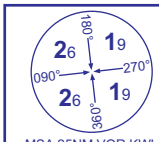
ALTERNATIVE PROCEDURE
Arrival **not below MSA**. Overhead NDB(L) KW (IAF) at **2600** turn to establish on the outbound leg of the holding pattern. Extend the outbound leg of the hold descending to **2400**. At I-ORK DME 8.5 (KWL DME 9) (CAT A,B) or I-ORK DME 9.5 (KWL DME 10) (CAT C) turn right to establish on the extended FAT; when established continue as for basic procedure.

ENTRY TO BASE TURN PROCEDURE AFTER HOLDING
If required, the Base Turn procedure may be entered after holding by flying a teardrop reversal manouevre from overhead the holding facility after flying inbound in the hold as follows: Fly outbound on track 099°M (CAT A,B) or 118°M (CAT C) for 1 MIN then turn left to return to the overhead to enter the base turn procedure. Lowest altitude to commence procedure from the hold is **2600**.



NOTE FAT is parallel to RWY C/L but offset 136 metres north.

CHANGE (9/26): MAG VAR. MAG TRACKS.

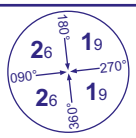
TRANSITION ALTITUDE **3000**



ARRIVING FROM THE NORTHEAST
Arrival **not below MSA**. Request ATC approval for DME arc arrival when within 40NM of Kirkwall. Intercept and establish NDB(L) KW QDM 222° inbound, or VOR DME KWL R041 **not below minimum enroute altitude**. After passing KWL DME 25 (I-ORK DME 24.8) inbound, subject to ATC approval, descend as required **not below 2600**. From KWL DME 13 (I-ORK DME 12.8) turn right to establish on KWL DME 11 (I-ORK DME 10.5) arc anticlockwise (IAF on NDB(L) KW QDM 222° (VOR KWL R041) at KWL DME 11 (I-ORK DME 10.8). When established, descend along the arc to **2400**(2361). From VOR KWL R281 (NDB(L) KW QDM 101°) turn left onto LOC/extended FAT. When established, from FAF KWL DME 6.8 (I-ORK DME 6.3) at **2400**(2361), continue with appropriate final approach procedure.

ARRIVING FROM THE SOUTH AND ON N560 NORTH BOUND
Arrival **not below MSA**. Request ATC approval for DME arc arrival when within 40NM of Kirkwall. Intercept and establish NDB(L) KW QDM 012° inbound, or VOR DME KWL R193 (N560) **not below minimum enroute altitude**. After passing KWL DME 15 (I-ORK DME 14.5) inbound, subject to ATC approval, descend as required **not below 2600**. From KWL DME 13 (I-ORK DME 12.5) turn left to establish on KWL DME 11 (I-ORK DME 10.5) arc clockwise (IAF on NDB(L) KW QDM 012° (VOR KWL R193) at KWL DME 11 (I-ORK DME 10.5). When established, descend along the arc to **2400**(2361). From VOR KWL R254 (NDB(L) KW QDM 074°) (ILS/LOC) or VOR KWL R254 (VOR) turn right onto LOC/extended FAT. When established, from FAF KWL DME 6.8 (I-ORK DME 6.3) at **2400**(2361), continue with appropriate final approach procedure.

EGHC AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGHC AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Non-radio aircraft not accepted.
b) High visibility clothing must be worn on the apron and manoeuvring area at all times, except for passengers under escort.
c) Personal electronic devices (ie mobile phones) are not to be used on the apron without specific authorisation.
d) All visitors must use the green walkways to cross the apron and remain in one tight group when airside.
e) For security reasons, all visiting aircraft and personnel must keep well clear of the scheduled Skybus aircraft.

2 GROUND MOVEMENT

a) Aircraft entering the apron for AVGAS will park as directed by ATC. Refuelling is a self service system and instructions are displayed on the pump. As soon as refuelling is complete, pilots must immediately call ATC to reposition the aircraft.
b) Pilots are to request ATC clearance for engine start.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Some parts of the manoeuvring area are undulating.
b) A public footpath tracks within the aerodrome boundary in the vicinity of the Runway 02 undershoot.
c) This aerodrome is prone to rapid changes in meteorological conditions.

d) Turbulence and windshear may be expected at lower levels of all approaches but particularly on approaches to Runways 02, 07 and 11 due to high cliffs and orographic effect.
e) The ATC Tower infringes the 1.10 surface from the Runway 16/34 centre-line by 0.9 M.
f) Model aircraft, kite activities and live shooting (rabbit control) may take place outside of aerodrome hours.
g) Some parts of the manoeuvring area may suffer damage caused by rabbits.
h) Cables on 30 FT poles near boundary between northwest through north to southeast.
i) Use of the RNAV procedures is strictly limited to those flights specifically authorised by the Aerodrome Authority. Pilots should note that they must be appropriately qualified to fly the GNSS Approaches at Land's End (i.e. they must hold an IMC (or European equivalent) or IR rating which has included a specific module on GNSS Approaches).

5 HELICOPTER OPERATIONS

a) Helicopters capable of doing so should ground taxi rather than air taxi when operating on the apron and in areas where aircraft are parked or holding. When air taxiing is unavoidable, helicopters should avoid taxiing within three rotor diameters of other aircraft. This distance should be considered as a minimum.
b) Helicopters will usually be instructed to join the standard fixed-wing circuit pattern (left or right hand) and depart or approach via the runways. Based operators familiar with the field may be cleared for direct joins and/or direct departures/approaches to/from the helipad.
c) Helicopters requiring Jet-A1 are normally required to alight on Bay 6 or the helipad.
d) Helicopters should not ground or air taxi along the grass Taxiway Bravo due to the dust/FOD hazard. Expeditious crossing of this taxiway is permitted.
e) Helicopters should be aware of potential FOD hazard (grass cuttings) in recently cut grass and should avoid overflying such areas whenever possible.
f) Helicopters are reminded that ATC permission must be obtained before engine start/rotor engagement is selected. No high power engine runs are permitted on the apron.
g) AVGAS helicopters requiring fuel must bring ground handling wheels to position onto fixed refuelling facility once ATC permission has been granted (no AVGAS bowser available).

6 USE OF RUNWAYS

a) Departures and arrivals will not be permitted for fixed wing aircraft unless the whole of the runway to be used is clearly visible to the duty ATCO.
b) Departures and arrivals will not be permitted for helicopters when the reported visibility is less than 400 M.

7 TRAINING

Not applicable

EGHC AD 2.21 NOISE ABATEMENT PROCEDURES

Not applicable

EGHC AD 2.22 FLIGHT PROCEDURES

1 LAND’S END RMZ

a) Passenger carrying flights operating between Land's End Airport, Penzance Heliport, Tresco Heliport and Scilly Isles / St Mary's Aerodrome operate within airspace designated as an RMZ centred on a direct track from Land’s End to Scilly Isles from the SFC to 4000 FT ALT. Pilots intending to transit the Land’s End RMZ must comply with section 2 below.
b) Pilots intending to transit the Land’s End RMZ must contact either Culdrose ATC on 134.055, Land’s End ATC on 120.255 MHz (if approaching from the east) or St Mary’s ATC on 124.880 MHz (if approaching from the west), prior to entering. Pilots of aircraft transiting the Culdrose AIAA should contact Culdrose ATC on 134.055 (Refer to AD 2-EGHC-3-1).
c) Aircraft operating under VFR may be asked to follow the Northern (R251 LND) route according to traffic and/or weather conditions in the Land’s End RMZ.

2 LAND’S END RMZ REQUIREMENTS

For flight within the Land’s Ends RMZ aircraft commanders must comply with one of the following:

a) Establish satisfactory two-way RTF communication with and pass pertinent flight details to ATC prior to entering the Land’s End RMZ and maintain two-way communication with ATC whilst operating within the Land’s End RMZ.
b) Conduct flight in accordance with valid Letter of Agreement.
c) Conduct flight in accordance with agreed tactical arrangements with either Land’s End ATC or St Mary’s ATC.

3 CIRCUIT DIRECTIONS

a) Circuit direction is normally left hand. More than one runway may be in use and pilots are to be aware that the circuit direction may be varied by ATC.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGHF AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGHF AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Solent Airport is PPR mandatory and all pilots are to ensure they have read the information provided on the Airport website www.solentairport.co.uk/pilot-information/ prior to arrival.
b) Pilots approaching Lee-on-Solent and intending to remain outside of Southampton CTR/Solent CTA are advised to maintain a listening watch only on Solent Radar 120.230 and select SSR code 7011 to reduce the risk of infringing adjacent controlled airspace.
c) Visiting traffic to Lee-on-Solent should be familiar with the layout and topography of the aerodrome (see aerodrome website).

2 GROUND MOVEMENT

a) The Control Tower is the location for all visitor parking.
b) The Coastguard dispersal is out of bounds and is not to be used by visiting aircraft.
c) Collection point for fees and charges is in the Visitor Reception.
d) Bravo Hold is only to be used for Code 2B Aircraft with a maximum wingtip clearance of 22 M or less, due to reduced wingtip clearances at the southern end of taxiway. Aircraft with a greater wingtip clearance requirement will need to backtrack the main runway.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Solent CTA approximately 3 NM west of aerodrome.
b) SAR and rotary daily H24 operations.
c) Model aircraft flying operates in the south-east of the aerodrome.
d) Fleetlands Heliport is located 1.9 NM to the north-east of Lee-on-Solent and has an active ATZ.
e) Possible compass error when using Runway 05 Bravo 2 Hold. Some aircraft may experience magnetic disturbances, affecting the Heading Reference System. Pilots should ensure that, pre-flight checks are conducted within the white box or at the hold point. When

positioned for take-off from Runway 05 the aircraft heading reference is checked against the runway alignment. Aircrew noticing a compass anomaly should notify ATC as soon as possible.

f) Helicopter training in a designated area takes place on the airport.
g) Airfield sweeping, including the runway, will be conducted prior to airport opening hours on Friday morning (approximately 0400-0600 (0300-0500)). Pilots authorised for out of hours operations are to remain vigilant for the presence of the sweeper vehicle.

5 HELICOPTER OPERATIONS

a) SAR rotary operations take priority.
b) All non-SAR rotary operations may use same arrival, departure, circuit and ground procedures.
c) The rotary training area 'The Triangle' is situated on the southside grass adjacent to the Echo taxiway. Whilst grass runway operations are in progress all non-SAR rotary traffic conducting general handling or low energy manoeuvres are to remain within the confines of 'The Triangle' unless authorised by ATS.
d) Rotary traffic is permitted to land or depart from 'The Triangle'.
e) Visiting rotary aircraft may follow circuit, arrival and departure procedures and can expect to hover-taxi using the taxiways, where appropriate or as instructed by the ATSU, to the designated visitor areas of the aerodrome.
f) Based rotary operators may follow pre-agreed taxiing and routing procedures.

6 USE OF RUNWAYS

a) More than one runway may be in use at any one time.
b) Grass strip is inspected but not licensed and should only be used at pilot’s discretion.
c) All fixed wing aircraft should be aware of rotary traffic operating to the south of the main runway.
d) The Runways 05/23 and grass strip are operated as a single runway strip. No simultaneous parallel approaches or departures are permitted.

7 TRAINING

Not applicable

EGHF AD 2.21 NOISE ABATEMENT PROCEDURES

a) The circuit patterns are drawn to avoid noise sensitive areas (avoid overflying Stubbington and Hill Head (which are inside the circuit) and Fareham South-West (on the NW corner outside the circuit)).
b) When departing Runway 23, track the extended centre-line to avoid overflying housing near the threshold of Runway 05.
c) Arrivals from the north are to route through the Titchfield Gyratory and on to base leg avoiding all housing for Runway 23 or downwind for Runway 05.

EGHF AD 2.22 FLIGHT PROCEDURES

1 GENERAL

a) Standard circuits flown at 1000 FT AAL. Circuit direction Runway 23 right-hand / Runway 05 left-hand.
b) Warbird circuits flown at 1200 FT AAL. Warbird circuit direction Runway 23 left-hand / Runway 05 right-hand.
c) Rotary traffic may operate in the Helicopter Training Area (HTA) known as 'The Triangle'. All pilots should be aware of rotary traffic using the Helicopter Training Area to the south of Runway 05/23.
d) All aircraft operating within the circuit are required to select transponder conspicuity code 4306.

2 JOINING AND DEPARTURE PROCEDURES

a) Aircraft should remain outside of Fleetlands ATZ, unless in good two-way communication with Fleetlands Information (135.705).
b) Standard join from the north:

   i. Remain west and outside Fleetlands ATZ:
   ii. Downwind for Runway 05 or right base for Runway 23.
   iii. Straight-in-Approach or overhead joins for Runway 23 are subject to circuit traffic and AFISO workload. Pilots must call Fleetlands Information 135.705 for ATZ transit prior to Wickham VRP.

c) Standard join from the south, west and east. Aircraft arriving from the south, west and east are suggested to join via Spinnaker VRP, Calshot VRP or Cowes VRP. Be aware that Calshot VRP is located underneath Solent CTA 2 which extends from 2000 FT – 5500 FT AMSL and is just to south of the Southampton Airport CTR.

   i. Left base for Runway 05 or downwind for Runway 23.
   ii. Straight-in approaches and overhead joins are subject to circuit traffic and AFISO workload. Standard joins are preferred.

d) Aircraft inbound or departing Solent Airport are to select transponder conspicuity code 4306 prior to joining the visual circuit. As a guide, this should be done at any of the following locations: Calshot, Cowes, Spinnaker Tower or Wickham.
e) Allocation of this conspicuity squawk is for a radio service only does not constitute any radar service.

7	ATS	H24. See also AD 2.18.
8	Fuelling	AVGAS 100LL: 0700-1800 (0600-1700). Out of hours AVGAS 100LL available by arrangement with Mutliflight Ltd, subject to call out charges. (See also AD 2.4). AVTUR Jet A-1: 0500-2359 (0400-2259) PPR outside of these hours.
9	Handling	Available by arrangement with handling agents.
10	Security	H24. Terminal Passenger Screening 0300-2200 (0200-2100).
11	De-icing	Available by arrangement with handling agent.
12	Remarks	-

EGNM AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	By arrangement. Nearest railway siding: Bradford Valley.
2	Fuel and oil types	AVTUR JET A-1, AVGAS 100LL 80, 100, Shell 555, Exon 2380, Mobil Jet 254, Mobile Jet 2 plus various hydraulic fluids.
3	Fuelling facilities/capacity	AVTUR JET A-1 Main Apron: 1,000,000 L. Bowsers: 5 x 44,000 L, 2 x 33,000 L, AVGAS 100LL available at Multiflight Apron. De-fuelling facility not available.
4	De-icing facilities	Available by arrangement with handling agents. Type ECO 26 Type 2.
5	Hangar space for visiting aircraft	Limited.
6	Repair facilities for visiting aircraft	Full up to 13,000 lbs AUW, minor above, 24 hour service if necessary.

7	Remarks	Handling is mandatory. All aircraft, including those for engineering maintenance, are required to make suitable handling arrangements prior to arrival. Handling agents are: Swissport: Tel: 0113-250 3251. Frequency: 131.500 MHz. Southside: Multiflight: Tel: 0113-238 7140/7118. Frequency: 131.685 MHz. GA and Business Aviation handling provided on the Southside by Multiflight Ltd and on the Northside by Swissport. AVGAS 100LL is available from Multiflight Ltd. AVGAS refuelling facilities for helicopters by special prior notified arrangement with Multiflight Ltd.

EGNM AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels in the vicinity
2	Restaurants	Restaurant, buffet and bar.
3	Transportation	Buses, coaches and taxis. Nearest railway station: Horsforth
4	Medical facilities	Limited first aid.
5	Bank and Post Office	Bureau de Change.
6	Tourist Office	-
7	Remarks	-

EGNM AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A7 RFF Categories 8 and 9 by arrangement, PPR 24 HR notice.
2	Rescue equipment	1x Rosenbauer Panther (12500 L Water, 1500 L Foam), 2x Rosenbauer Panther HRET (11200 L Water, 1500 L Foam), 1x Carmichael Cobra (12000 L Water, 1680 L Foam), 1x Ford Ranger 4x4 Incident Command Vehicle.
3	Capability for removal of disabled aircraft	Basic equipment onsite. Equipment for heavier aircraft could be made available. Contact: 0113-391 3231 (Airside Operations Unit).
4	Remarks	-

EGNM AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, Chemical de-icing. 2x Schmidt Compact Jet Sweeper, 2x Overaasen Compact Jet Sweeper, Daf + SB90, MAN + SB90, Massey Ferguson + large brush/plough, New Holland Tractor fitted with brush + de-icing unit, JCB Ramp Hog, Ramp Hog, LBA John Deere Tractor + brush/plough, McCormick Tractor fitted with Ramp Hog 6 M Blade, Schmidt ASP De-icer spray vehicle, Daf 75 De-icer Spray Vehicle, Rolba 400 Snow Blower, Rolba 1000 Snow Blower.
2	Clearance priorities	Standard. See AD 1.2.2. EGNM Snow Plan refers. Available on request.
3	Remarks	RWY 14/32 de-iced with GAC. Runway surface condition over each third of the runway reported using a runway condition report (RCR). The report will include a runway condition code (RWYCC) using numbers 0-6, the contaminant, coverage and depth, and a description of the contaminant. Braking action is not promulgated. Runway and Taxiway conducted by AFS/Airside Operations. Latest airfield conditions available, Tel: 0113-391 1698 (ATIS Telephone Broadcast) or Tel: 0113-391 3231 (Airside Operations).

EGNM AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	APRON Surface: Concrete PCR 642/R/A/W/U

2	Taxiway width, surface and strength	Taxiway A B-C: 38 M Surface: Concrete PCR 642/R/A/W/U Taxiway A C-D3: 45 M Surface: Concrete PCR 642/R/A/W/U Taxiway A D3-EAST END: 32 M Surface: Concrete PCR 642/R/A/W/U Taxiway A RWY-B: 38 M Surface: Concrete PCR 386/R/A/W/U Taxiway D: 23 M Surface: Concrete PCR 555/R/D/X/U Taxiway E: 23 M Surface: Concrete PCR 523/R/B/W/U Taxiway F: 13.5 M Surface: Asphalt PCR 25/F/A/W/U Taxiway G: 10.5 M Surface: Asphalt PCR 25/F/A/W/U Taxiway L: 23 M Surface: Asphalt PCR 507/F/D/X/U Taxiway LINK B: 25 M Surface: Concrete PCR 386/R/A/W/U Taxiway LINK C: 35 M Surface: Concrete PCR 642/R/A/W/U Taxiway M: 23 M Surface: Asphalt PCR 25/F/A/W/U Taxiway N N3-N4: 23 M Surface: Concrete PCR 501/R/A/W/U Taxiway N RWY-N3: 23 M Surface: Asphalt PCR 377/F/A/W/U
3	Altimeter checkpoint location and elevation	Apron 662 FT (At Stand 1)
4	VOR checkpoints	-
5	INS checkpoints	As stand coordinates, see AD 2-EGNM-2-2.
6	Remarks	Attitude and Heading Reference System (AHRS) alignment issues possible on Multiflight East Apron as a result of shielding from the hangars causing GPS signal tracking failure. If affected, recommended action is to relocate aircraft to a different position away from the hangar. Always contact ATC prior to start and taxi.

EGNM AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Stands 1 to 23 are marked for nose-in guidance with marshaller. Stands 15 to 18R are MARS (Multi Access Ramp System) stands.

2	Runway and taxiway markings and lighting	Runway marking aid(s): 14/32: Runway designation, runway centre-line, runway threshold, fixed distance and touchdown and zone markings. Runway side stripes. 32 Turning 'D' is not equipped with centre-line taxiway lights. Pilots to exercise caution when manoeuvring.
3	Stop bars and runway guard lights (if any)	Stop Bars located at Holding Points A1, B, C, D1, D2, D3, E1, E2, F1, L1, N1, N2 and N3. Stop Bars at Runway Holding Points (A1, B, D1, E1, E2, F1, L1, N1) are in operation H24.
4	Other runway protection measures	-
5	Remarks	Taxiway Alpha restricted to aircraft of wingspan not exceeding 36 M. Taxiway November between November 3 and November 4 restricted to aircraft of wingspan not exceeding 36 M. Taxiway Delta restricted to aircraft of wingspan not exceeding 61 M. Taxiway Foxtrot south of the junction with Taxiway Golf is restricted to aircraft of wingspan not exceeding 18.5 M. Through traffic between Taxiways Foxtrot and Golf is restricted to aircraft of wingspan not exceeding 18.5 M. Taxiways Foxtrot and Mike not available at night. LGTD WDI - 535140.92N 0013921.61W, 535214.26N 0013955.54W.

EGNM AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Mandatory handling applies for all visiting non-based aircraft.
b) Aircraft using the aerodrome are to carry Third Party Insurance cover of not less than £2,000,000.
c) The aerodrome is not available to aircraft unable to communicate with ATC by radio, unless by special arrangement with Airport Authority for maintenance purposes.
d) Use governed by regulations applicable to Leeds CTR.
e) Pilots not filing a flight plan are to book out by telephone directly with ATC. Book out by radio will not be accepted.
f) All flights, except General Aviation below 5700 KG and Military flights, are subject to the prior approval of Leeds Bradford Airport Ltd. and prior notification to Airport Coordination Ltd. (ACL), who act as an agent for the airport. Requests for ad-hoc slot allocations should be made to ACL during working hours, Mon-Fri 0830-1700 (0730-1600) by e-mail: lonacxh@acl-uk.org; or Tel: +44 (0)161-493 1850, Fax: +44 (0)161-493 1853, or at all other times to Airfield Operations +44 (0)113-391 3231 or email: airside.safetyunit@lba.co.uk. OCS account holders can add, change and cancel slots using the online coordination portal at: www.online-coordination.com.
g) It is a requirement that every airline using Leeds Bradford Airport must have local orders compatible with LBA Emergency Orders. Airlines, General Aviation operators and Flying clubs should also note that it is their responsibility to recover disabled aircraft and aircraft wreckage and have appropriate arrangements in place before commencing flying operations into the aerodrome. LBA will act as the coordinating body throughout the recovery operation and has only very limited equipment which might be used to salvage disabled aircraft.
h) Visiting GA pilots must ensure that they are fully briefed on arrival, departure and taxi procedures prior to using the Aerodrome. ATZ entry may be refused, or flights can expect significant delays if unfamiliar with ATC procedures.

i) Non ACL slot allocated GA/BA movements can expect significant delays between 0600-0800 (0500-0700), March-October due to runway capacity.
j) High visibility clothing must be worn at all times on all aprons (including flight crew).
k) The main northside apron is designated under the Aviation and Maritime Security Act 1990. For security and safety reasons operators of all aircraft using the aerodrome are advised that the use of a handling agent is mandatory. All persons embarking or disembarking to/from aircraft must be escorted by their handling agent.

2 GROUND MOVEMENT

a) General

i. Aircraft are not permitted to enter allocated north side parking stand without marshaller guidance. If no marshaller is present, pilots must hold position and contact ATC.
ii. Marshalling mandatory on Multiflight East Apron.
iii. All aircraft using the north side stands, must be able to accept push-back. Aircraft, which cannot will be parked remotely, marshalled and will only be accepted if space permits (prior arrangement with Airside Operations required). Companies and handling agents are to ensure that the equipment necessary to provide push-back is available when required.
iv. Supplementary (Multi Access Ramp System) parking arrangements for aircraft with wingspans of 30 M or less may be initiated at any time, ATC will advise. Aircraft will be marshalled under these conditions.
v. In-to-wind parking is available in accordance with procedures published in the LBA Aerodrome Manual (prior arrangement with Airside Operations required).
vi. To assist with planning, aircraft must advise ATC as soon as possible if it becomes apparent that they will not be ready for departure upon reaching the holding points. Pilots must inform ATC prior to entering the runway if they are aware that they will not be ready for departure on line up.
vii. Aircraft able to use intersections for departure (particularly D1 for Runway 32 or A1 for Runway 14) should inform ATC when requesting push back or start up.
viii. Minimum thrust should be used for breakaway and taxi on all taxiways, in particular when turning (towards the Runway) through Holding Points B, C, D3 and N4.

b) Clearance Delivery and Start Up Procedures

i. ATC Clearance should be requested before start up but not before EOBT – 15 minutes. Pilots must advise stand number, or position, together with the ATIS letter received and QNH on first contact.
ii. Leeds Delivery is responsible for passing ATC clearance to aircraft prior to start-up only.
iii. Start up and push-back clearance is given by Leeds Bradford Tower only. Aircraft requiring a cross-bleed start must advise Leeds Delivery on first contact.
iv. Start up should not be requested until the aircraft is fully ready for start and or pushback with a tug attached.
v. Aircraft able to use intersections for departure (particularly D1 for Runway 32 or A1 for Runway 14) should inform ATC when requesting push back or start up.

c) Pushback Procedures

i. Aircraft requesting push-back must be in direct communication with the tug crew, via a headset person. Aircraft must inform ATC if they have no direct communication with a headset person (e.g. Hand signals only).
ii. Pushback instructions will normally include a direction to face as east, west, south OR to a Tug Release Point (TRP). See Aerodrome Chart AD 2.EGNM-2-1 for TRP positions.
iii. Pushback and start instructions may contain reference to an adjacent stand or defined point on a taxiway. The term long push may also be used together with a location definition.
iv. Where two aircraft up to B737/A321 size request simultaneous pushback, on the main apron stands 1-18, in the same direction at least one stand must separate the aircraft prior to push.

d) Remote Holding

i. Aircraft that have requested a ready message with ATC may request, or may be required to push and park subject CTOT.
ii. Requests to push and park are at the sole discretion of ATC and will not be facilitated during periods of high workload.
iii. All instructions to ‘push & park’ will be to an appropriate Tug Release Point (TRP) and flight crew must monitor the Tower frequency whilst remote holding.

e) Ground Manoeuvring Restrictions

i. The marked centre-line turning circle for wide-bodied aircraft using the Runway 32 turning pad may only be achieved using up to 52° of nose wheel steering. Additionally, there is no straight section of the centre-line parallel to runway centre-line before commencement of the 180° turn onto the runway centre-line.
ii. Pilots are reminded not to cross red stopbars unless a specific instruction to cross a lit stopbar is given by ATC.

f) Runway Backtrack Procedures

i. Backtracking should be as expeditious as possible, consistent with safety.
ii. After landing Runway 32, aircraft (max take off weight 40,000 KG or more) requiring to backtrack should expect to use Taxiway Echo. ATC clearance must be obtained prior to re-entering the runway from Echo.

