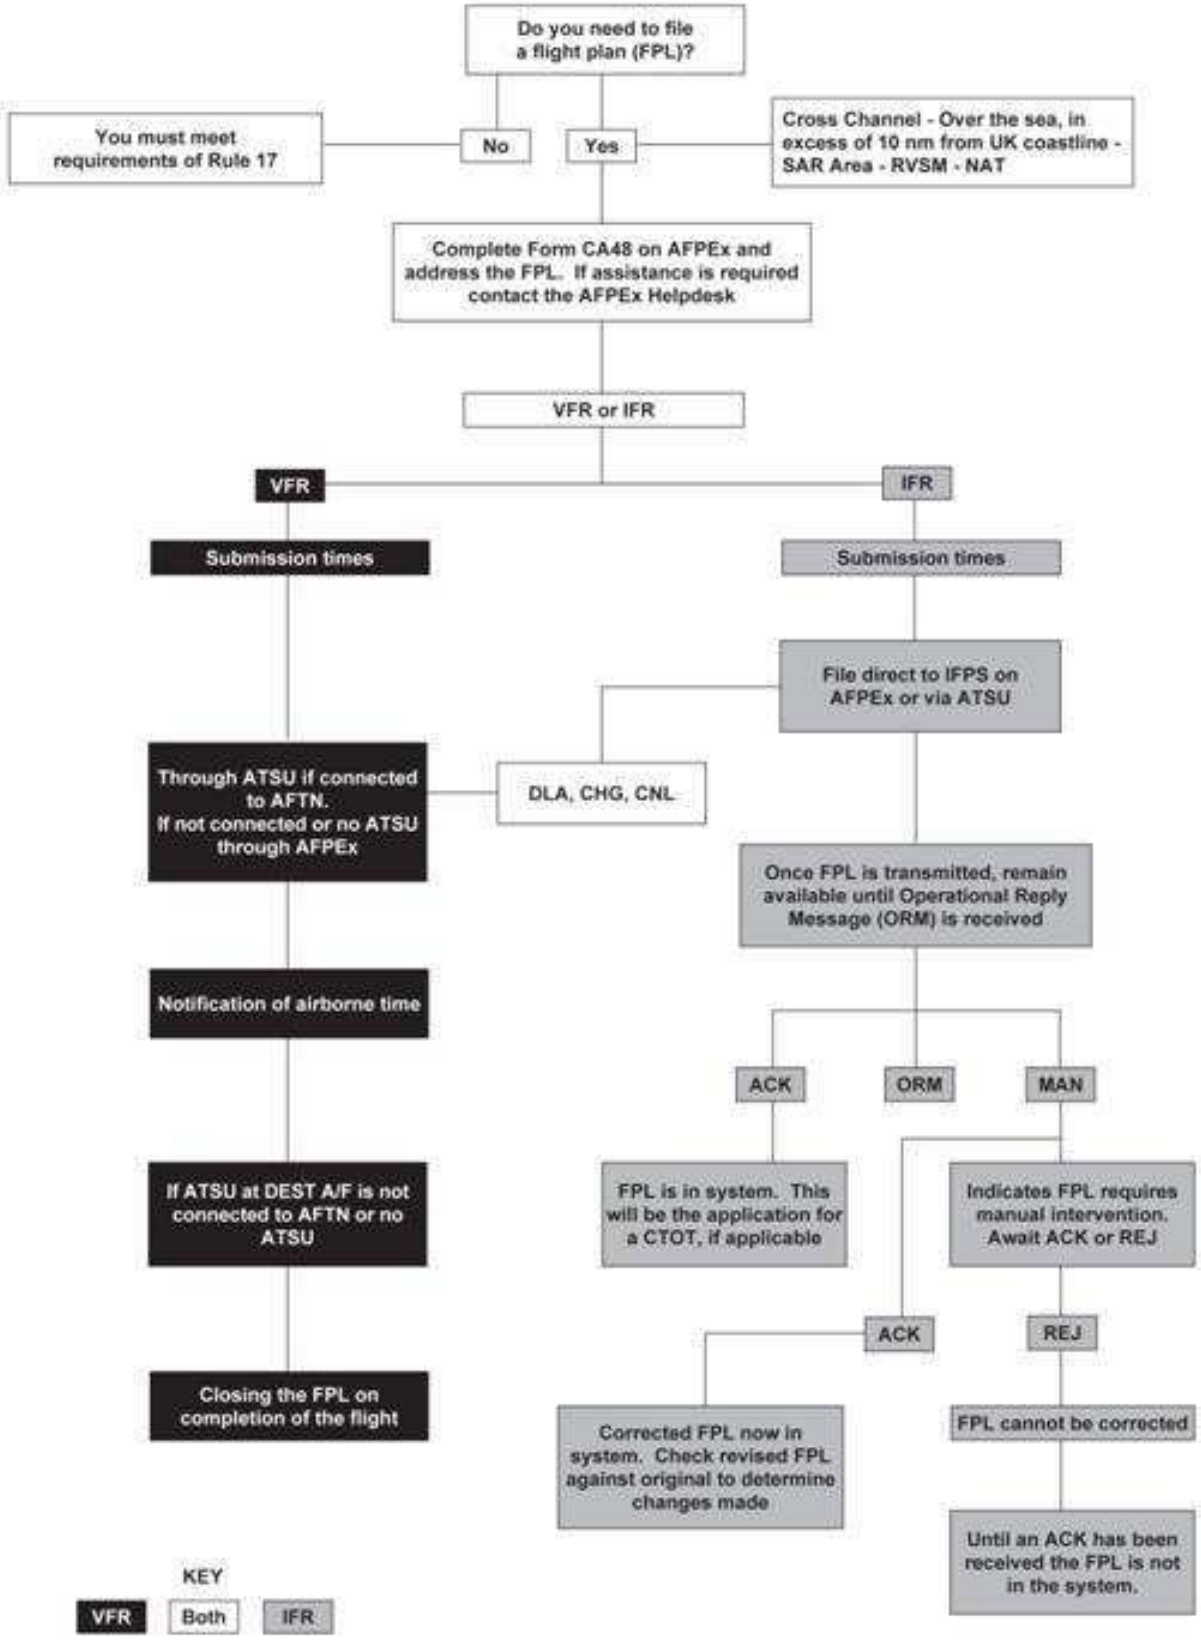
3.7.3 Details of the requirements for the submission and duration of RPLs can be found in the IFPS User Manual section of the Network Operations HANDBOOK. The **IFPS Users Manual and the Network Operations HANDBOOK** are available, free of charge, from:

Post: Eurocontrol Library
Rue de la Fusee, 96
B - 1130 Brussels, Belgium
Http: https://www.public.nm.eurocontrol.int/PUBPORTAL/gateway/spec/index.html

ENR 1.10 FLIGHT PLANNING (continued)

3.8 **Specific Eurocontrol Requirements for RPL Operations**

3.8.1 The basic principles for the submission of Repetitive Flight Plans are contained in ICAO Docs 4444 and 7030. The following paragraphs detail the differences between the ICAO Standard and the Eurocontrol requirement, which permits a more flexible approach within the basic rules. Full details are contained in the IFPS User Manual section of the Network Operations HANDBOOK.



3.8.2 RPLs shall cover the entire flight from the departure aerodrome to the destination aerodrome. Therefore, an RPL shall be submitted by the flight plan originator for its entire route. A mixture of both RPL and FPL message shall not be permitted. RPL procedures shall be applied only when ALL ATS authorities concerned with the flights have agreed to accept RPLs. In this respect, all States of the IFPS Zone accept RPLs. It is the responsibility of the AO to ensure that RPLs for flights which are partly outside the Zone are properly co-ordinated and addressed to the relevant external ATS authorities.

3.8.3 To suspend an RPL the originator should send the information in the format as shown in the IFPS User Manual. However, originators should note that flights cannot be suspended for less than 3 days. If the suspension is for less than 3 days, individual daily cancellation messages must be sent by the originator to the IFPS in order not to waste ATC capacity by leaving 'ghost' flights in the NMD and ATC databases.

3.8.4 To cancel an RPL for a specific day, the originator need only send a normal ICAO CNL message to both of the IFPS units (EUCHZMFP and EUCBZMFP or BRUEP7X and PAREP7X) **but not earlier than 20 hours before the EOBT of the flight.** The same rule applies for a change (CHG) or delay (DLA) message since at 20 hours before EOBT the RPL is transferred to the IFPS and the RPL effectively becomes a FPL.

ENR 1.10 FLIGHT PLANNING (continued)

4 THE FLIGHT PLAN FILING PROCESS VIA AFPEx

ENR 1.10 FLIGHT PLANNING (continued)

5 LOW-LEVEL CIVIL AIRCRAFT NOTIFICATION PROCEDURES (CANP)

5.1 Introduction

5.1.1 Many military and civil aircraft operate in Class G Airspace below 2000 FT AGL, where ground radio and radar coverage is not always available to assist pilots in avoiding collisions. Collision avoidance must necessarily, therefore, be based on the 'see and avoid' principle, assisted as far as possible by information on known activity. Whereas a variety of civil aviation activities take place within this airspace, military activity consists mainly of low flying training.

5.1.2 It is not practicable to obtain and disseminate traffic information on all civil flights below 2000 FT AGL, nor is it possible to disseminate details of military low-level flights within the UK Low Flying System (UKLFS) to civil operators. Nevertheless, the greatest conflict of interests occurs at or below 1000 FT AGL where the majority of military low-level operations take place and where civil aircraft may be engaged upon activities, as defined at paragraph 5.2.1, which might inhibit pilot look-out or reduce aircraft manoeuvrability. In addition, certain recreational and other civil flying activity, away from licensed aerodromes, needs to be considered.

5.1.3 A system exists to collect information on civil aerial activities for distribution to military operators to assist in flight planning. This system is known as the Low-Level Civil Aircraft Notification Procedure (CANP).

5.1.4 Before commencing any low flying sortie, military pilots receive a comprehensive brief on all factors likely to affect their flight, including relevant CANP details. Hence, maximum participation in CANP by those planning to conduct the qualifying activities is essential if full benefit is to be obtained from the procedure.

5.1.5 Pilots/operators, or their representatives, intending to embark upon aerial activities described below should notify details of the flights to the Military Airspace Management Cell (MAMC) - Low Flying Co-ord (LFC) at 78 Squadron Swanwick. For the purposes of CANP, direct-dial, Freephone and E-mail facilities are available as follows:

Monday to Thursday	0700-2000 (0600-1900);
Friday	0700-1500 (0600-1400).

5.1.6 E-mail notification is preferred for CANP requests as this allows LFC to E-mail or telephone confirmation of E-mail and issue a reference number to the aircraft operating authority. Contact details are as follows:

Phone: 01489-443100.
Email: SWK-MAMCLFCOORD@mod.gov.uk

5.2 Commercial Aerial Activity

5.2.1 The following civil aerial activities at and below 1000 FT AGL with an expected duration in excess of 20 minutes at a specific location, should be notified to LFC:

a) Aerial crop spraying;
b) underslung aerial load lifting;
c) aerial photography and filming;
d) aerial survey/air surveillance.

Note: *For the purposes of this notification, crop spraying is to be considered as the generic term for all agricultural tasks carried out by an aircraft.*

5.2.1.1 Pipeline/powerline inspection activity is the subject of ENR 1.10, paragraph 6. However, aircraft carrying out powerline inspections and which are able to operate within a limited geographical area may apply for warning status under CANP. Any request for such protection should be made as far in advance as is possible through the E-mail address or Freephone numbers shown at paragraph 5.1.6. The manager of the UKLFS at MAMC LFC, 78 Squadron Swanwick will consider requests of this nature on a case-by-case basis.

5.2.2 Procedure

5.2.2.1 CANP telephone messages should provide details of the intended activity in the following format:

a) Type of activity;
b) location(s): Preferably as a 2-letter, 6-figure grid reference taken from an OS 1:50,000 map, although latitude and longitude will be accepted. The name of a nearby village or town is also required;
c) area of operation(s): (See paragraph 5.2.4.1);
d) date and time of intended operation(s): Start/finish in local time;
e) maximum operating height(s) AGL;
f) number and type(s) of aircraft;
g) contact telephone number(s);
h) operating company and telephone number(s) (if applicable).

ENR 1.10 FLIGHT PLANNING (continued)

Example: CANP NOTIFICATION
A - UNDERSLUNG LOADS
B - SU 561310 - OVINGTON
C - 2 NM RADIUS
D - 12 SEPTEMBER - 1000 to 1300
E - 1000 FEET AGL
F - SINGLE MB105 HELICOPTER
G - Contact fax and telephone number for the site
H - ROTARY HELICOPTERS LTD - Fax and telephone number of operator.

5.2.2.2 Once a notification has been accepted, LFC will allocate a reference number which pilots/operators should retain. Operators are advised that, in the interests of safety and accuracy, all telephone calls to LFC are recorded.

5.2.2.3 Operators should, where possible, use the E-mail facility as the primary method of filing a notification. Requests should be submitted using Form CA 2366 as reproduced at Figure ENR 1.10-1. Customised variations of this form are acceptable if they contain all the information required at paragraph 5.2.2.1. A contact E-mail address and telephone number must be provided in order that notification can be confirmed and a reference number issued (additional copies of Form CA 2366 can be obtained from the Safety and Airspace Regulation Group (SARG) at the address shown at paragraph 5.4.1). **Users will receive a CANP reference number from LFC by E-mail or return telephone call.** This reference number should be retained until the termination of the activity with which it is associated.

5.2.3 **Pre-notification Required**

5.2.3.1 Pre-notification of intended operations should be communicated, by email if possible, to LFC not less than 4 hours before commencement of the activity. Email requests will receive an email or telephone call from LFC with time authentication and reference number. Notifications by telephone will receive a time authentication followed by a return call from LFC with a reference number. Although successful transmission of the CA 2366, or a time authenticator for notification by telephone, not less than 4 hours from the start of the CANP activity can normally be considered as confirmation that a CANP warning for the period requested will be issued. Operators may only request an avoidance under exceptional circumstances and if avoidance status is to be refused (significant adverse effect on military training) the operator will be advised accordingly. CANP activity that takes place in the Highland Restricted Area may also be refused subject to restrictions detailed in the latest Highlands Restricted Area (HRA) AIC.

5.2.3.2 Whenever possible, pre-notification of operations due to take place up to 1300 (1200) should be made the previous day and those due to take place after 1300 (1200) should be pre-notified on the morning of the same day. Consideration should also be given to LFC opening hours (paragraph 5.1.5); as multiple notifications just prior to LFC evening closure may not be processed until the following morning and operators therefore risk not having their activity notified to military crews before activity commencement the next day. It is accepted that there will be occasions when the minimum pre-notification time cannot be met. Nevertheless, late notifications should still be made and every effort will be made to distribute the information as widely as possible. However, reports received less than 4 hours before operations are due to commence are, progressively as the time diminishes, less likely to reach all military pilots before they depart on their low-level sorties and will, therefore, only be issued as a warning to military aircrew.

5.2.3.3 Due to the closure of LFC at weekends, activities planned for the weekend should be notified to LFC no later than 1600 (1500) on the Friday before, in order to receive warning status against any pre-notified Military flying. This also applies to flights which may enter low level due to the prevailing weather and the nature of the activity.

5.2.4 **Operating Area Boundaries**

5.2.4.1 The airspace notified under CANP should not exceed an area bounded by a 2 NM radius circle. **If more than one area is to be notified, these areas are not to be activated concurrently**. In the case of underslung aerial load lifting operations the area should be defined as a corridor extending 2 NM either side of intended track from ground level to a maximum of 1000 FT AGL. When the route of an underslung load exceeds 20 NM it should, wherever possible, be divided into sections not exceeding 20 NM in length; an overlap of 20 minutes is acceptable in such circumstances.

5.2.4.2 CANP may be used to notify pipeline inspection activity in a limited area (see ENR 1.10, paragraph 6), however, warning status will normally only be granted for a maximum period of 2 hours. Concurrent activation will be permitted, although the manager of the UKLFS still retains the right to refuse such requests when the impact on military training is considered to be unacceptable. Specific sites identified for the application of this facility are as follows:

ENR 1.10 FLIGHT PLANNING (continued)

Newark-on-Trent	530400N 0005200W
Tewkesbury	520000N 0021200W
Glasbury	520000N 0030800W
Kineton	520800N 0013000W
5 nm North of Ebbw Vale	515500N 0031900W

Additional sites may be identified as required by PINS operators subject to normal notification procedures.

5.2.4.3 Pilots of military fixed wing aircraft flying at an IAS greater than 140 KT will avoid areas reported under CANP either laterally or vertically. CANP users should note that military pilots may overfly the reported area by a minimum of 500 FT. Thus, for example, if the height of the CANP area is 1000 FT AGL, military aircraft may overfly the area at a minimum height of 1500 FT AGL. Therefore, the lateral and vertical boundaries that define the area of activity should equate only to the parameters within which the activity is planned to take place and should not build in an allowance as a safety factor.

5.2.4.4 Pilots/operators should note that, other than in exceptional circumstances, the dimensions of a CANP 'warning or avoidance' as defined at paragraph 5.2.4.1 are generally not negotiable. Any request for a CANP of non-standard dimensions should be made, as far in advance as possible, to the contact numbers shown at paragraph 5.1.6.

5.2.5 **Cancellation and Re-submissions**

5.2.5.1 Activities reported under CANP may considerably restrict the airspace available for military low flying training. Thus, in order to maintain the integrity of the CANP system, every reasonable attempt should be made to inform LFC as soon as it becomes obvious that an activity previously notified will no longer take place, or that the activity has been completed. Notification of a completed activity should be made irrespective of the time remaining on the CANP.

5.2.5.2 To eliminate the possibility of error, an application **must** be made in accordance with paragraph 5.2.2.1 on each occasion. Re-submission by reference to a previously issued CANP Reference Number **will not** be accepted by LFC.

5.2.6 **Infringements of CANP Airspace**

5.2.6.1 Infringements of CANP airspace will be fully investigated. If it is considered that CANP airspace has been infringed by military aircraft, and more than 4 hours pre-notification has been given in accordance with paragraph 5.2.3.1, then pilots/operators should contact LFC as soon as possible with the following information:

a) Reference Number (paragraph 5.2.2.2 refers);
b) date and time of the incident;
c) number and type of aircraft involved;
d) position and estimated profile (heading/height) of aircraft involved.

5.2.6.2 Pilots/operators should note that military light aircraft flying at an IAS of 140 KT or less, helicopters and any aircraft flying within a MATZ, need not avoid CANP airspace. However, pilots of such military aircraft will be aware of the notified activity, subject to the minimum notifying period indicated at paragraph 5.2.3.2.

5.3 **Recreational and Other Aerial Activities**

5.3.1 **Recreational Aerial Activities**

5.3.1.1 LFC invite notifications concerning certain recreational aerial activities planned to occur at or below 1000 FT AGL. Such notifications will be granted warning status under CANP and will be promulgated to military aircrew. Notifications are only required, however, when 5 or more gliders, hang-gliders and paragliders, free-flight balloons, microlight aircraft or model aircraft will be operating:

a) From a site not listed in the UK AIP for such activity; or
b) from a site listed in the UK AIP but outside the published operating hours of the site, where these are detailed.

5.3.1.2 BHPA Members may seek avoidance status when operating from one of the BHPA listed sites on weekdays (as also listed in the UK Military Low Flying Handbook). LFC must be notified by 2000 (1900) the day before flight, Monday - Thursday and by 1600 (1500) on Friday for the following Monday (excluding PH). Notification after these times will attract warning status only. LFC should be informed as soon as possible if the activity is cancelled.

5.3.1.3 Notwithstanding the provisions of paragraph 5.3.1.1(b), operators will be aware that permissions for cable launched gliding, hang-gliding and paragliding activities, to a height of more than 60 M AGL, are issued by SARG. Individual permissions will stipulate that, if activity during a weekday, it is conditional on compliance with the CANP system.

ENR 1.10 FLIGHT PLANNING (continued)

5.3.2 **Other Aerial Activities**

5.3.2.1 LFC also invites notification of the following activities:

a) Tethered and captive balloons (to a height greater than 60 M AGL);
b) kite flying, involving 5 or more kites from a specified site, (to a height greater than 60 M);
c) operations of aircraft from water;
d) any other aerial activity likely to create an exceptional concentration of aircraft at a site not listed in the UK AIP.

5.3.3 **Procedure**

5.3.3.1 E-mail or telephone notification should provide details of the intended activity as at paragraph 5.2.2.1.

Example: RECREATIONAL ACTIVITY
A - HANG-GLIDING
B - ST 187101 - UPOTTERY AERODROME, DEVON
C - 2 NM RADIUS
D - 19 NOVEMBER - 0900 to 1500 (local time)
E - N/A
F - EXPECTED NUMBER OF HANG-GLIDERS - 6
G - Telephone number of the site
H - DISCOVER AIR HANG-GLIDING GROUP (Telephone number if different to that at G).

5.3.3.2 Once a notification has been accepted, LFC will allocate a reference number which pilots/operators should retain.

5.3.3.3 The E-mail facility detailed in paragraph 5.1.6 should be used where possible for the notification of recreational activities.

5.3.4 **Pre-notification is required as in paragraph 5.2.3.1**

5.3.5 **Operating Area Boundaries**

5.3.5.1 The airspace notified should not exceed an area bounded by a 2 NM radius circle, from ground level to 1000 FT AGL.

5.3.5.2 Recreational and other aerial activities will not normally attract CANP avoidance areas; however, warnings of such activities will be promulgated to military aircrew.

5.3.6 **Cancellation**

5.3.6.1 Every reasonable attempt should be made to inform LFC as soon as it becomes obvious that an activity previously notified will no longer take place, or that the activity has been completed. Notification of a completed activity should be made irrespective of the time remaining on the CANP.

5.4 **Comments / Recommendations**

5.4.1 Users are invited to forward comments on CANP, or recommend improvements to the procedure to:

Post: Airspace Regulation, CAA, 1 NE Aviation House, Beehive Ring Road, Crawley, West Sussex, RH6 0YR
Email: airspace@caa.co.uk

6 PIPELINE AND POWERLINE INSPECTION PROCEDURES

6.1 **Introduction**

6.1.1 Pipeline and powerline inspection aircraft that operate in the airspace below 1000 FT AGL are not normally able to predict their movements with sufficient accuracy to utilise the CANP system for advising military aircraft of their activities.

6.1.2 To reduce the potential for confliction between pipeline and powerline inspecting aircraft and low-flying aircraft, a number of measures were introduced in October 1993. The system is continually monitored and updated to allow for changes to inspection procedures and profiles.