3 CAT II/III OPERATIONS

a) Runway 32 is suitable for Category II/IIIb operations by operators whose minima have been accepted by the Civil Aviation Authority.
b) During Category II/III operations special ATC procedures (Low Visibility Procedures (LVP's)) will be applied. Pilots will be informed when these procedures are in operation by RTF and ATIS automatic broadcasts.
c) Category II/III Holding Points are B, D1, F1, L1 and N1 only. Amber/Green coded taxiway centre-line guidance lights are switched on for route guidance. Aircraft on stands 7-18 will normally taxi through Holding Points C and D3. Pilots must request marshaller assistance, wingtip guidance or 'Follow Me' if it is considered necessary, prior to start up or after landing before entering the apron.
d) Arriving aircraft: after completing landing run await or request taxi clearance **prior** to vacating the runway or backtracking. Entry to Taxiway A will be via yellow/green centre-line routeing guidance through B, C or D3.
e) Aircraft will not report runway vacated until they have entered the taxiway and the aircraft is established on the fully green coded centreline lights. Pilots must not report vacated whilst they are on the portion of taxiway showing mixed amber/green lighting.
f) During day conditions taxiways F, M and G should not be used in a met visibility of less than 800 M unless the aprons and taxiways are visible from ATC at all times.

4 WARNINGS

a) Bird activity noted at this airport. Occasionally large flocks of Gulls transit across the aerodrome at dawn and dusk. Aircraft may be delayed whilst birds are cleared.
b) Pilots are advised to expect windshear and turbulence when the surface wind is between 190° and 280° above 20 KT. Some variations to reported wind readings may also occur.
c) Pilots are advised that paragliding operations take place at Tong within the Leeds Bradford Airport Control Zone, coordinates 534608.27N 0014117.14W, bearing 195° MAG, range 7 NM from Leeds Bradford Airport ARP. Paragliders transit to and from the site from the south west not above 1000 FT QNH. Pilots under VFR/SVFR are requested to avoid this area if possible. Traffic information will NOT be passed by ATC.
d) Pilots are advised that hang gliding and paragliding operations take place within the Leeds Bradford Airport Control Zone on Baildon Moor 535124.59N 0014711.58W bearing 264° MAG, range 4.5 NM from Leeds Bradford Airport ARP. Hang gliders and paragliders operate within a 1 NM radius of this site, non-radio not above 1500 FT QNH. Pilots under VFR/SVFR are requested to avoid this area if possible.
e) Pilots are advised that hang gliding and paragliding operations take place within the Leeds Bradford Airport Control Zone on Ilkley Moor 535444.01N 0014750.57W bearing 297° MAG, range 5.6 NM from Leeds Bradford Airport ARP. Hang gliders and paragliders operate within a 1 NM radius of this site, non-radio not above 1500 FT QNH. Pilots under VFR/SVFR are requested to avoid this area if possible.

5 HELICOPTER OPERATIONS

a) Arrival Procedures: ATC will allocate either a direct approach, or a circuit join based on the runway in use, dependant on the prevailing traffic conditions.
b) Direct Approach

   i. Helicopters are to approach the aerodrome from the NE or SW remaining well clear of the approach and climb out to Runway 14/32.
   ii. Helicopters will be requested to report approaching the aerodrome boundary to await further instructions.
   iii. Direct arrivals from the NE are to obtain clearance to cross Runway 14/32 prior to crossing the aerodrome boundary and be prepared to hold, or orbit at the boundary if requested. When cleared to cross the runway helicopters are to arrange their flight to cross the runway as expeditiously as possible direct to the allocated Helicopter Aiming Point (HAP) avoiding overflying any parked or taxiing aircraft. Pilots wishing to use the runway at night or at any other time should make an early request to ATC.
   iv. Direct arrivals from the SW are to report approaching the aerodrome boundary for onward clearance. When cleared to do so arrivals shall route direct to the allocated HAP ensuring that they remain well to the south of runway 32 at all times. The south side taxiway runway holding points may be used as a reference point as the point to remain south of when approaching the HAP from the south. If, due to the surface wind conditions it is required to cross runway 32 to enable a turn into wind for arrival this should be requested on first contact with the Leeds Tower Controller.

c) Circuit Based Approach

   i. Under certain traffic conditions helicopters may be given a standard circuit join for the runway in use. On turning final the helicopter is to break directly for the allocated HAP prior to reaching the runway threshold.

d) Taxi Instructions

   i. ATC will issue an instruction to air taxi from the HAP to the relevant parking apron.

e) Departure Procedures

   i. Helicopters will be given clearance to lift from the apron and air taxi to the allocated HAP. When cleared for takeoff, South, or Westbound departures shall depart ensuring that they remain well to the south of Runway 32 at all times. If surface wind conditions dictate that a lift into wind requires a runway crossing this should be requested prior to taxi.
   ii. Departures to the East or North shall, when cleared to do so cross the runway as expeditiously as possible on track the relevant VRP, ensuring that the departure track does not overfly parked or taxing aircraft.

6 USE OF RUNWAYS

a) Variable circuit direction in force.
b) In accordance with EU OPS Sub-part E the following approach operations are available to approved operators:

   i. Runway 14 suitable for Lower than Standard Category I operations supported by an ILS Classification of II/D/2;

ii. Runway 32 suitable for Lower than Standard Category I operations supported by an ILS Classification of II/D/2;
iii. Runway 32 suitable for Other Than Standard Category II operations supported by an ILS Classification of II/D/2;
iv. Runway 14 suitable for EVS operations;
v. Runway 32 suitable for EVS operations.

7 TRAINING

a) Training flights must be booked in advance with ATC by telephone: 0113-391 3282. The filing of a flight plan does not constitute a booking to carry out training. Failure to make a booking may result in aircraft being refused use of the facilities. All training is subject to traffic and ATC capacity.
b) A slot booking system is used for training that involves instrument holding. Slots must be booked on the date of the requested slot with ATC by telephone. Operators may normally book a maximum of two slots in any one day. Further slots on the same day may not be booked until one hour before the requested slot.
c) Any changes to training requirements must be notified to ATC, in particular when slots are no longer required. Should traffic or ATC workload increase after bookings have been accepted, training may be refused or ended at short notice.
d) Training flights may only be permitted between 0700-2300 (0600-2200).
e) Any aircraft conducting practice instrument holding or approach procedures must have a serviceable transponder.
f) Training by aircraft greater than 5700 KG is not normally permitted on Sundays.
g) Training flights by jet aircraft shall be subject to the following conditions:

i. No jet training on Sundays, Good Friday or Christmas Day;
ii. Jet circuits shall be carried out at least 1500 FT AAL;
iii. Jet aircraft carrying out visual circuits shall climb straight ahead to 1000 FT AAL before turning. All other jet aircraft must follow the published NPRs.

h) Rebated fees for training flights are subject to prior written approval from the Airport Authority. Training rebates cannot be approved verbally, and will not be granted retrospectively.

8 AIRCRAFT NOISE RESTRICTIONS

a) Overview

For the purpose of this section:

i. ‘Night period’ and ‘night quota period’ means the period from 2300 (2200) hours to 0700 (0600) hours;
ii. ‘Noise classification' means the noise level band in EPNdB, for take-off or landing, as the case may be, for the aircraft in question;
iii. 'Quota' means the maximum permitted sum of the quota counts of all aircraft taking off from or landing at the aerodrome in question during any one season in the night quota period;
iv. 'Quota count (QC)' means the amount of the quota assigned to one take-off or to one landing by the aircraft in question, this number being related to its noise classification;
v. An aircraft is deemed to have taken off or landed during the night period if the time recorded by the appropriate air traffic control unit as 'airborne' or 'landed' respectively falls within that period.

b) Determining Quota Count (QC)

Aircraft taking off or landing at Leeds Bradford Airport are described in this section as follows:

i. Exempt aircraft; - see below note
ii. Aircraft having a quota count of 0;
iii. Aircraft having a quota count of 0.125;
iv. Aircraft having a quota count of 0.25;
v. Aircraft having a quota count of 0.5;
vi. Aircraft having a quota count of 1;
vii. Aircraft having a quota count of 2 or greater;

The QC is a system used to define the noise rating of an aircraft on departure/arrival. The QC is calculated by:

Departing QC = (EPNdB [Lateral] + (EPNdB [Flyover]) /2

Arriving QC = EPNdB [Approach] – 9

The quota count of an aircraft on taking off or landing is to be calculated on the basis of the noise classification for that aircraft on take-off or landing as appropriate as follows:

Departing QC Limits		
DB Lower Level	**DB Upper Level**	**QC**
0	80.99	0
81	83.99	0.125
84	86.99	0.25
87	89.99	0.5
90	92.99	1

Departing QC Limits		
DB Lower Level	**DB Upper Level**	**QC**
93	95.99	2
96	N/A	>2

c) Prohibition on Take-off or Landing

Any aircraft which has a quota count of 1 or more may not take off during the night quota period except emergencies where there is an immediate danger to life or health, whether human or animal.

EGNM AD 2.21 NOISE ABATEMENT PROCEDURES

The following Noise Preferential Routeings and Procedures shall apply to jet aircraft (except military aircraft).

a) These procedures may at any time be departed from to the extent necessary for avoiding immediate danger.
b) Operators of aircraft using the airport shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in areas surrounding the airport.
c) Aircraft will use Runway 14 for landing and Runway 32 for take-off, whenever this is possible, having regard to wind, cloud base, approach aid limitations and aircraft performance and requirements. In the event of marginal conditions the runway to be used is at the aircraft Commanders discretion. However, violation of the selective runway procedure cannot be acceptable for expedite reasons, and it is regretted that inconvenience in taxiing distances and/or airborne routeing must be accepted in the interest of reducing aircraft noise intrusion on the local environment
d) Departing Aircraft:

i. Runway 14 – After take-off maintain runway heading to 'I LBF' DME 2 before setting course (or 'I LF' DME 2 when Runway 32 is being used for landing traffic).
ii. Runway 32 – Climb straight ahead. At 1202 FT QNH (520 FT QFE) or I-LF D0.5, whichever is the later, turn left to track 310° MAG. At 'I LF' DME 2.1 *535340N 0014258W reduce to minimum safe power settings and turn left to make good a track of 271° MAG. Maintain this track until 'I LF' DME 3.5 *535405N 0014521W before setting course.
iii. Turbo-prop: After take-off make good a track of 310° MAG and at DME 2.1 turn onto course.

Note: *The above routeings are compatible with normal ATC practice. In individual cases they may be varied owing to operational circumstances. The use of the Noise Preferential Routeings specified above is supplementary to the noise abatement take-off techniques as used by piston engined, turbo-prop and turbo-jet aircraft.*

e) Target Noise levels

'By day' means 0700-2300 (0600-2200).

'By night' means 2300-0700 (2200-0600).

All aircraft (excluding military aircraft) shall be operated in such a way that at the relevant monitoring point they will not generate a noise level:

i. After take-off from Runway 32 more than 85 dB(A) by day or 77dB(A) by night;
ii. After take-off from Runway 14 more than 92 dB(A) by day or 84 dB(A) by night;
iii. On approach to Runway 32 more than 85 dB(A) by day or 79 dB(A) by night.

f) Night Restrictions

i. The airport company is subject to planning requirements imposed during the night time period 2300-0700 (2200-0600).
ii. Such aircraft movements are permitted only by approval from one of the following:

- Head of Airfield Operations — 0771-101 6610
- Airside Operations — 0113-391 3231

iii. Movements in the night time period by aircraft failing to meet the imposed conditions will only be permissible in the following circumstances:

1. Delayed landings up to 0100 (0000) by aircraft scheduled to land between 0700-2300 (0600-2200).
2. An emergency ie; A flight where there is an immediate danger to life or health, whether human or animal.

g) Unless otherwise instructed by ATC, aircraft using the ILS in IMC or in VMC shall not descend below 2000 FT before intercepting the glidepath, nor thereafter fly below the glidepath. An aircraft approaching without assistance from ILS or radar shall follow a descent path which will not result in its being at any time lower than the approach path which would be followed by an aircraft using the ILS glidepath.
h) To minimise disturbance in areas adjacent to the airport, Captains are requested to avoid/reduce the use of reverse thrust after landing, whenever possible consistent with safe operation of the aircraft.
i) Ground running of aircraft engines is not permitted between 2300-0700 (2200-0600) and is subject to ATC permission at all other times.
j) Fanstop Procedures

i. Simulated asymmetric 'go-arounds' for Runway 14 must be initiated at or above 300 FT (QFE);
ii. Simulated engine out manoeuvres from Runway 14 are not permitted on departure.

EGNM AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR OUTBOUND AIRCRAFT

a)

i. Aircraft are to expect a NELSA 3W SID for the following routes when Runway **32** is in use:

Northbound – N601 (NELSA), P18 (DCT - GASKO) – Expect first CPDLC Data Link Authority to be EGPX

Southbound – L612 (DCT - MCT - DCT - LISTO), N862 via P17 (DCT - BARTN), L8 via P18 (DCT - MCT - DCT - LISTO), M605 (DCT - POL) – Expect first CPDLC Data Link Authority to be EGTT

Westbound – Y70 (DCT - CROFT), L10 FL 85 - (DCT - CROFT - DCT - WAL) – Expect first CPDLC Data Link Authority to be EGPX

ii. Aircraft are to expect a POL 2X SID for the following routes when Runway **14** is in use:

Northbound – N601 (POL), P18 (POL) – Expect first CPDLC Data Link Authority to be EGPX

Southbound – L612 (DCT - MCT - DCT - LISTO), N862 via P17 (POL), L8 via P18 (DCT - MCT - DCT - LISTO), M605 (POL) – Expect first CPDLC Data Link Authority to be EGTT

Westbound – Y70 (POL), L10 FL 85 - (DCT - WAL) – Expect first CPDLC Data Link Authority to be EGPX
LAMIX and DOPEK SIDs – Expect first CPDLC Data Link Authority to be EGTT

Aircraft departing to aerodromes not connected to the above initial routes will receive individual tactical clearances.

b) Radio Failure Procedure

i. In the event of complete radio communication failure in an outbound aircraft, the pilot will adopt the appropriate procedure notified at ENR 1.1.3.

2 PROCEDURES FOR INBOUND AIRCRAFT

a) Standard Inbound Routes from Airways

Approach from	Via	Route
NW	L612 N57	CALDA - POL - LBA POL - LBA
N	P18	GASKO - LBA
E	Y70	GOLES - BATLI - LBA
S	N57/T420 N601	TNT - DENBY - LBA EMBOR - TNT - DENBY - LBA
SW	N864	REXAM - BARTN - POL - LBA
W	L10/L975	WAL - BARTN - POL - LBA

Aircraft likely to be issued tactical headings prior to transfer from Scottish Control to EGNM RAD.

b) Inbound Aircraft from other than the Airways System

i. Aircraft wishing to enter the Leeds Bradford Control Zone and/or Control Area direct from the London FIR are required to obtain permission at least 10 minutes before reaching the CTR or CTA Boundary, when they will be advised of the route to follow consistent with the current traffic situation.

3 RADIO COMMUNICATIONS FAILURE PROCEDURES

a) In the event of complete radio communication failure in an aircraft, the pilot will adopt the appropriate procedure notified at ENR 1.1.3. The route to be used when leaving the Zone in accordance with this procedure is

Position at time of decision	Route
NDB(L)/LBA	Track 010°(T) from NDB(L) LBA at ALT 3000 FT until clear of CTR/CTA.

b) In the event of radio communications failure or no contact with Scottish Control by NELSA, if departing on a NELSA 3W SID or if departing on a POL 2X SID, immediately Squawk 7600, take up a right hand hold at either NELSA or Pole Hill at FL 070 for 3 minutes. Thereafter follow standard radio communications failure procedures in accordance with the UK AIP.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

5 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside Leeds Bradford controlled airspace within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Leeds Radar frequency, 134.580 MHz, are encouraged to select SSR code 2677.

541152N 0014544W - 535800N 0022410W -
535240N 0021607W - 533650N 0015216W -
533210N 0014910W - 533433N 0012238W -
534146N 0011444W - 540551N 0013920W -
541152N 0014544W.

b) Selection of code 2677 does not imply receipt of an ATC service. Pilots of aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of controlled airspace.
c) Whilst squawking 2677 pilots should be aware that Leeds Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 2677 shall be deselected.
e) Aircraft who intend to either transit Leeds CTR or route underneath any portion of the CTA, should still contact Leeds Radar on 134.580 MHz for a service and clearance if required.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1924
HEIGHTS IN FEET AGL (1084)

LEEDS BRADFORD

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **2800** in the sector defined by the lateral limits; 535126N 0015650W thence clockwise by an arc of a circle radius 8NM centred on 535539N 0014519W to 540259N 0013958W - 535154N 0013910W - 535126N 0015650W.

b) **2300** in the sector defined by the lateral limits; 540259N 0013958W thence clockwise by an arc of a circle radius 8NM centred on 535539N 0014519W to 540101N 0013518W - 535337N 0012356W thence clockwise by an arc of a circle radius 8NM centred on 534815N 0013358W to 535218N 0012219W - 535154N 0013910W - 540259N 0013958W.

c) **2200** in the sector defined by the lateral limits; 535154N 0013910W - 535218N 0012219W thence clockwise by an arc of a circle radius 8NM centred on 534815N 0013358W to 534042N 0013822W - 535154N 0013910W.

d) **2600** in the sector defined by the lateral limits; 535126N 0015650W - 535154N 0013910W - 534042N 0013822W thence clockwise by an arc of a circle radius 8NM centred on 534815N 0013358W to 534253N 0014356W - 534724N 0015053W thence anticlockwise by an arc of a circle radius 3NM centred on 534709N 0015556W to 535007N 0015505W - 535016N 0015519W thence clockwise by an arc of a circle radius 8NM centred on 535539N 0014519W to 535126N 0015650W.

e) **2900** in the sector defined by the lateral limits; 535007N 0015505W thence clockwise by an arc of a circle radius 3NM centred on 534709N 0015556W to 534724N 0015053W - 535007N 0015505W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **3000**, or last assigned level if higher to **NDB(L) LBA**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) LBA**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the **NDB LBA**.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. The ATC Surveillance service is provided by Primary and/or Secondary Radar equipment.
7. **This chart should only be used for the cross-checking of assigned altitudes whilst in receipt of an ATC Surveillance service.**
8. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
9. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.

EGCM AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGCM AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Not available to aircraft unable to communicate with Tower.
b) Aerobatic manoeuvres and low flypasts are prohibited unless prior approval has been given by the aerodrome operator.
c) Airport is PPR for all aircraft movements. The filing of a Flight Plan does not comply with the requirements to obtain PPR.

2 GROUND MOVEMENT

a) Caution, reduced wing tip clearance between taxiing and parked aircraft on Main Apron.

3 CAT II/III OPERATIONS

Not applicable.

4 WARNINGS

a) The only signals are light signals.
b) Pilots are to join and depart via the aerodrome VRPs, joining the visual circuit from the crosswind, downwind, base or finals. No deadside or overhead joins due to the conjoined ATZ with Sherburn in Elmet airfield to the south.
c) Obstacle marking and lighting: Control Tower, hangars, flood light stands and anemometer north of Runway 24/06.
d) At both ends of 06/24, the pavement width is wider than the delineated runway width.

5 HELICOPTER OPERATIONS

a) In order to avoid noise sensitive areas surrounding the aerodrome, helicopters should conform to the normal helicopter circuit procedures.
b) 700 FT Circuit Height on QFE arrivals and departure.
c) Helicopters should conform to a Helicopter circuit of 700 FT QFE with a 24 LH (Left Hand) and 06 RH (Right hand).
d) Helicopters should arrive via the official reporting points and position to Heli North or Heli South avoiding Sherburn Airfield ATZ and Fix wing circuit.
e) During LVP operations minimum MET visibility 450 M.

6 USE OF RUNWAYS

a) Except where a public transport operator has a lower State authorised take-off minima, the Aerodrome Authority cannot approve departures in RVR conditions of less than 400 M.

7 TRAINING

a) Use of the aerodrome for training is subject to agreement.
b) The number of aircraft in the visual circuit will be determined by Tower, subject to the prevailing weather conditions and other commercial or corporate traffic.
c) Booking procedures for all circuit training flights may be introduced by Tower during busy periods.

EGCM AD 2.21 NOISE ABATEMENT PROCEDURES

1 GENERAL

a) Every operator of aircraft using the airport shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in the area surrounding the airport.
b) Only those aircraft meeting ICAO Chapter 3 criteria or better will be accepted. Contact Flight Operations on +44(0)1937-534197.
c) Pilots are requested to avoid the use of reverse thrust or reverse pitch above idle power settings on landing, consistent with the safe operation of the aircraft.
d) Due to the close proximity of residential areas, ground running of engines or Auxiliary Power Units (APU) shall be kept to a minimum consistent with operational requirements. At no time shall APUs be run for more than 30 minutes without Aerodrome Operator consent.
e) All aircraft should avoid flying over local villages.
f) **Runway 06** - Circuit pattern:

i. **Take-off**

Turn left as son as practicable to do so and establish on track to clear the village of Ryther (060 degrees, 2 NM). If remaining in the circuit, ensure that crosswind and downwind track is to the north of the villages Bolton Percy and Appleton Roebuck. It is acceptable to maintain a track between the two villages following the railway line.

ii. **Landing**

Maintain the downwind leg north of the villages Bolton Percy, Appleton Roebuck and Ulleskelf to avoid overflying. No low approaches over the village of Church Fenton. Remain north of the railway line.

g) **Runway 24** - Circuit pattern:

i. **Take-off**

Turn right as soon as practicable to do so and establish a westerly track to avoid overflying the village of Church Fenton. If remaining in the circuit ensure that the crosswind and downwind track is to the north of the villages Ulleskelf, Bolton Percy and Appleton Roebuck. Remain north of the railway line. It is acceptable to turn on base leg between the two villages following the railway line south bound (performance permitting).

ii. **Landing**

Ensure base leg remains clear of the villages Bolton Percy and Appleton Roebuck and if performance permits off set final approach to avoid the village of Ryther. Offset approach does not apply to aircraft on the RNP approach.

EGCM AD 2.22 FLIGHT PROCEDURES

1 CIRCUIT PROCEDURES

a) Aircraft taking off, 'going around' or making 'touch and go' landings may be subject to noise procedures as instructed by Tower.
b) Circuit direction: Runway 24 right hand; Runway 06 left hand.
c) Fixed wing circuit height 1000 FT QFE.
d) Helicopters circuit height 700 FT QFE.

2 VFR FLIGHTS

a) Arrival Procedures

i. The arrival procedure for traffic arriving at Leeds East Airport (LEA) will be via VFR reporting points not below 1500 FT AAL.

b) Departure Procedures

i. VFR departures will follow noise abatement then climb on track avoiding inbound VRP's.
ii. All departing and arriving aircraft should avoid overflying villages on the downwind leg. See AD 2.21.

3 VFR DEPARTURES JOINING AIRWAYS IFR

a) Subject to controller workload, expect to be controlled by either Scottish Control or Leeds Radar as appropriate.
b) Ops can obtain clearances from the relevant agency on aircraft start-up.
c) Commanders are reminded that LBA CAS exists between LEA and Pole Hill (FL85 and below) - Southerly departures file via UPTON avoiding LBA CAS.

4 PROCEDURES FOR INBOUND AND OUTBOUND AIRCRAFT

a) All IFR traffic are to include EGCMZTZX as a flight plan addressee.

5 INSTRUMENT APPROACH PROCEDURES (IAP)

a) RNP Instrument Approach Procedures at LEA are established in Class G airspace and no approach control service is provided.
b) All IAPs must have a pre-booked approach time slot from LEA Operations on 01937-534197 which must be adhered to maintain separation.
c) Initial airborne requests for a procedure slot not accepted, unless in an emergency.
d) LEA Operations will provide a briefing document relating to the IAP. Pilots are to abide by the procedures in the briefing document when executing the IAP.
e) For an IVGOB IAF join, permission to transit LBA CAS is required from Leeds Approach.
f) Squawk 5077 when using EGCM RNP Approach.
g) Pilot Brief can be found on LEA website (www.leedseastairport.co.uk) for procedures and bookings.

6 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGBG AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGBG AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of aerodrome outside operational hours is strictly PPR.
b) Use of aerodrome for night flying on Tuesday and Thursday is PPR
c) Asphalt parking area on the runway is not to be used while runway 15/33 is in use. Alternative parking will be available on the grass at the side of the tower or on the hard standings to the rear of the control tower.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Grass runways and taxiway are subject to waterlogging, especially in winter, and may be closed without notice for long periods.
b) Helicopter hover training takes place on the grass between the grass runways, and on the grass runways when not in use.
c) High ground 727 FT AMSL, 061°T, 3.9 NM from ARP.
d) Church 580 FT AMSL, 049°T, 1.5 NM from ARP.
e) The Taxiway adjacent to the Signal Square is encroached upon by a fence, reducing the strip width to 10.35 M.

5 HELICOPTER OPERATIONS

a) On the H in the centre of the grass triangle.
b) No run on landings are to be made on the grass runways.

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGBG AD 2.21 NOISE ABATEMENT PROCEDURES

a) Avoid overflying local villages.

EGBG AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Fixed wing circuits left hand on Runways 10, 33, 22, 34 and 24. Fixed wing circuits right hand on Runways 28, 15, 04, 16 and 06.
b) The standard overhead join is preferred for fixed wing.
c) Fixed wing circuits will be at 1000 FT QFE.
d) Helicopter circuits are to the left on runways 28, 15, 04, 16 and 06. Helicopter Circuits are to the right on runways 10, 33, 22, 34 and 24.
e) Helicopter circuits will be at 700 ft QFE.
f) The standard fix wing join is overhead. Aircraft should not descend below 1200 FT QFE on the deadside due to the helicopter circuit below at 700 FT QFE. Helicopters will join their circuit downwind.

EGET AD 2.3 OPERATIONAL HOURS

1	AD Administration	Mon-Fri: 0900-1700 (0800-1600) and by arrangement; Mon (Feb-Oct): 0730-1700 (0630-1600) and by arrangement; Sat (May-Oct): (1000-1230) Summer only and by arrangement.
2	Customs and immigration	By arrangement with Duty FISO, minimum 24 hours notice.
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	-
7	ATS	As AD hours. See also AD 2.18.
8	Fuelling	AVGAS 100LL - As AD Hours and by arrangement. JET A1 - First fuel uplift from: Mon-Fri 0930 (0830) and by arrangement; Sat 1030 (summer only) and by arrangement.
9	Handling	Available upon request.
10	Security	-
11	De-icing	-
12	Remarks	Tingwall Aerodrome is PPR, minimum of 24 hours notice via phone call or email to Duty FISO.

EGET AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Limited.
2	Fuel and oil types	AVTUR Jet A1, AVGAS 100LL
3	Fuelling facilities/capacity	AVGAS 100LL - up to 28000 LT, limited supply of AVTUR Jet A1 - maximum 2000 LT - check availability prior to departing base airport.
4	De-icing facilities	-
5	Hangar space for visiting aircraft	Very limited - strictly by prior arrangement.
6	Repair facilities for visiting aircraft	Limited, seek advice of Duty FISO.
7	Remarks	Most credit/debit cards accepted (except Maestro cards).

EGET AD 2.5 PASSENGER FACILITIES

1	Hotels	-
2	Restaurants	-
3	Transportation	-
4	Medical facilities	-
5	Bank and Post Office	-
6	Tourist Office	-
7	Remarks	Passenger facilities are limited at the Aerodrome. Pilots intending to visit Tingwall are advised to look at www.shetland.org for details of accommodation, restaurants, hire cars, taxis etc.

EGET AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A2 RFF Category 3 accepted under remission.
2	Rescue equipment	CAT 3 Fire Appliance with CAT 2 Fire Appliance as reserve.
3	Capability for removal of disabled aircraft	Nil at Aerodrome - suitable equipment available.
4	Remarks	-

EGET AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Limited mechanical snow clearing available by prior arrangement.
2	Clearance priorities	-
3	Remarks	Where NOTAM, SNOWTAM or TAF indicates that weather or contamination may be an issue, intending pilots may request further information by contacting the Duty FISO on 01595-744481.

EGET AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	APRON Surface: Asphalt -
2	Taxiway width, surface and strength	-
3	Altimeter checkpoint location and elevation	-
4	VOR checkpoints	-
5	INS checkpoints	-
6	Remarks	Apron leads directly on to runway, with holds at Alpha and Bravo

EGET AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	-
2	Runway and taxiway markings and lighting	-
3	Stop bars and runway guard lights (if any)	-
4	Other runway protection measures	-
5	Remarks	Limited apron space available. Parking provided on a 'first come, first served' basis. Self parking under direction of FISO. Semi-circular mark on apron to provide BN2B access to AVGAS fuelling Station. Holds at Alpha and Bravo. Avoid parking near landside access gate outside opening hours, in case of emergency access required by ambulance/air ambulance personnel. WDI: 601132.43N 0011441.08W (LGTD).

EGET AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of Aerodrome is subject to Terms and Conditions of Use. Pilots intending to use Lerwick/Tingwall aerodrome must familiarise themselves and abide by the Terms and Conditions of use. Terms and Conditions can be found on Tingwall Airport website.
b) Prior Permission Required. Contact the Duty AFISO for further information.
c) Pilots must contact Tingwall Information to request engine start up.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Tingwall Airport has an ATZ, but all airspace is uncontrolled. Tingwall Airport is PPR, with a Flight Information Service only. Strong winds and turbulence may be expected at Tingwall Airport.
b) Pilots are advised to exercise caution with regards to wind shear emanating from the aerodrome and neighbouring buildings immediately to the west of the threshold on Runway 01, or on take-off from Runway 19. This is most evident when wind directions are approximately 220 degrees through 350 degrees.

c) Birds, including geese, gulls and corvids are common. The Visual Control Room has restricted visibility from approximately 210 degrees through 300 degrees, as such, FISOs may be unaware of any bird activity in this zone.
d) Five large wind turbines are sited to the southeast of Tingwall Airport, on Burradale Hill.
e) Hill of Linkster, 2300 M northwest of ARP at 276 FT AMSL.
f) Hill of Griesta, 1300 M southwest of Runway 01 Threshold at 368 FT AMSL.
g) Ward of Laxfirth, 1600 M northeast of Runway 19 Threshold at 317 FT AMSL.
h) Hill of Herrislea, 1700 M east and parallel to runway at 447 FT AMSL.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

a) Where the surface wind is at 90° to the runway, Runway 19 shall be reported as the runway in use (due to the enhanced Visual Control Room visibility).

EGGP AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotel within 50 M of Terminal and other hotels in the vicinity.
2	Restaurants	Yes.
3	Transportation	Buses, taxis and car hire. Railway stations at Liverpool South Parkway (1.7 NM), Runcorn (4.5 NM) and Liverpool Lime Street (6.5 NM).
4	Medical facilities	Full Medical Response H24 - First aid only. Defibrillators available.
5	Bank and Post Office	ATMs and Bureau de Change in terminal.
6	Tourist Office	-
7	Remarks	-

EGGP AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A7 RFF Category 8 and 9 available on request by prior notice.
2	Rescue equipment	Fire Category 7 - 1 x Command vehicle 4x4 Nissan Navarro, 2 x Oshkosh Striker 6x6 Major Foam Tender (12,000 litres water, 1680 litres foam, 227 KG Dry Powder & 10 KG Co2), 2 x Cobra 6x6 Major Foam Tender (10,000 litres water, 1300 litres foam, 200 KG Dry Powder & 10 KG Co2). Spare – 2 x Cobra 6x6 Major Foam Tender (22,000 litres water, 3000 litres foam, 400 KG Dry Powder & 10 KG Co2).
3	Capability for removal of disabled aircraft	Aircraft recovery services, including towing, removal, and necessary repairs, are available upon request for operators. In the event of an aircraft becoming disabled on the airfield, LJLA will coordinate specialised external support to promptly facilitate the movement of the aircraft. Contact: Tel: 0151-907 1551 (Airport Operations Centre).
4	Remarks	-

EGGP AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, Chemical de-icing.

2	Clearance priorities	Standard. See AD 1.2, Section 2.
3	Remarks	Latest information regarding snow state/clearance programme, Tel: 0151-907 1551 (Airport Operations Centre).

EGGP AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

5	INS checkpoints	See Aerodrome Parking/Docking Chart at AD 2-EGGP-2-2.
6	Remarks	-

EGGP AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Main Apron access is via Uniform/Victor/Whisky. Stands 1-14, 32-41 are taxi in/ push-back. On occasion aircraft can be parked for self-manoeuvring. Stand 34 has the facility for an aircraft to start its engines on stand and taxi straight through onto Taxiway Alpha under ATC instruction. Airfield operations will be contacted prior to taxi through to remove apron and taxiway retro-reflective markers abeam Stand 34 prior to utilisation of taxi through function. Stands 1-6 are fitted with AGNIS Visual Docking Guidance System (VDGS), all other stands on the Main Apron require the aircraft to be parked under the instruction of the Marshaller. Stand 14A is a self-manoeuvring stand for Code E aircraft. Individual airline operators are advised to contact the Airport Operations Centre (Tel: 0151-907 1551) to discuss the 'exit manoeuvring requirements' from the stand, which involves a nose wheel turning angle of 55°. Eastern Apron: Access is via Taxiway Tango. Stands 51-56 are fitted with AGNIS and PAPA VDGS. Stands 51 and 54 can accommodate Code C aircraft. Stands 52 and 55 can accommodate Code D aircraft. The activation of the AGNIS is an indication to the Captain that the stand has been inspected and is clear of FOD and any obstacles. If the AGNIS is not switched on, the aircraft should hold its position on the taxilane until the AGNIS has been activated, or a marshaller is present. For self-manoeuvring aircraft in any doubt aircraft captains should ask for Marshaller guidance.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 09/27: Runway designation markings. Runway threshold markings and HI lighting. Runway 09 threshold permanently displaced. Runway aiming point and Touchdown zone markings. Runway 27 HI touch down zone lighting. Runway centre-line markings and HI lighting spaced for operations in RVR below 550 M. Runway edge markings and HI lighting. Runway End HI lighting. Stopway HI lighting. Taxiway marking aid(s): All runway holding positions have runway guard lights, stopbars and illuminated hold point signs. Enhanced taxiway centre-line markings are provided at A1, C, D, E, F and G. Taxiway centre-lines have markings and HI lighting spaced for operations in RVR below 550 M. Taxiway edge markings are provided only at certain locations eg: internal radii of acute taxiway junctions. Retro reflective blue markers are installed in similar locations and on taxiways T, U, V and W.
3	Stop bars and runway guard lights (if any)	At Holding Points A1, A2, C, D, E, F, G and W: HI uni-directional switchable Red. At Holding Points A3, A8, K, L, T, U and V: HI bi-directional switchable Red. Holding Points A2, A3, A8, K, L, T, U, V and W: illuminated only during Low Visibility Operations.
4	Other runway protection measures	-
5	Remarks	Intermediate apron holding positions on Taxiway Uniform (Uniform 2), Taxiway Victor (Victor 2) and Taxiway Whiskey (Whiskey 2), are provided to hold aircraft when necessary, prior to parking on stand. The taxiway strip to the east of Holding Point Kilo is limited to 42 M on the north side of the taxiway. Two WDI: 532003.08N 0025138.66W (LGTD) - 532006.79N 0025017.54W (LGTD).

EGGP AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Pilots are to 'book out' by telephoning details to ATC on 0151-907 1532 (1541 for circuit training). ‘Booking out’ by radio is not accepted.
b) The wearing of high visibility clothing is mandatory for all personnel employed on each of the apron areas, including flight crews.
c) The aerodrome is PPR for aircraft which are not based at Liverpool Airport. Mandatory handling is required for all visiting or non-based aircraft. Prior permission should be requested through a handling agent or FBO, AOC and airportcontrol@liverpoolairport.com; (see AD 2.4). No permission will be granted by ATC. Aircraft without prior permission could be refused landing clearance except in an emergency. Filing a flight plan does not constitute a PPR request.
d) Prior permission for departures and arrivals is required from ATC for aircraft unable to communicate with ATC by radio.
e) Aircraft Captains, through their staff and/or Handling agents, are responsible for the safety of persons and/or vehicles on the apron during engine start.
f) All flights, except General Aviation and Military flights, are subject to the prior approval of the Airport Operations Director, Liverpool Airport Ltd and prior notification to Airport Co-ordination Ltd, who act as an agent for the airport. Requests for ad-hoc slot allocations should be made to ACL during working hours Mon-Fri 0830-1700 (0730-1600) by SITA: LONACXH; e-mail: lonacxh@acl-uk.org; or Tel: +44 (0)161-493 1850, Fax: +44 (0)161-493 1853, or at all other times to Airfield Operations +44 (0)151-907 1551. OCS account holders can add, change and cancel slots at any time on the online coordination portal: https://www.online-coordination.com.
g) Liverpool ATC conduct Radar in the Tower (RiTT) operations, which will be notified via ATIS. During RiTT operations, ATC will be unable to provide the following: NDB approaches, SRAs, or training approaches.
h) Smoking airside, including the use of e-cigarettes/vapes is strictly prohibited.

2 GROUND MOVEMENT

a) Aircraft entering the Main Apron will be as directed by ATC, however, aircraft with a wingspan of 36 M or more will enter through Taxiway Whiskey (W).
b) Aircraft re-positioning on the aprons must obtain ATC permission and then follow the marshaller’s guidance.
c) Taxiway Alpha from Holding Point Alpha 3 to Runway 27 threshold is restricted to aircraft with less than 52 M wingspan (code D). Aircraft with a wing span of 52 M or more shall be escorted by a follow-me vehicle ensuring nose wheel is maintained on the taxiway centre-line. A wing person shall be provided on the single story building 41.5 M north of the taxiway centre-line between Alpha 3 and the 27 threshold which infringes the code D taxiway strip.

d) Owing to the position of the hangars, Stands 1 and 32 are out of sight of ATC. Pilots should listen carefully to their taxi instructions.
e) Pilots are to report their stand number when requesting start-up. Start-up must not be requested until the aircraft is fully ready to start.
f) Take-off, landing and taxiing on grass areas is not permitted.
g) The General Aviation parking area (Kilo) is limited to aircraft of 5700 KG or less.
h) Visiting aircraft entering the GA apron at Kilo are to call Ravenair on 131.755 for parking instructions.
i) All runway holding position stop bars are constantly illuminated except when de-selected by ATC to permit aircraft and vehicles to enter runway.
j) A Temporary Demarcated Area is available on Stands 11,12 or 14 for any flights of Non-Qualifying Status. This area is only available by prior request. All aircraft parked on this area must not request start with ATC until prepared for taxi and the ground handling agents have given their approval to the pilot to do so, in order to ensure the area is free from all obstructions and to prevent blocking the roadway as vehicles cannot pass with illuminated anti-collision lights.
k) If a pilot has any doubt about taxiing instructions or ground clearance they should ask for marshalling assistance, which upon request will be provided.
l) Minimum breakaway power is to be used by aircraft operating on Apron areas.
m) Apron Lima is privately owned (Code B aircraft) with restricted access to approved aircraft only.

3 CAT II/III OPERATIONS

a) Runway 27, subject to serviceability of the required facilities, are suitable for Category II and III operations by operators whose minima have been accepted by the Civil Aviation Authority.
b) During CAT II/III operations, special ATC procedures (Low Visibility Operations) will be applied. Pilots will be informed by ATC when these procedures are in operation. Pilots are advised that implementation of these procedures can cause delays for inbound and outbound traffic.
c) Aircraft departing Runway 27 must hold at the Alpha 2 holding point.
d) Arriving aircraft must continue to the end of the runway to vacate via CHARLIE. Aircraft must report runway vacated and report reaching Alpha 8.
e) For CAT II/III Operations, changeover standby power to mains takes place in 1 second.
f) Aircraft parking on the main apron will normally enter at Whiskey and exit at Uniform, except when directed by ATC.
g) Illuminated stop bars will be in operation at Holding Points A2, A3, A8, K, T, U, V and W during Low Visibility Operations.

4 WARNINGS

a) Pilots should positively identify the runway in use before committing the aircraft to a landing.
b) Pilots are reminded of the proximity of Restricted Area EGR311, 5 NM southwest of the aerodrome.
c) Aircraft completing visual approaches to Liverpool airport from the south and southeast are requested to avoid overflying the industrial chemical works situated on the south bank of the River Mersey, 1 NM south of the NDB LPL.
d) Pilots should exercise caution when leaving the main apron via Taxiway Victor to ensure they do not enter the rapid exit turn-off at ECHO when taxiing to Runway 09 or Runway 27.
e) Pilots are reminded that throughout the year, bird concentrations may be present on all areas under agricultural use on the approaches to Runway 09/27. Deterrent/dispersal within the aerodrome boundary is conducted by the Airfield Operations Unit and pilots may be requested by ATC to delay a departure or arrival if dispersal proves difficult.
f) Radio controlled models up to 20 KG operate at maximum altitude 400 FT AGL during daylight hours only, between 1000-2100 (0900-2000), within the confines of: Frodsham Marshes (132° - 4.4 NM), Halton Moss (085° - 7.6 NM) and Arrowe Park (290° - 11 NM).
g) Maintenance equipment on airport hotel roof. When in use equipment penetrates through the Obstacle Limitation Surface by maximum of 2.0 M. Obstacle approximately 625 M on a bearing of 329° from ARP. Equipped with obstacle warning light that automatically illuminates when the equipment is in use. When not in use and in parked position it is no longer an obstacle.
h) Over recent years, three specific Laser Hotspot areas have been identified in the vicinity of Liverpool Airport from which aircraft are more susceptible to laser attack from the ground. These areas are Liverpool city centre (7 NM northwest), Warrington town centre (10 NM northeast) and Runcorn town centre (4.5 NM east). Pilots are encouraged to report all laser attacks immediately to ATC including details of the colour of the laser and, where possible, the precise location of the laser. This information is then passed to the local police for an immediate response.
i) UK legislation requires UAVs unless otherwise authorised, to be flown at a level not above 400 FT above ground level and away from the vicinity of airports. Pilots encountering or observing UAVs operating above this level or in the vicinity of the airport are strongly encouraged to inform Liverpool ATC of the presence of the UAV. A description of the UAV, including its approximate level and location, should be communicated to ATC as soon as possible. ATC will then ensure that this information is immediately passed to the relevant police authority for further investigation on the ground.
j) Due to congested airspace, in the event of a missed approach, ATC may amend the standard missed approach instructions and may only issue headings.
k) Pilots to be aware that selected vehicles operate under a free ranging procedure on the Alpha Taxiway. Free ranging vehicles will continuously monitor ATC however are not directly under ATC instruction.

5 HELICOPTER OPERATIONS

a) Parts of the manoeuvring area can be used for take-offs and landings as instructed by ATC. Thresholds of the operational runways are designated as aiming points.
b) Arrivals: ATC will either select the appropriate threshold or instruct the helicopter to make an approach to the runway. If instructed to approach the runway, the helicopter is to turn on to a final approach and arrange the descent to flare to ground or hover taxiing speed in the fixed wing runway touchdown zone.
c) Taxiway Alpha Arrivals/Departures: Approach/Departures to the Alpha taxiway are only permitted when:

    i. the runway is closed; and
    ii. the helicopter is operating on a VFR clearance; and
    iii. there are no aircraft, vehicles or personnel on the taxiway.

d) Departures: These will be made from the runway, Aiming Points or parallel taxiway as selected by ATC.
e) Taxiing - Hover (or ground taxiing if applicable) is required to/from the parking area via designated taxiways.
f) A training area for helicopter hovering has been designated to the west of Taxiway Charlie on a disused taxiway and grassed area. Manoeuvring helicopters shall be exempt from the 500 FT rule if it is conducting manoeuvres, in accordance with normal aviation practice, within boundaries of a licensed or Government aerodrome or, with the written permission of the CAA at other sites. When flying in accordance with the above exemption the helicopter must not be operated closer than 60 M to any persons, vessels, vehicles or structures located outside the aerodrome or site.
g) A FATO has been created south of the main runway that is available for use by Liverpool John Lennon Airport based helicopters only. The midpoint of the FATO is 531956.30N 0025107.80W with dimensions of 30 M x 30 M.

6 USE OF RUNWAYS

a) Variable circuit directions at the discretion of ATC.
b) Overhead join of the circuit is not available. Pilots should join the circuit as instructed by ATC.

7 TRAINING

a) Training flights by turbo-jet powered aircraft shall be subject to the prior approval of ATC. They will not normally be permitted on Sundays before 1000 (0900) or after 2000 (1900). On other days they will not be permitted between 2300-0700 (2200-0600). They will be subject to the following conditions:

   i. All crew training circuits shall be carried out at least 1500 FT AAL;
   ii. In other respects, training aircraft shall comply with the noise abatement procedures detailed below.

b) All types of IFR/VFR training are only available by prior arrangement with ATC and are subject to availability of training slots. Pilots are strongly advised to book their training slots with ATC well in advance. Failure to make a booking may result in the aircraft being refused use of the facilities.
c) Pilots unable to make the booked time must inform ATC as soon as possible so that a new booking may be made. Pilots should inform ATC as soon as possible of booking cancellations. Any flight delayed by 30 minutes or more will be deemed to have been cancelled.
d) When Runway 09 is the declared runway in use, instrument training to Runway 27 will not be permitted. Only radar vectored ILS/DME approaches will be available for instrument training to Runway 09.
e) The filing of a flight plan does not constitute a booking to carry out training from the airport.
f) VFR movements between 0000-0700 (2300-0600) are subject to PPR from ATC 0151-907 1541.

EGGP AD 2.21 NOISE ABATEMENT PROCEDURES

1 GENERAL

Every operator of aircraft using the aerodrome shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in LPL Controlled Airspace.

2 REVERSE THRUST

To minimise disturbance in areas adjacent to the aerodrome, Flights Crew shall avoid the use of reverse thrust after landing, unless necessary for the safe operation of the aircraft, especially between 2300-0600 (2200-0500).

3 AIRCRAFT NOISE QUOTA SYSTEM

Liverpool John Lennon Airport operates and manages a Night Noise Quota System, which is based on the CAA Supplement to the UK AIP, pertaining to the Airport Noise Restrictions Notice for London Heathrow, London Gatwick and London Stansted. The quota count value for the take-off and landing by individual aircraft types is shown in the Annexe to the above mentioned Supplement.

a) The night quota period is between 2300-0700 (2200-0600), with the quota count period being between 2330-0600 (2230-0500).
b) Operators must supply information appertaining to the noise characteristics (aircraft type, engine type, operating weight and maximum certificated landing or take-off weight as appropriate) and quota count for all non-exempt aircraft using Liverpool John Lennon Airport, between 2300-0700 (2200-0600). This information must be provided as part of the PPR request process and copied to the Environment Team. E-mail: environment@liverpoolairport.com.
c) Quota Count Operational Restrictions†

   i. 2300-2330 (2200-2230) – Aircraft with quota count of QC/8 and QC/16 must not be scheduled to take-off or land;
   ii. 2330-0600 (2230-0500) – Aircraft with quota count of QC/8 and QC/16 must not take-off or be scheduled to land;
   iii. 0600-0700 (0500-0600) – Aircraft with quota count of QC/16 must not take-off or be scheduled to land.

   Note: Certain exemptions (including emergencies) apply contact the Environmental Manager for a full list of exemptions.

4 ARRIVALS

Inbound aircraft, other than light aircraft flying under VFR or Special VFR, shall maintain a height of at least 2000 FT above aerodrome level until cleared to descend for landing. Aircraft approaching without assistance from ILS or radar shall follow a descent path which will not result

in its being at any time lower than the approach path which would be followed by aircraft using the ILS glidepath, and it is recommended that aircraft join final approach at not less than 3 NM.

5 DEPARTURES

a) Runway 27

i. After take-off all aircraft of more than 5700 KG (12,500 LB) MTWA shall climb straight ahead at maximum rate to 1000 FT AAL before turning.

b) Runway 09

i. Between 2300-0700 (2200-0600), Runway 09 will only be available for take-off when over-riding operational considerations necessitate its use, eg performance requirements.
ii. After take-off the initial turn onto outbound heading shall be commenced as soon as practicable, but not below 500 FT AAL and not before passing the end of the runway.

c) After completion of the initial turn onto outbound heading, all turbo-jet powered aircraft shall reduce power for noise abatement purposes so as to maintain a rate of climb of at least 500 FT per minute at power settings which will ensure progressively decreasing noise levels at points on the ground under the flight path.