6.2 **Centralised Aviation Data Service (CADS)**

6.2.1 The use of Centralised Aviation Data Service (CADS) enables users, in the route-planning stage of a sortie, to both identify potential conflicts with the routes of other CADS users and submit and assess low level booking information to LFC. It is very much an ‘early Situational Awareness (SA)’ tool, providing a prompt for further action to ensure that aviators reduce the risk of Mid Air Collision (MAC) as far as is reasonably practicable. It provides a detailed route summary to all users.

6.2.2 Before any flight, pipeline and powerline inspection operators are encouraged to input their route into CADS*. Training on the system and the detailed procedures for using CADS are available from MAMC LFC based at 78 Squadron, Swanwick. They can

ENR 1.10 FLIGHT PLANNING (continued)

be contacted at SWK-MAMCLFCOORD@mod.gov.uk. Best endeavour is to be used to employ CADS on every sortie.

Note: ** CADS and potentially any subsequent replacement.*

6.2.3 Users should submit routes as early as practicable to maximise visibility of their plan to other users. Route detail may be updated before flight if required. Users should ensure that their route on CADS is plotted as accurately as practicable; the accuracy of each waypoint's position and the time of overflight should allow a subsequent user to gain SA of the plan and identify any potential conflict.

6.2.4 Crews should be aware that CADS only provides SA on flying activity planned by other CADS users. Furthermore, it does not allow for airborne route/timing changes due to weather or other constraints. Crews must ensure that effective lookout remains a fundamental discipline for avoiding MAC.

6.3 **Pipeline/Powerline Inspection Notification System (PINS)**

6.3.1 Pipeline/Powerline Inspection Notification System (PINS) allows for the collation of information on pipeline/powerline inspection programmes and its distribution by NOTAM.

6.3.2 Pipeline/powerline inspection aircraft pilots or their representatives should notify details of all inspection flights to LFC. For this purpose, the PINS E-mail and Freephone facilities are available during the following times:

Monday to Thursday 0700-2000 (0600-1900);
Friday 0700-1500 (0600-1400).

Note: *LFC does not operate on a 24 hour basis.*

6.3.3 E-mail notification is preferred for PINS as this allows LFC to E-mail or telephone confirmation of E-mail to the aircraft operating authority. Operators are advised that, in the interests of safety and accuracy, all telephone calls to LFC are recorded. The contact details for LFC are as follows:

Phone: 0800-515544 or 01489-443100.
Email: SWK-MAMCLFCOORD@mod.gov.uk

6.3.4 Details of planned inspection activity may be notified up to one month in advance. However, to ensure maximum effectiveness of the system, any changes to the pre-planned schedules should be passed to LFC by 1800 (1700) on the preceding weekday. Monday's schedules should be passed by 1700 (1600) on the preceding Friday. These details will be promulgated to military crews during the evening preceding the day of activity by means of a NOTAM for each weekday. The NOTAM will include a consolidated list of all PINS activity by area for the day between 0800-1700 (0700-1600). The areas notified, shown at ENR 6-20, are coincident with the Low Flying Areas of the military UKLFS with LFAs 7, 11 and 14 each subdivided into 2 further areas, but exclude military low flying Avoidance Areas and Dedicated User Areas.

6.4 **Recommended Height Profiles**

6.4.1 Aircraft engaged on pipeline inspection flights are likely to operate in the height band 500 FT to 700 FT AGL (typically 70-90 KT) where they will be above, and skylined to, the majority of military low flying aircraft that operate below 500 FT. Aircraft engaged on powerline inspection flights are likely to operate in the height band 50 FT to 200 FT AGL (typically <40 KT).

6.4.2 Since both inspection and military aircraft can be expected to operate outside of these height bands, pilots are not absolved from maintaining a good lookout and applying visual avoidance criteria. In particular, it should be noted that helicopters involved in inspections will continue, when required by the inspection, to descend in accordance with any permissions granted by the CAA in relation to the provisions of SERA.3105 Minimum Heights, SERA.5001 VMC Visibility and Distance from Cloud Minima and/or SERA.5005 Visual Flight Rules. Where circumstances dictate, helicopters may land to permit further investigation.

6.4.3 The nature of powerline inspections and the height at which they are flown is such that aircraft engaged on these duties are unlikely to conflict with the majority of low flying fast jet military aircraft except in certain specific areas shown at ENR 6-20. Inspection pilots intending to fly in these particular areas are reminded that military aircraft are authorised to fly down to 100 FT Minimum Separating Distance and that they should therefore plan their sortie accordingly. Military helicopter low flying traffic regularly conduct wires crossings at powerlines and therefore there is a requirement to notify and be vigilant, particularly in the areas shown at ENR 6-20 for helicopter activity.

6.4.4 Pipeline/Powerline inspection sorties which are able to operate within a limited area, may apply for warning status under CANP (ENR 1.10-13). This procedure is encouraged in known areas of conflict between military aircraft and inspection helicopters; 5 such areas have been specifically identified in paragraph 5. Any request for such protection should be made as far in advance as is possible through the E-mail or Freephone numbers shown at paragraph 6.3.3. The manager of the UKLFS, at LFC, 78 Squadron Swanwick, will consider requests of this nature on a case-by-case basis.

6.5 **Conspicuity**

6.5.1 Discrete Radiotelephony (RTF) callsigns and a dedicated Secondary Surveillance Radar (SSR) code have been allocated to aircraft on power and pipeline inspection flights. Thus the nature of flight will be immediately apparent to the Air Traffic Service Unit and to other aircraft operating on the frequency as soon as the initial radio transmission using the dedicated callsign is made. The

differing height profile (as per paragraph 6.4.1) and callsign should allow ATC units to understand and identify the likely inspection profile. Similarly, radar controllers will be able to detect the presence of an inspection aircraft which might not be in radio communication with that unit.

6.5.2 **RTF Callsigns**

6.5.2.1 Aircraft conducting inspection flights will use the callsign 'pipeline' or 'powerline', depending upon the nature of the task, followed by a unique numerical suffix. Hence, a helicopter carrying out a powerline inspection might use the callsign 'Powerline12'.

6.5.2.2 A list of operators and their allocated RTF numerical suffixes are listed in the table below. The WPD Helicopter Unit and the National Grid Company plc's licensed contracted operators only use callsign prefix 'Electricity' and 'Grid' respectively.

PINS Conspicuity Callsign Allocation	
Company	**Callsign Suffix**
HeliAir	44 to 47 inclusive, 66 and 100
Helicentre Aviation	81 to 85 inclusive
National Grid Company plc (Fixed & Rotary Wing)	GRID
PLM Dollar Group Limited	50 to 65 and 67 to 71 inclusive
Ravenair (Fixed Wing)	33 and 34
WPD Helicopter Unit	ELECTRICITY

6.5.3 **SSR Operating Procedures**

6.5.3.1 The special purpose SSR Code 0036 has been allocated to pipeline/powerline operations. Pilots should select this code, with Mode C, throughout the period that the aircraft is engaged in inspection activities. Unless there are overriding requirements, ATC Units should permit retention of the dedicated squawk by PINS aircraft for the benefit of adjacent radar equipped units. When in transit between the operating base and the region pilots should comply with the SSR Operating Procedures published at ENR 1.6, paragraph 2.1.3.

6.5.3.2 Air Traffic Controllers are reminded that, in accordance with Note 2 to the UK SSR Code Allocation Plan (ENR 1.6, paragraph 2.6), code 0036 must be considered as unverified and unvalidated.

6.6 **Conclusion**

6.6.1 It must be emphasised that the procedures detailed herein are advisory and that the promulgation of the activities will be in the form of warnings not avoidances. Both CADS and PINS should be used to inform all low flying traffic of potential conflictions. Failure to make pre-flight booking, either through CADS or PINS will not prevent inspection sorties taking place. Similarly, deviation from the booking is at the discretion of the helicopter pilot. The only consequence would be the inability to provide greater clarity to military crews of inspection activity.

6.6.2 Users are invited to forward comments or recommended improvements on pipeline and powerline inspection procedures to:

Post: Airspace Regulation, CAA, 1 NE Aviation House, Beehive Ring Road, Crawley, West Sussex, RH6 0YR
Email: airspace@caa.co.uk

7 MILITARY LOW FLYING TRAINING IN THE UNITED KINGDOM

7.1 **Introduction**

7.1.1 The United Kingdom Military Low Flying System (UKLFS) is sponsored by the MoD. The Safety and Airspace Regulation Group and the MoD co-sponsor this section to inform civilian pilots about military low flying training operations in the UK in the interest of mutual flight safety.

7.1.2 Low flying training remains an essential element in the tactical inventory of an effective air force and regular training in a realistic environment is essential to maintain operational capabilities. Over the UK, low flying is carried out by the Royal Air Force, Royal Navy, Army Air Corps and the UK based 16th United States Air Force. To a much lesser degree, training is also conducted by other NATO air forces.

7.2 **The United Kingdom Military Low Flying System (UKLFS)**

7.2.1 The UKLFS extends across the whole of the UK and surrounding overseas areas, from the surface to 2000 FT. This permits a wide distribution of activity, which contributes to flight safety and reduces the environmental impact of low flying. Military pilots are directed to avoid major conurbations, built up areas, Controlled Airspace (CAS), Aerodrome Traffic Zones (ATZ) and other sensitive locations. Inevitably, the protection given to these areas creates unavoidable concentrations of military low flying activity where corridors are formed between them. Where necessary, military pilots follow directional flows below 2000 FT to reduce the risk of confliction.

7.2.2 The UKLFS comprises the airspace vertically from surface to 2000 FT AGL/AMSL extending laterally to the FIR boundary. For

ease of management the airspace is sub-divided into Low Flying Areas (LFA) by day and a different structure of Night LFAs/ Sectors at night (see charts at ENR 6-20 and 6-21). Low Flying Co-ord (LFC) based at 78 Squadron Swanwick is responsible for the day-to-day management of the majority of the UKLFS. Certain LFAs, nominated as Dedicated User Areas (DUA), are allocated for special use (such as concentrated helicopter training) and are managed under local arrangements. Civil pilots should be aware that Unusual Air Activity (UAA) and night exercises are frequently conducted in DUAs including aircraft operating without, or with reduced lighting particularly when in formation. A limited amount of UAA is conducted in other areas of the UKLFS, which will usually be promulgated by AUS NOTAM.

7.2.3 In the North of Scotland, the Highlands Restricted Area (HRA) is used for special training, often in Instrument Meteorological Conditions (IMC). To ensure safety, entry by civilian and non-participating military aircraft is normally prohibited during the promulgated operating hours. The HRA is not permanently active. Activation times will be promulgated via NOTAM. See ENR 5.1.

7.2.4 UK Danger Areas are regularly used for weapons training. This can lead to an increased amount of low flying in the surrounding airspace. Details of Danger Areas can be found at ENR 5.1.

7.3 **Military Low Flying Activity**

7.3.1 Military fixed wing aircraft (except light aircraft) are considered to be low flying when less than 2000 FT Minimum Separation Distance (MSD), which is the authorised minimum separation, in all directions, between an aircraft and the ground, water or any obstacle. The lowest height at which military aircraft normally fly is 250 FT MSD. However, in three specially designated areas, known as Tactical Training Areas (TTA), located in Mid-Wales, in the Borders of Scotland and in the North of Scotland, a small number of flights may be authorised to fly down to 100 FT MSD. Military light propeller aircraft and helicopters are considered to be low flying when operating below 500 FT MSD. In practice, most military low flying takes place between 250 FT and 500 FT MSD, decreasing in intensity up to 1000 FT MSD and reducing further in the 1000 FT to 2000 FT height band. Occasionally, however, military aircraft perform high-energy manoeuvres between 250 FT and 2000 FT, during which rapid changes in height, speed and direction of the aircraft will occur.

7.3.2 The vast majority of low flying training is conducted on weekdays between 0700-2300 (0600-2200), although a limited amount may take place outside these times or at weekends. Fast jet aircraft are normally limited to a cruising speed of 450 KT, although speeds of up to 500 KT can be authorised for short periods during simulated attacks and practice interceptions. Of course, light propeller aircraft and helicopters operate at much lower speeds.

7.3.3 Most low flying takes place in the UK Flight Information Regions (FIR), outside CAS, where ground radio and radar coverage is not adequate to provide a radar service to military aircraft flying at low level. It would be equally impractical for military jet aircraft to achieve deconfliction by contacting ATC units. Military low flying is only conducted in Visual Meteorological Conditions (VMC), where pilots not only fly with visual reference to the surface, but also apply the ‘see and avoid’ principle regarding other aircraft. The exception to this rule is low flying in the HRA, when active, which is regularly conducted in limited visibility using terrain following radar.

7.3.4 LFC based at 78 Squadron Swanwick disseminates information on hazards and restrictions, including Civil Aircraft Notification Procedure (CANP) and some recreational aviation activities, to military aircrews via a military NOTAM distribution network. It is also possible for some late warnings to be passed to aircrew by telephone before flight, but once airborne, because of high transit speeds, frequency distribution and terrain screening, there is a limit on the extent to which ground to air communications can be maintained.

7.4 **Civilian Low Flying**

7.4.1 Civilian pilots engaged in low level aerial work might be subject to aircraft manoeuvring limitations and/or restricted lookout. CANP exists to provide military aircrews with information on civil aircraft below 1000 FT AGL engaged in crop spraying, photography, surveys or helicopters carrying under-slung loads. Military aircraft flying at speeds in excess of 140 KT will avoid the notified CANP areas of operation either laterally or vertically, with a separation of not less than 500 FT. Recreational activities will not normally attract CANP avoidance areas, but military aircrew will take account of some specified activities when planning low flying sorties. Information on the use of CANP is published at ENR 1.10, paragraph 5.

7.4.2 To reduce the risk of confliction with low flying military aircraft, civilian pilots conducting transit flights under Visual Flight Rules (VFR) during the working week are recommended to fly above 2000 FT AGL if possible. In particular, they should avoid operating in the 250 FT to 1000 FT height band. When departing from aerodromes in the FIR, pilots should endeavour to reach 1000 FT as quickly as possible, and to delay descent below 1000 FT for as long as possible when approaching such aerodromes. Military pilots are directed to avoid ATZs. Where an ATZ is established, civilian pilots are recommended to fly circuits and procedures within the ATZ as far as they can. In the vicinity of aerodromes without an ATZ military pilots will apply the ‘see and avoid’ principle.

7.5 **Conclusion**

7.5.1 In UKLFS airspace, as elsewhere in the FIR, deconfliction depends on pilots seeing and avoiding other aircraft. Civilian pilots can make a considerable contribution to flight safety by flying above 1000 FT whenever possible and remaining aware that some military flying occurs in the 1000 FT to 2000 FT height band.

ENR 1.11 ADDRESSING OF FLIGHT PLAN MESSAGES

1 IFR Flight plan addressing

1.1 An IFR Flight Plan is to be addressed as follows (add all addresses that apply):

Route	Message Address
Flight wholly within the IFPS Zone (ENR 1.10 refers)	EUCHZMFP and EUCBZMFP **or use** IFPS collective address EGZYIFPS
Within the Shanwick OCA and FIR	EUCHZMFP and EUCBZMFP
Flights which will transit the SOTA	EUCHZMFP and EUCBZMFP
Flights which will transit the BOTA	LFRRZQZX
Flights requiring a service from Swanwick Military	EGZYOATT
Flight or part of flight outside the IFPS Zone	As detailed in the AIP of the State or country flown through – see note.

2 Mixed IFR/VFR Flight plan addressing

2.1 The IFR portion of a mixed mode (IFR/VFR) Flight Plan is to be addressed as per the table above; the VFR portion is to be addressed as per the guidance below.

3 VFR Flight plan addressing

3.1 A VFR Flight Plan is to be addressed to the Departure and Destination aerodrome (ICAO Location Indicator + ZTZX) plus any additional addresses as specified in the tables below (add all addresses that apply):

Aerodrome	Requirement
EGAC (Belfast/City)	Add EGAAZTZX (Aldergrove ARO)
EGAD (Newtownards)	Add EGACZTZX (Belfast City ATC)
EGEC (Campbeltown)	Add EGPEZEZA
EGFF (Cardiff)	Add EGFFZIZF (for VFR departures from Cardiff and VFR flight plans requiring onward transmission) Add EGFFFDMS (for all VFR or IFR departures from Cardiff)
EGHH (Bournemouth)	Add EGHIZTZX (Southampton Zone)
EGLK (Blackbushe)	Add EGLFZTZX (Farnborough ATC)
EGNH (Blackpool)	Add EGNOZTZX (Warton Approach)
EGNL (Walney)	Add EGNOZTZX (Warton Approach)
EGPA (Kirkwall)	Add EGPEZEZA
EGPB (Sumburgh) and any other Shetland Isles aerodrome/destination	Add EGPDZTZX Add EGPEZEZA
EGPC (Wick)	Add EGPEZEZA
EGPE (Inverness)	Add EGPEZEZA
EGPH (Edinburgh)	Add EGPHZGZX
EGPI (Islay)	Add EGPEZEZA
EGPL (Benbecula)	Add EGPEZEZA
EGPN (Dundee)	Add EGPEZEZA
EGPO (Stornoway)	Add EGPEZEZA
EGPR (Barra)	Add EGPEZEZA
EGPU (Tiree)	Add EGPEZEZA
EGSY (St Athan)	Add EGFFZTZX
EGTF (Fairoaks)	Add EGLFZTZX

Route	Address
Entering or remaining within Scottish FIR/UIR	EGZYVFRP
Entering or remaining within London FIR/UIR	EGZYVFRT
Within the Shanwick Oceanic FIR	EGGXZOZX
Entering or remaining within Channel Islands CTR or CTAs	EGJJZRZX
Entering any Aberdeen ATSU Off-shore Area of Responsibility (shown at ENR 6-23)	EGPDZTZX
Any flight or portion of flight through an FIR of a neighbouring state (eg Cross Channel flight)	As detailed in the AIP of the State or country flown through – see note.

Note: *AIPs for all Eurocontrol states can be downloaded free of charge from the Eurocontrol Website at: http://www.ead.eurocontrol.int/eadcms/eadsite/index.php.html*

INTENTIONALLY BLANK

ENR 1.12 INTERCEPTION OF CIVIL AIRCRAFT

1 Notification

1.1 The procedure to be followed by the pilot-in-command of an intercepted aircraft and visual signals for use by intercepting and intercepted aircraft listed below are hereby notified for the purposes of the UK Air Navigation Order.

1.2 Under Article 9 of the Convention on International Civil Aviation, each contracting State reserves the right for reasons of military necessity or public safety, to restrict or prohibit the aircraft of other States from flying over certain areas of its territory.

1.3 The Regulations of a State may prescribe the need to investigate the identity of aircraft. Accordingly, it may be necessary to lead an aircraft of another nation, which has been intercepted, away from a particular area (such as a prohibited area) or, an intercepted aircraft may be required to land for security reasons at a designated aerodrome.

1.4 To avoid the interception of civil aircraft, adherence to flight plans and ATC procedures and the maintenance of a listening watch on the appropriate ATC frequency, make the possibility of interception highly improbable. If the identity of an aircraft is in doubt, all possible efforts will be made to secure identification through the appropriate Air Traffic Service Units.

1.5 As interception of civil aircraft are, in all cases, potentially hazardous, the interception procedures will only be used as a last resort.

1.6 The word 'interception' does not include the intercept and escort service provided on request to an aircraft in distress in accordance with Search and Rescue procedures.

1.7 An aircraft which is intercepted by another aircraft shall immediately:

a) Follow the instructions given by the intercepting aircraft, interpreting and responding to visual signals in accordance with the tables at ENR 1-12-2;
b) notify, if possible, the appropriate Air Traffic Services Unit;
c) attempt to establish radio communication with the intercepting aircraft or with the appropriate intercept control unit, by making a general call on the emergency frequency 121.500 MHz, giving the identity of the intercepted aircraft and the nature of the flight; and if no contact has been established and if practicable, repeating this call on the emergency frequency 243 MHz;
d) if equipped with SSR transponder, select Mode A, Code 7700 and Mode C, unless otherwise instructed by the appropriate Air Traffic Services Unit.

1.8 If radio contact with the intercepting aircraft is established but communication in a common language is not possible, attempts shall be made to convey essential information and acknowledgement of instructions by using the following phrases and pronunciations:

Phrase	Pronunciation	Meaning	Phrase	Pronunciation	Meaning
Callsign	**Kol** sa - In	My callsign is (callsign)	Mayday	**Mayday**	I am in distress
Wilco	**Vill** - Ko	Understood will comply	Hijack	**Hi - Jack**	I have been hijacked
Can Not	**Kann** Nott	Unable to comply	Land (place name)	Laand (place name)	I request to land at (place name)
Repeat	Ree - **Peet**	Repeat your instruction	Descend	Dee - **Send**	I require descent
Am Lost	**Am Losst**	Position unknown			

Note 1: *The callsign required to be given is that used in radiotelephony communications with Air Traffic Services Units and corresponding to the aircraft identification in the flight plan.*

Note 2: *Circumstances may not always permit, nor make desirable, the use of the phrase 'HIJACK'.*

1.9 The following phrases are expected to be used by the intercepting aircraft in the circumstances described above: (SERA.11015 Interception Table S11-3 refers).

Phrase	Pronunciation	Meaning	Phrase	Pronunciation	Meaning
Callsign	**Kol** sa - In	What is your callsign?	You Land	**You Laand**	Land at this aerodrome
Follow	**Fol** - Lo	Follow me	Proceed	Pro - **Seed**	You may proceed
Descend	Dee - **Send**	Descend for landing			

1.10 If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by signals, the intercepted aircraft shall request immediate clarification while continuing to comply with the visual instructions given by the intercepting aircraft.

1.11 If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by radio, the intercepted aircraft shall request immediate clarification while continuing to comply with the radio instructions given by the intercepting aircraft.