6 ENGINE TESTING

Aircraft engine testing is subject to the approval of the Airport Authority and shall only be permitted between the hours of 0700-2300 (0600-2200). Outside these hours engine testing will not be permitted other than in exceptional operational circumstances.

7 REQUIREMENTS

These requirements may be departed from the extent necessary for avoiding immediate danger or risk to life or property.

8 CONTINUOUS DESCENT APPROACHES TO RUNWAY 09

a) Turbo-jet and turbo-prop aircraft are expected to apply continuous descent, low power, low drag approach techniques at all times.
b) Subject to ATC instructions, inbound aircraft are to maintain as high an altitude as practical and adopt a low power, low drag, continuous descent approach profile. ATC will provide estimated track distance to touchdown to allow pilots to descend at a rate they judge best suited to achieve continuous descent without using more power or drag than necessary. The object will be to join the glidepath at the appropriate height for the distance without level flight.
c) To facilitate these techniques aircraft should be flown no faster than 250 KT from the Speed Limiting Points and below FL 100 and 250-210 KT during the intermediate approach phase. Thereafter speed should be managed so as to achieve a continuous descent using as little power or drag as possible. ATC may impose speed control if required for seperation purposes.
d) ATC will provide regular range checks. Pilots who require additional track mileage to facilitate a successful CDA should inform ATC as soon as possible.

Note: *Continuous descent approaches are only available on Runway 09. Runway 27 operations may require prolonged flight at lower altitude for airspace integration. See EGGP AD 2.22 2 (e) (iii).*

EGGP AD 2.22 FLIGHT PROCEDURES

1 RADIO COMMUNICATIONS FAILURE PROCEDURES

a) In the event of complete communication failure in an aircraft, the pilot will adopt the appropriate procedures notified at ENR 1.1.3, with the following exceptions.

i. When complete communication failure occurs in an aircraft before ETA or before EAT, when this has been received and acknowledged, the aircraft will:

1. Fly to the LPL NDB holding point;
2. hold at the last assigned level until the last acknowledged ETA plus 10 minutes or EAT when this has been given; or, if radio failure occurs after an aircraft has reported over the holding point, hold at the last assigned level until ATA plus 10 minutes, or 10 minutes after the last acknowledged communications with ATC whichever is the later.
3. then commence descent for landing in accordance with the procedures detailed at ENR 1.1.3 and effect a landing within 30 minutes (or later if able to approach and land visually).

ii. Aircraft which are instructed by ATC to hold at TIPOD or KEGUN, before proceeding to the LPL NDB, will in the event of complete communication failure:

1. When an Onward Clearance Time has been received and acknowledged, leave TIPOD or KEGUN at that time at the last assigned level and proceed to the LPL NDB, then carry out the procedure as shown at ENR 1.1.3; or
2. when 'Delay Not Determined' has been transmitted by ATC, leave TIPOD or KEGUN on the route and at the level shown in paragraph iii to leave Controlled Airspace.

iii. The routes and altitudes to be used when leaving the TMA and CTR in accordance with the procedures given at ENR 1.1.3 are shown in the table below; the route to be followed is dependent on the position of the aircraft

Position at time of decision	Route
TIPOD	Track 360°T at last holding level minus 500 FT.
KEGUN	Track 270°T at last holding level minus 500 FT.
NDB LPL	Track 330°T at last holding level minus 500 FT ALT.
VOR WAL	Track 340°T at last holding level minus 500 FT ALT.

2 PROCEDURE FOR INBOUND AIRCRAFT

a) Clearance to enter the CTR.

Aircraft flying the Airways System will be cleared into the CTR without having to request a specific entry clearance.

b) Aircraft wishing to enter the CTR or TMA under IFR direct from the London FIR must observe the normal procedure for joining Airways at one of the following Reporting Points: Pole Hill VOR and Wallasey VOR.

c) Aircraft unable to comply with these procedures because they are not equipped for flight on Airways may, traffic and weather conditions permitting, be cleared to proceed to Liverpool, in accordance with the procedures described at paragraphs 4 to 7.

d) **Standard Terminal Arrival Routes (STARs)**

Standard arrival routes for aircraft inbound from the airways system will be routed via the Standard Terminal Routes (STARs) detailed at AD 2-EGGP-7 charts.

e) **Non-RNAV1 Inbound Aircraft**

Where STARs are designated as RNAV1 Only, Non-RNAV1 aircraft shall file via the existing route structure as featured in the Standard Route Document (SRD). Non-RNAV1 aircraft should not proceed beyond TIPOD/KEGUN without ATC clearance.

f) **Approach Procedures under Radar Control**

i. When inbound traffic is being sequenced by Radar, the approach procedure will be flown under directions from the Radar Controller. Aircraft will be given a track to take up according to the runway-in-use and will be allocated a level. Changes of heading or level will be made only on instructions from the Radar Controller except in the case of radio communication failure in the aircraft or at the Radar Unit. When cleared to descend, aircraft should descend at a rate of at least 500 FT per minute.

ii. In the event of radar failure, new instructions will be issued to each aircraft under radar control and the procedures as defined for approach without radar control put into effect. If radio communication fails at the Radar Unit, pilots on approach will revert to Approach Control for new instructions.

iii. Due to the close proximity of Manchester Airport 20 miles to the east of Liverpool Airport, various restrictions exist regarding descent profiles for aircraft inbound to Liverpool when landing Runway 27. These restrictions are dependent upon the runway in use at Manchester and are detailed below:

1. Manchester Runway 05L or 05R

Left Hand Circuit to Runway 27 is NOT available unless an emergency situation exists. All aircraft shall be positioned for a Right Hand Circuit to Runway 27. Aircraft shall be required to pass north abeam Liverpool Airport, WAL 10d, at or below 3000 FT descending to be 2500 FT or below by WAL 18d. In addition, KEGUN arrivals from the south will initially be positioned to the west of Liverpool Airport and will not be able to track within 5 miles of Liverpool Airport until the aircraft is at or below 3000 FT.

2. Manchester Runway 23L or 23R

Left Hand Circuit to Runway 27 is available. Aircraft shall be required to pass south abeam Liverpool Airport at or below 3000 FT descending to be 2000 FT by I-LQ D8 east of the airfield. For a Right Hand Circuit to Runway 27, aircraft shall be required to pass north abeam Liverpool Airport, WAL 10d, at or below 4000 FT descending to be 2000 FT or below by WAL 18d.

More restrictive descent profile requirements do exist. These are implemented on an infrequent basis and when they become effective aircraft will be advised of the requirements on an individual basis.

g) **Approach Procedures Without Radar Control**

i. When Liverpool inbound traffic is not being sequenced by Approach Radar, aircraft will be cleared direct from the holding facility to carry out an Approach Procedure. When cleared, descend in the NDB(L) LPL holding pattern to 2500 FT ALT, then carry out the required procedure in accordance with the Instrument Approach charts.

3 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Speed Limit

i. A speed limit of 250 KT applies to all departures whilst flying below FL 100 unless previously removed by ATC. ATC will endeavour to remove the speed limitation as soon as possible and will use the phrase 'No ATC Speed Restriction'. The phrase must not be

interpreted as relieving the pilot of his responsibility for the observance of any noise abatement procedures which may include a speed/power limitation.

ii. In certain weather conditions and perhaps for other reasons of safety, pilots may not be able to comply with the speed limit. When such circumstances are anticipated, the pilot should inform ATC when requesting start-up clearance, stating the minimum speed acceptable. In this event, pilots will be informed before take-off of any higher speed limitation. Similarly, should such circumstances arise during flight, the pilot should immediately advise ATC, stating the minimum speed acceptable.

iii. Should weather conditions or other factors necessitate any modification of this procedure, the relevant information will be broadcast by ATC.

b) Allocation of Cruising Levels

i. When a re-clearance of Altitude/Flight Level is issued after take-off by ATC, it is the responsibility of the pilot to comply with at least the minimum altitudes shown in the SID procedure during the climb to the new assigned Altitude/Flight Level.

ii. Exceptionally, when ATC issue a re-clearance below the final SID altitude pilots must not climb above this revised altitude until further clearance is received.

c) Radio Communication Failure Procedures

i. In the event of complete radio communication failure in an outbound aircraft, the pilot will adopt the appropriate procedure notified at ENR 1.1.3

ii. For the purpose of radio failure, climb to flight-planned level should be commenced after the last position shown in column 4 of the SIDs where an altitude is specified.

d) Wake vortex, departures

i. Holding Points G & D are not considered by ATC to be intersection departures for the purposes of wake vortex separation, where the departure is a Light aircraft following a Small or Lower-Medium wake turbulence category aircraft using the full runway length (up to, but not including B757-sized or similar aircraft).

ii. Where pilots require greater than 2 minutes departure separation in such circumstances, this should be notified to ATC before entering the runway for line-up. Failure to notify ATC in advance of entering the runway may result in additional delay.

4 PROCEDURES FOR FLIGHTS BETWEEN MANCHESTER AND LIVERPOOL

a) IFR flights between Manchester and Liverpool Airports will normally be cleared via EKLAD 1R/Y off Runway 23R/L or via ASMIM 1S/Z off runway 05L/R to route to TIPOD/KEGUN.

b) IFR flights between Liverpool and Manchester Airports will normally be cleared via WAL 2T/V departure thence as directed by ATC.

5 SPECIAL AERODROME PROCEDURES

Flights within the local circuit area of aerodromes within the Zone or within access lanes of sectors serving these aerodromes may be made subject to the conditions listed below.

a) Air Traffic Rules for Liverpool CTR

i. During the notified hours of watch of Liverpool Air Traffic Control, the rules require that a pilot wishing to fly within the Control Zone must, unless otherwise authorized, comply with the following procedures:

1. **CALL** the appropriate Unit on the frequency giving details of the aircraft's position, level and proposed track;
2. **OBTAIN CLEARANCE** from Liverpool ATC for the flight;
3. **LISTEN OUT** on the appropriate frequency;
4. **OBEY** all instructions from Liverpool ATC.

b) Local Flying Area and Neston Lane

i. Within a local flying area of 1.5 NM radius centred on the aerodrome (position 532001N 0025100W), and within an entry/exit lane, width 1 NM, centre-line Liverpool Airport-Neston VRP from the boundary of the local flying area to the west boundary of the Control Zone, flights without compliance with IFR requirements may take place subject to the following conditions:

1. Aircraft to remain below cloud and in sight of the ground or water;
2. maximum altitude: 1500 FT, Liverpool QNH;
3. minimum flight visibility: 3 KM;
4. prior clearance to be obtained from Liverpool ATC.

c) Mersey Entry/Exit Lane

i. The local flying area is linked via the River Mersey to Seaforth Docks by means of an entry/exit lane, 1 NM in width, aligned on a centre-line joining positions 531927N 0025345W - 532300N 0025940W - 532741N 0030205W ('Seaforth Dock VRP'). Flights may take place without compliance with IFR requirements subject to the following conditions

1. Aircraft to remain below cloud and in sight of the ground or water;
2. maximum altitude: 1500 FT, Liverpool QNH;
3. minimum flight visibility: 3 KM;
4. prior clearance to be obtained from Liverpool ATC.

6 VFR AND SPECIAL VFR FLIGHTS

a) Clearance may be requested for Special VFR flight within the Liverpool CTR and will be given whenever the traffic situation permits. Special VFR flights are subject to the general conditions laid down in ENR 1.2.

Note: *Pilots holding a Private Pilots Licence (Aeroplanes) are reminded of the flight visibility requirements for Special VFR flight laid down in Schedule 8 part B of the Air Navigation Order 2016. All VFR and SPECIAL VFR Flights shall be operated in accordance with SERA.*

b) Aircraft may be given radar vectoring whilst within the CTR if, due to the traffic situation, ATC considers it necessary. Pilots are reminded that it is their responsibility when operating on a Special VFR Clearance to remain at all times clear of cloud and in sight of the surface and in flight conditions which will enable them to determine their flight path and ensure that they comply with SERA.3105 Minimum Heights, SERA.5010 Special VFR in control zones and ENR 1.2 paragraph 1.3(l). Pilots must inform the radar controller if compliance with these requirements entails a change of heading or level.
c) Pilots are reminded that a Special VFR clearance applies only to flight within the CTR and does not extend to flight within the surrounding airspace.
d) Special VFR flight may be subject to delay when they cannot be fitted readily into the traffic flow.
e) In order to reduce conflict with IFR flights, Special VFR arriving/departing flights will normally be cleared not above a specified altitude and to route via a published Visual Reference Point.
f) Special VFR clearances will not be issued to fixed wing aircraft departing from Liverpool if the reported weather conditions are: visibility 1500 M or less, or the cloud ceiling is less than 600 FT.
g) In order to integrate VFR flights to/from Liverpool Airport with the IFR traffic flow, standard routes are established along which VFR clearance will be issued subject to the conditions specified above. The routes provide a uni-directional traffic flow, dependent upon the runway in use at Liverpool Airport. The routes are detailed in paragraph 7 below and shown on the chart at AD-2-EGGP-4. Non-standard routes may be requested but ATC approval will only be granted if the traffic situation allows. Pilots are reminded of the requirements to remain in VMC at all times and to comply with the relevant parts of SERA and the Rules of the Air Regulations 2015, and must advise ATC if at any time they are unable to comply with instructions.
h) Aircraft requiring to hold south of Liverpool Airport should minimise flight over Stanlow oil refinery (4 NM south of the airport).
i) Aircraft approaching Liverpool Airport from the south and south east are requested to avoid overflying the industrial chemical works on the south bank of the River Mersey, 1 NM south of the Runcorn Bridge.

7 STANDARD VFR ENTRY/EXIT ROUTES IN THE LIVERPOOL CONTROL ZONE

a) Runway 27

		Route	Max Altitude	Remarks
Outbound to	North	Route via the River Mersey, to leave CTR via VRP Seaforth Dock.	2000 FT	
	South	Cross River Mersey and follow M53 Motorway, to leave CTR via VRP Vicars Cross Roundabout.	1500 FT	Remain east of EGR311 (Capenhurst).
Inbound from	North	Enter CTR via VRP Kirkby, route east of M57 Motorway, then as directed by ATC.	2000 FT	
	South	Enter CTR via VRP Tarporley Roundabout, route to the western edge of Helsby, then as directed by ATC.	1500 FT	

b) Runway 09

		Route	Max Altitude	Remarks
Outbound to	North	East of M57 Motorway, leave CTR via VRP Kirkby.	2000 FT	
	South	Cross River Mersey and leave CTR via VRP Tarporley Roundabout.	1500 FT	
Inbound from	North	Enter the CTR via VRP Seaforth Dock, route via the River Mersey, then as directed by ATC.	2000 FT	
	South	Enter CTR via VRP Vicars Cross Roundabout, follow M53 Motorway to VRP M53 Junction 11 (Stoak Interchange), then as directed by ATC.	1500 FT	Remain east of EGR311 (Capenhurst).

8 EGR323 NORTH WEST TRANSIT CORRIDOR

a) The EGR323 North West Transit Corridor lies immediately to east of the Liverpool CTR. EGR323 procedures are described in ENR 5.1 PROHIBITED, RESTRICTED AND DANGER AREAS.

9 VISUAL REFERENCE POINTS (VRP)

a) Remain to the east of the Burtonwood Services/M56 Junction 11 VRPs to remain clear of Liverpool CTR.
b) Remain to the west of the Stretton (Disused AD) VRP to remain clear of Manchester CTR.

c) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

10 FREQUENCY MONITORING CODE

a) Pilots operating outside the Liverpool CTR/CTA but within the area bounded by the following coordinates and maintaining a listening watch only on the Liverpool Radar frequency, 119.855 MHz, may select code 5060 with mode Charlie. Solo student pilots fulfilling the above criteria may select code 5067 with mode Charlie.

530626N 0024349W - 530314N 0024935W -
530253N 0023748W - 533723N 0023744W -
533223N 0025907W - 533213N 0031406W -
532621N 0032107W - 531909N 0032201W -
531525N 0031346W - 531714N 0031104W -
531427N 0030140W - 530626N 0024349W

b) Selection of 5060/5067 does not imply the receipt of an ATC service. Aircraft displaying these codes are not expected to contact ATC under normal circumstances, but remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Liverpool CTR/CTAs at all times. Pilots are reminded that the Manchester CTR/CTAs and the Hawarden RMZ are in close proximity to the Liverpool CTR/CTAs and the display of 5060/5067 does not constitute authority to transit these areas without permission.
c) Whilst squawking 5060/5067, pilots should be aware that Liverpool Radar may make blind calls in order to ascertain a pilot's intentions/ routing.
d) When an aircraft ceases to maintain a listening watch or is no longer flying within the area, the pilot will deselect transponder code 5060/ 5067.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL **1036**
HEIGHTS IN FEET AGL (190)

LIVERPOOL

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **1800** in the sector defined by the lateral limits; 532014N 0031520W - 532309N 0031205W - 532734N 0030310W - 533000N 0024259W - 532525N 0023502W - 531547N 0023242W - 531106N 0023723W - 531105N 0025408W - 531427N 0030140W - 531609N 0030723W thence anticlockwise by an arc of a circle radius 4NM centred on 531619N 0031403W to 532014N 0031520W.

b) **2100** in the sector defined by the lateral limits; 531609N 0030723W thence anticlockwise by an arc of a circle radius 4NM centred on 531619N 0031403W to 532014N 0031520W - 531855N 0031647W - 531609N 0030723W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2500**, or last assigned level if higher, to **NDB(L) LPL**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) LPL**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4 or the special procedure for the Manchester CTR and TMA (EGGP AD 2.22).

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. The ATC Surveillance service is provided by Primary and/or Secondary Radar equipment.
7. When receiving Radar Vectors for Runway 27 approaches, pilots should question ATC if no base leg turn has been passed by the time the aircraft reaches 8 DME east of the airfield, due to the proximity of the Manchester CTA.
8. **This chart should only be used for the cross-checking of assigned altitudes whilst in receipt of a ATC Surveillance service.**
9. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of Instrument approaches other than SRA is cleared to intercept the final approach track.**

LIVERPOOL
REXAM

REXAM 2T RWY 27	Climb straight ahead on LPL NDB QDR 265°. At **I-LQ** D8 turn left onto **WAL VOR** R183 to **REXAM**. Crossing **I-LQ** D8 at **2500 or above**. Crossing **WAL** D6 at **3500** or above. Crossing **WAL** D15 at **4000**.	N42.
REXAM 2V RWY 09	Climb straight ahead. At **I-LVR** D1 or **581** QNH (**500** QFE) if sooner, turn right onto **POL VOR** R223 to **REXAM**. Crossing **POL** D44 at **3500 or above**. Crossing **POL** D50 at **4000**.	N42.

GENERAL INFORMATION

1 Close in obstacles exist for departures from RWY 09. See Aerodrome Obstacle Chart and EGGP AD 2.10 Aerodrome Obstacles.
2 SIDs reflect Noise Preferential Routeings. See EGGP AD 2.21 for Noise Abatement Procedures.
3 RWY 27. Aircraft of more than 5730KG (12500LB) climb straight ahead at maximum rate to 1081 QNH (1000 QFE).
4 After completion of the initial turn onto outbound heading, all jet aircraft shall reduce power so as to maintain a rate of climb of at least **500** per minute.
5 En-route cruising levels will be allocated after departure by 'Scottish Control'. **Do not climb above SID level until cleared by ATC**.
6 Callsign for RTF frequency used when instructed after take-off 'Scottish Control'. On first contact advise callsign, SID designator, current altitude and cleared altitude.
7 Maximum 250KIAS below FL100 unless otherwise authorised.
9 Expect first CPDLC Data Link Authority to be EGTT.
9 Aircraft routeing via P17 requesting a cruising level of FL270 or above can expect a clearance from 'London Control' to cross OSSEP **FL270** or above. Traffic unable to comply must inform ATC.

EGLC AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGLC — LONDON CITY

EGLC AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 513019N Long: 0000319E Mid point of Runway 09/27.
2	Direction and distance from city	6 NM E of City of London.
3	Elevation / Reference temperature / Mean Low Temperature	20 FT / 20 °C / -
4	Geoid undulation at AD ELEV PSN	149 FT
5	Magnetic Variation / Annual Change	1.39°E (2027) / 0.17°E
6	AD Administration Address Telephone Telefax	LONDON CITY AIRPORT LTD Royal Docks, Silvertown, London E16 2PX. 01489-571177 (ATC) 020-7646 0000 (Administration) 020-7511 1040 (Administration) 020-7511 0248 (Ops/FBU)
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	All telephone calls to ATC are recorded.

EGLC AD 2.3 OPERATIONAL HOURS

1	AD Administration	Mon-Fri 0630-2200 (0530-2100); Sat 0630-1230 (0530-1130); Sun 1230-2200 (1130-2100); PH 0900-2200 (0800-2100).
2	Customs and immigration	Mon-Fri 0630-2230 (0530-2130); Sat 0630-1330 (0530-1230); Sun and PH 0900-2300 (0800-2200). Prior notice required by 1400 (1300) on previous day.
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	As aerodrome hours.
7	ATS	As aerodrome hours. See also AD 2.18.
8	Fuelling	As aerodrome hours.
9	Handling	As aerodrome hours.
10	Security	As aerodrome hours.
11	De-icing	As aerodrome hours.
12	Remarks	Aerodrome Hours are maximum permitted for scheduling purposes. No static customs presence, contact Waterloo International Terminal: 020-7919 6710.

EGLC AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	-
2	Fuel and oil types	AVTUR JET A-1
3	Fuelling facilities/capacity	Road Tanker up to 37,500 LT.
4	De-icing facilities	Available via handling agent.
5	Hangar space for visiting aircraft	None.
6	Repair facilities for visiting aircraft	Available by arrangement.
7	Remarks	A nominated handling agent is mandatory for all visiting aircraft. Handling for corporate and General Aviation by arrangement with London City Airport Jet Centre, Tel: 020-7646 0400; Fax: 020-7646 0450; SITA: LCYGAXH

EGLC AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels in the vicinity
2	Restaurants	Restaurant, buffet bar.
3	Transportation	Trains, buses, taxis, hire cars. Nearest railway station: London City Airport (Docklands Light Railway).
4	Medical facilities	Limited first aid treatment.
5	Bank and Post Office	Bureau de Change.
6	Tourist Office	-
7	Remarks	-

EGLC AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A6 RFF Category A7 accepted under remission.
2	Rescue equipment	Water borne rescue equipment as per Aerodrome Manual.
3	Capability for removal of disabled aircraft	Limited facilities available
4	Remarks	RFFS available throughout aerodrome operating hours.

EGLC AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, Chemical de-icing.
2	Clearance priorities	Standard
3	Remarks	-

EGLC AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	EAST APRON Surface: Concrete - MAIN APRON (STAND 10) Surface: Concrete PCR 387/R/C/Y/U MAIN APRON (STANDS 3-9) Surface: Concrete PCR 285/R/C/Y/U
2	Taxiway width, surface and strength	Taxiway TANGO (BTN A-D): 15 M Surface: Concrete PCR 440/R/B/W/T Taxiway TANGO (BTN D-E): 22 M Surface: Concrete - Taxiway TANGO (BTN E-M): 18 M Surface: Concrete - Taxiway TANGO (BTN T1-A): 16 M Surface: Concrete PCR 285/R/C/Y/U
3	Altimeter checkpoint location and elevation	Apron 17 FT
4	VOR checkpoints	-
5	INS checkpoints	See Aircraft Parking/Docking Chart.
6	Remarks	-

EGLC AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Self-manoeuvring stand marking (with marshalling assistance).
2	Runway and taxiway markings and lighting	Runway marking aid(s): 09/27: Runway threshold. Runway designators. Aiming point and TDZ markings. Taxiway marking aid(s): Yellow centre-line. Enhanced taxiway centre-line markings in place on all taxiways. Taxiway light(s): Green centre-line lights with amber Intermediate Hold Point lighting.
3	Stop bars and runway guard lights (if any)	Red stop bars and co-located runway guard lights on access taxiways.
4	Other runway protection measures	-
5	Remarks	Taxiway: Apron and access taxiways green centre-line lights augmented with blue edge lights on curves. Selectable lead-on lights. Blue edge lights on edges of runway turning areas and apron. WDI (LGTD): 513020.59N 0000338.46E; 513021.74N 0000301.72E.

EGLC AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGLC AD 2.11 METEOROLOGICAL INFORMATION PROVIDED

1	Associated MET Office	MET OFFICE HEATHROW
2	Hours of service MET Office outside hour	H24 -
3	Office responsible for TAF preparation Periods of validity	MET OFFICE HEATHROW 9 hours
4	Trend forecast Interval of issuance	-
5	Briefing/consultation provided	Self briefing/telephone.
6	Flight documentation Language(s) used	Charts abbreviated plain language text. TAFs/METARs. English
7	Charts and other information available for briefing or consultation	-
8	Supplementary equipment available for providing information	Automated recording telephone (ATIS): +44 (0)207-511 6055.
9	ATS units provided with information	LONDON CITY
10	Additional information (limitation of service, etc.)	RVR 25-1500 M.

1	2	3	4	5	6	7
ILS/LOC I 1.39°E (2027)	ILST	111.150 MHz	HO	513017.44N 0000403.03E	-	(RWY 09) Due to terrain, localizer front course coverage is restricted to 10 NM and to Sector 30° right to 35° left of the centre-line.
ILS/GP	ILST	331.550 MHz	HO	513021.77N 0000246.08E	-	5.5° ILS Ref Datum Hgt 35 FT. Pilots may not receive full fly up right of runway centre-line beyond 6.5 NM.
ILS/LOC I 1.39°E (2027)	ILSR	111.150 MHz	HO	513020.30N 0000231.79E	-	(RWY 27) Not to be used outside 30° left of centre-line. Pilots may not receive full fly right between 20° and 15° left of centre-line when beyond 6 NM. Localiser not to be used beyond 17 NM.
ILS/GP	ILSR	331.550 MHz	HO	513019.72N 0000351.26E	-	5.5° ILS Ref Datum Hgt 35 FT.
VOR/DME 1.22°E (2027) 1.0°E (2026)	LON	83X 113.600 MHz	H24	512914.09N 0002759.54W	113 FT	VOR DOC: 20 NM/50,000 FT (10 NM/50,000 FT in Sector R094-164, 35 NM/50,000 FT in Sector R064-094 and 40 NM/50,000 FT in Sector R254-289). There may be VOR bearing fluctuations in Sector R334-170. DME DOC: 40 NM/50,000 FT (100 NM/50,000 FT in Sector R179-254 and 80 NM/50,000 FT in Sector R254-314). DME unlocks may occur in the Sector R179-249 at ranges greater than 50 NM.
DME	ILST	48Y 111.150 MHz	HO	513022.05N 0000246.56E	42 FT	(RWY 09) On AD. DME freq paired with ILS I-LST. Zero ranged to THR of Runway 09.
DME	ILSR	48Y 111.150 MHz	HO	513020.02N 0000351.11E	40 FT	(RWY 27) On AD. DME freq paired with ILS I-LSR. Zero ranged to THR of Runway 27.
NDB 1.39°E (2027)	LCY	322.000 kHz	H24	513015.66N 0000403.01E	-	On AD. Range 10 NM.
VOR/DME 1.39°E (2027) 1.1°E (2024)	BIG	98X 115.100 MHz	H24	511951.15N 0000205.32E	589 FT	VOR DOC: 20 NM/50,000 FT (30 NM/50,000 FT in Sector R259-314 and 45 NM/50,000 FT in Sector R314-344). DME DOC: 60 NM/50,000 FT (125 NM/50,000 FT in Sector R284-044 and 100 NM/50,000 FT in Sector R044-134). Due to terrain, coverage at low level is reduced in Sector R114-219. In addition DME unlocks may occur in Sector R004-039 at ranges up to 25 NM.

EGLC AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) No aeroplane registered in the United Kingdom shall use the aerodrome unless there is contained in its Flight Manual data and procedures for approach path angles of 5.5° or steeper and no other aeroplane shall use the aerodrome unless it has data and procedures

for approach path angles of 5.5° or steeper which have been approved or otherwise authorised by the regulatory authority of the State in which it is registered.

b) The use of the aerodrome is subject to prior permission of the Airport Director. Additionally operators of aircraft are required to satisfy the Airport Director that they are able to comply with local noise restrictions applicable to the airport.
c) Extensions to opening hours (shown by the latest NOTAM) are available on request to the Airport Director or his representative. Delayed aircraft may be permitted to operate 30 minutes beyond published maximum operating hours shown at AD 2.3 item 1 by prior arrangement.
d) Operations by all aircraft shall be permitted only when the runway is dry, or if wet devoid of other than small areas of water not exceeding 3 MM in depth. Operations will be prohibited when the runway is contaminated by ice or slush to a depth exceeding 3 MM, or dry snow to a depth of 10 MM, or the reported friction measurement is reported as worse than 'medium' provided that this condition shall not apply if there is an appropriate entry covering operation from contaminated runways contained in the relevant flight manual.
e) The aerodrome is not available for use by single engine aircraft. Available to fixed-wing aircraft only. Recreational flying is not permitted.
f) Single pilot operations are not permitted.
g) It is not permitted to nominate EGLC as a diversion aerodrome.
h) All flights operating at London City Airport require a slot allocated by Airport Coordination Ltd (ACL). Requests for ad-hoc slot allocations should be made to ACL during working hours Mon-Fri 0830-1700 (0730-1600) by SITA: LONACXH; e-mail: lonacxh@acl-uk.org; or Tel: 0208-564 0605, Fax: 0208-564 0691. Outside these times, during published operating hours to Aerodrome Operations Stand Planner 0207-646 0083. OCS account holders can add, change and cancel slots at any time on the online coordination portal: https://www.online-coordination.com/default.aspx?AspxAutoDetectCookieSupport=1.
i) All aircraft shall only commence start up and taxi when a marshaller is present and available to provide relevant signals.
j) When operating on the aprons, high visibility tabards must be worn and fastened.
k) Ground service crews are responsible for removal of all chocks.
l) Pilots are reminded not to cross the taxiway double white lines when conducting visual inspections of aircraft.

2 GROUND MOVEMENT

a) Pilots are requested to use minimum power when manoeuvring on and off parking stands and when entering the runway. The use of minimum power is particularly emphasised when holding at the entry points to the runway and when entering the runway.
b) Parking: Pilots should self-manoeuvre their aircraft on to the appropriate stand lead-in line (as directed by ATC) and approach the stand as closely as possible. Direction to the final parking position will be provided by marshallers. Under no circumstances may aircraft enter a stand without guidance from marshallers.
c) Under no circumstances may aircraft self park or taxi without guidance from marshallers.
d) GA Apron: Pilots will be directed by ATC to taxi to the Jet Centre. Pilots must then follow the marshaller’s instructions for parking.
e) To ensure adequate wing tip clearance is maintained from adjacent stands, it is imperative that pilots follow the lead-out markings on all stands.
f) Pre-departure ATC clearance by datalink (DCL) is available at London City Airport for suitably equipped aircraft. If an attempt to obtain DCL is unsuccessful aircraft must instead request via RTF. Pilots are to request departure clearance no later than EOBT - 10.
g) If the aircraft is not adequately positioned on stand the pilot should proceed as directed by ATC. Prior to undertaking the manoeuvre, in order to re-position onto stand, the pilot must request permission from ATC to enter the taxilane and advise ATC if the aircraft is unable to follow the stand lead-off line. Only once permission has been granted by ATC shall the pilot commence the movement into the taxilane.
h) Use of aircraft Auxiliary Power Units (APUs) are subject to strict controls as set out in published airport regulations. Between the hours of Mon-Fri 0630-2200 (0530-2100); Sat 0630-1230 (0530-1130); Sun 1230-2200 (1130-2100), APUs should be shut down as soon as practicable following arrival and not restarted until 10 minutes prior to departure, except when the outside air temperature (as promulgated by ATC) is below +5C or above +20C. Flights with departure times at or just after published airfield opening time are able to start APU from STD -10 mins but not before Mon-Sat 0620 (0520) or Sun 1220 (1120). Operators wishing to use their APU during the above conditions should contact ATC and inform them of APU start-up. This will allow ATC and AO to note APU running times that may be required by the local authority. The use of APUs are not permitted outside of published airfield operating hours unless the airfield operating hours have been extended. Fixed Electrical Ground Power (FEGP) or Mobile Ground Power (MGP) must be used whenever available and serviceable.
i) Pilots should caution other aircraft in the process of parking when taxiing.
j) E295/E290/BCS1 – Stand 10L: When parking on Stand 10L, E295/E290/BCS1 are not to vacate the runway at Alpha. When parking Stand 10L, Stand 9 will be vacant.

3 CAT II/III OPERATIONS

a) London City Airport is not suitable for lower than standard category I operations.

4 WARNINGS

a) Windshear - When landing on either runway in strong wind conditions pilots may experience building induced turbulence and/or windshear. Pilots initiating a missed approach due to windshear should report Windshear Go-Around to alert ATC to possibility of a level bust. The Standard Missed Approach altitude is 2000 FT.
b) Compass Error when using Runway 27 hold. Some aircraft types may experience magnetic disturbances, affecting the Heading Reference System. Pilots should ensure that, when positioned for take-off from Runway 27, the aircraft heading reference is checked against the runway alignment. Flight crew noticing a compass anomaly should notify ATC as soon as possible.
c) Level Bust - All Standard Instrument Departures have stop altitudes of 3000 FT due to presence of London TMA.

5 HELICOPTER OPERATIONS

a) Use of the airport by helicopters is not permitted without prior authorisation from the Airport Authority.
b) See EGLL AD 2.22 and chart AD 2-EGLL-3-2 for details of helicopter procedures within the London CTR and London City CTR.

6 USE OF RUNWAYS

a) Minimum Runway Occupancy Time - Departing Aircraft.

i. The crew of departing aircraft must inform ATC if they are not ready for departure when instructed by ATC to line-up.
ii. Whenever possible, cockpit checks should be completed prior to line-up and any checks requiring completion when lined-up on the runway should be kept to the minimum required.
iii. Pilots not able to comply with these requirements should notify City Tower as soon as possible.

b) Minimum Runway Occupancy Time - Arriving Aircraft.

i. Pilots are reminded that prompt exit from the runway enables ATC to apply minimum spacing on final approach that will achieve maximum runway utilisation and will minimise the occurrence of 'go-arounds'.
ii. No taxiway to be used as a RET. Any aircraft that continues landing roll beyond TWY Kilo may infringe the ILS critical area.
iii. Pilots expecting to use the full runway length to stop (e.g. due aircraft weight/meteorological conditions) are requested to inform Thames Director on first contact.

c) The end of the Runway 09 477 M and Runway 27 475 M TDZ is marked with two pairs of white inset high intensity lights. This visual reference may be lost prior to landing depending on point of touchdown and attitude of the aircraft. If during final approach it is anticipated that the touchdown point will be outside this area, a missed approach procedure should be initiated.

7 TRAINING

a) Only training necessary for the operation of aircraft at the aerodrome will be permitted. All training is subject to the approval of the Airport Director.

EGLC AD 2.21 NOISE ABATEMENT PROCEDURES

a) Noise abatement procedures for aircraft departing London City and joining Controlled Airspace are included in the appropriate Standard Instrument Departure (SID) instructions.
b) Aircraft departing London City CTR/CTA into the FIR or departing on training flights within the London City CTR/CTA are to climb straight ahead to a minimum of 1000 FT AAL before turning on track unless otherwise instructed by ATC.
c) Aircraft making approaches to London City without assistance from the ILS shall follow a descent path which will not result in its being at any time lower than the approach path that would be followed by an aircraft using the ILS glide path.
d) Pilots of aircraft carrying out visual approaches to Runway 09 and Runway 27 shall not fly below altitude 1600 FT and 1500 FT respectively until established on the final approach.
e) To minimise disturbance in areas adjacent to the aerodrome, commanders of aircraft are requested to keep the use of reverse thrust to the utmost minimum, while ensuring the safe operation of the aircraft.
f) To minimise disturbance in areas adjacent to the aerodrome, when landing on Runway 09, commanders of aircraft are requested to avoid extending landing gear before ODLEG, unless required to do so by operating conditions to maintain the safety of the aircraft.

EGLC AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT

a) **Standard Arrival Routes - London City**

The standard routes for inbound aircraft are detailed in the Standard Arrival Routes (STAR) shown at AD 2-EGLC-7-STAR Charts.

b) **RNAV 1 IFR Arrivals from the ATS En-Route Structure via JACKO or GODLU**

Aircraft and crews equipped and approved for RNAV 1 operations can expect to be cleared to fly an RNAV1 Transition as detailed in AD 2-EGLC-7-RNAV 1 Charts.

c) **Inbound Speed Control**

ATC normally issue speed control instructions of 160 KT until 5 DME on Runway 09 and 160 KT until 6 DME on Runway 27. If necessary pilots may reduce speed 1.0 DME prior to these distances without reference to ATC. Speed reductions prior to this shall be advised to Thames Director on first contact.

2 DEPARTURES

a) All Standard Instrument Departures have stop altitudes of 3000 FT due to presence of London TMA traffic 1000 FT above.
b) Departure Speed Restriction: In order to optimise the departure flow and assist in the separation between successive departing aircraft a speed limit of 250 KT IAS below FL 100 is applicable until removed by ATC. ATC may remove the speed restriction by using the phrase ‘No ATC Speed Restriction’. Pilots are reminded that this phrase does not relieve the pilot of the responsibility to adhere to the ground track of the Noise Preferential Route, which may require a speed/power limitation.

c) If for any reason pilots are unable to comply with the 250 KT IAS speed restriction the pilot should immediately advise ATC and state the minimum speed acceptable. If a pilot anticipates before departure that they will be unable to comply with the speed restriction, they should inform ATC when requesting start-up clearance, stating the minimum speed acceptable. In this case the pilot will be informed before take-off of any higher speed limitation.

Note: *RNAV 1 Departures via SOQQA*

Pilots are to follow the RNAV 1 departure route as indicated in Chart AD 2-EGLC-6-4. However, crews should be aware that early climb instructions will be given by ATC to reach FL 70/80 by SODVU for integration with the RNAV1 Transition Arrival procedure; this will be followed by routine vectoring to join the ATS en-route network.

d) ATC may request a 7 DME NE London City position report from pilots upon departure from London City. When departing Runway 27, 7 DME NE London City is approximately equivalent to LON 25.5D, LCE04 or LCN06. When departing Runway 09, 7 DME NE London City is approximately equivalent to LON 27D, CLN 38D or LCE02.

3 RADIO COMMUNICATION FAILURE PROCEDURES

In the event of complete Radio Communication Failure (RCF) in an aircraft, the pilot is to adopt the appropriate procedure in ENR 1.1 paragraph 3.4 except where described below:

a) **Inbound RNAV 1 Aircraft via JACKO or GODLU**

i. **Via JACKO**

1. **RCF occurring prior to arrival at JACKO**. The pilot is to adopt the RCF procedures detailed in ENR 1.1 paragraph 3.4.2.2.4 squawking Mode A 7600 when the RCF is detected. On leaving the JACKO hold, route BABKU direct RAVSA then continue on the appropriate arrival transition, complying with the vertical profile shown on the chart and complete an instrument approach for the appropriate runway in use.
2. **RCF occurring on the sequencing leg after JACKO**. Squawk Mode A 7600. Fly at the last assigned level to the end of the sequencing leg at LCE23, route to RAVSA, then continue on the appropriate arrival transition complying with the vertical profile shown on the chart and complete an instrument approach for the appropriate runway in use.
3. **RCF occurring having been cleared off the sequencing leg**. Squawk Mode A 7600. Fly direct to RAVSA, then continue on the appropriate arrival transition complying with the vertical profile shown on the chart and complete an instrument approach for the appropriate runway in use.

ii. **Via GODLU**

1. **RCF occurring prior to arrival at GODLU**. The pilot is to adopt the RCF procedures detailed in ENR 1.1 paragraph 3.4.2.2.4, squawking Mode A 7600 when the RCF is detected. On leaving the GODLU hold, route ELMIV direct RAVSA then continue on the appropriate arrival transition, complying with the vertical profile shown on the chart and complete an instrument approach for the appropriate runway in use.
2. **RCF occurring on the sequencing leg after GODLU**. Squawk Mode A 7600. Fly at the last assigned level to the end of the sequencing leg at LCE13, route to RAVSA, then continue on the appropriate arrival transition complying with the vertical profile shown on the chart and complete an instrument approach for the appropriate runway in use.
3. **RCF occurring having been cleared off the sequencing leg**. Squawk Mode A 7600. Fly direct to RAVSA then continue on the appropriate arrival transition complying with the vertical profile shown on the chart and complete an instrument approach for the appropriate runway in use.

b) **Outbound Aircraft**

In the event of complete RCF in an aircraft, the pilot shall operate secondary radar transponder on Mode A code 7600 with Mode C and follow the procedure published on the SID and thereafter commencing climb to flight planned level after the last position where an altitude is specified in the communication failure procedure text box, with the exception of those listed below:

i. ODUKU 1A/1H

Pilots should follow the procedures shown at ENR 1.1, paragraph 3.4.

ii. SAXBI 1A/1H

Without descending from last assigned level, if higher, follow lateral track of coded procedure. Maintain 3000 FT ALT to SAXBI then route via N27 to HEN, climb to cross HEN at 5000 FT ALT. After HEN, climb to flight planned level.

iii. SOQQA 1A

Without descending from last assigned level, if higher, follow lateral track of coded procedure. Maintain 3000 FT ALT to LCN06. Climb to 4000 FT ALT to be level 4 NM before SOQQA and maintain. After SOQQA, climb to flight planned level.

iv. SOQQA 1H

Without descending from last assigned level, if higher, follow lateral track of coded procedure. Maintain 3000 FT ALT to LCE03. Climb to 4000 FT ALT to be level 3 NM before SOQQA and maintain. After SOQQA, climb to flight planned level.

4 PROCEDURES FOR TRANSIT AIRCRAFT

a) Aircraft wishing to transit the London City CTR/CTA (or the London CTR) shall contact 'Heathrow Radar' (H24).
b) Refer to EGLL AD 2.22 for VFR/SVFR flights within the London and London City CTRs.

5 AERODROME OPERATING MINIMA - NON-PUBLIC TRANSPORT FLIGHTS

a) Refer to AD 1.1 sub-section 4 before application.

6 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

Note: *Refer also to VRPs in use at London Heathrow.*

7 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside the London City CTR within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Thames Director frequency, 132.700 MHz, are encouraged to select SSR code 0012.

513630N 0001545E - 514111N 0001345W -
514027N 0003627W - 514015N 0005348W -
513444N 0005508W - 512335N 0005516W -
511422N 0003506W - 511957N 0001917E -
513630N 0001545E.

b) Selection of 0012 does not imply the receipt of an ATC service. Pilots of aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the London City CTR at all times.
c) Whilst squawking 0012, pilots should be aware that Thames Director may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 0012 shall be deselected.

EGLC AD 2.23 ADDITIONAL INFORMATION

1 MODE S BAROMETRIC PRESSURE SETTING DATA

a) London Terminal Control has the ability to downlink Mode S Barometric Pressure Setting (BPS) data. Therefore, if the downlinked pressure data is at variance with the BPS expected by Air Traffic Control, pilots can expect additional challenge. When Air Traffic Control pass a reminder of the appropriate BPS, it is anticipated that the aircrew will cross check the altimeter settings and confirm set.

2 REMOTE TOWER OPERATIONS

a) The Aerodrome Air Traffic Service is provided remotely from a Remote Tower Centre;
b) The signalling lamp is positioned at the Remote Tower Mast, on site at the airport (Lat: 513010.44N Long: 0000319.92E).

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1305
ELEVATIONS IN FEET AGL (591)

LONDON CITY

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **2100** in the sector defined by the lateral limits; 512038N 0000835W - 512207N 0000314E - 511829N 0000545E thence clockwise by an arc of a circle radius 4NM centred on 511651N 0000005W to 511548N 0000613W - 512038N 0000835W.

b) **2000** in the sector defined by the lateral limits; 513022N 0001000W thence clockwise by an arc of a circle radius 3NM centred on 513016N 0000512W to 513040N 0000026W - 512556N 0000036E - 512207N 0000314E - 512038N 0000835W - 512426N 0001026W - 513022N 0001000W.

c) **2000** in the sector defined by the lateral limits; 511818N 0002650W - 512038N 0000835W - 511548N 0000613W thence anticlockwise by an arc of a circle radius 4NM centred on 511651N 0000005W to 511829N 0000545E - 512207N 0000314E - 512606N 0003549E - 511814N 0003550E - 510853N 0001125W - 511056N 0002519W - 511818N 0002650W, except within 3NM radius circle enclosing the Wrotham Mast (511914N 0001714E) where the minimum altitude is **2300**.

d) **1900** in the sector defined by the lateral limits; a circle radius 3NM centred on 513119N 0001542W.

e) **1800** in the sector defined by the lateral limits; 513723N 0003108W - 514239N 0003533E - 512606N 0003549E - 512207N 0000314E - 512556N 0000036E - 513040N 0000026W thence anticlockwise by an arc of a circle radius 3NM centred on 513016N 0000512W to 513022N 0001000W - 512426N 0001026W - 512038N 0000835W - 511818N 0002650W - 513723N 0003108W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually (remaining outside the London CTR) or by means of an appropriate final approach aid. If not possible proceed at 2000FT, to **LCY NDB(L)**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **LCY NDB(L)**†.

†In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. 913FT vertical separation approved against the Crystal Palace mast to meet ATS operational requirements.
7. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
8. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an Intercept of 40° or less, and in the case of Instrument approaches other than SRA is cleared to Intercept the final approach track.**
9. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
10. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.

BPK 1A RWY 27	Straight ahead to **LCW01**, direct to **LCN01** - **LCN04** - **LCN05**, left to **BPK**.	N57, N601 northbound and for landing at London Luton.
SAXBI 1A RWY 27	Straight ahead to **LCW01**, direct to **LCN01** - **LCN04** - **LCN05**, left to **BPK**, left to **SAXBI**.	N27.
OBSTACLE CLEARANCE - RWY 27: Maintain minimum 7.20% climb gradient to **1102** (1083).		

NOTE 1. Close-in obstacles exist for departures from RWY 27. See Aerodrome Obstacle Chart and EGLC AD 2.10 Aerodrome Obstacles.
NOTE 2. Gradients in excess of the minimum obstacle clearance climb gradients are required for airspace purposes.
NOTE 3. Adhere to maximum speed limits where specified by waypoint constraints.
NOTE 4. Maximum 250KIAS below **FL100** unless authorised by ATC.
NOTE 5. Expect first CPDLC Data Link Authority to be EGTT.
NOTE 6. For RCF Procedure see AD 2.22, 3(c).

ADDITIONAL RNAV DATA
1. DME/DME only procedure: no critical navaids.
2. RNAV1 SIDs are available only for approved aircraft that are either GNSS equipped or that have DME/DME and INS/IRU with automatic runway updating capability.

DESCENT PLANNING
Pilots should plan for possible descent clearance as detailed in the table below. **ACTUAL DESCENT CLEARANCE WILL BE AS DIRECTED BY ATC.**

ATPEV HOLDS
ATPEV holds are referred to by ATC as ATPEV Left Hand' and ATPEV Right Hand'. Hold speeds are lower than transition speeds due to airspace containment.

EGKK — LONDON GATWICK

EGKK AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGKK — LONDON GATWICK

EGKK AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 510853N Long: 0001125W Mid point of Runway 08R/26L.
2	Direction and distance from city	2.7 NM N of Crawley. 24.7 NM S of London.
3	Elevation / Reference temperature / Mean Low Temperature	203 FT / 20 °C / -
4	Geoid undulation at AD ELEV PSN	149 FT
5	Magnetic Variation / Annual Change	1.33°E (2027) / 0.17°E
6	AD Administration Address Telephone	GATWICK AIRPORT LIMITED. London (Gatwick) Airport, West Sussex RH6 0NP 0344-892 0322 (Gatwick Airport Ltd) 01293-601031 (ATC)
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	Telephone calls to ATC operational areas may be recorded.

EGKK AD 2.3 OPERATIONAL HOURS

1	AD Administration	H24
2	Customs and immigration	H24
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	-
7	ATS	H24
8	Fuelling	H24
9	Handling	H24
10	Security	H24
11	De-icing	H24
12	Remarks	Refer to AD 2.20 item 1.

EGKK AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Full. Nearest railway siding: Crawley New Yard, approx 1 NM.
2	Fuel and oil types	AVTUR JET A-1 Various, by arrangement with maintenance or service provider.
3	Fuelling facilities/capacity	Hydrant refuelling. Very limited bowser capacity. De-fuelling facilities subject to arrangement with fuel company.
4	De-icing facilities	By arrangement with handling agent.
5	Hangar space for visiting aircraft	Yes. By arrangement with local companies.
6	Repair facilities for visiting aircraft	Maintenance and repair by arrangement with local operators.
7	Remarks	Oxygen and related servicing by arrangement with local companies. Operators are to make prior arrangements with one of the handling agents for ground handling of all flights.

EGKK AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels linked to the north and south terminals.
2	Restaurants	Restaurants and bars.
3	Transportation	Trains, coaches, buses, taxis and hire cars. Nearest railway station, Gatwick Airport (South Terminal).
4	Medical facilities	Limited first aid treatment available.

5	Bank and Post Office	Bureau de Change.
6	Tourist Office	-
7	Remarks	-

EGKK AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A10 H24
2	Rescue equipment	High access vehicle.
3	Capability for removal of disabled aircraft	Gatwick Airport Limited does not have the capability to recover disabled aircraft therefore, airlines must have a confirmed contract in place with an aircraft recovery/salvage contractor for aircraft recovery. Aircraft recovery arrangements must be submitted to Gatwick Airport Limited via airsidecompliance@gatwickairport.com. The Aerodrome Operations Manager is the initial point of contact during an incident: 07803-120115/aom@gatwickairport.com.
4	Remarks	-

EGKK AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical and Chemical de-icing/anti-icing equipment including: Sweeper/Blowers, Sprayers of de-icing/anti-icing fluid, Tractors equipped with Ploughs and Brushes, Snow Cutters, Granular Spreaders.
2	Clearance priorities	Duty runway and associated taxiways, aircraft stands and apron areas. Other areas.
3	Remarks	Annual Snow Plan available from the Aerodrome Operator on request. De-icing/anti-icing of aircraft movement areas carried out as required using potassium acetate (KAC). Under certain circumstances during adverse weather the Airport Disruption Cell may be established. See also AD 1.2.2.