ENR 1.12 INTERCEPTION OF CIVIL AIRCRAFT (continued)

2 SIGNALS FOR USE IN THE EVENT OF INTERCEPTION

Signals initiated by intercepting aircraft and responses by intercepted aircraft				
Series	**INTERCEPTING Aircraft Signals**	**Meaning**	**INTERCEPTED Aircraft Responds**	**Meaning**
1	DAY-Rocking wings from a position slightly above and ahead of, and normally to the left of, the intercepted aircraft and, after acknowledgement, a slow level turn, normally to the left, on to the desired heading. NIGHT-Same and, in addition, flashing navigational lights at irregular intervals. ***Note 1:*** *Meteorological conditions or terrain may require the intercepting aircraft to take up a position slightly above and ahead of, and to the right of the intercepted aircraft and to make the subsequent turn to the right.* ***Note 2:*** *If the intercepted aircraft is not able to keep pace with the intercepting aircraft, the latter is expected to fly a series of race-track patterns and to rock its wings each time it passes the intercepted aircraft.*	You have been intercepted. Follow me.	**AEROPLANES:** DAY-Rocking wings and following. NIGHT-Same and, in addition, flashing navigational lights at irregular intervals. **HELICOPTERS:** DAY or NIGHT-Rocking aircraft, flashing navigational lights at irregular intervals and following. ***Note:*** *Additional action required to be taken by intercepted aircraft is prescribed in paragraphs 1.7, 1.8, 1.9, 1.10 and 1.11 on ENR 1-12-1.*	Understood, will comply.
2	DAY or NIGHT-An abrupt breakaway manoeuvre from the intercepted aircraft consisting of a climbing turn of 90 degrees or more without crossing the line of flight of the intercepted aircraft.	You may proceed.	**AEROPLANES:** DAY or NIGHT- Rocking wings. **HELICOPTERS:** DAY or NIGHT-Rocking aircraft.	Understood, will comply.
3	DAY-Circling aerodrome, lowering landing gear and overflying runway in the direction of landing or, if the intercepted aircraft is a helicopter, overflying the helicopter landing area. NIGHT-Same and, in addition, showing steady landing lights.	Land at this aerodrome.	**AEROPLANES:** DAY-Lowering landing gear, following the intercepting aircraft and, if after over-flying the runway landing is considered safe, proceeding to land. NIGHT-Same and, in addition, showing steady landing lights (if carried). **HELICOPTERS:** DAY or NIGHT-Following the intercepting aircraft and proceeding to land, showing a steady landing light (if carried).	Understood, will comply.

Signals initiated by intercepted aircraft and responses by intercepting aircraft				
Series	**INTERCEPTED Aircraft Signals**	**Meaning**	**INTERCEPTING Aircraft Responds**	**Meaning**
4	**AEROPLANES:** DAY-Raising landing gear while passing over landing runway at a height exceeding 300 m (1000 ft) but not exceeding 600 m (2000 ft) above the aerodrome level, and continuing to circle the aerodrome. NIGHT-Flashing landing lights while passing over landing runway at a height exceeding 300 m (1000 ft) but not exceeding 600 m (2000 ft) above the aerodrome level, and continuing to circle the aerodrome. If unable to flash landing lights, flash any other lights available.	Aerodrome you have designated is inadequate.	DAY or NIGHT-If it is desired that the intercepted aircraft follow the intercepting aircraft to an alternate aerodrome, the intercepting aircraft raises its landing gear and uses the Series 1 signals prescribed for intercepting aircraft. If it is decided to release the intercepted aircraft, the intercepting aircraft uses the Series 2 signals prescribed for intercepting aircraft.	Understood, follow me. Understood, you may proceed.
5	**AEROPLANES:** DAY or NIGHT- Regular switching on and off all available lights but in such a manner as to be distinct from flashing lights.	Cannot comply.	DAY or NIGHT-Use Series 2 signals prescribed for intercepting aircraft.	Understood.
6	AEROPLANES: DAY or NIGHT-Irregular flashing of all available lights. HELICOPTERS: DAY or NIGHT-Irregular flashing of all available lights.	In distress.	DAY or NIGHT-Use Series 2 signals prescribed for intercepting aircraft.	Understood.

ENR 1.13 UNLAWFUL INTERFERENCE

1 An aircraft which is being subjected to unlawful interference shall endeavour to notify the appropriate ATS Unit of this fact, any significant circumstances associated therewith and any deviation from the current flight plan necessitated by the circumstances, in order to enable the ATS Unit to give priority to the aircraft and to minimize conflict with other aircraft.

1.1 If an aircraft is subjected to unlawful interference, the pilot- in-command shall attempt to land as soon as practicable at the nearest suitable aerodrome or at a dedicated aerodrome assigned by the appropriate authority unless considerations aboard the aircraft dictate otherwise.

INTENTIONALLY BLANK

ENR 1.14 AIR TRAFFIC INCIDENTS

1 AIRPROX Reporting - General

1.1 An AIRPROX report should be made whenever a situation occurs in which, in the opinion of a pilot or air traffic services personnel, the distance between aircraft as well as their relative positions and speed have been such that the safety of the aircraft involved may have been compromised.

2 AIRPROX in UK Airspace

2.1 The UK Airprox Board (UKAB) investigates AIRPROX that occur in UK airspace. AIRPROX reports may be initiated by pilots or air traffic services (ATS) personnel and will be co-ordinated subsequently by the UKAB. Where the event meets Mandatory Occurrence Report (MOR) criteria an MOR should also be submitted to the CAA.

3 AIRPROX Reporting Procedures

3.1 Investigations are sometimes made more difficult due to the delay caused by the correct reporting procedure not being followed; those involved may not be aware that an AIRPROX report has been filed. In some cases, it is not possible to trace the other pilot, documentation or recordings may not have been preserved, or the ATS personnel involved may not be able to recollect the incident. Radar and R/T recordings are only preserved for 30 days unless requested to be held for longer by the relevant investigating authorities. Pilots and ATS personnel are therefore reminded that the appropriate procedure for reporting an AIRPROX occurrence is as follows.

3.2 **Immediate Actions - Pilots**

3.2.1 Those in communication with an ATS or listening out should make an initial report of an AIRPROX as soon as practicable, by radio, to the ATS Unit that they are with. They should prefix the message with the word "AIRPROX". Such initial reports act as an important trigger to allow the ATS unit involved to preserve any information relevant to the incident, and for the controllers involved to note the circumstances of the incident for use in future investigations.

3.2.2 Those not in communication with an ATS or not listening out at the time of the AIRPROX should make an initial report, by radio, as soon as practicable on contact with the next ATS.

3.2.3 If the AIRPROX cannot be reported by radio, an initial report should be made by the pilot immediately after landing, preferably using the UKAB App (see paragraph 3.4). This also allows submission should the report be submitted from a destination outside UK airspace.

3.3 **Immediate Actions - Air Traffic Services Personnel**

3.3.1 Whenever ATS personnel operating within UK airspace (including the Shanwick Oceanic FIR) or airspace of another state where the provision of ATS has been delegated to the UK, initiate an AIRPROX report or receive notification of an AIRPROX from either a pilot or the UKAB, it should be submitted as an AIRPROX MOR in accordance with current MOR reporting procedures. The AIRPROX MOR should be submitted as soon as possible using a form specifically designed for AIRPROX reporting. If no such form exists contact the UKAB for advice.

3.3.2 ATS personnel initiating an AIRPROX should not notify the pilots concerned whilst they are airborne but may inform them after landing. The UKAB will initiate tracing of the pilots involved as soon as possible after receipt of the initial ATS AIRPROX report.

3.4 **The AIRPROX Report**

3.4.1 A formal written report should be submitted within seven days of the incident, regardless of whether it was announced on the radio at the time. This allows for more accurate recollection of the event, both for those reporting and for other parties involved once they have been traced and contacted.

3.4.2 AIRPROX reports should be submitted either by:

i. The UKAB App; or
ii. CA1094 form. These should be sent to:

Email: contact@airproxboard.org.uk
Post: Director UK AIRPROX Board, Building 59, RAF Northolt, West End Road, Ruislip, Middlesex, HA4 6NG.
Fax: 0208-842 6056

UKAB will accept company reports but may request that an AIRPROX report also be submitted to ensure all required information is included.

3.4.3 All AIRPROX reports are subject to an initial review upon receipt. They will then receive thorough analysis based on the available evidence. The originator of the report and all aircraft operators and ATS agencies involved will be advised that the report has been received and that the analysis is under way. A request will be made for all those involved to submit reports of their recollections of

the AIRPROX.

3.5 **Military Personnel - Reporting of AIRPROX**

3.5.1 Military pilots and ATS personnel should refer to the appropriate regulations within MRP RA 1410 for AIRPROX reporting through the Defence Air Safety Occurrence Report (DASOR) system within the MAA's Air Safety Information Management System (ASIMS).

3.6 **AIRPROX Report Submission**

3.6.1 The most effective means of AIRPROX submission is by using the UKAB App, which is available for iOS or Android from the UKAB website: www.airproxboard.org.uk. CA1094 forms are also available from the UKAB website.

4 AIRPROX Analysis

4.1 The sole reason for assessment of AIRPROX by the UKAB is to enhance air safety by identifying associated lessons or proposing improvements in procedures and/or regulations. It is not the purpose of the UKAB to apportion blame or liability but simply to determine the factors that contributed to the AIRPROX and the risk of collision. All AIRPROX reports are published on the UKAB website at www.airproxboard.org.uk.

5 AIRPROX Assessment

5.1 Following appropriate analysis, the UKAB (a panel of civil and military pilots and air traffic services personnel from diverse aviation backgrounds) assesses each AIRPROX to determine contributory factors and the degree of risk. The UKAB may also make safety recommendations as the Board members deem appropriate.

5.2 Once each AIRPROX case is reviewed (i.e. the analysis and assessment stages have been completed), the pilots and ATS personnel involved in the AIRPROX, and their respective operating bodies, will be advised of the findings and asked to submit any factual inaccuracies prior to final release of the report. All AIRPROX reports and assessments are published at regular intervals.

Note: *The conclusions reached by the UKAB have no legal significance, and the anonymity of individuals and companies involved in an AIRPROX is preserved throughout the assessment and by dis-identifying reports in the subsequent publication process.*

5.3 Operators, pilots and ATS personnel who seek further information on any AIRPROX are requested to only contact the UKAB and not any other organisations involved.

6 AIRPROX in Foreign Airspace

6.1 Whilst the CAA has no authority to investigate any AIRPROX in foreign airspace, it is concerned about them particularly when UK public transport aircraft are involved. Accordingly, for these aircraft, copies of confirmatory reports made to foreign authorities and details of any response received from them are to be sent to SDD. This satisfies the MOR requirements. The CAA expects commanders/operators of the aircraft to initiate, confirm and follow through AIRPROX reports directly with the foreign authorities themselves in accordance with the appropriate national procedures. The Authority will, however, assist reporters where they have difficulty in following national procedures or in obtaining a response. Assistance may be obtained from the International Directorate, Civil Aviation Authority, 3W, Aviation House, Gatwick Airport South, West Sussex RH6 0YR (Tel: 01293-573815). The CAA may also take action of its own accord with a foreign authority on receipt of a report or follow-up where, for instance, from its knowledge of previous occurrences, it considers this necessary.

6.2 **Initial Report**

6.2.1 The procedure for reporting AIRPROX, as described in the appropriate State's AIP, should be followed.

6.3 **Follow Up Report**

6.3.1 The State's follow up procedure should be adhered to. In addition, a copy of the AIRPROX report on the State's form and an MOR should be sent to SDD.

6.3.2 If there is likely to be an appreciable delay in the transmission of a report, or the AIRPROX is considered particularly serious, the report to SDD should be sent via email. The message should be prefixed AIRPROX.

6.3.3 It is essential that where the form used may apply to an AIRPROX or ATC incident, the originator clearly annotates it as an AIRPROX.

6.3.4 AIRPROX and ATC Incident occurrences involving UK public transport aircraft in foreign airspace will be published in the SDD monthly listings for the information and action, where appropriate, of other UK operators likely to use the same airspace.

6.4 **Investigation of the Occurrence**

6.4.1 Providing that the initial and confirmatory reporting procedure has been followed, an investigation should be carried out by the appropriate foreign authority and the commander/operator advised of the findings and any preventive action taken. When a response is received, the commander/operator should pass the details to SDD indicating whether or not they are satisfied with the

ENR 1.14 AIR TRAFFIC INCIDENTS (continued)

outcome.

6.4.2 If the commander or operator is not satisfied and/or the CAA does not consider the outcome adequate, then further action may be taken with the authority concerned.

7 ATC Incidents

7.1 **In Foreign Airspace - UK Pilots/Operators**

7.1.1 The procedures in the State's AIP should be followed.

7.1.2 The MOR should be clearly annotated 'ATC Incident'.

7.1.3 The amount of attention accorded to incidents varies from State to State and it may be advisable on occasions to seek the assistance of the CAA in follow-up.

7.2 **In UK Airspace - Foreign Pilots/Operators**

7.2.1 Foreign pilots/operators may submit a report, regarding an ATC incident (which is not an AIRPROX) occurring in UK Airspace, into their own state reporting system under EU 376/2014. If an issue has been raised with the UK ANSP then the ANSP can report the event to SDD. Other states may be contacted if the SDD are made aware of the incident by UK parties.

	RAF BRIZE NORTON	BRIZE RADAR English 0900-1700 (0800-1600)	124.280 MHz	

1 General Information

1.1 Brize Norton Control Zone

1.1.1 Pilots wishing to enter the Control Zone must observe the normal procedure for joining Controlled Airspace and should make their request for entry when 15 NM or 5 minutes flying time (whichever is earlier) from the Control Zone Boundary. Pilots should make their request for Control Zone entry to BRIZE ZONE.

1.1.2 Pilots are advised that holding, instrument approach and departure procedures for Brize Norton are not wholly contained within the Control Zone. Additionally, due to the nature of military aircraft operations in the vicinity of Brize Norton, pilots operating in the vicinity of the Control Zone are advised to keep a good lookout for other traffic and are strongly recommended to request a Radar Service from BRIZE ZONE.

1.2 VFR Transit Flights

1.2.1 VFR flights requesting clearance to transit through the Brize Norton Control Zone may be given routing and/or altitude restrictions in order to enable VFR flights to be integrated with other traffic. Pilots should anticipate routing and/or holding instructions via the VRPs detailed in paragraph 2. Exceptionally, radar vectoring of VFR flights may be necessary for the effective integration of traffic.

1.2.2 Pilots are reminded of the requirement to remain in VMC at all times and to comply with SERA.3105 Minimum Heights and the relevant parts of SERA.5001 VMC Visibility and Distance from Cloud Minima and SERA.5005 Visual Flight Rules. Pilots must advise ATC if at any time they are unable to comply with the ATC instructions issued.

1.3 IFR Transit Flights

1.3.1 IFR flights requesting transit through the Brize Norton Control Zone will be accommodated whenever possible and will normally be given clearance and may be radar vectored to provide separation from other IFR flights.

1.3.2 Exceptionally, when re-routing would be impractical, due to the nature of military operations, vertical separation between IFR flights may be reduced to 500 FT provided that the pilots have been advised of, and have agreed to, the reduced separation.

2 Visual Reference Points (VRP)

a) Details of VRPs applicable to Brize Norton are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

1 AIRSPACE WITHIN WHICH ATS IS DELEGATED

1.1 The Areas Involved in the Transfer of ATS Responsibility Within the Northern North Sea at FL 85 and Below

1.1.1 **North Sea Area I** — Class G Airspace.

In this part of the Polaris FIR, the United Kingdom will provide Air Traffic Services to all aircraft at FL 85 and below. Procedures and communications will be as if this airspace is an integral part of the Scottish FIR. This area is bounded by arcs of Great Circles joining in succession the following points:
590504N 0013916E - 600000N 0000000E - 630000N 0000000E following the line of latitude to - 630000N 0003120E - 625328N 0003821E - 622219N 0010622E - 614410N 0013329E - 612122N 0014718E - 595346N 0020430E - 591722N 0014236E - 590504N 0013916E.

1.1.2 **North Sea Area II** – Class G Airspace (includes two areas of Class D Airspace).

In this part of the Scottish FIR, Norway will provide Air Traffic Services to all aircraft at FL 85 and below. Procedures and communications will be as if this airspace is an integral part of the Polaris FIR. This area is bounded by arcs of Great Circles joining in succession the following points:
590504N 0013916E - 570000N 0050000E - 563500N 0050000E - 560510N 0031455E - 563540N 0023642E - 575416N 0015748E - 582546N 0012854E - 590504N 0013916E.

1.1.2.1 **Balder CTA** – Class D Airspace.

In this airspace, contained within the North Sea Area II, a CTA of airspace Classification D has been established, in which Norway will provide Air Traffic Services to all aircraft at 1500 FT to FL 85. Procedures and communications will be as if this airspace is an integral part of the Polaris FIR. For lateral limits, please refer to CTA entry detailed in ENR 2.1.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

1.1.2.2 **Ekofisk CTA** – Class D Airspace

In this airspace, contained within the North Sea Area II, a CTA of airspace Classification D has been established, in which Norway will provide Air Traffic Services to all aircraft at 1500 FT to FL 85. Procedures and communications will be as if this airspace is an integral part of the Polaris FIR. For lateral limits, please refer to CTA entry detailed in ENR 2.1. RMZ is SFC to 1500 FT ALT, please refer to ENR 2.2, paragraph 5.1 for lateral limits.

1.1.3 **North Sea Area III** — Class G Airspace.

In this part of the Scottish FIR, Denmark will provide Air Traffic Services to all aircraft at FL 85 and below. Procedures and communications will be as if this airspace is an integral part of the Copenhagen FIR. This area is bounded by arcs of Great Circles joining in succession the following points:
563500N 0050000E - 550000N 0050000E - 551958N 0041955E - 554552N 0032208E - 555004N 0032355E - 555458N 0032055E - 560510N 0031455E - 563500N 0050000E.

1.1.4 **North Sea Area IV** — Class G Airspace (See Note).

In this part of the Reykjavik FIR/OCA, the United Kingdom will provide Air Traffic Services to all aircraft at FL 85 and below during the notified times of the Sumburgh Radar (Aberdeen ATSU) as listed at ENR 1.6, paragraph 4.5.2.2. Procedures and communications will be as if this airspace is an integral part of the Scottish FIR. This area is bounded by rhumb lines joining points (1) to (2) and points (3) to (4) and the arcs of Great Circles joining points (2) to (3) and points (4) to (1). The points within the Reykjavik FIR/OCA are:
(1) 610000N 0000000E following the line of latitude to -
(2) 610000N 0040000W -
(3) 630000N 0012637W following the line of latitude to -
(4) 630000N 0000000E -
(1) 610000N 0000000E.

Note: *Class A FL 55 and above outside notified times.*

1.2 The Area Involved in the Transfer of ATS Responsibility Within the Southern North Sea at FL 55 and Below

1.2.1 **North Sea Area V** — Class G Airspace.

In these parts of the London and Scottish FIRs the Netherlands will provide Air Traffic Services to all aircraft at FL 55 and below (FL 45 and below, beneath EGD323D and EGD323E). Procedures and communications will be as if this airspace was an integral part of the Amsterdam FIR. This area is bounded (excluding the extreme south-eastern fillet of EGD323E) by the arcs of Great Circles joining in succession the following points:
550000N 0050000E - 551958N 0041955E - 554552N 0032208E - 543715N 0025349E - 542245N 0024543E - 535745N 0025155E - 534003N 0025719E - 533503N 0025913E - 532809N 0030055E - 531803N 0030319E - 525551N 0030936E - 550000N 0050000E.
Aircraft operating within Area V are strongly encouraged to contact Amsterdam ACC (on published frequencies, providing their position, altitude, squawk, heading and intentions) and strongly encouraged to ensure that transponders are switched on and operational in Mode 3/A and C/ALT.

1.3 The Area Involved in the Transfer of ATS Responsibility Within the North Sea High Area between FL 195 and FL 660 (inclusive)

1.3.1 **North Sea High Area - FL 195 - FL 660** — Class C Airspace.

In these parts of the London and Scottish UIRs/FIRs Denmark will provide Air Traffic Services to all aircraft between FL 195 and FL 660 (inclusive) in parts of the London and Scottish FIRs/UIRs to Denmark. Procedures and communications will be as if this airspace was an integral part of the Copenhagen FIR. This area is bounded by arcs of Great Circles joining in succession the following points:
570000N 0050000E - 550000N 0050000E - 543000N 0043209E - 543843N 0042000E - 544927N 0041110E - 550252N 0040000E - 555116N 0033000E - 563035N 0033000E - 572000N 0042958E - 570000N 0050000E.

1.4 The Area Involved in the Transfer of ATS Responsibility Within the Southern North Sea between FL 175 and FL 245 (inclusive).

1.4.1 **North Sea CTA 2 (GODOS) and North Sea CTA 3 (MOLIX).**
FL 195 - FL 245 — Class C Airspace.
FL 175 - FL 195 — Class A Airspace.
In these parts of the London FIR the Netherlands will provide Air Traffic Services to all aircraft between FL 175 and FL 245 (inclusive) operating on ATS routes L17, L60, L74, L602, L989, M981, M982 and Y70. Procedures and communications will be as

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

if this airspace was an integral part of the Amsterdam FIR.

1.5 The Area Involved in the Transfer of ATS Responsibility Within the Amsterdam FIR.

1.5.1 **IBNOS Area**

FL 245 - FL 660 — Class C Airspace (ATS - London Area Control (Swanwick)).

In these parts of the Amsterdam FIR the United Kingdom will provide Air Traffic Services to all aircraft between FL 245 and FL 660 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. This area is bounded in succession by the following points:
515702.16N 0022122.62E - 515756.44N 0031018.61E - 512850.17N 0031018.61E - 514244.83N 0021001.17E - 515702.16N 0022122.62E

1.5.2 **ABNED Area**

FL 215 - FL 245— Class C Airspace (ATS - London Terminal Control (Swanwick)).

In these parts of the Amsterdam FIR the United Kingdom will provide Air Traffic Services to all aircraft between FL 215 and FL 245 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. This area is bounded in succession by the following points:
520027.05N 0031018.61E - 512850.17N 0031018.61E - 513812.59N 0023000.00E - 512720.12N 0023000.00E - 513000.00N 0020000.00E - 515709.71N 0022128.66E - 520027.05N 0031018.61E.

1.5.3 **AMRIV Area**

FL 195 - FL 215 — Class C Airspace (ATS - London Terminal Control (Swanwick)).
FL 55 - FL 195 — Class A Airspace (ATS - London Terminal Control (Swanwick)).

In these parts of the Amsterdam FIR the United Kingdom will provide Air Traffic Services to all aircraft between FL 55 and FL 215 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. This area is bounded in succession by the following points:
515827.02N 0024000.87E - 513554.52N 0024000.87E - 513812.59N 0023000.00E - 512720.12N 0023000.00E - 513000.00N 0020000.00E - 515709.71N 0022128.66E - 515827.02N 0024000.87E.

1.5.4 **SASKI Area B**

FL 245 - FL 660 — Class C Airspace (ATS - London Area Control (Swanwick)).

In these parts of the Amsterdam FIR the United Kingdom will provide Air Traffic Services to all aircraft between FL 245 and FL 660 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. This area is bounded in succession by the following points:
514244.83N 0021001.17E - 513812.59N 0023000.00E - 512720.12N 0023000.00E - 513000.00N 0020000.00E - 514244.83N 0021001.17E.

1.6 The Area Involved in the Transfer of ATS Responsibility Within the Southwestern Corner of the London UIR between FL 245 and FL 660 (inclusive)

1.6.1 **LARLA Triangle** - FL 245 - FL 660 — Class C Airspace.