EGKK AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

EGKK AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Pilots must not enter an aircraft stand unless the SEG (Stand Entry Guidance) is activated and the correct aircraft type is displayed, or a Gatwick Airport Limited marshaller has signalled clearance to proceed. If SEG is not activated on approach to the stand, flight crews must hold position on the taxiway and advise GMC of the non-activation of the SEG. Aircraft which have a very dark colour scheme may not be recognised by the SEG system. Aircrew must not attempt to self-park if the SEG is not activated. Note: ATC may request aircraft to 'report parked' – this is not an instruction to self-park. Aircrew are to note that all SEG systems are activated by their ground handling agent. The activation of SEG systems indicates a safety check of the stand has been made by the handling agent prior to the aircraft arrival. Azimuth and Stopping guidance is provided by Advanced Visual Docking Guidance System (A-VDGS) except on the following stands where a Marshaller is required: 33R, 130, 131, 132, 133, 134, 135, 136, 150L/R, 152L/R, 178L, 178R, 180R and 559. The SEG unit for Stand 557 is offset 3 M to the left of the centreline. All stands are designed for nose-in/push back operations except Stands 41E, 41, 41W, 43E, 43 and 43W. A variety of stand types and configurations are used: I. Standard apron/stands accommodate one aircraft and have a painted single yellow centreline. II. Multiple Aircraft Ramp System (MARS) stands consist of a primary centreline painted yellow and two secondary centrelines either side of the primary centreline painted in broken yellow and white. Secondary centrelines are designated with the primary stand number and the addition of 'L' (Left) or 'R' (Right). III. Multi-Choice Apron (MCA) use multiple primary and secondary centrelines, to allow the operation of a variety of different combinations of parked aircraft. Each centreline has its own designated stand number. Primary centrelines are painted yellow and secondary centrelines are painted in broken yellow and white. Individual illuminated yellow on black stand number indicators are provided except on the following stands: 13L, 13R, 31L, 31R, 32L, 32R, 33L, 33R, 34L, 34R, 35L, 35R, 36L, 36R, 41, 41E, 41W, 43, 43E, 43W, 150L, 150R, 152L, 152R, 178L, 178R and 180R.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 08L/26R: Full ICAO runway designation, runway threshold, aiming point, touchdown zone and runway centreline markings. Entry/exit taxiways to/from the runway are marked by a continuous painted yellow line from the centreline of the runway. 08R/26L: Full ICAO runway designation, runway threshold, aiming point, touchdown zone and runway centreline markings. Entry/exit taxiways to/from the runway are marked by a continuous painted yellow line from the centreline of the runway. RETILs see EGKK AD 2.20-6. Runway light(s): 08L/26R: Threshold - HI green lights with wing bars. Edge - HI white lights. Stop end - HI red lights. Runway Threshold Identification Lights (RTILS) - 2 synchronised flashing white lights, one at each end of the threshold bar. 08R/26L: Threshold - HI green lights with wing bars. Edge - HI white lights. Centreline - HI colour coded white/red lights. TDZ - HI white lights. Stop end - HI red lights. Colour coded yellow/green centreline lights indicate the runway entry/exit taxiways from/to the CAT III stop bars. All 08R/26L lights are light emitting diodes (LED). RETILs see EGKK AD 2.20-6. 26L: Starter Extension - Blue edge lights. Taxiway marking aid(s): Yellow painted centreline. Single yellow painted broken line denoting intermediate taxiway holding positions. Yellow painted lead-in line to stand with arrow bearing the stand number. Broken yellow painted centreline (Stands 5, 10, 38, 41 and 43). No entry signage and markings (northern end of Taxiway Echo).

		Taxiway light(s): Green centreline lights except on Taxiway Yankee where blue edge lights are installed. LED and non-LED lights are utilised. Where installed LED lights are used in continuous segments across sections of the taxiway system. Taxiway Unavailable Bars (TUBS) comprising of a line of red stop lights spaced at approximately 3 M centres across the full width of the mouth of each exit taxiway adjacent to Runway 08R/26L and running parallel to the runway centreline.
3	Stop bars and runway guard lights (if any)	Illuminated red stop bars are provided where appropriate. Stop bars and runway guard lights at runway holding positions are in operation H24.
4	Other runway protection measures	-
5	Remarks	The apron is marked for nose-in parking only and operators should ensure that agents can supply push-back facilities. ILS Localizer Sensitive Area: Colour coded alternate yellow and green centreline lights are installed on all entry/exit taxiways to/from Runway 08R/26L to denote the extent of the localizer sensitive area. WDIs (LGTD) - 510856.65N 0001014.64W; 510838.27N 0001222.34W.

EGKK AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use governed by regulations applicable to Gatwick CTR.
b) Departing aircraft are to call Gatwick Delivery for clearance 15 minutes before start up to allow for departure data to be processed. If Delivery is closed, the ATIS will state which frequency to contact for clearance and start.
c) Aircraft requiring to depart from Hold Mike 1 must advise Gatwick Delivery before start up.
d) Surface wind data is available for both ends of the duty runway. Normally, only the Touchdown surface wind will be passed. Stop end surface wind information is available on request. When the surface wind is between 300 degrees and 030 degrees and the average speed is 8 KT or less, ATC may use instant wind if the validity of the wind data displayed to them is in doubt. This is due to the sensitivity of the anemometer system and how the 2-minute average is calculated.
e) All flights operating at London Gatwick Airport are subject to prior approval of the Chief Executive Officer, Gatwick Airport Ltd (GAL), and require a slot allocated by Airport Coordination Ltd (ACL).

f) Flights for aerobatic, recreational, commemorative, charity and record breaking purposes will not be permitted to use the airport, except with the prior approval of the Chief Executive Officer.
g) Planned Diversion Procedure – Airline and other operators are advised that before selecting Gatwick as an alternate, prior arrangements for ground handling should have been agreed with one of the nominated handling agents.
h) The use of this airport for training purposes is prohibited. The deliberate simulation of engine failure is not permitted whilst on approach to or departure from the airport.
i) This Airport may be used by Executive and Private Aircraft (General Aviation) subject to the following conditions:

i. Requests for ad-hoc slot allocations should be made to ACL during working hours 0830-1700 (0730-1600) Monday to Friday (excluding public holidays) by e-mail: lonacxh@acl-uk.org; or Tel: 0208-564 0605, or at all other times to GAL Flow Planning Tel: 01293-503089/221 or e-mail: flow.planners@gatwickairport.com (or to their nominated handling agent who will obtain prior permission from Airport Coordination Ltd or GAL Flow Planning). Online Coordination System (OCS) account holders can add, change and cancel slots at any time on the online coordination portal: https://www.online-coordination.com/.

Prior permission for General Aviation operators should be requested not more than 10 days and preferably not less than 24 hours before intended movement. The following details must be notified for each flight:

1. Aircraft type, registration and operator;
2. Point of origin and destination;
3. Date/time of ETA and ETD Gatwick;
4. Nominated handling agent. (Mandatory for both domestic and international flights).

Due to increasing demand for runway slots, particularly at peak times of the day, General Aviation operators are advised that their requested slot time may not be available. In this case, the available runway slot times nearest to those requested will be offered by Airport Co-ordination Ltd. It is emphasised that runway slots are required for both arrivals at and departures from Gatwick. No runway slot is valid unless identified by a reference number in the form of a letter and five digits. The filing of a flight plan does not confer permission to use Gatwick Airport. Runway slots are required in addition to ATC slots. ATC clearance to approach/land or taxi/take-off does not imply the existence of a valid runway slot.

ii. General Aviation Terminal opening hours are: 0500-2300 (0400-2200). Hours by appointment only: 2300-0500 (2200-0400).
iii. All international passengers arriving on private and executive aircraft requiring HM Customs clearance, must proceed with their handling agent to the South Terminal.
iv. All commanders of private and executive aircraft arriving or departing on an international flight must obtain HM Customs clearance via their handling agent from the Customs Report Office in Atlantic House.
v. General Aviation Terminal – Meteorological Information.

There are no comprehensive meteorological facilities at the General Aviation Terminal. Pilots requiring meteorological information must either self-brief or arrange for their Handling Agent to collect the information on their behalf.

j) Fixed-wing and rotary aircraft using London Gatwick Airport do so in accordance with the Gatwick Conditions of Use document. A copy of the document is available on the London Gatwick Airport website: www.gatwickairport.com/company/about-us/regulation.html.
k) Nothing in the paragraphs above shall, however, prevent an aircraft that has declared an emergency from landing.
l) Fixed Electrical Ground Power must be used when available. Use of aircraft Auxiliary Power Units (APUs) and Ground Power Units (GPUs) are strictly controlled to minimise environmental impact. APUs must be shut down after arrival and only restarted before departure according to the timescales described in detail in published Gatwick Airport Directives and Notices, a summary of which is detailed below. Regular audits take place to ensure compliance with the regulations. Dispensation to use GPUs must be requested from GAL Airfield Operations Tel: +44(0)1293-503090.

	APU may be started before Scheduled Off Blocks Time (SOBT)	**APU must be shutdown after arrival on stand within**
Narrow Body Aircraft (Code A, B & C)	No more than 15 minutes prior to SOBT. **Or** not more than 30 minutes prior to SOBT when the FEGP has not been upgraded to provide enough power to support the FMS.	10 minutes
Wide Body Aircraft (Code D, E & F)	No more than 50 minutes prior to SOBT **Or** not more than 90 mins prior to SOBT when the FEGP has not been upgraded to provide enough power to support the FMS.	10 minutes

† Exceptions to these restrictions are:

Note 1: *When an aircraft is scheduled to be towed off to another location the APU may be restarted not in excess of 10 minutes prior to the planned movement.*

Note 2: *When the planned towing movement as specified under Note 1 is delayed by ATC, then the APU may be left running.*

Note 3: *Where the Aircraft Commander reasonably assesses the cabin temperature is such that bleed air is required to provide a safe environment for passengers and crew, the APU restriction may be extended without prior approval as follows:*

- *Narrow Body Aircraft up to 60 minutes before SOBT.*
- *Wide Body Aircraft up to 90 minutes before SOBT.*

Note 4: *Further exemptions may be requested from GAL Airfield Operations in accordance with Gatwick Airport Directives and Notices.*

2 GROUND MOVEMENT

a) General

i. Ground Movement Control (GMC) is in continuous operation and all surface movement of aircraft, vehicles and personnel on the Manoeuvring Area is subject to ATC authority.
ii. Directions issued by ATC should be followed specifically. RTF transmissions must be brief, concise and kept to the minimum number.
iii. Within the Manoeuvring Area, pilots will be cleared to proceed under general direction from GMC and they are reminded of the extreme importance of maintaining a careful lookout at all times. ATC instructions will normally specify the taxi route to be followed. Four Hot Spots (HS) where heightened attention is necessary are included on charts AD EGKK-2.

1. HS1 Foxtrot Romeo RET: When exiting Runway 26L at FR aircraft do not have to call for clearance to cross Runway 26R onto Taxiway Juliet.
2. HS2 Taxiway Echo: Potential routing error - Taxiway Echo is only available for aircraft vacating Runway 26L via ER RET. Taxiway Echo is one-way for northbound traffic only.
3. HS3 Delta RET: Possible routing error - traffic vacating Runway 08R at Delta be aware of potential confusion between Taxiways Romeo and Quebec.
4. HS4 Taxiway Juliet: Potential routing error - pilots taxiing eastbound on Taxiway Juliet be aware the taxiway deviates to the north at this point.

iv. Departing aircraft on first contact with Gatwick ATC must state aircraft type, stand number and the code letter of the latest ATIS received and maintain a listening watch on the appropriate frequency.
v. **It is the aircraft Commander's responsibility not to accept an ATC clearance into an area not approved for their type of aircraft.**
vi. Pilots of departing aircraft are reminded to contact Gatwick Delivery for clearance 15 minutes before start up to allow for departure data to be processed.
vii. Pre-departure clearance by datalink is available for suitably equipped aircraft. Pilots requesting pre-departure clearance by datalink must when entering the stand number ensure that:

1. Stand designators are entered as appropriate (eg. 141L, 562, 34R);
2. Ensure the stand number is entered with at least 2 figures (eg. 05).

viii. Taxiway Mike is available as an entry point to Runway 26L. Taxiway Mike can not be used as an exit point from Runway 08R.
ix. Flight crew are reminded of the extreme importance of maintaining a careful lookout at all times and are at all times responsible for wing tip clearance. The taxiway lighting system is an aid to pilots when operating on the manoeuvring area during darkness or in poor visibility. Notwithstanding the taxiway lighting system, pilots continue to remain responsible for wing tip clearance.
x. The taxiway system is designed for Cockpit Over Centreline (COCL) techniques however Judgemental Oversteer may be used at crews' discretion.

b) Gatwick Airport is equipped with an advanced surface movement radar utilising Mode-S.

i. Aircraft operators intending to use London Gatwick Airport should ensure that Mode-S transponders are able to operate when the aircraft is on the ground.
ii. Flight crew should select XPNDR or the equivalent according to specific installation, AUTO if available (OFF or STDBY should not be used), and the assigned Mode-A code.

1. From the request for push back or taxi, whichever is earlier;
2. After landing, continuously until the aircraft is fully parked on stand.

iii. After parking the Mode-A code 2000 must be set before selecting OFF or STDBY.
iv. Flight crew of aircraft equipped with Mode-S having an aircraft identification feature should also set the aircraft identification. This setting is the aircraft identification specified in Item 7 of the ICAO ATC Flight Plan. The aircraft identification should be entered from the request for pushback or taxi, whichever is earlier, through the FMS or the Transponder Control Panel.

c) Aprons

i. The aircraft commander must confirm with the ground crew, via the headset operator, that they are ready to push **before** calling ATC for pushback clearance. This is to ensure the tug driver is in the tug and listening for communications between 'Gatwick Ground' and the flight deck. **If the Aircraft Commander is not in two-way headset communication with the tug crew, they must inform the ATC Ground Movement Planner (GMP) 'Gatwick Delivery' when reporting ready for start**. It is important that the tug driver is able to listen to the exchange between the flight deck and ATC on the relevant frequency, so that the tug crew/ground crew have a full understanding of the detail of the ATC clearance. If the tug driver has not heard or understood the pushback clearance they must not push the aircraft. Requests and clearances will be issued between the flight deck and ATC only. On receipt of pushback clearance, the flight deck shall report the instruction verbatim to the ground crew. Any clarification required from the tug driver shall, in the first instance, be directed to the flight deck. If further clarification is required, then the tug driver should contact ATC
ii. The Manoeuvring Area is equipped with the following forms of taxiway guidance:

1. Yellow painted taxiway centre-lines;
2. Yellow painted holding position lines at the approach to runways;
3. Green taxiway centre-line lights and red stop bars controlled from the Tower;

4. An illuminated red stop bar means **STOP.** Aircraft must not proceed until the stop bar is extinguished or ATC permission is received;
5. Runway Guard Lights are installed at all runway/taxiway intersections, comprising dual alternating flashing yellow lights, operating H24;
6. Taxiway Unavailable Bars (TUBS) comprising of a line of red stop lights spaced at approximately 3 M centres across the full width of the mouth of each exit taxiway adjacent to Runway 08R/26L and running parallel to the runway centreline. TUBS are installed at Alpha, Bravo, Bravo Romeo, Charlie, Charlie Romeo, Delta, Echo Romeo, Foxtrot Romeo, Golf, Golf Romeo, Hotel and Juliet, to prevent incursions onto taxiways which are unavailable due to operational issues such as Work in Progress.

iii. Pilots are to use the minimum power necessary when manoeuvring on the taxiway system. This is of particular importance when manoeuvring in apron areas, where jet blast can affect adjacent stands.
iv. Cross-Bleed Starts - if informed by an aircraft that a cross-bleed start is required, ATC must consider the blast effect and utilise a non-standard push back if required. Aircraft must be aligned with the taxiway centreline before commencing the cross-bleed start.
v. Pilots pushing from Stand 12 are reminded not to start engines until the aircraft has been pulled forward abeam Stand 12, due to jet blast on the neighbouring airside road.
vi. After pushback from Stand 38 aircraft will be stopped off the taxiway centreline prior to being disconnected. When approved to taxi pilots should follow the broken yellow centreline back onto Taxiway Lima.
vii. Engines must not be run above ground idle during push-back. In any circumstances where ground idle or breakaway power needs to be exceeded, prior authorisation is required from ATC. GAL Airfield Operations may need to attend to ensure there is no jet blast risk.
viii. In the event of a mis-routeing, or the need to execute an unorthodox manoeuvre the flight deck must request revised instructions from ATC. This may require the attendance of a GAL Airfield Operations Leader Vehicle or assistance of an aircraft tug for the manoeuvre to be completed safely.
ix. Some operators may choose to taxi without all aircraft engines running. This type of operation has the potential to increase blast, especially when starting to move or negotiating tight turns. Operators must have assessed the jet blast risks before carrying out this reduced engine taxi procedure.
x. Aircraft are not authorised to power back off stands under their own power.

d) Ground movement of large aircraft - Code D (Wingspan between 36 M < 52 M)

i. The following routes are not available for Code D aircraft:

1. Taxiway Alpha November East of Taxiway Mike;
2. Taxiway Juliet East of Taxiway November;
3. Taxiway Victor East of Taxiway Whiskey;
4. Taxiway Whiskey;
5. Taxiway Zulu between Taxiway November and Taxiway Whiskey.

e) Ground movement of large aircraft - Code E (Wingspan between 52 M < 65 M)

i. The following routes are not available for Code E aircraft:

1. Taxiway Alpha November East of Taxiway Mike;
2. Taxiway Juliet East of Taxiway November;
3. Taxiway Victor East of Taxiway Whiskey;
4. Taxiway Whiskey;
5. Taxiway Zulu between Taxiway November and Taxiway Whiskey;
6. Taxiway Alpha Sierra is restricted to maximum Code D aircraft when Code F aircraft are using Taxiway Alpha November east of Taxiway Papa.

ii. The following restrictions apply:

1. Taxiway Lima between Taxiways Quebec and Sierra has a substandard but positive physical obstacle clearance (minimum of 42.5 M) due to the proximity of the adjacent road;
2. Taxiway Lima East of Stand 36 is not available for Code E aircraft with a wingspan in excess of 61 M due to the proximity of the adjacent blast screen;
3. Taxiway Yankee from Whiskey 1 Hold to Yankee 3 Hold is not available for Code E aircraft with a wingspan in excess of 61 M due to the proximity of the adjacent road.

f) Ground movement of large aircraft - Code F (Wingspan between 65 M < 80 M)

i. Taxiway routes available to Code F aircraft are shown on Aerodrome Chart AD 2-EGKK-2-5, marked in yellow:

1. There is a substandard but positive physical obstacle clearance (minimum of 47.5M) on Taxiway Juliet between Taxiways Sierra and Tango;
2. Taxiway Alpha Sierra is restricted to maximum Code D aircraft when Code F aircraft are using Taxiway Alpha November east of Taxiway Papa.

ii. The following contingency routes are also available for Code F aircraft:

1. Taxiway Romeo between Romeo Alpha and Lima;
2. Taxiway Lima between Taxiways Romeo and Quebec.

Prior approval is required from ATC due to the proximity of the road which restricts the availability of these routes and requires special procedures to be put in place in advance. Due to these restrictions the contingency routes are not shown in yellow on Aerodrome Chart AD 2.EGKK-2-5.

g) Remote De-icing – Aircraft Engines Running

i. There are two identified locations (de-icer pads) to enable remote de-icing of aircraft with engines running. They are managed and coordinated by the GAL de-icing service provider for airlines which have had Risk Assessments and Method Statements signed off by GAL. There is an agreed process in place for the operation of these pads.
ii. The two locations are uniquely identified as DA 43 and DA Sierra. Both will have resource to coordinate the operations and communicate with pilots and de-ice rig operatives. An electronic signage board will be provided for visual communications.

1. **DA 43**
Located on Stand 43 and can accommodate Code C aircraft only. The holding point for this pad is Stand 41. Aircraft will taxi to this location as directed by ATC.
2. **DA Sierra**
Located on Taxiway Sierra abeam Stands 170/171. Aircraft will be directed by ATC to hold on Taxiway Lima north of Taxiway Sierra prior to entering DA Sierra.

h) Remote Holding Procedures

i. Remote holding capacity is available to maintain the flow of aircraft by releasing occupied stands and pushback crews, this proactive approach supports optimal stand availability, reduces taxiway congestion and helps maintain overall airfield efficiency. ATC will endeavour to offer remote holding to applicable flights subject to availability. Flight crews must be ready for pushback and to promptly accept remote holding when requested. Flight crews must not request remote holding; the instruction will come from ATC and must be followed unless in exceptional circumstances. Applicable flights are usually those with CTOT or other delays in excess of 35 minutes however, ATC has the discretion to instruct other flights where there is an operational reason for doing so. Default positioning to remote hold is pushback and taxi, unless otherwise directed by ATC.
ii. Remote holding capacity is available via:

1. Stands 41 and 43.

a) Stands 41 and 43 Remote Holding/Drive-Through. Aircraft should stop at the positions indicated by the painted yellow stop arrows and await instructions from ATC. Access is available via Taxiways Kilo or Lima.
b) Stands 41E, 41W, 43E and 43W Remote Holding. From Taxiway Lima aircraft should enter the 41 or 43 centreline and then follow the east or west centreline. From Taxiway Kilo aircraft should access 41E, 41W, 43E and 43W via the specific lead-in arrow. Eastern centrelines are painted orange and western centrelines are painted blue. Aircraft stop positions are indicated by painted orange or blue stop arrows as appropriate. When approaching Stand 41E from the east along Taxiway Kilo, flight crews are to use judgemental oversteer when entering the stand to ensure suitable main undercarriage clearance of the adjacent grass area.
c) Stands 41E, 41, 41W, 43E, 43 and 43W Aircraft Parking Stands. When operating in aircraft parking stand mode, barriers will be deployed between Stands 41 and 43 and Taxiway Lima to safeguard the stands. Aircraft may only enter Stands 41E, 41, 41W, 43E, 43 and 43W via Taxiway Kilo and must be parked by a GAL Marshaller. In exceptional circumstances should an aircraft be required to taxi off Stand 41E, 41, 41W, 43E, 43 or 43W under its own power via Taxiway Lima, GAL Airfield Operations will require prior notification and authorisation via ATC.
d) Stand 42 is only available as a nose-in aircraft parking stand. Aircraft can self-park utilising the SEG system. Access is via Taxiway Kilo.

2. Straight pushback onto Stands 64L, 64R, 65, 66L, 66R, 132 and 133.
3. GAL aircraft marshaller guidance onto Stands 141R, 142R, 143L, 144L, 171L, 173, 175L, 230L, 231L, 232L and 233L. Pilots must not enter these stands until a marshaller is present. Access to Stand 173 is via the 173L lead-in arrow. Pilots should exit these stands by turning directly towards the taxiway centreline.
4. Tactical holding may be utilised on taxiways at the discretion of ATC.

i) Airport-Collaborative Decision Making (A-CDM)

i. London Gatwick Airport is an A-CDM–coordinated Airport, meaning it has adopted the permanent and fully automatic data exchange Airport-CDM concept by providing a set of DPI messages (Departure Planning Information – E-DPI, T-DPI-t, T-DPI-s, A-DPI and C-DPI) to the Eurocontrol Network Manager Operations Centre (NMOC). This data transfer allows more accurate and efficient CTOT allocation. The basic NMOC procedures continue to apply but NMOC will take the local TTOT into consideration for CTOT calculation and will try to adjust it accordingly.
ii. Definitions of Commonly Used A-CDM Terms:

1. **Target Off-Blocks Time (TOBT) -** The time an aircraft is expected to be ready to leave the stand (agreed by Ground Handling Agent and flight deck) in the case of normal operations, or ready for on stand de-icing to commence (where appropriate), in the case of winter operations. This must be updated to an accuracy of +/- 5 minutes by GHA. Accurate and stable TOBTs enhance operations on the ground as they provide all airport partners with a clear picture of the intentions of aircraft on the ground.
2. **Actual Start Request Time (ASRT)** - The time an aircraft actually calls ready to Tower. Start requests will only be accepted if an aircraft is A-CDM compliant, meaning TOBT has not expired (which happens at TOBT + 5 minutes) and there are no other data issues with the flight plan.