In this part of the London UIR, France will provide Air Traffic Services to all aircraft between FL 245 and FL 660 (inclusive). Procedures and communications will be as if this airspace were an integral part of the France UIR. This area is bounded by arcs of Great Circles joining in succession the following points:
493323N 0065617W - 492841N 0045513W - 485542N 0073430W - 493323N 0065617W.

For FRA procedures see AIP France.

1.6.2 **TAKAS Box** - FL 245 - FL 660 — Class C Airspace.

In this part of the London UIR, the Irish Republic will provide Air Traffic Services to all aircraft between FL 245 and FL 660 (inclusive). Procedures and communications will be as if this airspace were an integral part of the Shannon UIR. This area is bounded by arcs of Great Circles joining in succession the following points:
493500N 0080000W - 493323N 0065617W - 485542N 0073430W - 485000N 0080000W - 493500N 0080000W.

For FRA procedures see AIP Ireland.

1.7 The Area Involved in the Transfer of ATS Responsibility Within the Irish Sea

1.7.1 **Holyhead CTAs 10, 11, 12, 13, 14, 19, 20 and 21 and Irish Sea CTAs 4, 5, 6 and 7** — Class C Airspace.

In this part of the London FIR, the Irish Republic will provide Air Traffic Services to all GAT. Procedures and communications will be as if this airspace were an integral part of the Shannon FIR.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

1.7.2 **BANBA CTA** FL 195 - FL 660 — Class C Airspace.

In this part of the London FIR/UIR, the Irish Republic will provide Air Traffic Services to all GAT, between FL 195 and FL 660 (inclusive). Procedures and communications will be as if this airspace were an integral part of the Shannon UIR.

1.8 The Area Involved in the Transfer of ATS Responsibility Within the Shannon FIR/UIR

1.8.1 **Donegal Area -** FL 245 - FL 660 — Class C Airspace.

In this part of the Shannon UIR, the United Kingdom (Scottish AC (Prestwick)) will provide Air Traffic Services to all aircraft between FL 245 and FL 660 (inclusive). Procedures and communications will be as if this airspace were an integral part of the Scottish UIR. This area is bounded by arcs of Great Circles joining in succession the following points:
542500N 0081000W - 552000N 0065500W - 552500N 0072000W - 552000N 0081500W - 544500N 0090000W - 543858N 0093320W - 542500N 0081000W.

1.8.2 **EGLINTON CTA (CTA 1)** 1500 FT ALT - FL 75 - Class C Airspace (ATS - EGAE).

In this part of the Shannon FIR, the United Kingdom will provide Air Traffic Services to all aircraft between 1500 FT altitude and FL 75 (inclusive). Procedures and communications will be as if this airspace was an integral part of the Scottish FIR. This area is bounded in succession by the following points:
550527N 0071520W - 545506N 0072926W - 550205N 0073332W - 550527N 0071520W.

1.8.3 **EGLINTON CTA (CTA 2)** 2000 FT ALT - FL 75 — Class C Airspace (ATS - EGAE).

In this part of the Shannon FIR, the United Kingdom will provide Air Traffic Services to all aircraft between 2000 FT altitude and FL 75 (inclusive). Procedures and communications will be as if this airspace was an integral part of the Scottish FIR. This area is bounded in succession by the following points:
550205N 0073332W - 545506N 0072926W - 545212N 0073329W - 550114N 0073807W - 550205N 0073332W.

1.8.4 **EGLINTON CTA (CTA 3)** 3000 FT ALT - FL 75 - Class C Airspace (ATS - EGAE).

In this part of the Shannon FIR, the United Kingdom will provide Air Traffic Services to all aircraft between 3000 FT altitude and FL 75 (inclusive). Procedures and communications will be as if this airspace was an integral part of the Scottish FIR. This area is bounded in succession by the following points:
551217N 0070547W - 550527N 0071520W - 550317N 0072703W - Arc 10 NM radius centred on EGAE ARP (550234N 0070943W) - 551217N 0070547W.

1.8.5 Outside the published hours of operation of Eglinton ATC (or NOTAM extensions thereof), the blocks of Airspace CTA1, CTA2, CTA3, revert to Class G Airspace under the authority of Shannon ACC.

1.9 The Area Involved in the Transfer of ATS Responsibility Within the North Atlantic

1.9.1 **RATSU Triangle**

SFC - FL 195 — Class G Airspace.
FL 195 - FL 660 — Class C Airspace.

In this part of the Scottish FIR/UIR, Iceland (Reykjavik ACC) will provide Air Traffic Services to all aircraft between the surface and FL 660 (inclusive). Procedures and communications will be as if this airspace were an integral part of the Reykjavik FIR. The area is bounded by straight lines joining in succession the following points:
610000N 0070000W - 604000N 0100000W - 610000N 0100000W following the line of latitude to - 610000N 0070000W.

1.9.2 **The Common Boundary Line (61N)**

SFC - FL 195 — Class G Airspace.
FL 195 - FL 660 — Class C Airspace.

At the Scottish and Reykjavik FIR/UIR boundary, Iceland (Reykjavik ACC) will provide Air Traffic Services to all aircraft between the surface and FL 660 (inclusive). Procedures and communications will be as if this airspace were an integral part of the Reykjavik FIR. The area is a straight line joining the following points:
610000N 0000000E following the line of latitude to - 610000N 0070000W.

1.9.3 **MOLAK Triangle**

FL255 - FL660 — Class C Airspace.

In this part of the Scottish UIR, the Irish Republic (Shannon ACC) will provide Air Traffic Services to all aircraft between FL 255 and FL 660 (inclusive). Procedures and communications will be as if this airspace were an integral part of the Shannon UIR. The area is bounded by straight lines joining in succession the following points:
544311.750N 0100000.000W - 543857.730N 0093320.029W - 543400.000N 0100000.000W - 544311.750N 0100000.000W.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

1.10 The Area Involved in the Transfer of ATS Responsibility Within the Paris FIR – La Manche Low.

1.10.1 **La Manche East (Low) 1 – FL 115 - FL 265.**

FL 115 - FL 195 — Class D Airspace (ATS - London Area Control (Swanwick)).
FL 195 - FL 265 — Class C Airspace (ATS - London Area Control (Swanwick)).

In these parts of the Paris FIR the United Kingdom will provide Air Traffic Services to all aircraft between FL 115 and FL 265 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. The area is bounded by arcs of Great Circles joining in succession the following points:

504000N 0012800E - 503606N 0013218E - 501017N 0015131E - 500331N 0013906E - 501629N 0010108E - 502517N 0004917E - 504000N 0012800E.

1.10.2 **La Manche East (Low) 2 – FL 195 - FL 265.**

FL 195 - FL 265 — Class C Airspace (ATS - London Area Control (Swanwick)).

In these parts of the Paris FIR the United Kingdom will provide Air Traffic Services to all aircraft between FL 195 and FL 265 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. The area is bounded by arcs of Great Circles joining in succession the following points:

501629N 0010108E - 500331N 0013906E - 495656N 0012709E - 501629N 0010108E.

1.10.3 **La Manche East (Low) 3 – FL 115 - FL 265.**

FL 115 - FL 195 — Class D Airspace (ATS - London Terminal Control (Swanwick)).
FL 195 - FL 265 — Class C Airspace (ATS - London Area Control (Swanwick)).

In these parts of the Paris FIR the United Kingdom will provide Air Traffic Services to all aircraft between FL 115 and FL 265 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. The area is bounded by arcs of Great Circles joining in succession the following points:

505419N 0012754E - 504244N 0014405E - 503925N 0013811E - 503606N 0013218E - 504000N 0012800E - 505419N 0012754E.

1.11 The Area Involved in the Transfer of ATS Responsibility Within the Reims UIR – La Manche High Area.

1.11.1 **La Manche East (High 1) - FL 265 - FL 285 — Class C Airspace.**

In this part of the Reims UIR, the United Kingdom will provide Air Traffic Services to all aircraft between FL 265 and FL 285 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. The area is bounded by arcs of Great Circles joining in succession the following points:

505419N 0012754E - 504244N 0014405E - 503925N 0013811E - 503606N 0013218E - 501346N 0015706E - 501017N 0015131E - 500659N 0014527E - 495656N 0012709E - 495951N 0012317E - 495841N 0011944E - 502405N 0004611E - 502517N 0004917E - 504000N 0012800E - 505419N 0012754E.

1.11.2 **La Manche East (High 2) - FL 285 - FL 660 — Class C Airspace.**

In this part of the Reims UIR, the United Kingdom will provide Air Traffic Services to all aircraft between FL 285 and FL 660 (inclusive). Procedures and communications will be as if this airspace was an integral part of the London FIR/UIR. The area is bounded by arcs of Great Circles joining in succession the following points:

505419N 0012754E - 504244N 0014405E - 503925N 0013811E - 503606N 0013218E - 501346N 0015706E - 501017N 0015131E - 500659N 0014527E - 495656N 0012709E - 495519N 0012412E - 495841N 0011944E - 502405N 0004611E - 502517N 0004917E - 504000N 0012800E - 505419N 0012754E.

1.12 The Area Involved in the Transfer of ATS Responsibility Within the London FIR – South-eastern Section of the English Channel.

1.12.1 **Part of Lille TMA Area 7 - 1500 FT AMSL - FL 65 Class E Airspace (ATS Lille Approach).**

In this part of the London FIR, France will provide Air Traffic Services to all aircraft between 1500 FT AMSL – FL 65 (inclusive). Procedures and communications will be as if this airspace was an integral part of the Paris FIR. The area is bounded by arcs of Great Circles joining in succession the following points:

503800N 0011500E - 504526N 0012800E - 504000N 0012800E - 503608N 0011744E - 503800N 0011500E.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

1.13 The Area Involved in the Transfer of ATS Responsibility Within the London FIR – The Channel Islands.

1.13.1 **Channel Islands CTA 1 (North) - FL 55 - FL 80 — Class D Airspace.**

In this part of the London FIR, Jersey will provide Air Traffic Services to all aircraft between FL 55 and FL 80 (inclusive). Procedures and communications will be as if this airspace was an integral part of the Channel Islands airspace which is delegated to Jersey from France during the opening hours of Jersey ATC. The area is bounded by arcs of Great Circles joining in succession the following points:

500000N 0030000W - 494951N 0030000W - 494802N 0031023W - 500000N 0032000W following the line of latitude to - 500000N 0030000W.

1.13.2 **Channel Islands Control Zone (North) - SFC - FL 80 — Class D Airspace.**

In this part of the London FIR, Jersey will provide Air Traffic Services to all aircraft between SFC and FL 80 (inclusive). Procedures and communications will be as if this airspace was an integral part of the Channel Islands airspace which is delegated to Jersey from France during the opening hours of Jersey ATC. The area is bounded by arcs of Great Circles joining in succession the following points:

500000N 0020000W - 494951N 0030000W - 500000N 0030000W following the line of latitude to - 500000N 0020000W.

1.13.3 **Channel Islands TMA (North) - FL 80 - FL 195 — Class A Airspace.**

In this part of the London FIR, Jersey will provide Air Traffic Services to all aircraft between FL 80 and FL 195 (inclusive). Procedures and communications will be as if this airspace was an integral part of the Channel Islands airspace which is delegated to Jersey from France during the opening hours of Jersey ATC. The area is bounded by arcs of Great Circles joining in succession the following points:

500000N 0020000W - 494802N 0031023W - 500000N 0032000W following the line of latitude to - 500000N 0020000W.

1.14 The Areas involved in the Transfer of ATS Responsibility are marked on the charts at ENR 6-44 to ENR 6-58.

2 MILITARY AERODROME TRAFFIC ZONES

2.1 Description

2.1.1 At designated military aerodromes, Military Aerodrome Traffic Zones (MATZ) are established to provide increased protection to aircraft in the critical stages of circuit, approach and climb-out. Established MATZ are listed at paragraph 2.4 and shown on the ENR 6-59 chart.

2.1.2 A MATZ acquires the status of the airspace classification within which it lies, ATC instructions are mandatory for military pilots within all portions of the MATZ. In the airspace outside the Aerodrome Traffic Zone (ATZ), compliance with MATZ procedures is encouraged though not compulsory for civil pilots.

2.1.3 In general, the dimensions of a MATZ are as follows:

a) The airspace within 5 NM radius of the mid-point of the longest runway, from the surface to 3000 FT AAL.
b) The airspace within a stub or stubs projected from the above airspace, having a length of 5 NM along the centre-line(s) aligned with the selected final approach path(s), and a width of 4 NM (2 NM either side of the centre-line) from 1000 FT AAL to 3000 FT AAL.
c) Exceptions to the above exist, for details of the dimensions of specific zones and the associated stub(s) see paragraph 2.4 and ENR 6-59 (chart).

2.1.4 Where two or more MATZ are grouped together and one aerodrome is designated the Controlling Aerodrome, the upper limit of each MATZ within the Combined MATZ (CMATZ) is determined with reference to the elevation of the highest aerodrome in the CMATZ.

2.1.5 An ATZ, as defined in the Air Navigation Order, exists within a MATZ and is based upon the same reference point as defined in paragraph 2.1.3 and detailed at paragraph 2.4. Although civil recognition of a MATZ is not mandatory, pilots are to comply with the provisions of Rule 11 of the Rules of the Air Regulations 2015 in respect of the ATZ.

2.1.6 Routine hours of activity for each MATZ are listed at paragraph 2.4. However, it should be noted that where a military aerodrome extends its operating hours via NOTAM that the associated MATZ will also be activated for the same extended period.

2.1.7 Normally, the Controlling Aerodrome ATC Unit for a CMATZ is to remain open while any one of the aerodromes in the CMATZ is open for flying. Alternatively, the Controlling Aerodrome may delegate overall responsibility to the aerodrome remaining open,

including arrangements for operating the CMATZ frequency.

2.2 Procedures for Penetration of a MATZ

2.2.1 A MATZ Penetration Service is available from the controlling aerodromes listed at paragraph 2.4 for the provision of increased protection to RTF equipped aircraft. Pilots wishing to penetrate a MATZ should, subject to paragraph 2.1.2, observe the following procedures:

a) When 15 NM or 5 minutes flying time from the MATZ boundary, whichever is the greater, establish two-way RTF communication with the controlling aerodrome on the appropriate frequency using the phraseology:

'..... (controlling aerodrome), this is ..... (aircraft callsign), request MATZ (and ATZ) penetration.'

b) When the call is acknowledged and when asked to 'pass your message', the pilot should pass the following information:

i. Callsign;
ii. Type of aircraft;
iii. Position;
iv. Heading;
v. Altitude;
vi. Intentions (eg destination and the intention to route through one or more ATZ);

c) Comply with any instructions issued by the controller;
d) Maintain a listening watch on the allocated RTF frequency until the aircraft is clear of the MATZ/ATZ;
e) Advise the controller when the aircraft is clear of the MATZ/ATZ.

Note 1: *Flight conditions are not required unless requested by the controller.*

Note 2: *Terrain clearance will be the responsibility of the pilot.*

Note 3: *Since compliance is not compulsory for civil aircraft some aircraft within the MATZ may not be known to the controller. All pilots should therefore maintain a good look-out at all times.*

2.2.2 The military ATSU providing the MATZ Penetration Service will normally continue the service that the aircraft was previously receiving. In the interests of flight safety and good airmanship, it is strongly recommended that all pilots not previously receiving an ATS obtain a MATZ penetration 'approval' from the MATZ operating authority prior to entering a MATZ. It is recognised that most MATZ crossing/penetration 'approvals' will be obtained via RTF by pilots in receipt of a UK FIS; however, it should be possible for a pilot to request a MATZ crossing/penetration 'approval' without the use of radio (i.e. by prior agreement via telephone). In accordance with Class G Airspace classification and the rules of UK FIS, pilots are ultimately responsible for maintaining their own separation against other airspace users within the MATZ. Occasionally, a change in service may need to be negotiated in order to facilitate the MATZ crossing and the advisory information and/or instructions passed by the ATSU will correspond with the service being provided. In the event of no radar being available, a non-radar Basic Service, and/or routing instructions, might be provided to aircraft penetrating the MATZ.

2.2.3 Subject to paragraph 2.2.4, when crossing a MATZ or CMATZ it is the responsibility of the pilot to ensure that permission is obtained to transit each individual ATZ embedded therein. The pilot, in their request for approval to transit the MATZ/CMATZ, may ask the controller to obtain such permission on their behalf. When issuing any approval to cross a MATZ or CMATZ controllers are, where appropriate, to articulate clearly any permission to transit embedded ATZs.

2.2.4 Whilst specific permission is not required to transit an ATZ that is not served by an ATC unit, flights within such ATZs are nevertheless subject to the pilot obtaining information from the associated flight information service unit or air/ground unit to enable the flight to be conducted safely (Rule 11 of the Rules of the Air Regulations 2015 refers). In such cases the pilot may ask the controller to obtain relevant information on his behalf.

2.2.5 If appropriate, controllers will endeavour to co-ordinate flights with the controlling authority of an adjacent MATZ, but pilots should not assume approval to penetrate another MATZ until it is explicitly given.

Note: *Given that military aircrew observance of a MATZ and associated ATC instructions are mandatory, MATZ penetration by a military aircraft is subject to specific permission/clearance.*

2.2.6 To enable vertical separation to be applied, all aircraft will be given an altimeter setting to use within the MATZ. Normally this will be the aerodrome QFE, with exceptions being listed in the table remarks at paragraph 2.4. In the case of overlapping MATZs, the altimeter setting to be used will be the QFE of the higher or highest aerodrome of the CMATZ. This will be passed as the 'Clutch QFE'.

2.3 Availability of the MATZ Penetration Service

2.3.1 A MATZ Penetration Service will normally be available during the hours listed in paragraph 2.4. However, due to the requirement of military units to adjust their operating hours at short notice to meet operational needs, pilots should call for the penetration service irrespective of the time. If no reply is received after two consecutive calls, pilots are advised to ‘proceed with caution’. In such circumstances they should transmit their intention to do so on the MATZ frequency, including their planned routing and height so as to increase the awareness of the controller and any other aircraft operating within the vicinity. Information on the operation

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

of aerodromes outside their normal operating hours may be obtained by telephone from the Distress and Diversion (D & D) cell at the London ATCC. Telephone: 01489-612406.

2.3.2 Where an ATSU is open but unable to grant a MATZ penetration approval, civil pilots may opt to enter the MATZ in line with paragraph 2.1.2 and 'proceed with caution' following the procedures as per paragraph 2.3.1 and noting that they must still avoid the ATZ in line with paragraph 2.1.5.

2.3.3 In some circumstances when the ATSU is closed, control of the MATZ frequency may be delegated to a flight information service unit or other air/ground unit. In these circumstances whilst a MATZ penetration approval will not be available, information relevant to the safe conduct of flight within the MATZ should be provided. Details of where such services exist are annotated in the remarks column of paragraph 2.4.

2.4 MATZ Participating Aerodromes

MATZ Designation/ Mid-point of Longest Runway	AD Elevation (FT) (AMSL)	MATZ Core Radius/Limits	1st Stub Heading °T to AD/ Distance/ Limits	2nd Stub Heading °T to AD/ Distance	Controlling Aerodrome/ ATS unit callsign/ frequency/ channel/ language	Hours of applicability	Remarks

3.2 Air Traffic Service

Regional Supplementary Procedures DOC 7030.

3.2.1 Air Traffic Service for the Shanwick OCA is provided by the Oceanic Area Control centre at Prestwick supported by the communications station at Ballygirreen near Shannon, Ireland. The callsign SHANWICK will be used.

3.2.2 Aircraft operating along tracks through successive points on the northern or southern boundaries of Gander and Shanwick OCAs will be provided with Air Traffic Services by Gander or Shanwick as appropriate.

3.2.3 Air Traffic Service in the NOTA and SOTA is provided by Shannon Area Control Centre, using the callsign ‘SHANNON’. Full details of the service provided and the procedures used are contained in AIP Ireland.

3.2.4 Air Traffic Service in the BOTA is provided by Brest Area Control Centre, using the callsign ‘Brest Control’. Full details of the service provided and the procedures used are contained in AIP France.

3.3 Flight Rules

Annex 2, Annex 11 and Regional Supplementary Procedures DOC 7030.

3.3.1 Flight shall be conducted in accordance with the Instrument Flight Rules (even when not operating in Instrument Meteorological Conditions) when operated within the Shanwick OCA.

3.3.2 Clearances to climb or descend maintaining own separation while in Visual Meteorological Conditions shall not be issued.

3.3.3 **Rules Applicable to all IFR flights**

3.3.3.1 ARINC 424

3.3.3.1.1 NAT operators should use a full latitude/longitude (e.g., 13-character) input for waypoints containing both half-degree and whole degrees of latitude and whole degrees of longitude.

3.3.3.1.2 NAT operators with an operational need to populate the aircraft NDB with a 5-character waypoint identifier should use the established ARINC 424 "H" format for half-degrees of latitude such as Hxxyy, where xx = degrees and 30 minutes of NORTH latitude and yy = degrees of WEST longitude (e.g., H5250 = 52°30' NORTH 050°00' WEST).

3.3.3.1.3 It is recognized that, for whole degree waypoint inputs, such operators will likely continue using the ARINC 424, 7.2.5 "N-suffix" format (e.g., 5250N = 52°00' NORTH 050°00 WEST). It is recommended that insertion of waypoints into the FMC be accomplished by established automated data link systems (e.g. AOC and CPDLC) wherever possible.

3.3.3.1.4 Regardless of FMC waypoint format and entry method, flight crew procedures should require each pilot to independently display and verify the DEGREES and MINUTES loaded into the FMC for the latitude/longitude waypoints defining the route contained in the NAT oceanic clearance to mitigate potential display ambiguity.

3.3.3.1.5 ATC CPDLC route clearance uplinks will be in a full Lat/Long format and will require those operators using ARINC 424 and the "H"

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

format to ensure their flight crews are trained to display and verify the full Lat/Longs of any uplink.

3.4 Separation of Aircraft within the Shanwick OCA

Regional Supplementary Procedures DOC 7030.

3.4.1 Separation, including radar separation, of aircraft within the NOTA and SOTA will be to standards defined by the Irish ATC authorities. Separation, including radar separation, of aircraft within the BOTA will be to standards defined by the French ATC Authorities.

3.4.2 Reduced Vertical Separation Minima (RVSM) applies within the Shanwick OCA between FL 290 and FL 410 inclusive. Aircraft wishing to fly within this level band must meet the RVSM requirements.

3.4.3 The French and Irish Authorities respectively designate the BOTA and NOTA/SOTA airspace between FL 290 and FL 410 inclusive for the purpose of transitioning non-RVSM approved aircraft operating to and from the North Atlantic Region.

3.5 NAT Organized Track System (NAT OTS)

Regional Supplementary Procedures DOC 7030.

3.5.1 Organized tracks are formulated and published as an AFTN Track Structure Message. The day-time structure, valid from 1130 UTC until 1900 UTC at 030°W is published by Shanwick, and the night-time structure, valid from 0100 UTC until 0800 UTC at 030°W by Gander.

3.5.2 All NAT Operators shall provide Company Preferred Route information providing Shanwick with the number of jet flights and routes likely to be requested during each of the main traffic periods, eg westbound flights crossing 030°W between 0800 and 1900 UTC and eastbound flights crossing 030°W between 2200 and 0900 UTC.

3.5.2.1 Shanwick can accept airlines Company Preferred Route information for westbound flights in two formats; The Preferred Route Message format (PRM) or alternatively a Flight Plan day minus 1 format (FPL-1).

3.5.2.2 Operators wishing to submit Company Preferred Route information via Flight Plan day minus 1 format (FPL-1) are required to pre-register by email at CPR@nats.co.uk before doing so.

3.5.2.3 The westbound PRM or FPL-1 is to be sent no later than 1900 UTC and the eastbound PRM no later than 1000 UTC. The format of the PRM, FPL-1 and the AFTN addresses to which they are to be sent are contained at ENR 2.2, paragraphs 3.24, 3.25 and 3.26.

3.5.3 The most northerly Track of a day Organized Track System (OTS) is designated as NAT Track Alpha, the adjacent Track to the south as NAT Track Bravo etc. In the case of the structure published for night use the most southerly Track is designated Zulu, the adjacent Track to the North is designated Yankee, etc.

3.5.4 Flight levels are allocated for use within the Track structure to make optimum use of the available airspace.

3.5.5 Pilots are encouraged to flight plan on published NAT tracks, when appropriate, although it is not mandatory to do so.

3.5.6 To permit an orderly change-over between successive OTSs a period of several hours is interposed between the termination of one system and the commencement of the next. During these periods, operators are expected to file random flight plans or use the co-ordinates of a track in the system about to come into effect. Appropriate flight planning levels are contained in the tables in paragraph 3.6.13.2. In all cases of doubt, advice should be sought by telephone from the appropriate OAC supervisor.

3.6 Flight Plans

Annex 2, Regional Supplementary Procedures DOC 7030 and PANS Doc 4444 ATM/501.

3.6.1 Pilots and operators are advised that as Shanwick is within the IFPS area, they are to ensure that all flight plans routing via the Shanwick Area of Responsibility are addressed to both EUCHZMFP and EUCBZMFP.

3.6.2 Submission of a Flight Plan advises ATC of the pilot's intent and the aircraft/pilot capabilities and authorisations (UK Flight Planning Guide CAP 694). ATC clearances are provided consistent with these capabilities and it is important that the content of the Flight Plan is correct.

Within the Flight Plan the PBN descriptors used in Item 10 – 'Equipment' indicates that:

a) Designated equipment fitted to the aircraft is serviceable.
b) Flight Crew are qualified for the intended operation.
c) The AOC holder holds the required navigation authorisations.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

It should be noted that for routes T9 and T290 there is currently no ICAO code for use within the Flight Plan to declare RNP2 capability, therefore (and in conformance with CAP 694) aircraft with RNP2 capability should submit the following descriptors within Item 10 – 'Equipment' and Item 18 – 'Other Information' as a minimum when operating via T9 or T290:

Field 10 – Equipment and Capabilities						
G	H	I (Note)	R	W	Y	Z
GNSS	HF RTF	Inertial Navigation	PBN Approved	RVSM Approved	VHF with 8.33 kHz	Other Equipment

Note: *T9 and T290 are designated with a navigational specification of RNP2 and are further designated as Continental/Offshore for the purposes of contingency requirements.*

Field 18 – Other Information
NAV/RNP2

3.6.3 For flights conducted along one of the organized tracks from the entry point into the NAT Flight Information Regions to the exit point, the organized track shall be defined in the flight plan by the abbreviation 'NAT' followed by the code letter assigned to the track. For flights wishing to join or leave an organized track at some point between entry and exit fixes, full track details should be specified in the flight plan, the track letter should not be used to abbreviate any portion of the route in these circumstances.

3.6.4 Flights planned wholly or partly outside the organized tracks shall be planned along great circle tracks joining successive significant points. The latitude and longitude of each designated reporting line (eg 010W, 020W, 030W, 040W, 050W, 060W, Fishpoint and landfall), should be entered in Item 15 of the flight plan.

3.6.5 ATS requires flights entering or exiting the Gander OCA to flight plan in accordance with the published NAT OTS or, if exiting the Gander OCA by way of 58°N 050°W and south thereof, via the following named points and associated 050°W coordinates:

- CUDDY DCT 58N 050W (Midwest Traffic)
- DORYY DCT 58N 050W (Eastern Seaboard Traffic)
- ENNSO DCT 5730N 050W
- HOIST DCT 57N 050W
- IRLOK DCT 5630N 050W
- JANJO DCT 56N 050W
- KODIK DCT 5530N 050W
- LOMSI DCT 55N 050W
- MELDI DCT 5430N 050W
- NEEKO DCT 54N 050W
- PELTU DCT 5330N 050W
- RIKAL DCT 53N 050W
- SAXAN DCT 5230N 050W
- TUDEP DCT 52N 050W
- UMESI DCT 5130N 050W
- ALLRY DCT 51N 050W
- BUDAR DCT 5030N 050W
- ELSIR DCT 50N 050W
- IBERG DCT 4930N 050W
- JOOPY DCT 49N 050W
- MUSAK DCT 4830N 050W
- NICSO DCT 48N 050W
- OMSAT DCT 4730N 050W
- PORTI DCT 47N 050W
- RELIC DCT 4630N 050W
- SUPRY DCT 46N 050W
- RAFIN DCT 45N 050W
- BOBTU DCT 44N 050W

3.6.6 Estimated Times

3.6.6.1 For flights conducted in the NAT, the accumulated estimated elapsed times to each oceanic FIR boundary shall be specified in Item 18 of the flight plan, following the EET/indicator.

3.6.6.2 For flights entering Shanwick OCA directly from the SOTA, the Estimated Elapsed Time (EET) for the Shanwick Boundary filed in Item 18 of the flight plan is to be the EET for the point of crossing the Shanwick/SOTA Boundary (RODEL/SOMAX/BEDRA/ KOGAD/OMOKO/TAMEL or LASNO).

3.6.6.3 For flights entering Shanwick OCA directly from the BOTA, the EET for the Shanwick Boundary filed in Item 18 of the flight plan is

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

to be the EET for the point of crossing the Shanwick/BOTA Boundary (ETIKI/UMLER/SEPAL/BUNAV or SIVIR).

3.6.6.4 For flights exiting Shanwick OCA directly to the SOTA, the EET for the Shannon Boundary filed in Item 18 of the flight plan is to be the EET for the point of crossing the Shanwick/SOTA Boundary (RODEL/SOMAX/BEDRA/KOGAD/OMOKO/TAMEL or LASNO).

3.6.6.5 For flights exiting Shanwick OCA directly to the BOTA, the EET for the Brest Boundary filed in Item 18 of the flight plan is to be the EET for the point of crossing the Shanwick/BOTA Boundary (ETIKI/UMLER/SEPAL/BUNAV or SIVIR).

3.6.6.6 For flights entering Shanwick OCA directly from the NOTA, the EET for the Shanwick Boundary filed in Item 18 of the flight plan is to be the EET for the point of crossing the Shanwick/NOTA Boundary (VENER/RESNO/ETARI/PIKIL/BILTO/SUNOT or AGORI).

3.6.6.7 For flights exiting Shanwick OCA directly to the NOTA, the EET for the Shannon Boundary filed in Item 18 of the flight plan is to be the EET for the point of crossing the Shanwick/NOTA Boundary (VENER/RESNO/ETARI/PIKIL/BILTO/SUNOT or AGORI).

3.6.7 Flights Routing to/from GOMUP (57N 010W)

3.6.7.1 Flights will not be cleared to route along 57N between GOMUP (57N 010W) and SUNOT (57N 015W). Flights to/from GOMUP routing to/from 020W will be required to cross 020W at or north of 58N.

3.6.8 The designated reporting lines within the Shanwick OCA are:

For flights Europe — North America	Eastern boundary of the OCA, and longitudes 02000W and 03000W.
For flights Europe — Iceland	01000W and latitude 6100N (RATSU).
For flights Europe — Azores	00845W and latitude 4500N.

3.6.9 MACH Numbers

3.6.9.1 Jet aircraft intending to operate in the Shanwick OCA must indicate the MACH number planned to be used for any portion of the flight within the area in Item 15 of the flight plan.

3.6.9.1.1 Jet aircraft should indicate their proposed speeds in the following sequence:

a) Cruising speed (TAS) in knots;
b) Oceanic Entry Point and cruising MACH number;
c) Landfall Fix and cruising speed (TAS) in knots.

3.6.9.2 All other aircraft: speed in terms of TAS in knots or MACH number.

3.6.10 Minimum Navigation Performance Specification (MNPS)

3.6.10.1 If the flight is certified as being in compliance with Minimum Navigation Performance Specifications (MNPS) and intends to operate in the North Atlantic High Level Airspace (NAT HLA) for any portion of the flight, the letter ‘X’ shall be inserted after the letter ‘S’ in item 10 of the flight plan to indicate that the flight has been approved for operations within the NAT HLA. It is the captain’s responsibility to ensure that specific approval has been given for such operations by the State of Registry of either the aircraft or of the operator. See paragraph 3.18.1 (Application of MNPS in Shanwick OCA).

3.6.11 **North Atlantic Data Link Services**

3.6.11.1 ICAO document 10037, “Global Operational Data Link (GOLD) Manual”, North Atlantic Airspace and Operations Manual DOC 007

The NAT Data Link Mandate (NAT DLM) for Data Link Services applies within the Shanwick OCA between Flight Levels 290 and 410 inclusive and requires that aircraft have fitted and operate FANS 1/A equipment, i.e. FANS 1/A CPDLC and ADS-C.

CPDLC and ADS-C service is available throughout the whole of the Shanwick OCA.

Flights equipped with and prepared to operate FANS 1/A (or equivalent) CPDLC and ADS-C data link systems will be permitted to flight plan to enter the NAT DLM airspace, (NAT Regional Supplementary Procedures (ICAO Doc 7030) paragraphs 3.3.2 and 5.4.2 apply for CPDLC and ADS-C respectively).

Certain non-equipped flights, as noted below, may flight plan to enter mandated airspace, however such flights may not receive their requested profile which fully corresponds to the filed flight plan.

3.6.11.2 These procedures are applicable to all FANS 1/A flights that are required, or wish to, participate in NAT DLM Data Link Services.

The FANS data link log-on address for the Shanwick OCA is EGGX.

For correct functioning of FANS data link the aircraft identification entered in the avionics must be precisely the same as that contained in the filed flight plan. This should be confirmed by the flight crew prior to log-on.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

3.6.11.3 FANS 1/A equipped flights are permitted to enter the mandated airspace if the flight plan indicates in Item 10:

a) D1 (ADS-C with FANS 1/A capabilities); and
b) J5 (CPDLC FANS 1/A SATCOM (INMARSAT)); and/or
c) J7 (CPDLC FANS 1/A SATCOM (Iridium)).

Non-FANS 1/A equipped flights are permitted to enter the mandated airspace if the flight plan indicates in Item 18:

a) STS/FFR; or
b) HOSP; or
c) HUM; or
d) MEDEVAC; or
e) SAR; or
f) STATE.

3.6.11.4 Any aircraft not equipped with FANS 1/A (or equivalent) systems may request a continuous climb or descent, without intermediate level off, through the mandated airspace. Such requests will be considered on a tactical basis.

Altitude Reservation (ALTRV) requests will be considered on a case by case basis irrespective of the equipage status of the participating aircraft.

NAT DLM restrictions are not applicable to aircraft experiencing a contingency situation.

3.6.11.5 Flights that experience an equipment failure prior to departure which renders the aircraft non-DLM compliant should re-submit a flight plan to remain clear of mandated airspace.

Flights that experience an equipment failure after departure but before entry to mandated airspace which renders the aircraft unable to operate FANS 1/A (or equivalent) CPDLC and/or ADS-C systems must notify ATC of their status prior to entering the airspace. Such flights may be approved to operate in the airspace subject to tactical considerations.

Flights that experience a FANS 1/A data link equipment failure while the flight is operating within NAT DLM airspace must immediately advise ATC. Such flights may be allowed to continue within the airspace subject to tactical considerations.

3.6.11.6 ATS Surveillance Service utilising ADS-B is available to suitably equipped flights throughout the Shanwick OCA. Service is enabled by ADS-B equipment hosted in a network of earth satellites.

ADS-B use is mandatory for flights operating on routes T9 and T290 to facilitate access to these routes by certain aircraft unable to comply with the NAT DLM. These routes are designated continental/offshore; see 3.18.1.8 below and ENR 3.5 'Other Routes' for further details.

Participating flights benefit from enhanced flight monitoring and the application, where appropriate, of surveillance separation minima.

Summary of Data Link, Navigational and Communications provisions in the Shanwick High Level Airspace.

Note: *Detailed Communications requirements can be found at 3.9 below.*

Shanwick HLA (FL 290 – FL 410) Data Link, Navigational and Communications Requirements
BOTA (Note 1) and SOTA (Note 2)

Route Type	HF	CPDLC	ADS-C	RSP180	RNP4	RCP240	RNP10	ADS-B (Note 3)	RNP2 (Note 4)
PBCS OTS Track	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Non-PBCS OTS Tracks and Random Routes	Yes	Yes	Yes	No	No	No	Yes	No	No
T9 and T290	Yes	No	No	No	No	No	Yes	Yes	Yes

Note 1: *Brest Oceanic Transition Area – see AIP France.*
Note 2: *Shannon Oceanic Transition area – See AIP Ireland.*
Note 3: *ADS-B with dedicated 1090 MHz out capability.*
Note 4: *T9/T290 RNP2 designation is continental/offshore utilising ADS-B with VHF voice available.*
Note 5: *With the exception of HF radio these requirements do not apply outside NAT HLA.*

3.6.11.7 **Uplink Message Latency Monitor Function**

3.6.11.7.1 Set Timer

3.6.11.7.1.1 The uplink message latency monitor function is designed to prevent pilots from acting on a CPDLC uplink message that has been delayed in the network. Approximately 5 minutes after entering Shanwick Oceanic airspace, equipped flights will receive a message advising crews to set the latency timer: "SET MAX UPLINK DELAY VALUE TO 300 SEC".

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

3.6.11.7.1.2 When the pilot receives the uplink CPDLC message "SET MAX UPLINK DELAY VALUE TO 300 SEC" he/she shall;

a) Send a positive response to ATC as prompted by the avionics (ACCEPT [ROGER]) regardless of whether the aircraft supports the latency monitor.

Note 1: *It is important that pilots respond to the "SET MAX UPLINK DELAY VALUE TO 300 SEC" uplink message to avoid having open unanswered CPDLC messages in the system. This also applies to aircraft that have deficient message latency monitor functionality or no such functionality at all.*

Note 2: *The Global Operational Data Link Manual specifies that the pilot should append the response downlink with the free text message "TIMER NOT AVAILABLE" when the message latency monitor function is not available in the aircraft.*

b) If the aircraft is equipped with a correctly functioning message latency monitor, enter the specified uplink delay into the avionics in accordance with the aircraft procedures. Some avionics will automatically set the delay value in accordance with the uplink message and do not allow for a manual input.

Note 1: *If an aircraft is instructed to log off and then log on again mid-flight, ATC may send the message "SET MAX UPLINK DELAY VALUE TO 300 SEC" again once the logon is completed.*

3.6.11.7.2 Delayed CPDLC Uplink Message

3.6.11.7.2.1 When a pilot receives a CPDLC uplink message with an indication that the message has been delayed the pilot shall:

a) Revert to voice communications to notify the ATS unit of the delayed message received and to request clarification of the intent of the CPDLC message; and
b) Respond appropriately to close the message as per the instructions of the controller.
c) The pilot must not act on the delayed uplink message until clarification has been received from the controller.

3.6.12 Reduced Vertical Separation Minima (RVSM)

3.6.12.1 If the flight is certified as being in compliance with the Minimum Aircraft System Performance Specification (MASPS) and intends to operate in RVSM Airspace for any portion of the flight, the letter 'W' shall be inserted after the letter(s) 'S' and 'X' (if applicable) in Item 10 of the flight plan to indicate that the flight has been approved for operations within RVSM Airspace. It is the Captain's responsibility to ensure that specific approval has been given for such operations by the State of registry of either the aircraft or the operator. See Paragraph 3.18.2 (Application of RVSM in Shanwick OCA).

3.6.13 **Flight Level Allocation**

3.6.13.1 Operators are permitted to file flight plans at any flight level for a route which is wholly contained within the routing structure of T13, T16 and T213, however flight planning requirements apply to T9 and T290 (see ENR 3.5 Other Routes).

3.6.13.2 If a flight entering the Shanwick OCA is expected to be level critical, Operators should contact the initial OAC prior to filing the flight plan to determine the likely availability of such level(s).

3.6.13.3 Request for a suitable alternative flight level may be included in Item 18 of the flight plan.

3.6.13.4 Flight plans for flights departing from points within adjacent regions and entering the NAT Region, without intermediate stops, should be submitted at least 3 hours prior to departure. For addressing of Flight Plan messages see ENR 1.11.

3.6.13.5 Flight Plans for flights through NOTA/SOTA Airspace by aircraft not equipped with VHF RTF are to be annotated, in Item 18, COM/ UHF only.

3.7 Send an 'RCL'

'RCL': Voice, or data link message via ACARS, used to provide ETA at Oceanic Entry Point (OEP), requested flight level, and Mach.

Annex 11 and PANS Doc 4444 ATM/501.

3.7.1 Aircraft entering Shanwick OCA from domestic airspace are required to send an 'RCL' to Shanwick using one of the methods indicated in paragraph 3.8.

3.7.1.1 For Westbound aircraft routing via RATSU (61N 010W), see paragraph 3.8.3.

3.7.1.2 Aircraft entering Shanwick OCA from an adjacent OCA will normally receive approval for their level, route and speed by the authority controlling the adjacent OCA.

3.7.2 Aircraft which have filed a flight plan using a MACH number are permitted to fly at normal speed at the MACH number in the filed flight plan. Any changes to speed shall be issued on entering Shanwick airspace. After leaving Oceanic Airspace aircraft should maintain their assigned MACH number in domestic airspace unless the appropriate ATC unit authorises a change.

3.7.3 It is essential that the ETA within the 'RCL' is correct. If the estimate for the Oceanic Boundary last reported to Shanwick is found

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

to be in error by 3 minutes or more, flights must transmit a revised estimate to Shanwick, as soon as possible.

3.7.4 Flights that experience or suspect GNSS interference en-route to the Shanwick OEP shall notify Shanwick ATC in the RCL.

3.7.5 Notification should be included in the RCL message via ACARS or voice, confirming degradation of navigation status and detail of ongoing loss/impacts to the aircraft systems and capabilities.

Examples of RCL 'ATC REMARKS/' text:

- 'GNSS INTERFERENCE RNP10 ONLY'
- 'NO DATA LINK'
- 'DEGRADED NAVIGATION NO GNSS'

3.7.6 In addition, operators can also make Shanwick aware when one of their flights has been impacted by GNSS interference through direct contact.

3.7.7 **Abbreviated Route Amendments**

3.7.7.1 Upon receipt of the ACARS Data Link ’RCL’, any route amendment to the current flight plan (what is loaded in the FMS) will be issued by voice.

3.7.7.2 An abbreviated route amendment is issued when an aircraft is rerouted onto a NAT TRACK or when there is a change to one coordinate only. In all other circumstances full details of the cleared route will be given.

3.7.7.3 A pilot-in-command shall, if at any time in doubt, request a detailed description of the cleared route from ATS.

3.7.8 **Identification of Track Structure Message**

3.7.8.1 Shanwick OAC will identify each Westbound NAT Track Structure Message by using a 3 digit Track Message Identification number (TMI) in the remarks section of the Track Structure Message.

Example: Remarks: Trk Message Ident 283.

3.7.8.2 Gander and Shanwick OACs will generate a revised TMI number only when the change is to:

a) Any NAT Track co-ordinate including named positions;
b) NAT Track published levels;
c) Named Points within European Routes West; or
d) Any combination of (a), (b) or (c).

Note: *Both centres will continue to publish revisions regarding other items such as North American Routings (NARS), but revisions outside the above listed categories will not warrant a change to the TMI.*

3.7.8.3 Amendments will be identified by adding an Alpha character to the TMI number for each revision.

Example: (Remarks amended) Remarks: Amended Track Message Ident 283 A, B, C etc.

3.7.9 **Reroutes on to NAT Tracks**

3.7.9.1 Flights will receive reroutes on VHF or HF radio. If the aircraft is rerouted to follow an organised track an abbreviated routeing will be issued and the pilot must confirm the Track Message Identification number (TMI). If the pilot cannot correctly identify the Track Message Identification, Shanwick will read the approved NAT Track coordinates in full and request a full read back of those coordinates.

3.8 ’RCL’ Requests

3.8.1 **Westbound Aircraft (Apart from Traffic as detailed in paragraph 3.8.2)**

3.8.1.1 Westbound aircraft operating within the United Kingdom UIR/FIR and the northern part of the France UIR should submit an ’RCL’ by voice to 'Shanwick Oceanic' on VHF RTF. VHF coverage is contained within an area joined by the following points: 48N 010W - RATSU (61N 010W) - 61N 005W - 52N 004E - 48N 004W - 48N 010W. An ’RCL’ request should be submitted when an accurate boundary estimate can be calculated, and submitted between 30 and 90 minutes prior to the Oceanic boundary ETA. United Kingdom departures are to submit an ’RCL’ as soon as possible after departure. Aircraft overflying the United Kingdom UIR/FIR and the northern part of the France UIR are to submit an ’RCL’ when they consider that they are within the area specified above. Aircraft other than jet should submit an ’RCL’ at least 40 minutes before the ETA for the OCA entry point.

3.8.1.1.1 For Westbound aircraft routing via RATSU (61N 010W), see paragraph 3.8.3.

3.8.1.2 Aircraft unable to contact 'Shanwick Oceanic' on VHF should submit an ’RCL’ by voice on a NARTEL HF frequency (North Atlantic en-route HF RTF Network) at least 40 minutes before the ETA for the Oceanic Boundary and thereafter maintain a SELCAL watch

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

for the 'Oceanic Clearance' message.