3. **Target Start Approval Time (TSAT)** - The time that ATC expect to give start approval, which is based on TOBT, CTOT, other traffic using the runway, any constraints to runway/airspace capacity, and taxi time. Use of TSAT should reduce queuing times at the runway hold, while maintaining a high runway utilisation.
4. **Target Take-Off Time (TTOT)** - The time that an aircraft is expected to take off. TTOT is a target – the requirement for an aircraft to be airborne within a time window only applies to flights with a CTOT. Most aircraft will take off within +/- 5 minutes of TTOT, but this time is not accurate enough to be relied upon for starting the second engine after single engine taxi.
5. **Calculated Take-Off Time (CTOT)** - Assigned by NMOC when flow restrictions are in place. The standard slot tolerance window requires aircraft to depart within -5 to +10 minutes of its CTOT (as existing requirement).

iii. Flight Deck shall comply with the following A-CDM procedure:

1. Ensure the flight is ready to push at TOBT +/- 5 minutes: ground activities completed, doors closed, push-back tug connected, cockpit ready for start-up.
2. Maintain regular communication with the TCO/GHA who are responsible for updating the TOBT.
3. If a delay to TOBT +5 or a departure earlier than TOBT -5, is identified notify the GHA immediately and ensure TOBT is updated before contacting ATC.

iv. When ready to push back (which should be at TOBT +/- 5 mins):

1. Pilots must report to Gatwick Delivery: "[Call-sign] [stand] [QNH] ready".
2. Pilots will either receive Start Approval, Gatwick Delivery will respond: "[Call-sign] roger", or “[Call-sign] You are non-ACDM compliant, contact your handling agent”. If this happens, pilots must not contact ATC again until the handling agent confirms compliance. In most cases this is done by updating TOBT, however the handling agent can check CDM alerts and notify the pilot if the flight plan needs to be updated by their Company.
3. Any push-and-hold procedures to be applied will be initiated at call-up.
4. If ready, but delayed by ATC, DO NOT update the TOBT.
5. If a pilot has not reported ready for departure by TOBT +5, TOBT will be deleted and the TOBT must be updated with the TCO/GHA to become A-CDM compliant.

v. When ATC is ready to approve push (normally at TSAT +/- 5 mins):

1. Gatwick Delivery will issue appropriate instruction.
2. Pilots should follow normal procedures for communication with Tower.

vi. A-CDM Process During Winter Operations:

1. When de-icing is required, TOBT is defined as when the aircraft is expected to be ready for either pushback or on-stand de-icing.
2. Planned de-icing activity is fed into the Gatwick A-CDM system by GHA, who enters the intention to de-ice the aircraft. The de-icing Company allocate de-icing location (on stand or remote) and estimated start time and duration of de-icing.
3. When ready for de-icing on stand, the ground handler must report ready via Aircraft Ready to De-ice Time (ARDT).
4. The TTOT and TSAT during de-icing will take into account de-icing times and locations.
5. When ready to move the aircraft (either direct to the runway or to a remote de-icing pad), pilots should follow normal procedures for communication with Tower.

vii. On stand de-icing:

1. For on-stand de-icing, at TOBT +/-5 mins the GHA will report via A-CDM system that turn activities have been completed and the aircraft is ready (ARDT) for de-icing.
2. Once de-icing on stand is complete, pilots report to Gatwick Delivery and state: ‘[Call-sign] [stand] [QNH] ready to move’.
3. All further communication will be in line with standard procedures.

viii. Remote de-icing:

1. In the case of remote de-icing, at TOBT +/-5 mins pilots report to Gatwick Delivery and state: ‘[Call-sign] [stand] [QNH] ready to move’.
2. ATC will provide start clearance and taxi instructions to the remote de-icing pad.

3 CAT II/III OPERATIONS

a) Runways 08R and 26L, subject to serviceability of the required facilities, are suitable for Category II and III operations by operators whose minima have been accepted by the Civil Aviation Authority.
b) During Category II and III operations, Special ATC procedures (ATC Low Visibility Procedures) will be applied. Pilots will be informed when these procedures are in operation by ATIS broadcast or by RTF.
c) Departing Aircraft: ATC will require departing aircraft to use the following Category III holding positions:

- Runway 26L — Alpha 3, Charlie 3 or Mike 3;
- Runway 08R — Juliet 3, Juliet 4, Juliet 7, Hotel 3 or Golf 3.

Occasionally it may be necessary for other departure points to be used due to work in progress or at the discretion of ATC. Under these circumstances, due allowance will be made by ATC for the necessary ILS protection.

d) Arriving Aircraft: All appropriate runway exits will be illuminated, and pilots should select the first convenient exit. Surface Movement Radar (SMR) is normally available to monitor pilot 'runway vacated' reports.

i. When SMR is not available to ATC, runway Localizer Sensitive Area (LSA) vacation will be confirmed by receipt of a pilot report that the tail of the aircraft has passed the last of the alternate yellow and green centreline lights. These lights denote the extent of the ILS LSA.

e) When Low Visibility Procedures are in force reduced landing rates can be expected due to the requirement for increased spacing between arriving aircraft. In addition to the prevailing weather conditions, such factors as equipment serviceability may also have an effect on actual landing rates. For information and planning purposes, the approximate landing rates that can be expected are:

- RVR (M) — Expected Landing Rate
- Greater than 1000 — 24
- Between 1000 and 550 — 20
- Between 500 and 350 — 15
- Less than 300 — 12 or less

4 WARNINGS

a) In low visibility at night the apron and car park floodlighting may be seen before the approach lights on Runway 26L and Runway 26R approaches.
b) Except for light signals, ground signals are not displayed.
c) Pilots are warned, when landing on Runway 26L/R in strong southerly/south-westerly winds, of the possibility of building induced turbulance and windshear effects.
d) There are trees on high ground to the west, under the approach to Runways 08L and 08R. The tops are up to 287 FT AAL at ranges between 1.25 and 3 NM.
e) A hazard beacon showing a steady red light is situated on the extended centre-line of Runway 08R on tree covered high ground, 1.8 NM from 08R threshold. Trees within 0.6 NM of the beacon rise up to 89 FT above it. Another beacon, showing a steady red light, is situated 0.66 NM NNW of the first. Together, they mark the line of high ground. The beacons are switched on at night and when the high intensity approach lights are in use.
f) HT power line to the N, E and SE of airport; minimum distance 1.6 NM at 146 FT AAL rising to the S to 326 FT AAL at 4 NM. High ground to SE and S rising to 406 FT AAL is 3.5 NM from airport at its nearest point.
g) Arrivals – Due to disruption to the ILS signal during Code F operations, pilots can expect late notification of only RNP approach availability.

5 HELICOPTER OPERATIONS

a) All inbound and outbound helicopters must use the runways and may not carry out direct approaches to or take-off from apron areas or taxiways with the exception of emergency services flights e.g. Helicopter Emergency Medical Service (HEMS), police etc. Helicopter handling agents are to obtain slot allocation for all flights. After landing, helicopters will ground taxi or air taxi to an allocated parking area (usually an adjacent stand). A GAL Airfield Operations Leader vehicle will normally be in attendance. While helicopters are operating on the manoeuvring area extreme caution must be exercised regarding rotor-tip clearance and downwash.

6 USE OF RUNWAYS

a) Special runway utilisation procedures are detailed at GEN 3.3, Section 3, Para 3.9.4.
b) **Departure Wake Vortex Separations**

The following pairs of holding positions for Runways 26L/08R are considered to be the same point for the purposes of departure wake vortex separation:

Runway 26L	Runway 08R
Holding positions Mike 1/3 and Alpha 2/3	Holding positions Juliet 1/3 and Hotel 1/3
Holding positions Mike 1/3 and Bravo 1	Holding positions Juliet 1/3 and Golf 1/3
Holding positions Alpha 2/3 and Bravo 1	Holding positions Hotel 1/3 and Golf 1/3
Holding positions Bravo 1 and Charlie 1/3	
Holding positions Bravo 1 and Yankee 1/2	

c) **Use of Runway 08L/26R**

i. Runway 08L/26R is a non-instrument runway and will only be used when Runway 08R/26L is temporarily non-operational due to maintenance or incident. Runway 08R/26L is closed regularly to allow maintenance to take place. Dates and times are subject to change, latest details are advised by NOTAM and airport notices.
ii. Runway 08L/26R cannot be used simultaneously with Runway 08R/26L because of insufficient separation between the two. For this reason also, extensive safeguarding procedures are required (see d ii) before Runway 08L/26R can be activated. Runway 08L/26R is not available on request by pilots. Lighting for the closed runway and parallel taxiway will not be visible on approach.
iii. Taxiway Echo cannot be used as an exit during Runway 08L/26R operations.

d) **Restriction of Operation**

i. During Runway 08L/26R operations, delays may occur to aircraft taxiing on the aerodrome due to the following:

1. Taxiway Juliet, between Juliet 8 and Taxiway Sierra is limited to use by aircraft of wingspan of 36 M or below during take-offs or landings on Runway 08L/26R. Taxiway Juliet, between Taxiway Sierra and Juliet 5 is limited to use by aircraft of wingspan of 50 M or below during take-offs or landings on Runway 08L/26R.
2. Additional restrictions when the Surface Movement Radar (SMR) is not available.
3. Taxiway Alpha November is not available as an entry point to Runway 26R when 26R is the active runway.

ii. When Runway 08L/26R is being brought into planned use the aerodrome will be closed for a period of up to 15 minutes to allow the necessary safeguarding procedures to be implemented. The same will apply when Runway 08R/26L is brought back into use. In an emergency situation, implementation of the change to Runway 08L/26R can be expected to take substantially longer.

e) **Navaids**

When Runway 08L/26R is in use the only navigational aids available are:

i. Surveillance radar;
ii. DME.

f) **Runway and Approach Lights**

i. It is not possible for both Runway 08R/26L and Runway 08L/26R lighting systems to be illuminated at the same time.
ii. Runways have displaced thresholds. The take-off runway starts before the threshold markings in the pre-threshold area which is indicated by white centreline arrows. Aircraft entering the runway in the pre-threshold area should begin their take-off roll here and not wait until the threshold to apply take-off thrust.
iii. The take-off distance (TODA) for Runway 08L starts at the beginning of the runway, indicated by the white painted runway demarcation line marking abeam the 08L TODA sign, this is where the take-off roll should commence. The 08L TODA sign is located to the right of the runway, 307 M **before** the marked runway displaced threshold.
iv. The runway holding positions, in addition to illuminated red stop bars, are marked by mandatory signs and yellow flashing runway guard lights.
v. When the taxiway lighting system is in use during Runway 08L/26R operation, limited selective switching of green centreline lights is available in conjunction with illuminated red stop bars at runway holding positions. Pilots must exercise extreme caution to remain on the correct taxiway route when cleared to the runway from a holding position. In certain positions, yellow flashing runway guard lights, forward of the holding positions, denote the proximity of the runway itself.

g) **Minimum Runway Occupancy Time**

i. **Departures**

1. On receipt of line-up clearance pilots should ensure that they are able to taxi and line up on the runway as soon as the preceding aircraft has commenced either its take-off roll or landing run.
2. On receipt of take-off clearance, pilots should ensure that they are able to commence take-off without delay.
3. Pilots not able to comply with these requirements should notify ATC as soon as possible once transferred to the Gatwick Tower frequency.

ii. **Arrivals**

1. High Intensity Runway Operation requires all aircraft to exit the runway at the fastest speed commensurate with safety. Extended runway occupancy may result in following aircraft being sent around.
2. Pilots should pre-plan their landing and roll out to target the exit taxiways that provide a safe and expeditious exit from the runway to reduce delays and maximise utilisation at all times.

08R	**D**	**CR**	**BR**
Distance from threshold (M)	1376	1796	2251
Design Exit Speed (KT)	38	49	50
Notes: Landing aircraft are to vacate expeditiously. Arrivals must taxi beyond the CAT III hold point and do not require clearance to enter/cross Runway 08L/26R when vacating Runway 08R. Traffic vacating at **CR** or **D** must contact ATC promptly when instructed. Traffic vacating at **BR** is to join Taxiway Papa and hold short of Taxiway Juliet unless otherwise instructed. Tactical requests to extend the landing roll to reduce ground taxi/exit nearer to the parking stand are not to be made to ATC. Taxiways **ER** and Mike are not available for vacating Runway 08R.			

26L	**ER**	**FR**	**GR**
Distance from threshold (M)	1480	1835	2126
Design Exit Speed (KT)	50	50	49

Notes:
Landing aircraft are to vacate expeditiously.
Arrivals must taxi beyond the CAT III hold point and do not require clearance to enter/cross Runway 08L/26R when vacating Runway 26L.
Traffic vacating at **ER** is to cross Runway 08L/26R onto Taxiway Juliet via Taxiway Echo, without stopping on the runway exit taxiway. The route from **ER** eastbound onto Runway 08L/26R and holding short of Taxiway Tango without stopping on the runway exit taxiway, is also available when instructed by Air Traffic Control.
Traffic vacating **FR** and **GR** is to cross Runway 08L/26R onto Taxiway Juliet, without stopping on the runway exit taxiway.
Taxiway Delta is not available for vacating Runway 26L.

3. Rapid Exit Taxiway Indicator Lights (RETILs) and paint markings are provided on Runway 08R/26L to assist pilots in judging distances to Rapid Exit Taxiways enabling braking action to be applied for a more efficient roll-out and runway exit speed. RETILs are provided for exit at D and CR on Runway 08R and ER and FR on Runway 26L.

   The RETILs provide a 3-2-1 countdown pattern of yellow lights together with painted markings placed at 300 M, 200 M and 100 M from the intersection of the runway centreline with the Rapid Exit Taxiway centreline. 3 white painted bars and 3 yellow lights are provided at 300 M to go, 2 white bars and 2 yellow lights at 200 M to go and 1 white bar and 1 yellow light at 100 M to go. Painted bars and RETILS are positioned on the left hand side of the runway centreline for Runway 08R and the right hand side of the runway centreline for Runway 26L. The painted bars are angled in the direction of the Rapid Exit Taxiway.

7 TRAINING

Not applicable

EGKK AD 2.21 NOISE ABATEMENT PROCEDURES

Notice under Section 78(1) of the Civil Aviation Act 1982

Whereas:

(1) By virtue of the Civil Aviation (Designation of Aerodromes) Order 1981 (a) Gatwick Airport – London is a designated aerodrome for the purpose of Section 78 of the Civil Aviation Act 1982 (b);
(2) the requirements specified in this notice appear to the Secretary of State to be appropriate for the purpose of limiting, or of mitigating the effect of, noise and vibration connected with the taking off or, as the case may be, landing of aircraft at Gatwick Airport – London.

Now, therefore, the Secretary of State, in exercise of the powers conferred on him by Section 78 (1) and (12) of the Civil Aviation Act 1982, by this notice published in the manner prescribed by the Civil Aviation (Notices) Regulations 1978 (c), hereby provides as follows:

1. This notice may be cited as the Gatwick Airport – London (Noise Abatement Requirements) Notice 2023 and came into operation on 28 December 2023.
2. It shall be the duty of every person who is the operator of any aircraft which is to take off or land at Gatwick Airport – London to secure that, after the aircraft takes off or, as the case may be, before it lands at the aerodrome the following requirements are complied with:

   1. After take-off the aircraft shall be operated in such a way that it is at a height of not less than 1000 FT AAL at 6.5 KM from start of roll as measured along the departure track of that aircraft.
   2. The sites of the noise monitoring terminals relating to Gatwick Airport – London are:

Description	OS Co-ordinates	Elevation above aerodrome	Latitude	Longitude
Site 1: Russ Hill	TQ 2227 3923	54 M	*510821N	0001513W
Site 3: Orltons	TQ 2166 3878	57 M	*510807N	0001545W
Site 5: Oaklands Park Farm	TQ 2170 3939	52 M	*510827N	0001542W
Site 4: Moat House	TQ 3180 4140	4 M	510924N	0000700W
Site 6: Bellwood	TQ 3176 4177	3 M	*510936N	0000702W

3. Subject to sub-paragraphs (5) and (6) below, any aircraft shall, after take-off, be operated in such a way that it will not cause more than 94 dBA Lmax by day 0700-2300 (0600-2200) as measured at any noise monitoring terminal at any of the sites referred to in sub-paragraph (2) above.
4. Subject to sub-paragraphs (5) and (6) below, any aircraft shall, after take-off, be operated in such a way that it will not cause more than 89 dBA Lmax by night 2300-0700 (2200-0600) **and** that it will not cause more than 87 dBA Lmax during the night quota period 2330-0600 (2230-0500) as measured at any noise monitoring terminal at any of the sites referred to in sub-paragraph (2) above.
5. The limits specified in sub-paragraphs (3) and (4) above shall be adjusted in accordance with the following table in respect of any noise monitoring terminal at any of the sites referred to in the table in sub-paragraph (2) above to take account of the location of that terminal and its ground elevation relative to the aerodrome elevation.

Description	Adjustment dBA
Site 1: Russ Hill	plus 5.0
Site 3: Orltons	plus 1.9

Description	Adjustment dBA
Site 5: Oaklands Park Farm	plus 1.9
Site 4: Moat House	0.0
Site 6: Bellwood	minus 0.2

6. For the purpose of determining an infringement of the limits specified in sub-paragraphs (3) and (4) above, if the aircraft was required to take-off with a tailwind, an amount of up to 2dB of the noise recorded at the noise monitor should be disregarded. The amount to be disregarded shall be:

   - 0.4 dB for a tailwind of up to 1 KT
   - 0.8 dB for a tailwind exceeding 1 KT but not exceeding 2 KT
   - 1.2 dB for a tailwind exceeding 2 KT but not exceeding 3 KT
   - 1.6 dB for a tailwind exceeding 3 KT but not exceeding 4 KT
   - 2.0 dB for a tailwind exceeding 4 KT.

   For this purpose, tailwind is to be calculated from the wind data measured in the on-airfield anemometers and wind vanes according to the formula:

   (windspeed x cosine (runway heading minus wind direction)) x – 1.

   If the station is unavailable, the nearest equipped noise monitoring terminal or aerodrome METAR shall be used.

7. Where the aircraft is a jet aircraft, after passing the point referred to in sub-paragraph (1) above, it shall maintain a gradient of climb of not less than 4% to an altitude of not less than 3000 FT. The aircraft shall be operated in such a way that progressively reducing noise levels at points on the ground under the flight path beyond that point are achieved.
8.

   a) This sub-paragraph (8) applies to aircraft other than:

      i. any propeller driven aircraft whose MTWA does not exceed 5700 KG; or
      ii. during the period between 0600-2330 (0500-2230), any propeller driven aircraft whose MTWA does not exceed 17000 KG.

   b) Subject to sub-paragraph (8) (d) below, after any aircraft to which sub-paragraph (8) applies takes off from any runway specified in the first column of the following table, the aircraft shall follow the Noise Preferential Routeing Procedure specified in the third column of the table which relates to the ATC clearance previously given to the aircraft and specified in the second column of the table, whether flying in IMC or VMC.
   c) The ATC clearance via Mayfield specified in the second column of the table will not be available between 2300-0700 (2200-0600). Aircraft following the Noise Preferential Routing Procedure which relates to that clearance shall not fly over Crawley, Crawley Down or East Grinstead.
   d) Where any aircraft to which this sub-paragraph (8) applies has taken off on a VFR flight plan, it shall follow the applicable Noise Preferential Routeing Procedure before turning onto the intended track.

Take-off Runway	ATC Clearance	Procedure
26L/R	Via ACORN (This route to be used only under Radar Control).	Straight ahead until I-WW DME 2.3 then turn right to intercept DET VOR RDL258 by DET DME 31 to DET DME 15.
	Via BOGNA	Straight ahead and maintain track 256°. At MID DME 10.5 turn left to intercept OCK VOR RDL175. At OCK DME 28 turn left to intercept MID VOR RDL145 to BOGNA.
	Via Midhurst	Straight ahead and maintain track 256° to intercept MID VOR RDL062.
	Via SFD (This route to be used only 2300-0600 (2200-0500))	Straight ahead and maintain track 256° until crossing SFD VOR R317 (I-WW DME 6.8) then turn left to intercept RDL310 to SFD VOR.
	Via Mayfield (This route to be used only 0700-2300 (0600-2200))	Straight ahead until I-WW DME 2.3 then turn left to intercept MAY VOR RDL282 by MAY DME 13 to MAY VOR.
	Circuit Flights	Straight ahead until I-WW DME 2.3 NM before turning across wind.
08L/R	Via DET VOR R260	Straight ahead until I-GG DME 3.5 turn left to intercept DET VOR RDL260 to DET DME 43.
	Via ACORN	Straight ahead until I-GG DME 3.5 then turn left to track 051°M to intercept DET VOR RDL258 by DET DME 20 to ACORN.
	Via TUNBY	Straight ahead and maintain track 076° to intercept DVR VOR RDL270 to TUNBY.
	Via Seaford	Straight ahead until I-GG DME 2.5 then turn right to intercept SFD VOR RDL342 to SFD VOR.
	Circuit Flights	Straight ahead until I-GG DME 2.5 before turning across wind.

9. After taking off the aircraft shall avoid flying over the congested areas of Horley and Crawley.

10. Where the aircraft is approaching the aerodrome to land it shall, commensurate with its ATC clearance, minimise noise disturbance by the use of continuous descent and low power, low drag operating procedures (referred to in Detailed Procedures for descent clearance in section EGKK AD 2.22 of the UK AIP). Where the use of these procedures is not practicable, the aircraft shall maintain as high an altitude as possible. In addition, when descending on initial approach, including the closing heading, and on intermediate and final approach, thrust reductions should be achieved where possible by maintaining a 'clean' aircraft configuration and by landing with reduced flap, provided that in all the circumstances of the flight this is consistent with safe operation of the aircraft.
11. Before landing at the aerodrome the aircraft shall maintain as high an altitude as practicable and shall not fly over the congested areas of Crawley, East Grinstead, Horley and Horsham at an altitude of less than 3000 FT (Gatwick QNH) nor over the congested area of Lingfield at an altitude of less than 2000 FT (Gatwick QNH).
12.

    a) Except where sub-paragraph (12) (b) applies, the aircraft shall not join the final approach to either runway at a height of less than 1500 FT AAL.
    b) where the aircraft is a propeller driven aircraft whose MTWA does not exceed 5700 KG, it shall not join the final approach to either runway at the aerodrome at a height of less than 1000 FT AAL and shall follow a descent path which will not result in its being at any time lower than the height of the approach path normally indicated by the PAPI.

13.

    a) Where the aircraft is using the ILS in IMC or VMC it shall not descend below 2000 FT (Gatwick QNH) before intercepting the glidepath, nor thereafter fly below the glidepath; and
    b) an aircraft approaching without assistance from the ILS shall follow a descent path which will not result in its being at any time lower than the height of the approach path normally indicated by the PAPI.

14. Aircraft which land at Gatwick Airport - London between 2330-0600 (2230-0500), whether or not making use of the ILS localizer and irrespective of weight or type of approach, shall not join the centre-line:

    a) below 3000 FT or
    b) closer than 10 NM from touchdown.

15. Without prejudice to the provisions of sub-paragraphs (1)-(14) above, the aircraft shall at all times be operated in a manner which is calculated to cause the least disturbance practicable in areas surrounding the aerodrome.
16. The requirements set out in sub-paragraphs (1)-(15) above may at any time be departed from to the extent necessary for avoiding immediate danger or for complying with the instructions of an Air Traffic Control unit.

3. In this notice, except where the context otherwise requires:

'dBA' means a decibel unit of sound level measured on the A-weighted scale, which incorporates a frequency dependent weighting approximating the characteristics of human hearing;

Lmax' means the highest instantaneous sound level recorded (with the noise monitoring terminal set at the slow meter setting);

other abbreviations used are defined in GEN 2-2 of the United Kingdom Aeronautical Information Publication (Air Pilot).

Erin Cowburn
Deputy Director
Airports Policy Division
28 December 2023 **Department for Transport**

a) S.I. 1981/651.
b) 1982 c.16.
c) S.I. 1978/1303.
d) 1972 c.6.

Notes

(These notes are not part of the notice)

1. The Noise Preferential Routeing Procedures specified in the above notice are compatible with normal ATC requirements. The use of the routeings specified above is supplementary to noise abatement take-off techniques as used by piston-engined, turbo-prop, turbo-jet and turbo-fan aircraft.

2. The attention of operators is drawn to the provisions of Section 78 (2) of the Civil Aviation Act 1982, under which if it appears to the Secretary of State that any of the requirements in this notice have not been complied with as respects any aircraft, he may direct the manager of the aerodrome to withhold facilities for using the aerodrome from the operator of the aircraft. However, the Secretary of State accepts that occasional and exceptional breaches of the noise limits, or of the height requirement, would not be expected to lead to sanctions under Section 78 (2). Such breaches would, however, run the risk of financial penalties.

3. Noise from ground running of aircraft engines is controlled in accordance with instructions issued by Gatwick Airport Limited.

4. To minimise disturbance in areas adjacent to the aerodrome, commanders of aircraft are requested to avoid the use of reverse thrust after landing, consistent with the safe operation of the aircraft, between 2330-0600 (2230-0500).

5. Full details concerning the maximum number of occasions and the types of aircraft which are permitted to take off or land at night during specified periods at this aerodrome are promulgated by Supplement.

6. For monitoring purposes, a descent will be deemed to have been continuous provided that no segment of level flight longer than 2.5 nautical miles (NM) occurs below 7000 FT QNH and 'level flight' is interpreted as any segment of flight having a height change of not more than 50 FT over a track distance of 2 NM or more, as recorded in the airport noise and track-keeping system.