3.8.1.3 Aircraft Communication Addressing and Reporting System (ACARS) equipped aircraft may submit an 'RCL' and receive their 'Oceanic Clearance' message via datalink, for entry points on the Shanwick eastern boundary (from LUSEN to PASAS), without the requirement to contact Shanwick on RTF. Approval for the use of this system will be given by Shanwick Engineering Ops by contacting them at email: Shanwick.Engineering@nats.co.uk. This system should not be used by aircraft within 30 minutes of the Shanwick boundary; instead, VHF or HF RTF should be used.

3.8.1.4 While in communication with Shanwick to submit an 'RCL', aircraft must also maintain communication with the ATC authority for the airspace within which they are operating. Aircraft unable to contact Shanwick on VHF or on NARTEL HF should request the ATC authority for the airspace in which they are operating to relay their 'RCL' to Shanwick.

3.8.1.5 Aircraft entering Shanwick directly from the Madrid FIR/UIR should operate the procedures in paragraphs 3.8.1.2 and 3.8.1.4 at least 40 minutes before the ETA for 45N.

3.8.1.6 'RCL's shall include:

a) Callsign;
b) OCA entry point and ETA;
c) requested MACH number and flight level;
d) any change to flight plan affecting OCA;
e) the highest acceptable flight level which can be maintained at the OCA entry point.

Note: *'Entry Points' are the boundary position between Shanwick OCA and domestic airspace, ie for SOTA these are: RODEL, SOMAX, KOGAD, BEDRA, OMOKO, TAMEL or LASNO, for BOTA these are: ETIKI, UMLER, SEPAL, BUNAV or SIVIR and for NOTA these are: VENER, RESNO, ETARI, PIKIL, BILTO, SUNOT or AGORI.*

Example of 'RCL'.
'Estimating SUNOT at One One Three One, Speed, Mach decimal eight zero, Flight Level three five zero, able Flight Level three six zero, second choice Track Charlie'.

If the 'RCL' also includes a change to the original Flight Plan, affecting OCA:
'BAW 123; Estimating PIKIL at One One Four Seven, Speed, Mach decimal eight zero, Flight Level three four zero, Now Requesting Track Charlie, able Flight Level three six zero, second choice Track Delta'.

3.8.2 **Aircraft Sending an 'RCL' (Request for Clearance) before Departure**

3.8.2.1 Flights whose elapse time from departure to the Shanwick OEP (Oceanic Entry Point) is 30 minutes or less should submit an 'RCL' before departure on OCL, VHF, or HF. Only flights whose elapse time from departure to the Shanwick OEP is 30 minutes or less and who are unable to submit an 'RCL' before departure on OCL, VHF, or HF shall request via 3.8.2.2.

3.8.2.2 Flights who are unable to submit an 'RCL' before departure on OCL, VHF, or HF shall request by telephone to Shanwick on 01294-655100. This may be done by the handling agent, operating company, or Aerodrome ATC (at the request of the pilot) or by the crew. Shanwick will issue the 'Oceanic Clearance' message, via AFTN, or telephone for relay to the crew.

3.8.2.2.1 If 'RCL' submission is not required prior to departure, pilots are reminded that they should request clearance between 90 and 30 minutes prior to the Shanwick boundary. Aircraft entering Shanwick directly from the Madrid FIR/UIR are reminded that they should submit an 'RCL' at least 40 minutes before the ETA for 45N, as outlined in paragraph 3.8.1.5.

3.8.2.3 **General**

3.8.2.3.1 An 'RCL' should be submitted when an accurate boundary estimate can be calculated, and submitted between 30 and 90 minutes prior to the Oceanic boundary ETA. Submitting an 'RCL' more than 90 minutes prior to the ETA may result in rejection of the 'RCL'.

3.8.2.3.2 The 'RCL' must contain an accurate boundary ETA, based on the expected ETD. Pilots are responsible for informing Shanwick to request a reclearance, as soon as possible, if the Shanwick boundary ETA changes by 3 minutes or more.

3.8.2.4 **OCL Equipped Aircraft Submitting an 'RCL' Before Take-off**

3.8.2.4.1 The free-text field of the 'RCL' should include the phrase, 'ETD <time><aerodrome name>', eg ETD 1137 EGAA.

3.8.2.5 **Voice Process**

3.8.2.5.1 The following phraseology is to be used:

a) 'RCL'
b) Flight Identification
c) Oceanic Entry Point and ETA
d) Requested Mach Number and Flight Level
e) Any change to the flight plan affecting OCA
f) 'ETD', Time, Aerodrome name - eg ETD 1137 EGPH.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

3.8.2.6 **Reclearances**

3.8.2.6.1 Pilots should inform Shanwick as soon as possible, preferably before departure, if the Shanwick boundary ETA changes by 3 minutes or more or if a profile modification is required.

3.8.2.6.2 Pilots may input a second 'RCL' by ACARS, VHF, HF or via the method as per 3.8.2.2 if they wish to amend their request.

3.8.2.6.3 Shanwick may send a message via OCL or domestic asking the flight to contact Shanwick by voice. Pilots must contact Shanwick as soon as possible after the receipt of that message.

3.8.3 **Flights Routing via 6100N**

3.8.3.1 Flights routing via RATSU (6100N 01000W) do not require OCA clearance from Shanwick OAC. Therefore, aircraft intending to route via RATSU (6100N 01000W) must not contact Shanwick Clearance Delivery.

3.8.3.2 ATC Procedures via 6100N (above FL 55)

3.8.3.2.1 An amended procedure for traffic between Scottish AC (Prestwick), Reykjavik OAC and Shanwick OAC in the vicinity of 6100N 01000W simplifies the ATC procedures used and makes use of reduced separation standards. A system of preferred routings is established between the Scottish UIR and the Reykjavik OCA as detailed below.

3.8.3.3 Routings

3.8.3.3.1 Dependent on anticipated traffic demands over the North Atlantic Area, Reykjavik OAC may establish NAT Tracks through the following points along 61N:

RATSU;
MATIK;
NALAN;
OSBON;
PEMOS;
RIXUN;
SOSAR.

Note: *The tracks will be published by Shanwick OAC on behalf of Reykjavik OAC using the normal NAT Track promulgation method.*

3.8.4 **Time Keeping Procedures**

3.8.4.1 Prior to entry into Oceanic Airspace, the pilot shall synchronise the time reference system(s) to be used during the flight for the calculation of waypoint Actual Time of Arrival (ATA) and Estimated Time of Arrival (ETA) to an acceptable international time source. The pilot passing ATAs and ETAs to ATC is to ensure that they are based on a time reference system that has been properly synchronised.

3.8.4.2 Acceptable international time sources are:

a) **BBC** (United Kingdom, Greenwich) — H24 on 12095 kHz; 0200 - 2315 on 9410 kHz; 0430 - 0030 on 15070 kHz; 0800 - 1600 on 17705 kHz, 17640 kHz, 9760 kHz, 9750 kHz. Time is UTC and given every minute. within specified periods.
b) **Global Positioning System**, corrected to UTC.
c) **WWV** (USA Fort Collins, Colorado) — H24 on 2500 kHz, 5000 kHz, 10000 kHz, 15000 kHz, 20000 kHz (AM/SSB). Time is UTC and given every minute.
d) **CHU** (National Research Council (NRC), Canada) — H24 on 3330 kHz, 7335 kHz, 14670 kHz (SSB). Time is UTC and given every minute.

Note: *Aircraft Communications Addressing and Reporting Systems (ACARS) are not suitable time sources due to the unknown delay involved between the time that the update message is generated and when it is received by the ACARS equipment on the aircraft.*

3.9 Communications

3.9.1 Aircraft operating in the Shanwick OCA must be capable of maintaining direct two-way communication with the appropriate aeronautical radio stations. The carriage of NARTEL HF frequencies in the Shanwick OCA is mandatory. The appropriate frequencies and service areas are detailed in paragraph 3 9.12.

3.9.2 Flights planning to operate outside VHF coverage may request a waiver from the HF requirement, provided the flight has at least two other long-range communication systems appropriate for the route of flight and falls into one of the following categories:

- Air carriers with HF unserviceable wishing to return to base for repairs; or
- Ferry or delivery flights; or
- Special event flight.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

Applications for HF Relief shall be made to the Shanwick Supervisor via email (shanwicksupervisors@nats.co.uk) giving a minimum 24 hours notice prior to entering the Shanwick OCA.

3.9.3 Pilots of aircraft equipped with VHF communications only, which are not eligible to request an HF Waiver as per 3.9.2, should plan their route outside the Shanwick OCA and ensure that they are within VHF coverage of appropriate ground stations throughout the flight. Theoretical coverage diagrams are shown at ENR 6-73 and ENR 6-74.

3.9.4 Aircraft subject to the NAT DLM must carry and operate FANS 1/A CPDLC equipment.

FANS 1/A CPDLC service is available throughout the Shanwick OCA.

3.9.5 Aircraft operating on T9 and T290, in addition to maintaining routine communications with Shanwick Radio on HF radio, are required to monitor VHF Channel 128.360 MHz which is reserved for intervention or emergency purposes only.

Upon first contact with Shanwick Radio the radio officer will:

a) Assign a primary and secondary HF frequency;
b) Designate the position and frequency to contact the next agency;
c) Provide a SELCAL check;
d) Assign Channel 128.360 MHz for monitoring.

Channel 128.360 MHz is continually monitored by both radio officers who use the callsign ‘Shanwick Radio’ and air traffic controllers who use the callsign ‘Shanwick Control’.

If immediate contact is required with the flight due to an emergency situation, or if a navigational non-conformance is identified, the Shanwick controller may contact the flight directly on Channel 128.360 MHz.

3.9.6 Continuous watch on emergency frequency 121.500 MHz.

3.9.6.1 The VHF emergency frequency of 121.500 MHz should be continuously guarded except for those periods when aircraft are carrying out communications on other channels, or when airborne equipment or cockpit duties do not permit the simultaneous guarding of multiple channels.

3.9.6.2 When contact has been established between aircraft on emergency frequency 121.500 MHz, subsequent communication should be conducted on another frequency mutually agreed between the aircraft concerned.

3.9.7 Pilots may use SATCOM voice for routine ATS communications in the Shanwick OCA.

Note: *At this time Shanwick only supports Quick-Dial Service via the INMARSAT system, for normal communications.*

3.9.7.1 A dedicated Quick-Dial satellite voice telephone number for Shanwick Radio has been programmed into the aeronautical Ground Earth Stations of the Inmarsat Signatories. The allocated airborne number for use via the aircraft satellite voice equipment is 425002.

3.9.7.2 SATCOM voice facilities are provided in addition to, but not as an alternative to, HF communications and pilots must adhere to all requirements pertaining to the carriage and use of HF radio. Pilots using this SATCOM number will continue to communicate with Shanwick OCA via Shanwick Radio and standard RTF phraseology should be used at all times.

3.9.7.3 A dedicated airborne number (423201) is provided for direct pilot/controller communication for use in emergency situations. GEN 3-6-5 refers. This dedicated Quick-Dial satellite voice telephone number has been programmed into the aeronautical Ground Earth Stations of the Inmarsat Signatories only and is not available through any other Satellite service provider.

3.9.7.4 SATCOM communications initiated due to HF propagation difficulties do not constitute an urgency situation and should be addressed to Shanwick Radio on 425002.

3.9.8 If an aircraft within the Shanwick OCA is unable to communicate direct with Shanwick Oceanic, the pilot-in-command must endeavour to pass position reports by one of the following methods:

a) By relay through any other Oceanic Centre with which communication has been established;
b) if no other means is available, by relay through another aircraft on frequency 121.500 MHz.

3.9.9 While operating in an HF air-ground communications environment, pilots shall maintain a listening watch on the assigned radio frequency. This will not be necessary, however, if the aircraft is SELCAL equipped and correct use is ensured. Correct SELCAL use shall comprise:

a) The inclusion of the SELCAL code in the flight plan;
b) the issue of a correction to the SELCAL code if subsequently altered due to change of aircraft or equipment; and
c) an operational check of the SELCAL equipment with the appropriate radio station at or prior to initial entry into Oceanic Airspace. This SELCAL check must be completed prior to commencing SELCAL watch.

3.9.10 Communications within NOTA and SOTA are carried out with Shannon ACC using VHF. The appropriate frequencies and service

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

areas are detailed in AIP Ireland.

3.9.11 Communications within BOTA are carried out with Brest ACC using VHF. The appropriate frequencies and service areas are detailed in AIP France.

3.9.12 Communications within the Shanwick OCA are as follows:

a) HF Aeromobile operations in the North Atlantic Region (NAT) are available for use in groups known as 'Families' and will be assigned as appropriate on first contact;
b) As a general guide, the following frequency allocation principles are used:

Frequency Family	Usage
NAT A	Assigned to aircraft flying routes with reporting coordinates between 43N and 47N.
NAT B and C	Assigned to aircraft flying routes with reporting coordinates between 47N and 64N. Primary assignment for aircraft flying central routes.
NAT D	Assigned to aircraft flying routes with reporting coordinates North of 62N.
NAT F	Assigned on a tactical basis and coordinated between Shanwick Radio and Gander Radio.
NAT H, I and J	Assigned on a tactical basis and coordinated between Shanwick Radio, adjoining NARTEL Radio Stations and Domestic Air Traffic Control agencies.

Service	Callsign/Ident	Freq	Hours of Service	Operating Authority and Remarks
1	2	3	4	5
		SELCAL is available on all HF A/G frequencies.		
				Irish Aviation Authority.
A/G	Shanwick Radio	3016 kHz 5598 kHz 8906 kHz 13306 kHz	0100-0900, 1800-2200 H24 0900-2100 HO	**Family A.** To be used by all aircraft flying the Southern NAT Routes. Assigned to aircraft flying routes with reporting coordinates between 43N and 47N.
A/G	Shanwick Radio	2899 kHz 5616 kHz 8864 kHz 13291 kHz 17946 kHz	0000-0900, 1800-2400 H24 0900-2100 HO HO	**Family B.** Assigned to aircraft flying routes with reporting coordinates between 47N and 64N.
A/G	Shanwick Radio	2872 kHz 5649 kHz 8879 kHz 11336 kHz 13306 kHz 17946 kHZ	0000-0900, 1800-2400 H24 0900-2100 HO HO HO	**Family C.** Assigned to aircraft flying routes with reporting coordinates between 47N and 64N.
A/G	Shanwick Radio	2971 kHz 4675 kHz 8891 kHz 11279 kHz 17946 kHz	0100-0800 0100-0800, 1100-1800 HO HO HO	**Family D.** Assigned to aircraft flying routes with reporting coordinates North of 62N.
A/G	Shanwick Radio	3476 kHz 6622 kHz 8831 kHz 13291 kHz 17946 kHz	0100-0800 1000-1800 1000-1800 HO HO	**Family F:** Assigned on a tactical basis and coordinated between Shanwick Radio and Gander Radio.
A/G	Shanwick Radio	2965 kHz 3491 kHz 5583 kHz 6556 kHz 6667 kHz 10021 kHz 10036 kHz 11363 kHz	HO	**Family H:** Assigned on a tactical basis and coordinated between Shanwick Radio, adjoining NARTEL Radio Stations and Domestic ATC agencies.
A/G	Shanwick Radio	2860 kHz 2881 kHz 2890 kHz 3458 kHz 3473 kHz 3488 kHz 5484 kHz 5568 kHz 6550 kHz 6595 kHz 10066 kHz	HO	**Family I:** Used on a tactical basis and coordinated between Shanwick Radio, adjoining NARTEL Radio Stations and Domestic ATC agencies.

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

Service	Callsign/Ident	Freq	Hours of Service	Operating Authority and Remarks
A/G	Shanwick Radio	2869 kHz 2944 kHz 2992 kHz 3446 kHz 3473 kHz 4651 kHz 4666 kHz 4684 kHz 5460 kHz 5481 kHz 5559 kHz 5577 kHz 6547 kHz 8843 kHz 8954 kHz 11276 kHz	HO	**Family J:** Used on a tactical basis and coordinated between Shanwick Radio, adjoining NARTEL Radio Stations and Domestic ATC agencies.
A/G	Shanwick Radio	2182 kHz 3023 kHz 5680 kHz	HO	Search and Rescue (SAR). Operated as required.
Hours of service of individual frequencies, or groups of frequencies, may vary as HF propagation conditions or operational requirements demand.				
A/G	Shanwick Radio	127.900 MHz 124.175 MHz	H24	To be used as far as practicable by aircraft when East of 020°W so as to reduce the loading on HF channels. Traffic received on this freq is handled in exactly the same way as if received on HF.
A/G and ATC	Shanwick Radio or Shanwick Control	128.360 MHz	H24	To enable direct controller pilot communications on routes T9 and T290. See ENR 2.2 paragraph 3.9.5.
A/G	Shanwick Oceanic	123.950 MHz	H24 **(See note)**	NATS Ltd. For use by aircraft registered in States West of 030°W for submitting an 'RCL' direct to OAC. ***Note:*** *If communication cannot be established on designated Channel, pilot should communicate on the alternative frequencies.*
A/G	Shanwick Oceanic	127.650 MHz	H24	For use by aircraft registered in States East of 030°W for submitting an 'RCL' direct to OAC. For this purpose Australia is regarded as being East of 030°W.
Air-to-Air	—	123.450 MHz	H24	Air-to-Air inter-pilot frequency.

Service	Callsign/Ident	SATCOM number	Hours of Service	Operating Authority and Remarks

3.10 Air Ground Messages

Annex 2, Regional Supplementary Procedures DOC 7030 and PANS Doc 4444 ATM/501.

3.10.1 Standard Air/Ground message types and formats are used within the NAT Region. To enable the ground stations to process messages in the shortest possible time, pilots should observe the following rules:

a) Use the correct type of message applicable to the data transmitted;
b) state the message type on the contact call to the ground station or at the start of the message;
c) adhere strictly to the sequence of information for the type of message;
d) all times in each of the messages should be expressed in hours and minutes.

3.10.2 Position
Content and data sequence to be used for routine position reports:

a) 'Position';
b) flight Identification;

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

c) present position;
d) time over present position (hours and minutes);
e) present Flight Level;
f) next position on assigned route;
g) estimated time for position (hours and minutes);
h) next subsequent position;
i) any further information eg MET data or Company Message.

Example: 'Position, LUFTHANSA420, SUNOT (57N 015W), 1235, FL 330, Est 56N 020W, 1310, Next 56N 030W'

3.10.3 Request Clearance

3.10.3.1 Content and data sequence to be used, in conjunction with a routine position report, to request a change of MACH number, Flight Level or route:

a) 'Request Clearance';
b) flight Identification;
c) present or last reported position;
d) time over present or last reported position (hours and minutes);
e) present Flight Level;
f) next position on assigned route or Oceanic Entry point;
g) estimate for next position or Oceanic Entry point;
h) next subsequent position;
i) requested MACH Number, Flight Level or route;
j) further information or clarifying remarks.

Example: 'Request clearance TRANSWORLD 801, 56N 020W, 1245, FL 330, Est 56N 030W, 1320, Next 56N 040W. Request FL 350'.

3.10.3.2 When a change of MACH number, Flight Level or route is requested and a position report message is not appropriate, the content and data sequence may be limited to:

a) 'Request Clearance';
b) flight Identification;
c) requested MACH number, Flight Level or route;
d) further information or clarifying remarks.

Example: 'Request Clearance SPEEDBIRD 212, Request FL 370'.

3.10.4 Revised Estimate

3.10.4.1 Content and data sequence to be used to up date estimate for next position:

a) 'Revised Estimate';
b) flight identification;
c) next position on route;
d) revised estimate for next position (hours and minutes);
e) further information.

Example: 'Revised Estimate SPEEDBIRD 212, 57N 040W, 0325'.

3.10.5 Miscellaneous

3.10.5.1 Content and data sequence to be used to pass information or make a request in plain language that does not conform with the content of other message formats. No message designator is required as this will be inserted by the ground station:
(a) Flight identification;
(b) general information or request in plain language and format free.

3.10.6 Time and Place of Position Reports

3.10.6.1 Position reports shall be made at the significant points of the current flight plan track.

3.10.6.2 Shanwick may require flights operating in an east-west direction to make additional position reports at any intermediate meridians spaced at intervals of 10 degrees of longitude between 005W and 030W.

3.10.6.3 Shanwick may require flights operating in a north-south direction to make position reports at any intermediate parallel of latitude.

3.10.6.4 In requiring aircraft to report their position at intermediate intervals, Shanwick will be guided by the requirement to have position information at approximately hourly intervals and also by the need to cater for varying types of aircraft and for varying traffic and

meteorological conditions.

3.10.7 Contents of Position Report

3.10.7.1 Position information shall be based on the best obtainable navigation fix. The time of fixing aircraft position shall be arranged to provide the most accurate position information and estimates possible.

3.10.7.2 'Position' shall be expressed by the latitude and longitude of the point at which the fixed reporting line is crossed. For flights whose tracks are predominantly east or west, latitude shall be expressed in degrees and minutes, longitude in degrees only. For flights whose tracks are predominantly north or south, latitude shall be expressed in degrees only, longitude in degrees and minutes. Aircraft operating in the Organized Track System for supersonic aircraft operations may report their position by reference to the track code with the longitude of the reporting point.

3.10.7.3 'Next position' shall normally be expressed as the significant point at which the aircraft is next required to report its position.

3.10.7.4 Unless providing position reports via ADS-C, if the estimated time for the next position as last reported to ATC has changed by three minutes or more, a revised estimate shall be transmitted to the ATC units concerned, as soon as possible.

3.10.7.5 The name or co-ordinates of the significant point following the 'next position' shall be given when making a position report.

3.10.8 Addressing Position Reports

3.10.8.1 Position reports, made to Shanwick by flights operating in the Shanwick OCA at a distance of 60 NM or less from the common Boundary with an adjacent OCA (including aircraft operating on tracks through successive points on the Boundary) should also be addressed to the controlling authority of the adjacent OCA.

3.11 Special Procedures for In-flight Contingencies

PANS Doc 4444

3.11.1 Although all possible contingencies cannot be covered, the procedures in 3.11.2, 3.11.3 and 3.11.4 provide the more frequent cases such as:

a) inability to comply with assigned clearance due to meteorological conditions (3.11.4 refers);
b) en-route diversion across the prevailing traffic flow (for example, due to medical emergencies (3.11.2 and 3.11.3 refer)); and
c) loss of, or significant reduction in, the required navigation capability when operating in airspace where the navigation performance accuracy is a prerequisite to the safe conduct of flight operations, or pressurisation failure (3.11.2 and 3.11.3 refer).

Note: *Guidance on procedures to follow when an aircraft experiences a degradation in navigation capabilities can be found in PANS-ATM, Chapter 5, section 5.2.2.*

3.11.1.1 The pilot shall take action as necessary to ensure the safety of the aircraft, and the pilot's judgement shall determine the sequence of actions to be taken, having regard to the prevailing circumstances. Air traffic control shall render all possible assistance.

3.11.2 **General Procedures**

Note: *Figure 3-1 provides an aid for understanding and applying the contingency procedures contained in paragraphs 3.11.2 and 3.11.3.*

3.11.2.1 If an aircraft is unable to continue flight in accordance with its ATC clearance, a revised clearance shall be obtained, whenever possible, prior to initiating any action.

3.11.2.2 If prior clearance cannot be obtained, the following contingency procedures should be employed until a revised clearance is received, the pilot shall:

a) leave the assigned route or track by initially turning at least 30 degrees to the right or to the left in order to intercept and maintain a parallel, direction track or route offset 9.3 KM (5.0 NM). The direction of the turn should be based on one or more of the following:
    i. aircraft position relative to any organised track or route system;
    ii. the direction of flights and flight levels allocated on adjacent tracks;
    iii. the direction of an alternate airport;
    iv. any strategic lateral offset being flown; and
    v. terrain clearance;
b) the aircraft should be flown at a flight level and an offset track where other aircraft are less likely to be encountered;
c) maintain a watch for conflicting traffic both visually and by reference to ACAS (if equipped) leaving ACAS in RA mode at all times, unless aircraft operating limitations dictate otherwise;
d) turn on all aircraft exterior lights (commensurate with appropriate operating limitations);
e) keep the SSR transponder on at all times and, when able squawk 7700, as appropriate;

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

f) as soon as practicable, the pilot shall advise air traffic control of any deviation from assigned clearance;
g) use whatever means is appropriate (i.e. voice and/or CPDLC) to communicate during contingency or emergency;
h) if voice communication is used, the radiotelephony distress signal (MAYDAY) or emergency signal (PAN PAN), preferably spoken three times, shall be used as appropriate;
i) when emergency situations are communicated via CPDLC, the controller may respond via CPDLC. However, the controller may also attempt to make voice communication contact with the aircraft;

Note: *Additional guidance on emergency procedures for controllers, radio operators and flight crew in data link operations can be found in the Global Operational Data Link (GOLD) Manual (Doc 10037).*

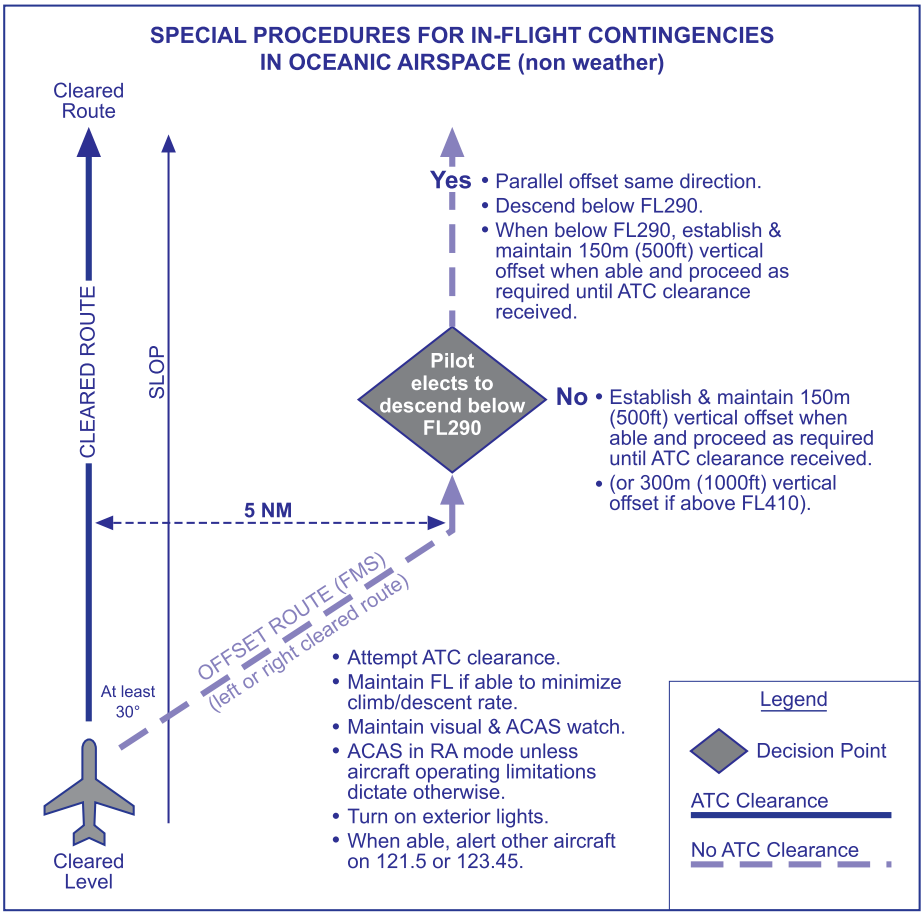
j) establish communications with and alert nearby aircraft by broadcasting, at suitable intervals on 121.500 MHz (or, as a backup, on the inter-pilot air-to-air frequency 123.450 MHz) and where appropriate on the frequency in use: aircraft identification, the nature of the distress condition, intention of the person in command, position (including the ATS route designator or the track code, as appropriate) and flight level; and
k) the controller should attempt to determine the nature of the emergency and ascertain any assistance that may be required. Subsequent ATC action with respect to that aircraft shall be based on the intentions of the pilot and overall traffic situation.

3.11.3 **Actions to be Taken Once Offset From Track**

3.11.3.1 If possible, maintain the assigned flight level until established on the 9.3 KM (5.0 NM) parallel, same direction track or route offset. If unable, initially minimize the rate of descent to the extent that is operationally feasible.

3.11.3.2 Once established on a parallel, same direction track or route offset by 9.3 KM (5.0 NM), either:

a) descend below FL 290, and establish a 150 M (500 FT) vertical offset from those flight levels normally used, and proceed as required by the operational situation or if an ATC clearance has been obtained, proceed in accordance with the clearance; or



Note: *Descent below FL 290 is considered particularly applicable to operations where there is a predominant traffic flow (e.g. east-west) or parallel track system where the aircraft's diversion path will likely cross adjacent tracks or routes. A descent below FL 290 can decrease the likelihood of conflict with other aircraft, ACAS RA events and delays in obtaining a revised ATC clearance.*

b) establish a 150 M (500 FT) vertical offset (or 300 M (1000 FT) vertical offset if above FL 410) from those flight levels normally used, and proceed as required by the operational situation, or if an ATC clearance has been obtained, proceed in accordance with the clearance.

Note: *Altimetry System Error may lead to less than actual 500 FT vertical separation when the above procedure is applied. In addition, with the 500 FT vertical offset applied, ACAS RAs may occur.*

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

Figure 3-1. Visual aid for understanding and applying the contingency procedures guidance

3.11.4 **Weather Deviation Procedures**

3.11.4.1 **General**

Note: *The following procedures are intended for deviation around adverse meteorological conditions.*

3.11.4.1.1 When weather deviation is required, the pilot should initiate communications with ATC via voice or CPDLC. A rapid response may be obtained by either:

a) stating “WEATHER DEVIATION REQUIRED” to indicate that priority is desired on the frequency and for ATC response; or
b) requesting a weather deviation using a CPDLC lateral downlink message.

3.11.4.1.2 When necessary, the pilot should initiate the communications using the urgency call “PAN PAN” (preferably spoken three times) or by using a CPDLC urgency downlink message.

3.11.4.1.3 The pilot shall inform ATC when weather deviation is no longer required, or when a weather deviation has been completed and the aircraft has returned to its cleared route.

3.11.4.2 **ACTIONS TO BE TAKEN WHEN CONTROLLER-PILOT COMMUNICATIONS ARE ESTABLISHED**

3.11.4.2.1 The pilot should notify ATC and request clearance to deviate from track or route, advising, when possible, the extent of the deviation requested. The flight crew will use whatever means is appropriate (i.e. voice and/or CPDLC) to communicate during a weather deviation.

Note: *Pilots are advised to contact ATC as soon as possible with requests for clearance in order to provide time for the request to be assessed and acted upon.*

3.11.4.2.2 ATC should take one of the following actions:

a) When appropriate separation can be applied, issue clearance to deviate from track; or
b) If there is conflicting traffic and ATC is unable to establish appropriate separation. ATC shall;

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

i. Advise the pilot of inability to issue clearance for the requested deviation;
ii. Advise the pilot of conflicting traffic; and
iii. Request the pilot's intentions.

3.11.4.2.3 The pilot should take the following actions:

a) comply with the ATC clearance issue; or
b) advise ATC of intentions and execute the procedures detailed in 3.11.4.3.

3.11.4.3 **ACTIONS TO BE TAKEN IF A REVISED ATC CLEARANCE CANNOT BE OBTAINED**

Note: *The provisions of this section apply to situations where a pilot needs to exercise the authority of a pilot-in-command under the provisions of Annex 2, 2.3.1.*

3.11.4.3.1 If the aircraft is required to deviate from track or route to avoid adverse meteorological conditions and prior clearance cannot be obtained, an ATC clearance shall be obtained at the earliest possible time. Until an ATC clearance is received, the pilot shall take the following actions:

a) if possible, deviate away from an organized track or route system;
b) establish communications with and alert nearby aircraft by broadcasting, at suitable intervals: aircraft identification, flight level, position (including ATS route designator or the track code) and intentions, on the frequency in use and on 121.500 MHz (or, as a backup, on the inter-pilot air-to-air frequency 123.450 MHz);
c) watch for conflicting traffic both visually and by reference to ACAS (if equipped);
d) turn on all aircraft exterior lights (commensurate with appropriate operating limitations);
e) for deviations of less than 9.3 KM (5.0 NM) from the originally cleared track or route remain at a level assigned by ATC;
f) for deviations greater than or equal to 9.3 KM (5.0 NM) from the originally cleared track or route, when the aircraft is approximately 9.3 KM (5.0 NM) from track, initiate a level change in accordance with Table 3-1;
g) if the pilot receives clearance to deviate from cleared track or route for a specified distance and, subsequently, requests, but cannot obtain a clearance to deviate beyond that distance, the pilot should apply an altitude offset in accordance with Table 3-1 before deviating beyond the cleared distance.
h) when returning to track or route, be at its assigned flight level when the aircraft is within approximately 9.3 KM (5.0 NM) of the centre line; and
i) if contact was not established prior to deviating, continue to attempt to contact ATC to obtain a clearance. If contact was established, continue to keep ATC advised of intentions and obtain essential traffic information.

Note: *If, as a result of actions taken under the provisions of 3.11.4.3.1, the pilot determines that there is another aircraft at or near the same flight level with which a conflict may occur, then the pilot is expected to adjust the path of the aircraft, as necessary, to avoid conflict.*

Table 3-1

Originally cleared track or route centre-line	Deviations > 9.3 KM (5.0 NM)	Level Changed
EAST (000° - 179° magnetic)	LEFT	DESCEND 90 M (300 FT)
	RIGHT	CLIMB 90 M (300 FT)
WEST (180° - 359° magnetic)	LEFT	CLIMB 90 M (300 FT)
	RIGHT	DESCEND 90 M (300 FT)

3.11.5 **Extended Range Operations by Aeroplanes with Two Turbine Power Units (ETOPS)**

3.11.5.1 If the contingency procedures are employed by a twin-engine aircraft as a result of an engine shutdown or failure of an ETOPS critical system, the pilot should advise ATC as soon as practicable of the situation, reminding ATC of the type of aircraft involved, and request expeditious handling.

3.12 Procedure for Strategic Lateral Offsets in NAT Airspace

Note 1: *The following incorporates lateral offset procedures for both the mitigation of the increasing lateral overlap probability due to increased navigation accuracy and wake turbulence encounters.*

Note 2: *The use of highly accurate navigation systems (such as the global navigation satellite system (GNSS)) by an increasing proportion of the aircraft population has had the effect of reducing the magnitude of lateral deviations from the route centre-line and, consequently, increasing the probability of a collision should a loss of vertical separation between aircraft on the same route occur.*

3.12.1 It has been determined that allowing aircraft conducting oceanic flight to fly lateral offsets, not to exceed 3.7 KM **(2 NM) right of centre-line** relative to the direction of flight in tenths of a nautical mile, will provide an additional safety margin and mitigate the risk of conflict when non-normal events such as aircraft navigation errors, altitude deviation errors and turbulence-induced altitude-keeping errors occur. Distributing aircraft laterally across the available positions adds an additional safety margin and reduces collision risk. PANS-ATM, Doc 4444 SLOP is now a standard operating procedure for the entire NAT Region and pilots are

encouraged to adopt this procedure as appropriate. These procedures are known as “Strategic Lateral Offset Procedures (SLOP).”

3.12.2 This procedure provides for offsets within the following guidelines. The following provisions apply:

a) Aircraft without automatic offset programming capability must fly the centre-line;
b) Though the majority of flights are able to perform offsets either 1 or 2 NM (whole nautical miles), flights able to perform SLOP procedure in tenths of a nautical mile should use that capability as it contributes to risk reductions;
c) It is recommended that pilots of aircraft capable of programming automatic offsets should randomly select flying centre-line or an offset. In order to obtain lateral spacing from nearby aircraft (i.e. those immediately above and/or below), pilots should use whatever means available (e.g. ACAS/TCAS, communications, visual acquisition, GPWS) to determine the best flight path to fly;
d) An aircraft overtaking another aircraft should offset within the confines of this procedure, if capable, so as to create the least amount of wake turbulence for the aircraft being overtaken;
e) The avoidance of wake turbulence (even in the OTS) can be accomplished effectively within the confines of the SLOP procedure, as specified above. Pilots may contact other aircraft on frequency 123.450 MHz, as necessary, to co-ordinate the best wake turbulence offset option;

Note: *It is recognised that pilots will use their judgement to determine the action most appropriate to any given situation and have the final authority and responsibility for the safe operations of the aircraft.*

f) Pilots may apply an offset outbound at the oceanic entry point and must return to centre-line at the oceanic exit point;
g) There is no ATC clearance required for this procedure and it is not necessary that ATC be advised;
h) Voice Position Reports should be based on the waypoints of the current ATC clearance and **not** on the offset positions;
i) **Pilots should not offset to the left of centre-line nor offset more than 2 NM right of centre-line.**

3.13 Adherence to ATC Approved Routes

Annex 2.

3.13.1 If an aircraft has inadvertently deviated from the route specified in the ATC clearance, it shall forthwith take action to regain such route within 100 NM from the position at which the deviation was observed.

3.14 Flight Information Service

PANS Doc 4444 ATM/501.

3.14.1 SIGMET Information

3.14.1.1 SIGMET information shall be transmitted to aircraft by VOLMET broadcast, by a general call to a group of aircraft, or by directed transmissions to individual aircraft, as determined by the appropriate area control centre according to circumstances, bearing in mind the need to ensure timely receipt of the information by the aircraft and to keep the load of the HF en-route communication channels to a minimum.

3.14.1.2 SIGMET information passed to aircraft shall cover a portion of the route up to two hours flying time ahead of the aircraft.

3.15 Air Traffic Services Messages

Regional Supplementary Procedures DOC 7030. PANS Doc 4444 ATM/501.

3.15.1 Filed flight plan messages for flights intending to operate within the Shanwick OCA, at a distance of 60 NM or less from the northern or southern boundaries of the Shanwick OCA, shall also be addressed to the controlling authority for the adjacent OCA.

3.16 Secondary Surveillance Radar (SSR)

Regional Supplementary Procedures DOC 7030.

3.16.1 Operation of transponders

3.16.1.1 Unless otherwise directed by ATC, aircraft equipped with SSR transponders in the NAT region shall operate transponders continuously on Mode A Code 2000 regardless of the direction of flight, except that the last assigned code shall normally be retained for a maximum period of 10 minutes after entry into NAT airspace.

3.16.1.2 For all SSR equipped aircraft with a routeing sequence Reykjavik-Shanwick- Scottish (BIRD-EGGX-EGPX) the last assigned code shall be changed to Mode A 2000 on transfer from Reykjavik and no later than ten minutes after entering Shanwick airspace.

Note: *This procedure does not affect the use of Special Purpose Codes 7500, 7600 and 7700 in cases of unlawful interference, radio failure or emergency.*

3.16.2 Aircraft intending to fly in the SOTA are expected to be equipped with an SSR transponder capable of responding to Mode A interrogations with 4096 codes and Mode C interrogations with Automatic Pressure Altitude Reporting. Aircraft SSR codes will be

allocated by Shannon ACC.

3.16.2.1 Exemptions from the SOTA SSR requirements for specific flights may be obtained from the Shannon ACC Supervisor before departure.

3.17 Action in the event of Air-Ground Communication Failure

3.17.1 The following procedures are intended to provide general guidance for North Atlantic (NAT) aircraft experiencing a communications failure. These procedures are intended to complement and not supersede State procedures/regulations. It is not possible to provide guidance for all situations associated with a communications failure.

3.17.2 General

3.17.2.1 If so equipped, the pilot of an aircraft experiencing a two way communications failure shall operate the secondary radar transponder on identity Mode A Code 7600 and Mode C.

3.17.2.2 The pilot shall also attempt to contact any ATC facility or another aircraft and inform them of the difficulty and request they relay information to the ATC facility with whom communications are intended.

3.17.3 Communications failure prior to entering NAT oceanic airspace.

3.17.3.1 Due to the potential length of time in oceanic airspace, it is strongly recommended that a pilot experiencing communications failure whilst still in European domestic airspace does not enter the Shanwick Oceanic Control Area but adopts the procedure as specified at ENR 1.1 sub-section 3. However, if the pilot elects to continue, then to allow the ATC organisation to provide adequate separation, adopt either the procedure at paragraphs 3.17.3.2 or 3.17.3.4.

3.17.3.2 If loss of communications is encountered before entering the NAT the pilot should:

- follow the radio communication procedures of the airspace in which the aircraft is operating;
- if the pilot elects to continue the flight, then enter oceanic airspace at the oceanic entry point at the level and speed resulting from the execution of the adjacent airspace radio communications failure (RCF) procedures then;
- follow the procedures in 3.17.4.1 below.

3.17.3.3 If the pilot elects to operate **without** a received and acknowledged oceanic clearance, the pilot shall enter oceanic airspace at the first oceanic entry point level and speed as contained in the filed flight plan and proceed via the filed flight plan route to landfall. That first oceanic level and speed shall be maintained to landfall.

3.17.4 Communications failure after entry to NAT oceanic airspace.

3.17.4.1 If loss of communications is encountered after entering the NAT then:

- The pilot shall maintain the currently cleared route, flight level and speed until reaching the Oceanic Exit Point.
- No route, flight level or speed change shall be made before the Oceanic Exit Point unless a change is deemed necessary by the pilot in command to ensure the safety of the aircraft.
- When being vectored or having been directed by ATC to proceed offset using RNAV without a specified limit, proceed in the most direct manner possible to re-join the current flight plan route no later than the next significant point, taking into consideration the applicable minimum flight altitude.

3.17.5 **Emergency Satellite Voice Calls from Aircraft** (See GEN 3.6, paragraph 6.4).

3.18 Minimum Aircraft System Performance Specification (MASPS)

3.18.1 **Application of Minimum Navigation Performance Specification (MNPS) in Shanwick OCA**

3.18.1.1 MNPS applies in that part of the Shanwick Oceanic Control Area from FL 285 to FL 420 inclusive. Aircraft using the NAT High Level Airspace (NAT HLA) shown at ENR 6-62 are required to have a navigation performance capability such that:

a) Pre-PBN navigation:

- The standard deviation of lateral track errors shall be less than 6.3 NM;
- the proportion of total flight time spent by aircraft 30 NM or more off the cleared track shall be less than 5.3×10^{-4};
- the proportion of the total flight time spent by aircraft between 50 and 70 NM off the cleared track shall be less than 13×10^{-5}.

These mathematical standards can be approximated operationally as follows:

- Aircraft must be operated so that lateral deviations from track remain less than 12.6 NM for at least 95 per cent of the time the system is required for navigation;
- the navigation system must demonstrate a continuing capability to keep lateral deviations from cleared track in excess of 30 NM to less than 53 per 100 000 flight hours in the system; and
- keep lateral deviations between 50 and 70 NM from cleared track to less than 13 per 100 000 flight hours in the system.

b) Area Navigation (RNAV) Specifications:

- RNAV 10 (RNP 10) specification shall be applicable to navigation systems used to support a minimum lateral separation of 60 NM between aircraft that the requirements to operate in the NAT HLA provided that a portion of the route of the aircraft is within, above or below NAT HLA. In addition RNAV 10 can support a minimum lateral separation of 50 NM between aircraft operating in the New York Oceanic East FIR.

c) Required Navigation Performance (RNP) Specifications:

- RNP 4 specification shall be applicable to navigation systems used to support minimum lateral separations as in (b) above and is required to support minimum lateral separations of 30 NM between aircraft operating within the control area of the New York Oceanic East FIR.

Note 1: *Aircraft that have been NAT MNPS approved by the State of Registry or the State of the Operator prior to 1 January 2015 shall be permitted to operate in NAT HLA until 30 January 2020. As of 1 January 2015 new NAT MNPS approvals shall not be granted.*

Note 2: *RNAV 10 (RNP 10) and RNP 4 approved aircraft require a NAT HLA MNPS approval to demonstrate compliance with the MNPS established for the NAT HLA.*

Note 3: *Except for the navigational portion the requirements for a NAT HLA MNPS approval are equivalent to the 3 requirements that were associated with granting NAT MNPS approvals.*

3.18.1.2 These mathematical standards can be approximated operationally as follows:

a) Aircraft must be operated so that lateral deviations from track remain less than 12.6 NM for at least 95 per cent of the time the system is required for navigation;
b) the navigation system must demonstrate a continuing capability to keep lateral deviations from cleared track in excess of 30 NM to less than 53 per 100 000 flight hours in the system; and
c) keep lateral deviations between 50 and 70 NM from cleared track, to less than 13 per 100 000 flight hours in the system.

3.18.1.3 In order to ensure that the required navigation standards are being observed within the NAT HLA, a continuous monitoring of the navigation accuracy of aircraft in this airspace takes place using land based radars in Canada, Ireland, France, Iceland and the UK. Where large navigation errors are observed the pilot of the aircraft concerned will be notified by the ATC Unit observing the error. The subsequent investigation to determine the cause of the error will involve the ATC Unit, the operator, and the State of Registry.

3.18.1.4 Lateral separation minima for aircraft operating in the NAT HLA are set out in the Regional Supplementary Procedures, NAT Region (ICAO Doc 7030/5). It is implicit in the concept of MNPS and essential to the application of these quoted separation minima, that all operations in the NAT HLA – be they Public Transport or General Aviation – achieve the highest standards of navigation performance accuracy. Thus all flights within the NAT HLA must have the specific approval of either the State of Registry of the aircraft or the State of Registry of the operator for such operations. UK registered aircraft are approved by the UK CAA in accordance with the Air Navigation Order. Such approvals will encompass all aspects of the expected navigation performance accuracy of the aircraft, navigation equipment carried, installation and maintenance procedures and crew navigation procedures and training.

3.18.1.5 The inherent obligations placed upon crews and operators of UK registered aircraft by the NAT HLA requirements can be summarized as follows:

a) The flight MUST have prior approval for operations in NAT HLA;
b) the approved aircraft minimum navigation installation MUST be serviceable and MUST have been checked for accuracy prior to entry into NAT HLA;
c) whilst in NAT HLA the approved operating procedures MUST be adhered to. Except in emergency, diversions from the ATC cleared track MUST NOT be made without prior approval of the controlling ATC Unit;
d) if subsequent unserviceability reduces the navigational capability below the required minimum for MNPS operations after entry into NAT HLA then the controlling ATC Unit MUST be advised so as to allow for any adjustments of separation from adjacent aircraft;
e) there MUST be a high standard of supervision, monitoring and cross checking of data inserted into automatic navigation system to prevent large errors arising from erroneous waypoint entries;
f) there MUST be a high standard of co-ordination with ATC Units to ensure that misunderstandings over the route to be flown do not occur.

3.18.1.5.1 Westbound flights submitting an 'RCL' to Shanwick to enter North Atlantic High Level Airspace (NAT HLA) may be invited to confirm that they have been approved for operating within NAT HLA by their State of Registry or their State of Operator.

3.18.1.5.2 The submission of a Flight Plan alone does **NOT** constitute NAT HLA operating approval. Pilots/operators unable to provide such confirmation will not be permitted to fly in NAT HLA airspace but will be required to operate outside HLA (below FL 285 or above FL 420). Details of the flight will be passed to the NAT Central Monitoring Agency (CMA) for follow-up action by the relevant State Aviation Authority.

3.18.1.6 **Navigation Equipment for Unrestricted NAT HLA Operations**.

3.18.1.6.1 In order to justify consideration for State approval for future unrestricted operation in the NAT HLA an aircraft will be required to

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

be equipped as follows:

a) **Two** fully serviceable Long Range Navigation Systems (LRNS).
A LRNS may be one of the following:

i. One Inertial Navigation System (INS);
ii. one Global Navigation Satellite System (GNSS); or
iii. one navigation system using the inputs from one or more Inertial Reference System (IRS) or any other sensor system complying with the NAT HLA requirement.

b) each LRNS must be capable of providing to the flight crew with a continuous indication of the aircraft position relative to desired track.
c) it is highly desirable that the navigation system employed for the provision of steering guidance is capable of being coupled to the auto-pilot.

Note 1: *currently the only GPS system fully operational and for which approval material is available is GPS.*

Note 2: *A GPS installation must be approved as follows:*
If the two required LRNSs are both GPS they must be approved in accordance with the current version of FAA Advisory Circular AC-20—138D Appendix 1. AC-20-138 requires that GPS systems used in Oceanic airspace must have a FDE function. States other than the USA may set their own standards for operational approval of GPS to provide Primary Means of Navigation in Oceanic and remote areas but in all cases these approvals will include the requirement to carry out Pre-Departure Satellite Navigation Prediction Programmes. If, however, GPS serves as only one of the two required LRNSs then it must be approved in accordance with FAA TSO-C129 or later standard as Class A1, A2, B1, B2, C1 or C2 or with equivalent European Aviation Safety Agency (EASA) documentation ETSO-C129a. In this instance individual States vary in their insistence upon the need for the conduct of pre-departure satellite navigation prediction programmes (viz. FDE/RAIM).

Note 3: *Currently equivalent approval material for GLONASS is not under development but it will need to be available prior to approval of any GLONASS equipped aircraft for NAT HLA operations.*

3.18.1.7 **Provisions for Partial Loss of the full MNPS Navigational Capability**

3.18.1.7.1 In the event of an aircraft **having State approval for un-restricted operation in NAT HLA** suffering partial loss of navigation capability (only one long range navigation system serviceable) prior to entry into Oceanic Airspace, the pilot should either avoid NAT HLA or consider a re-route via Reykjavik OCA.

3.18.1.8 **Special Routes for Aircraft fitted with a Single LRNS**

3.18.1.8.1 Aircraft, **having State approval for operating in NAT HLA,** which are equipped with normal short-range navigation equipment (VOR/DME, ADF) and at least one fully operational Long Range Navigation System (see paragraph 3.18.1.6.1) are considered capable of meeting the MNPS while operating along the following routes:

Note: *T9 and T290 have continuous VHF coverage at FL 300 and above.*

Via	Route Options
T9	LASNO - BEGAS (VHF, HF and ADS-B required)
T290	ADVAT - GELPO (VHF, HF and ADS-B required)

3.18.2 **Application of Reduced Vertical Separation Minima (RVSM) in Shanwick OCA**

3.18.2.1 RVSM applies in the MNPS Area of the Shanwick Oceanic Control Area from FL 290 to FL 410 inclusive. Aircraft using this area are required to have a height keeping performance capability as defined in the appropriate ICAO Documents/JAA Temporary Guidance Leaflet.

3.18.2.2 In order to ensure that the overall standard of required height keeping is being achieved within RVSM airspace a technical height keeping monitoring program has been established in accordance with ICAO guidance.

3.18.2.3 In order to ensure that the required altimetry standards are being observed within RVSM airspace, a technical height keeping monitoring programme has been initiated.

3.18.2.3.1 For the task of monitoring technical height keeping accuracy, a hybrid system comprising of a Height Monitoring Unit (HMU) and GPS Monitoring Systems (GMS) is employed. The HMU element consists of an unmanned ground-based HMU near Strumble (United Kingdom).

3.18.2.3.2 The GMS consists of air portable Global Positioning System Monitoring Units (GMUs), GPS reference stations, access to Mode C and MET information, post-flight processing facilities and logistic support.

3.18.2.4 It is implicit in the concept of RVSM airspace and essential to the application of this quoted vertical separation minimum, that all operations in the NAT High Level Airspace/RVSM airspace - be they Public Transport or General Aviation - achieve the highest

standards of navigation performance accuracy. Thus all flights within the NAT High Level Airspace must have the specific approval of either the State of Registry of the aircraft, or the State of Registry of the Operator, for such operations. UK Registered aircraft are approved by the UK CAA in accordance with the Air Navigation Order. Such approvals will encompass all aspects of the expected height keeping performance accuracy of the aircraft; altitude measuring equipment carried; installation and maintenance procedures and crew navigation procedures and training.

3.18.2.4.1 The inherent obligations placed upon crews and operators of UK registered aircraft by the NAT RVSM airspace requirements can be summarized as follows:

a) The flight **MUST** have prior approval for operations in NAT RVSM airspace;
b) the approved aircraft minimum altitude measuring installation **MUST** be serviceable and **MUST** have been checked for accuracy prior to entry into RVSM airspace;
c) whilst in RVSM airspace the approved operating procedures **MUST** be adhered to. Except in emergency, diversions from the ATC cleared Flight level **MUST NOT** be made without prior approval of the controlling ATC Unit;
d) if subsequent unserviceability reduces the altitude measuring capability below the required minimum for RVSM operations after entry into RVSM airspace then the controlling ATC Unit **MUST** be advised so as to allow for any adjustments of separation from adjacent aircraft;
e) there **MUST** be a high standard of supervision, monitoring and cross checking of altimeters to prevent a large discrepancy from the cleared flight level (less than 300 FT);
f) an automatic Altitude Keeping Device (AKD) should be operative and engaged during level cruise, except when circumstances such as the need to re-trim the aircraft or the onset of turbulence, require disengagement. In any event, adherence to cruise altitude should be accomplished by reference to one of the two primary altimeters;
g) there **MUST** be a high standard of co-ordination with ATC Units to ensure that misunderstandings over the cleared flight level do not occur.

3.18.2.5 Westbound flights submitting an 'RCL' to Shanwick to enter North Atlantic (NAT) Reduced Vertical Separation Minima (RVSM) airspace may be invited to confirm that they have been approved for operating within RVSM airspace by their State of Registry or their State of Operator.

3.18.2.5.1 The submission of a Flight Plan alone does **NOT** constitute NAT RVSM operating approval. Pilots/Operators unable to provide such confirmation will not be permitted to enter NAT RVSM airspace and will be issued an Oceanic approval to operate outside RVSM airspace (below FL 290 or above FL 410). Details of the flight will be passed to the NAT Central Monitoring Agency (CMA) for follow-up action by the relevant State Aviation Authority.

3.18.2.6 **Altitude Measuring Equipment or Features for Unrestricted RVSM airspace Operations**

3.18.2.6.1 In order to justify consideration for State approval for future unrestricted operation in the RVSM airspace, an aircraft will be required to be equipped as follows:

a) at least two primary altitude measurement systems meeting the MASPS requirements;
b) a static source error correction (SSEC)/position error correction (PEC) must be applied automatically;
c) an altitude deviation warning system that shall alert when the altitude displayed to the flight crew deviates from selected altitude by more than a nominal value. This nominal value shall not be greater than 300 FT. For aircraft whose application for type certification was made after 1 January 1997, the nominal value should not be greater than 200 FT. The overall equipment tolerance in implementing this nominal value shall not exceed 50 FT; and
d) an automatic altitude-alerting device which is required to be capable of controlling altitude within +/- 65 FT of the selected altitude, when the aircraft is operated in straight and level flight, under non-turbulent, non-gust conditions.

3.18.2.7 Suspension of RVSM due to actual or forecast Turbulence

3.18.2.7.1 On receipt of information indicating actual or forecast Turbulence, ATC should take the following action:

a) if possible, establish increased vertical, longitudinal or lateral separation; or
b) suspend RVSM operations in the affected area.

3.18.3 In order to assist operators and crews to achieve the required standard of navigation and height keeping accuracy two documents have been published:

a) Guidance and Information Material concerning Air Navigation in the NAT Region, including RVSM, is produced by and available from the ICAO Paris Office. The material in this Document deals primarily with planning and management of operations in the NAT Region and is mainly addressed to States and Operators;
b) The North Atlantic Operations and Airspace Manual. This manual has been developed specifically for use by pilots intending to operate in the NAT HLA. This manual is available for download from the EUR/NAT Regional Office section of the ICAO website www.icao.int.

3.18.4 Operators of UK registered aircraft intending to fly in NAT High Level Airspace can obtain further information on the measures necessary to gain CAA approval from the following:

Equipment and Installation Approvals:

The Chief Surveyor,

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

Post: CAA Safety Regulation Group, Aviation House, South Area, London Gatwick Airport, West Sussex RH6 0YR.
Phone: +44-(0)1293-573362;

Operational Approvals:

Post: Civil Aviation Authority, Flight Operations Department (Attn: Flight Operations Policy), Aviation House, 1W, South Area, London Gatwick Airport, West Sussex RH6 0YR.
Phone: +44-(0)1293-573521
Fax: +44-(0)1293-573991;

Further Information on other aspects of MNPS/RVSM Operations (including height-monitoring requirements):

Post: North Atlantic Central Monitoring Agency, c/o NATS Limited, Room G41, Atlantic House, Fresson Avenue, Prestwick, Ayrshire, KA9 2GX.
Phone: +44-(0)1292-692412 HMU Status (recorded message)
+44-(0)1292-692760
Fax: +44-(0)1292-692754
Email: natcma@nats.co.uk

3.19 Routes Between Northern Europe and Spain/Canaries/Lisbon FIRs

3.19.1 Operators are recommended to Flight Plan using routes T9, T13, T16, T213 and T290 as published in ENR 3.3 Other Routes.

3.19.2 For fuel planning purposes, operators should note that optimum cruising levels may not be available on T9, T13, T16, T213 and T290.

Note: *Operators should not file using the route designator T13, T16, T213, and should file full route coordinates for these routes.*

3.20 Alerting and Search and Rescue Services

(See GEN 3.6 of the UK AIP).

3.21 Procedures — Westbound

a) Westbound flights are advised to flight plan the routes through UK Airspace that are offered by the Standard Routes Document published on the AIS CD-ROM.
b) Westbound flights departing from UK airports that are not listed are to flight plan via the published UK Upper ATS route structure.
c) For the UK Upper ATS Routes for the Westbound North Atlantic Flow refer to the Standard Routes Document published on the AIS CD-ROM.

3.22 Procedures - In the Event of Shanwick Oceanic Area Control Centre Evacuation

3.22.1 Scottish and Oceanic Area Control Centre includes both Scottish Radar and Shanwick Oceanic Control. Should Shanwick OAC be evacuated the potential would exist for a major disruption to Air Traffic Control (ATC) within the Shanwick OCA and Scottish Radar units. The HF radio communications for the Shanwick Oceanic Centre are remotely located, so will not be affected.

3.22.2 In the event that Shanwick OAC is evacuated, Gander Oceanic will assume responsibility for the provision of Air Traffic Services (ATS) within the Shanwick OCA to the best of their ability.

3.22.3 As soon as possible after evacuation a contingency message will be sent to the operators and agencies that receive the NAT track message. A NOTAM shall also be issued. Recipients of both messages shall advise the affected traffic.

3.22.4 On receipt of the contingency message pilots are requested to broadcast to other flights on 121.500 and 123.450 MHz. A listening watch on these frequencies must be maintained.

3.22.5 HF congestion is likely. Communications should be kept to a necessary minimum. Unnecessary route changes will not be issued.

3.22.6 The procedures outlined below are to be used as guidance for pilots in the immediate aftermath of a sudden withdrawal of the ATC service as described above.

3.22.7 **Procedures - Westbound Flights**

3.22.7.1 Due to the uncertainty surrounding the contingency situation pilots are strongly advised to re-route around the Shanwick OCA or to land at an appropriate aerodrome.

3.22.7.2 **Westbound Flights within Scottish FIR**

3.22.7.2.1 If Scottish radar is subject to evacuation also, pilots of flights operating within the Scottish FIR may elect to continue, the flight must be operated in accordance with the last submitted and acknowledged 'RCL' from eastern boundary until last specified route point,

normally landfall.

3.22.7.2.2 Whilst operating within the Scottish FIR all flights are requested to make position reports on the last assigned frequency, stating position, level and next fix.

3.22.7.2.3 Flights may also elect to contact Scottish FIR aerodromes for assistance.

3.22.7.2.4 The following communications procedures have been developed in accordance with the Traffic Information Broadcast by Aircraft (TIBA) procedures recommended by ICAO (Annex 11 - Air Traffic Services, Attachment C).

At least 3 minutes prior to the commencement of a climb or descent the flight should broadcast on the last assigned frequency, 121.500, 243.000 and 123.450 MHz the following:

ALL STATIONS
(callsign)
(direction)
DIRECT FROM (landfall fix) TO (Oceanic entry point)
LEAVING FLIGHT LEVEL (number) FOR FLIGHT LEVEL (number) AT (distance)(direction) FROM (Oceanic entry point) AT (time)

When the level change begins, the flight should make the following broadcast:

ALL STATIONS
(callsign)
(direction)
DIRECTION FROM (landfall fix) TO (Oceanic entry point)
LEAVING FLIGHT LEVEL (number) NOW FOR FLIGHT LEVEL (number)

When level, the flight should make the following broadcast:

ALL STATIONS
(callsign)
MAINTAINING FLIGHT LEVEL (number)

3.22.7.3 **Westbound Flights within the Shanwick Oceanic Control Area**

3.22.7.3.1 Gander Oceanic shall endeavor to provide an ATC service throughout the Shanwick OCA as soon as evacuation commences.

3.22.7.3.2 All flights should establish communication with the next agency at the earliest opportunity stating current position, cleared flight level, next position and estimate, and subsequent position. This also applies to flights using automated position reports (ADS/FMC) because those reports may not have been received by the next agency.

3.22.7.3.3 When ADS equipped flights are notified of a Shanwick evacuation they must revert to voice position reporting until clear of Shanwick OCA, or notified otherwise. Pilots should note that they may be asked to log-on to CYQX when within the Shanwick OCA. They should not initiate this action until instructed to do so.

3.22.7.3.4 Any flights involved in level changes should complete the manoeuvre as soon as possible in accordance with the clearance.

3.22.7.3.5 If unable to establish radio contact, flights may use SATCOM voice or satellite telephone to provide position reports.

3.22.7.3.6 Flights may request their flight dispatch offices to forward position reports, if sending position reports to multiple ATS Units or if otherwise unable to forward position reports.

3.22.8 **Procedures for Eastbound Flights within the Shanwick Oceanic Control Area**

3.22.8.1 Gander Oceanic shall endeavour to provide an ATC service throughout the Shanwick OCA as soon as evacuation commences.

3.22.8.2 Flights operating with a received and acknowledged Oceanic Clearance will be expected to continue in accordance with the last clearance issued unless otherwise advised by ATC.

3.22.8.3 When ADS equipped flights are notified of a Shanwick evacuation they must revert to voice position reporting until clear of Shanwick OCA, or notified otherwise. Pilots should note that they may be asked to log-on to CYQX when within the Shanwick OCA. They should not initiate this action until instructed to do so.

3.22.8.4 Any flights involved in level changes should complete the manoeuvre as soon as possible in accordance with the clearance.

3.22.8.5 If unable to establish radio contact, flights may use SATCOM voice or satellite telephone to provide position reports.

3.22.8.6 Flights making automatic position reports are required to make voice position reports whilst within the Shanwick OCA, unless advised otherwise.

3.22.8.7 Communications with the next ATSU should be established at the earliest opportunity. Where no contact can be established,

ENR 2.2 OTHER REGULATED AIRSPACE (continued)

Shanwick Radio should be contacted on HF for advice.

3.22.8.8 **Procedures for Eastbound Flights entering the Scottish FIR**

3.22.8.8.1 Unless instructed otherwise, flights entering the Scottish FIR should use the following contingency routes:

a) RATSU DCT GUNPA contact Reykjavik Oceanic Control - 125.500 MHz;
b) LUSEN DCT ELKOG DCT ORVIK contact Polaris Control - channel 135.680;
c) ATSIX DCT AKIVO DCT KLONN contact Polaris Control - channel 136.280;
d) ORTAV DCT ODPEX DCT ELSAN contact Copenhagen Control - 134.680 MHz;
e) BALIX DCT NINEX DCT ASKAM contact Maastricht Control - 132.085 MHz;
f) ADODO DCT AMTAP DCT ROKAN DCT TOPPA contact Maastricht Control - 132.085 MHz;
g) ERAKA DCT ETSOM DCT ERKIT contact London Control - 128.130 MHz;

3.22.8.8.2 Flights operating close to the Reykjavik or Shannon northern boundaries should, where possible, establish communications with those units in order to negotiate a re-route to avoid the Scottish FIR.

3.22.9 **Procedures for Flights Flight Planned to enter Shanwick OCA from other Oceanic Centres**

3.22.9.1 Flights within Reykjavik or Santa Maria Oceanic airspace, can anticipate a large re-route to avoid the Shanwick OCA and Scottish FIR. Reykjavik and Santa Maria will issue advice on procedures to be followed.

3.23 Enquiries and Comments

3.23.1 Enquiries and comments about ATS procedures applicable to the Shanwick OCA should be addressed to:

Manager PC Procedures and Development,

Post: Room F-059, NATS Prestwick, Prestwick Centre, Fresson Avenue, Prestwick, Ayrshire, KA9 2GX.

3.23.2 Advice on day-to-day operations is available from Shanwick Oceanic Watch Manager Prestwick.

Phone: 01294-655300.

3.24 Format of NAT Company Preferred Routing Messages (CPR PRM)

Westbound:

(PRIORITY) (DESTINATION ADDRESS)
(DATE TIME OF ORIGIN) (ORIGIN ADDRESS)
(MESSAGE TYPE) — (COMPANY) — (WESTBOUND) — (YYMMDD AT 30W)
(DEP / DEST) (FIRST UK POINT) (ANCHOR POINT) (OCA RPS) (LANDFALL)
(INLAND FIX) (NUMBER OF FLIGHTS (01 — 99))

Note: *If there is no INLAND FIX then the latitude at 80W is to be used.*

Example:

FF EGGXZOZX EGTTZDZX CZQXZQZX CZQMZQZX CZULZQZX CYHQZDZX BIRDZQZX LPPOZOZX KZNYZRZX KCFCZDZX
111824 LSZHSWRW

3.25 Format of NAT Company Preferred Route Flight Plan day minus 1 (CPR FPL-1)

3.25.1 The Company Preferred Route Flight Plan day minus 1 (FPL-1) format utilises the standard ICAO flight plan (FPL) format and a predetermined Company Preferred Route Identifier (CPR_ID).

3.25.2 Upon receipt of a flight plan at a dedicated AFTN address (EGGXGATT) the Shanwick Automated Track Tool (ATT) system extracts the Oceanic Route portion from the Company Preferred Route Flight Plan day minus 1 (FPL-1), and correlates this with airline scheduled data which corresponds to the Company Preferred Route Identifier (CPR_ID). This provides Shanwick with both route and traffic loading information accordingly.

3.25.3 The Callsign field of the Company Preferred Route Flight Plan day minus 1 (FPL-1) is utilised to indicate the Company Preferred Route Identifier (CPR_ID). The CPR_ID is a unique designator which must be pre-configured with Shanwick to indicate the departure point and destination pairing.

3.25.4 The preferred route is detailed in the Company Preferred Route (FPL-1) as per a normal flight plan. The Date of Flight (DOF field) in field 18 shall indicate the flight is for the next day's OTS Design.

Examples:

The CPR_ID is a seven character code defined as follows:

Airline ICAO Code	British Airways:	**BAW**
Preferred Route Indicator	P (does not change)	**P**
Westbound	W	**W**
Company Preferred Route ID Number (00-99)	Correlates to set departure/destination	**01**
The resulting CPR_ID in this example is BAWPW01		

Example 1 – *(Indicating CPR_ID 01 for British Airways)*

CPR (FPL-1) sent to EGGXGATT on the 04/08/2016 for a Westbound OTS Design for the 05/08/2016.

3.25.5 **Initial Configuration and Setup for Company Preferred Route Messages FPL-1 Format**

3.25.5.1 Operators who would like to send Company Preferred Route messages via FPL-1 format are required to register by email at CPR@nats.co.uk. Registration is required so that configuration elements are completed prior to message sending.

3.25.5.2 During registration Company Preferred Identifiers (CPR_IDs) will be determined for each scheduled departure point and destination pairing to be flown by the airline and a start date will be provided by the Shanwick.

Example of CPR_ID TABLE