7. For monitoring purposes, a departure will be deemed to have complied with the Noise Preferential Routeing (NPR) if, in the portion of flight below the appropriate vectoring altitude (see note 8 below), it is properly recorded by the airports noise and track-keeping (NTK) system as having flown wholly within the Lateral Swathe (LS). The LS is defined from the centre-line of the relevant route coded in the NTK system, based upon a map accredited for this purpose by the Department for Transport, by the closer to the route centre-line depicted on the map of (a) a pair of lines either side, each diverging at an angle of 10° from a point on the runway centre-line 2000 M from start-of-roll: and (b) a pair of parallel lines representing a distance of 1.5 KM either side of the route centre-line. For avoidance of doubt, the depicted route and LS may include curved sections representing turns.

8. Aircraft which have attained an altitude of 4000 FT (Gatwick QNH) may be directed by air traffic controllers onto a different heading and commanders complying with any such direction will not by reason of so complying be deemed to have departed from the Noise Preferential Routeing. This applies:

   a) between 2330-0600 (2230-0500) to all take-offs, and

   b) between 0600-2330 (0500-2230) to:

      i. all departures from Runway 26L/R, other than those cleared via NOVMA, IMVUR, KENET or SAM SIDs.

      ii. take-offs from Runway 08L/R cleared via SFD.

   Between 0600-2330 (0500-2230) aircraft which have taken off from Runway 26L/R cleared via NOVMA, IMVUR, KENET or SAM SIDs or from Runway 08L/R (other than those cleared via SFD) and which have attained an altitude of 3000 FT (Gatwick QNH) may be directed by air traffic controllers onto a different heading and commanders complying with any such direction will not by reason of so complying be deemed to have departed from the Noise Preferential Routeing.

9. As the Navigation Aids (NAVAIDs) used previously in the noise abatement procedures are withdrawn as part of the NATS NERL NAVAID Rationalisation project and the conventional Standard Instrument Departures have been RNAV Substituted, the following latitude and longitude coordinates replicate the specific location of the old NAVAIDs which are listed below:

NAVAID	Coordinates
OCK VOR	511818.17N 0002649.86W

EGKK AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT

a) Inbound other than Airways

i. IFR aircraft inbound to London Gatwick direct from the London FIR will be required to use the procedure via Mayfield holding pattern detailed at paragraph 4(e).
ii. Pilots inbound to London Gatwick under VFR call Gatwick Director at one of the VFR Reference Points (VRPs) listed at paragraph 13, where aircraft will either be given a route to follow or will be identified by radar and directed into the Approach sequence.
iii. Except where required by the Instrument Approach Procedures, inbound aircraft to London Gatwick in both VMC and IMC should, whenever possible avoid flight below 3000 FT over towns and other populated areas within the Control Zone. Whenever possible aircraft under radar control will be directed to avoid flying over Crawley, East Grinstead, Horley and Horsham below 3000 FT. When a radar service is not being provided it will be the responsibility of captains of aircraft on VFR flight plans or on visual approaches to ensure compliance.

b) Inbound on Airways

i. Aircraft inbound to London Gatwick via the Airways System will be routed via the Standard Terminal Arrival Routes (STARs) detailed at AD 2-EGKK-7.

2 RADIO COMMUNICATION FAILURE PROCEDURES

a) Inbound Aircraft

i. In the event of complete radio failure in an aircraft the pilot is to adopt the appropriate procedures notified at ENR 1.1, subsection 3, with the exception described below.
ii. When complete communications failure occurs in the aircraft before ETA, or before EAT when this has been received and acknowledged, the aircraft will:

1. fly to the appropriate holding point (TIMBA, WILLO or Mayfield);
2. hold until the last acknowledged ETA plus 10 minutes or EAT when this has been given;
3. then commence descent for landing in accordance with the approach procedure for the runway-in-use (see AD 2-EGKK-7) and effect a landing within 30 minutes (or later if able to approach and land visually).

b) If complete radio communications failure occurs after an aircraft has reported to ATC on reaching the holding point, the aircraft will:

i. hold at the last assigned level at TIMBA, WILLO or Mayfield until:

1. ATA over the holding point plus 10 minutes or 10 minutes after the last acknowledged communication with ATC, whichever is the later; or
2. EAT when this has been received and acknowledged.

ii. then commence descent for landing in accordance with the approach procedure for the runway-in-use (see AD 2-EGKK-7) and effect a landing within 30 minutes (or later if able to approach and land visually).

c) When complete radio communication failure occurs during intermediate or final approach under radar control the procedures to be followed are detailed at AD 2-EGKK-5.
d) When complete radio communication failure occurs in the aircraft following a missed approach the aircraft will:

i. fly the appropriate missed approach procedure to Mayfield VOR/DME;
ii. complete at least one holding pattern at 3000 FT;
iii. then commence descent for landing in accordance with the approach procedure for the runway-in-use (see AD 2-EGKK-7) and effect a landing within 30 minutes (or later if able to approach and land visually).

e) The routes and levels to be used when leaving the Zone or Holding Area in accordance with the procedures given at ENR 1.1, subsection 3 are shown in the table below, the route to be followed is dependent on the position of the aircraft at the time the decision to leave the Zone is made.

Position at time of decision	Route
Mayfield	Track 250°T at last assigned altitude
TIMBA	Track 090°T at last assigned level
WILLO	Track 230°T at last assigned level/altitude

3 RADIO COMMUNICATION FAILURE PROCEDURES OUTBOUND AIRCRAFT

a) Outbound traffic operating on FRANE 1M/1V/1P/1W/1Z: If a clearance to climb or re-routing instructions have not been given, comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedures listed at AD 2-EGKK-6, at FRANE route via M604 to DAGGA and maintain 6000 FT until DAGGA; at DAGGA, commence climb to flight planned level.
b) All outbound traffic except those operating on FRANE 1M/1V/1P/1W/1Z: Comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedures (listed at AD 2-EGKK-6) or ATC clearance and commence climb to flight planned level after the last position at which an altitude is specified.

4 HOLDING

a) Aircraft inbound to London Gatwick Airport using the ATS Route Network will, after the initial routing, follow the appropriate STAR to the holding fixes TIMBA or WILLO. The STARs are illustrated at AD 2-EGKK-7. For aircraft holding below 6000 FT ALT, holding will be at Mayfield MAY VOR. (In light traffic conditions aircraft may be routed direct to MAY VOR above 6000 FT).
b) Pilots unable to comply with ATC clearance must notify ATC as soon as possible.
c) Aircraft may be radar-vectored off-route for the purpose of ATC separation. When separation has been achieved, ATC will give an approximate QDM to resume the STAR via the appropriate VOR radial or fix.
d) In the event of aircraft equipment failure, ATC must be advised and ATC instructions complied with.
e) Mayfield VOR/DME Holding Pattern:

i. This procedure will be used by aircraft inbound to London Gatwick from the FIR, after missed approach, via airways when instructed by London Control or when instructed by Gatwick Director.
ii. Aircraft will hold on an axis of 087° MAG (RDL 267°) turning left at the facility, generally from 3000 FT ALT to 6000 FT ALT. The end of the outbound leg is at 5 DME MAY.
iii. Altitudes at and below 6000 FT ALT will be allocated by Gatwick Director.

5 APPROACH PROCEDURES WITH RADAR CONTROL

a) When inbound traffic is being sequenced by Air Traffic Control, that part of the approach between the holding fix and the Final Approach Track (FAT) will be flown under directions from the Radar Controller. Once the aircraft is under Radar Control, changes of heading or flight level/altitude will be made only on instructions from the Radar Controller except in the case of radio communication failure in the aircraft or at the radar unit.

6 DETAILED PROCEDURES

a) Headings and flight levels at which to leave the holding facility will be passed by ATC. Radar vectors will be given, and descent clearance will include an estimate of track distance to touchdown. Further distance information will be given between initial descent clearance and intercept heading to the ILS. On receipt of descent clearance the pilot will descend at the rate they judge will be best suited to the achievement of continuous descent, the object being to join the glide path at the appropriate height for the distance without recourse to level flight.

b) During intermediate approach (after leaving the hold until approximately 6 NM before turning onto the ILS intercept heading), aircraft will be instructed to fly in the speed range 210 KT – 220 KT as required. Thereafter and until established on final approach, the highest possible speed within the band is 160 KT – 180 KT. Inbound aircraft must be established at 160 KT, on a stable approach at not less than 7 NM from touchdown and thereafter maintain that speed until 4DME. For aircraft that are unable to maintain 160 KT to 4 NM from touchdown, Gatwick Director will ascertain the final approach speed and inform the Tower Controller. Gatwick (Director) may transfer high speed traffic to the Tower but prior co-ordination between controllers will have been completed. Gatwick Director will effect prior co-ordination with the Tower if separation from a following aircraft is dependent on the leading aircraft maintaining a speed higher than 160 KT.

c) Adherence to speeds assigned by ATC is mandatory. These speeds are applied for ATC separation purposes. In the event of a new (non-speed related) ATC instruction being issued (e.g. an instruction to descend on ILS) pilots shall continue to maintain the previously allocated speed. All speed restrictions are to be flown as accurately as possible. Aircraft unable to conform to these speeds must inform ATC and state what speeds can be used. In the interests of accurate spacing, pilots are requested to comply with speed adjustments as promptly as is feasible within their own operational constraints. Pilots should advise ATC if circumstances necessitate a change of speed for aircraft performance reasons.

d) The spacing provided between aircraft will be designed to achieve maximum runway utilization within the parameters of safe separation minima (including vortex effect) and runway occupancy. It is important to the validity of the separation provided, and to the achievement of optimum runway capacity, that runway occupancy time is kept to a minimum consistent with the prevailing conditions. The procedures in EGKK AD 2.20 Local Aerodrome Regulations 6 (g) 'Minimum Runway Occupancy Time' also remain applicable.

e) Time Based Separation (TBS) - Advanced Mixed Mode (AMM) is used at London Gatwick.

AMM comprises use of:

- EUROCONTROL RECAT-EU re-categorisation of ICAO wake turbulence longitudinal separation minima on approach and departure to determine wake separation minima
- Approach spacing delivery using Time-Based separation standards to achieve RECAT-EU wake separation minima.
- Mixed Mode departure spacing optimised for the arrival aircraft type, Runway Occupancy Time and generic departure information.

A system using real time aircraft data to derive live wind information on Final Approach is utilised during AMM operations. When in stronger headwind conditions, a moderate reduction in separation distances from lead and follower aircraft may be observed in comparison to RECAT-EU distance based wake turbulence minima. For further details, refer to the AIC P 083/2020 www.nats.aero/ais.

f) The system is designed to maximize arrival capacity at London Gatwick and to minimize noise disturbance in the areas overflown during the approach and aircraft commanders are requested to conform to low-power, low-drag procedures, including delays to the extension of wing flaps and undercarriage until the final stages of the approach.

g) Missed Approach Procedures are contained on the Instrument Approach charts.

7 PRESSURE SETTINGS

a) When below the Transition Altitude, pilots are to fly on the aerodrome QNH until established on final approach, at which point QFE or any other desired setting may be used.

8 RADAR FAILURE

a) In the event of radar failure, fresh instructions will be issued to each aircraft under radar control and the procedures in paragraph 9 will be brought into use.

9 RADIO COMMUNICATIONS FAILURE AT THE RADAR UNIT

a) If radio communication completely fails at the radar unit when aircraft are under Radar Control, pilots will revert to Aerodrome Control for fresh instructions.

10 APPROACHES WITHOUT RADAR

a) When traffic is not being sequenced by Air Traffic Control, aircraft will be cleared from the holding areas to carry out the appropriate Initial Approach Procedures as outlined in AD 2-EGKK-7-17 and AD 2-EGKK-7-18.

11 PROCEDURES FOR OUTBOUND AIRCRAFT

a) RNAV SIDs are available only to aircraft which are equipped and operated in accordance with the requirements of JAA TGL-10, or equivalent, and approved by their State of Registry for RNAV 1 operations.

i. In addition, RNAV 1 SIDs are only available to those aircraft that are either GNSS equipped or that have **DME/DME and INS/IRU with an automatic runway update.**

ii. Aircraft which are not capable/certified as detailed in (b) and (i) above shall fly the conventional navigation version of the SID as detailed in the appropriate charts in AD 6.

iii. There are no critical navaids associated with the RNAV 1 SIDs assuming the use of GNSS or INS/IRU for initial guidance up to an altitude of 2000 FT. RNAV 1 SIDs are detailed in AD 6 together with appropriate navigation database coding tabulation.
iv. RNAV 1 SIDs are available for use, at ATC discretion, on a 24 hour basis (H24), unless otherwise stated on the chart.
v. RNAV 1 SIDs are clearly identified and distinguishable from conventional SIDs by the use of a specific suffix, which will be a 'Z' for 08R departures and an 'X' character for 26L departures. RNAV 1 SIDs are NOT available for use from Runway 26R/08L; Conventional Navigation SID will be issued by ATC for 26R/08L departures.
vi. Crews will be issued with an RNAV1 SID if their flight plan includes information such that the aircraft is RNAV1 capable. Crews shall request an ATC clearance for conventional SID route if unable to comply with RNAV1. On first RTF call after airborne, crews are to advise London Control/Gatwick Radar of the full SID designator as part of the requirements for initial calls on departure, e.g. "London Control, Fastjet 123 NOVMA 1X passing 2000 FT, climbing to altitude 4000 FT".
vii. Intersection departures **are** permitted for aircraft flying the RNAV SIDs. Aircrew flying aircraft that are not GNSS equipped and that are departing from an intersection shall ensure that the relevant actions have been taken on the flight deck so that the FMS has been updated and is informed that the aircraft will be departing from an intersection. This will ensure that the correct co-ordinates are used by the Inertial Navigation System / Inertial Reference Unit upon selection of TOGA and therefore reduce the risk of a map shift event on departure.
viii. Speed limits apply at specified waypoints for track containment purposes.
ix. Aircraft flying on RNAV 1 SIDs can expect to receive radar vectors from ATC as per the operating procedure for conventional SIDs.

b) Conventional SIDs

i. Conventional SIDs will be used for those aircraft which do not specify a preference for RNAV 1 SID clearance or for when an ATC clearance cannot be issued for the use of the RNAV 1 SIDs.
ii. Flights requiring M605 should plan BOGNA 1M/1V DCT HARDY.

12 SPEED LIMITATION

a) Departure Speed Restriction: In order to optimise the departure flow and assist in the separation between successive departing aircraft a speed limit of 250 KT IAS below FL 100 is applicable until removed by ATC. ATC may remove the speed restriction by using the phrase ‘No ATC Speed Restriction’. Pilots are reminded that this phrase does not relieve the pilot of the responsibility to adhere to the ground track of the Noise Preferential Route, which may require a speed/power limitation.
b) If for any reason pilots are unable to comply with the 250 KT IAS speed restriction the pilot should immediately advise ATC and state the minimum speed acceptable. If a pilot anticipates before departure that they will be unable to comply with the speed restriction, they should inform ATC when requesting start-up clearance, stating the minimum speed acceptable. In this case the pilot will be informed before take-off of any higher speed limitation.

13 SPECIAL VFR FLIGHTS

a) Special VFR clearances for flights within the Gatwick CTR may be requested and will be given whenever traffic conditions permit. These flights are subject to the general conditions laid down for Special VFR flights and will normally be given only to aircraft which carry RTF including the appropriate frequencies.

Note: *Pilots holding a Private Pilots Licence (Aeroplanes) are reminded of the visibility requirements for Special VFR flights laid down in Schedule 7 of the Air Navigation Order 2009 and the related notification in paragraph 1.2.*

b) The use of Special VFR clearances is intended to be confined to the following types of flight:

i. Light aircraft which cannot comply with full IFR requirements and wish to proceed to or from London Gatwick Airport;
ii. light aircraft which cannot comply with full IFR requirements and wish to transit the Gatwick CTR.

c) Special VFR clearances to operate within the Gatwick CTR for the purpose of proceedings to or from London Gatwick Airport will not be granted to fixed-wing aircraft if the reported visibility at the Airport is less than 3 KM or the reported cloud ceiling is less than 1000 FT.
d) Aircraft may be given a radar service whilst within the zone if, due to the traffic situation, ATC considers it advisable. It will remain the responsibility of the pilot to remain at all times in flight conditions which will enable them to determine their flight path and to keep clear of obstacles, and to ensure compliance with the relevant low flying restrictions of SERA and the Rules of the Air Regulations 2015, with particular regard to SERA.3105 Minimum Heights, pilots must inform the radar controller if compliance entails a change of heading or height.
e) Special VFR flights may be subject to delay when parts of their route are outside radar cover or when they cannot be fitted readily into the main traffic flow. Pilots should, therefore, always ensure that they have adequate fuel reserves and are able to divert to another aerodrome if necessary.

14 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

15 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside the Gatwick controlled airspace within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Gatwick Director frequency, 126.825 MHz, are encouraged to select SSR code 7012.

505832N 0003428W - 510314N 0003730W - 511422N 0003506W - 511957N 0001917E - 511217N 0002018E - 510002N 0001541E - 505900N 0001333E - 505541N 0001007W - 505832N 0003428W.

b) Selection of 7012 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Gatwick controlled airspace at all times.
c) Whilst squawking 7012, pilots should be aware that Gatwick Director may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 7012 shall be deselected.

EGKK AD 2.23 ADDITIONAL INFORMATION

1 MODE S BAROMETRIC PRESSURE SETTING DATA

a) London Terminal Control has the ability to downlink Mode S Barometric Pressure Setting (BPS) data. Therefore, if the downlinked pressure data is at variance with the BPS expected by Air Traffic Control, pilots can expect additional challenge. When Air Traffic Control pass a reminder of the appropriate BPS, it is anticipated that the aircrew will cross check the altimeter settings and confirm set.

WARNING
Runways have displaced thresholds.
The take-off runway starts before the threshold markings in the pre-threshold area which is indicated by white centreline arrows.
Aircraft entering the runway in the pre-threshold area should begin their take-off roll here and not wait until the threshold to apply take-off thrust.

VAR 1.3°E - 2027
N
Annual Rate of Change 0.17°E

Hot Spot - Foxtrot Romeo RET
HS1
Traffic vacating FR to cross Runway 26R onto taxiway Juliet.
When exiting Runway 26L aircraft do not have to call for clearance to cross Runway 26R.

Hot Spot - Taxiway Echo
HS2
Potential routing error - Taxiway Echo is only available for aircraft vacating Runway 26L via ER RET. Taxiway Echo is one-way for northbound traffic only.

Hot Spot - Taxiway Juliet
HS4
Potential routing error - pilots taxying eastbound on TWY J be aware the taxiway deviates to the north at this point.

Hot Spot - Delta RET
HS3
Potential routing error - traffic vacating 08R at Delta be aware of potential confusion between taxiways Romeo and Quebec.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1310
HEIGHTS IN FEET AGL (591)

LONDON GATWICK

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **2000** in the sector defined by the lateral limits; 511931N 0002318W - 512129N 0000900W - 511548N 0000613W thence anticlockwise by an arc of a circle radius 4NM centred on 511651N 0000005W to 511829N 0000545E - 512055N 0000403E thence clockwise by an arc of a circle radius 12NM centred on 510957N 0000339W to 505815N 0000023E - 505607N 0001505W thence clockwise by an arc of a circle radius 12NM centred on 510749N 0001910W to 511931N 0002318W.

b) **2100** in the sector defined by the lateral limits; 512129N 0000900W - 512140N 0000742W thence clockwise by an arc of a circle radius 12NM centred on 510957N 0000339W to 512055N 0000403E - 511829N 0000545E thence clockwise by an arc of a circle radius 4NM centred on 511651N 0000005W - 511548N 0000613W - 512129N 0000900W.

c) **2100** in the sector defined by the lateral limits; a circle centred on 511038.93N 0002230.29W with a radius of 3.2NM.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **3000**, or last assigned level if higher, to **MAY VOR**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **MAY VOR**†.

†In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4 or the special procedure for the Gatwick Control Zone detailed at EGKK AD 2.22.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. The ATC Surveillance service is provided by Primary and/or Secondary Radar equipment.
7. **This chart may only be used for cross-checking of altitudes assigned while under ATC Surveillance control.**
8. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
9. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.

CHANGE (11/26): NORTH WEST MSA REVISED. BIG, EPM, GWC, MID NAVAIDS REMOVED.

WIZAD 1X
RWY 26L

Climb straight ahead to **KKW04**, left to **KKS06**, left to **KKS09**, right to **KKS14 - MAY**, left to **KKS33 - WIZAD**. Via WIZAD; L9, L10 eastbound.

NOTE 1. RWY 26L obstacle requirement: minimum climb gradient 4.2% to **500** AAL.
NOTE 2. Close-in obstacles exist for RWY 26L departures. See Aerodrome Obstacle Chart and EGKK AD 2.10 Aerodrome Obstacles.
NOTE 3. Adhere to maximum speed limits where specified by waypoint constraints.
NOTE 4. Maximum 250KIAS below FL100 unless authorised by ATC.

ADDITIONAL RNAV DATA
1. DME/DME only procedure: no critical navaids.
2. RNAV1 SIDs are available only for approved aircraft that are either GNSS equipped or that have DME/DME and INS/IRU with automatic runway updating capability.

GENERAL INFORMATION
1. RNAV1 SIDs reflect Noise Preferential Routeings. See EGKK AD 2.21 Noise Abatement Procedures
2. En-route cruising levels will be issued after take-off by 'London Control'.
3. Callsign for RTF frequency used **when Instructed** after take-off is 'Gatwick Director'. Report callsign, SID designator, current altitude and Initial cleared altitude on first contact with 'Gatwick Director'.
4. ALL RNAV flight planned aircraft shall be allocated the RNAV version of Standard Instrument Departure. Crews must request ATC clearance via the conventional SID version if required.
5. **WIZAD SID is a tactical routing allocated by ATC to alleviate airspace congestion and may be offered at a late stage of taxiing to aircraft normally allocated MIMFO SID. Pilots unable to accept WIZAD SID when offered must Inform ATC and will be re-allocated MIMFO SID. WIZAD SID should not be used for flight planning purposes.**

CHANGE (6/26): MAG INFO REVISED. MAG HEADINGS. ACC FREQUENCY ADDED. MINIMUM CLIMB GRADIENT REVISED. SPEED LIMITS REVISED. NOTES REVISED.

RWY 08R/L 26L/R **MIMFO 1M 1V DVR 2P 2W**
(RNAV SUBSTITUTION ONLY)

MIMFO 1M/1V RWY 26L/R† Straight ahead until **I-WW** D2.3 (**1500** or above, MAX 220KIAS), then turn right to intercept **DET VOR** R258 by **DET** D31 (**3200** or above, MAX 220KIAS). Crossing **DET** D29 (**4000** or below, MAX 250KIAS). At **DET** D15.4 (**ACORN**) turn right onto **DVR VOR** R276 to **MIMFO (DVR VOR** R276/D33). Crossing **DET** D15.4 (**ACORN**) at **5000**. Crossing **MIMFO (DVR VOR** R276/D33) at **6000**. via Y312.

DVR 2P/2W RWY 08R/L Straight ahead, maintain track 076° to intercept **DVR VOR** R270 to **DVR VOR**. Crossing **DVR** D39 (**BIG VOR** R130/**TUNBY** intersection) at **5000** or above. Crossing **DVR VOR** R270/D33 at **6000**. via **DVR**; L9, L10 eastbound, L18.

OBSTACLE CLEARANCE
†RWY 26R: Maintain minimum 4.5% climb gradient to 703 QNH (500 QFE).
†RWY 26L: Maintain minimum 4.2% climb gradient to 703 QNH (500 QFE).

GENERAL INFORMATION
1 Close-in obstacles exist for RWY 26L/R and RWY08R/L departures. See Aerodrome Obstacle Chart and EGKK AD 2.10 Aerodrome Obstacles.
2 SIDs reflect Noise Preferential Routeings. See EGKK AD 2.21 for Noise Abatement Procedures.
3 Cross Noise Monitoring Points not below 1203 QNH (1000 QFE) thereafter maintain minimum climb gradient of 4% to 3000 to comply with Noise Abatement requirements.
4 Callsign for RTF frequency used **when Instructed** after take-off is 'London Control'. Report callsign, SID designator, current altitude and initial cleared altitude on first contact with 'London Control'.
5 En-route cruising levels will be issued after take-off by 'London Control'. **Do not climb above SID levels until Instructed by ATC.**
6 Adhere to maximum speed limits where specified by DME fixes.
7 Maximum 250KIAS below FL100 unless otherwise authorised by ATC.
8 SIDs for RWYs 26R and 08L are identical to those for RWYs 26L and 08R respectively. RWY codes V and W are allocated to 26R and 08L.
9 MIMFO 1M/1V: In order to alleviate airspace congestion pilots may be offered WIZAD 1X (RWY 26L RNAV/1) or WIZAD 4M/4V (RWY 26L/R conventional) SID at a late stage of taxiing. Pilots unable to accept WIZAD SID when offered must inform ATC and will be allocated MIMFO 1M/1V.

INITIAL APPROACH PROCEDURES
ILS RWY 08R

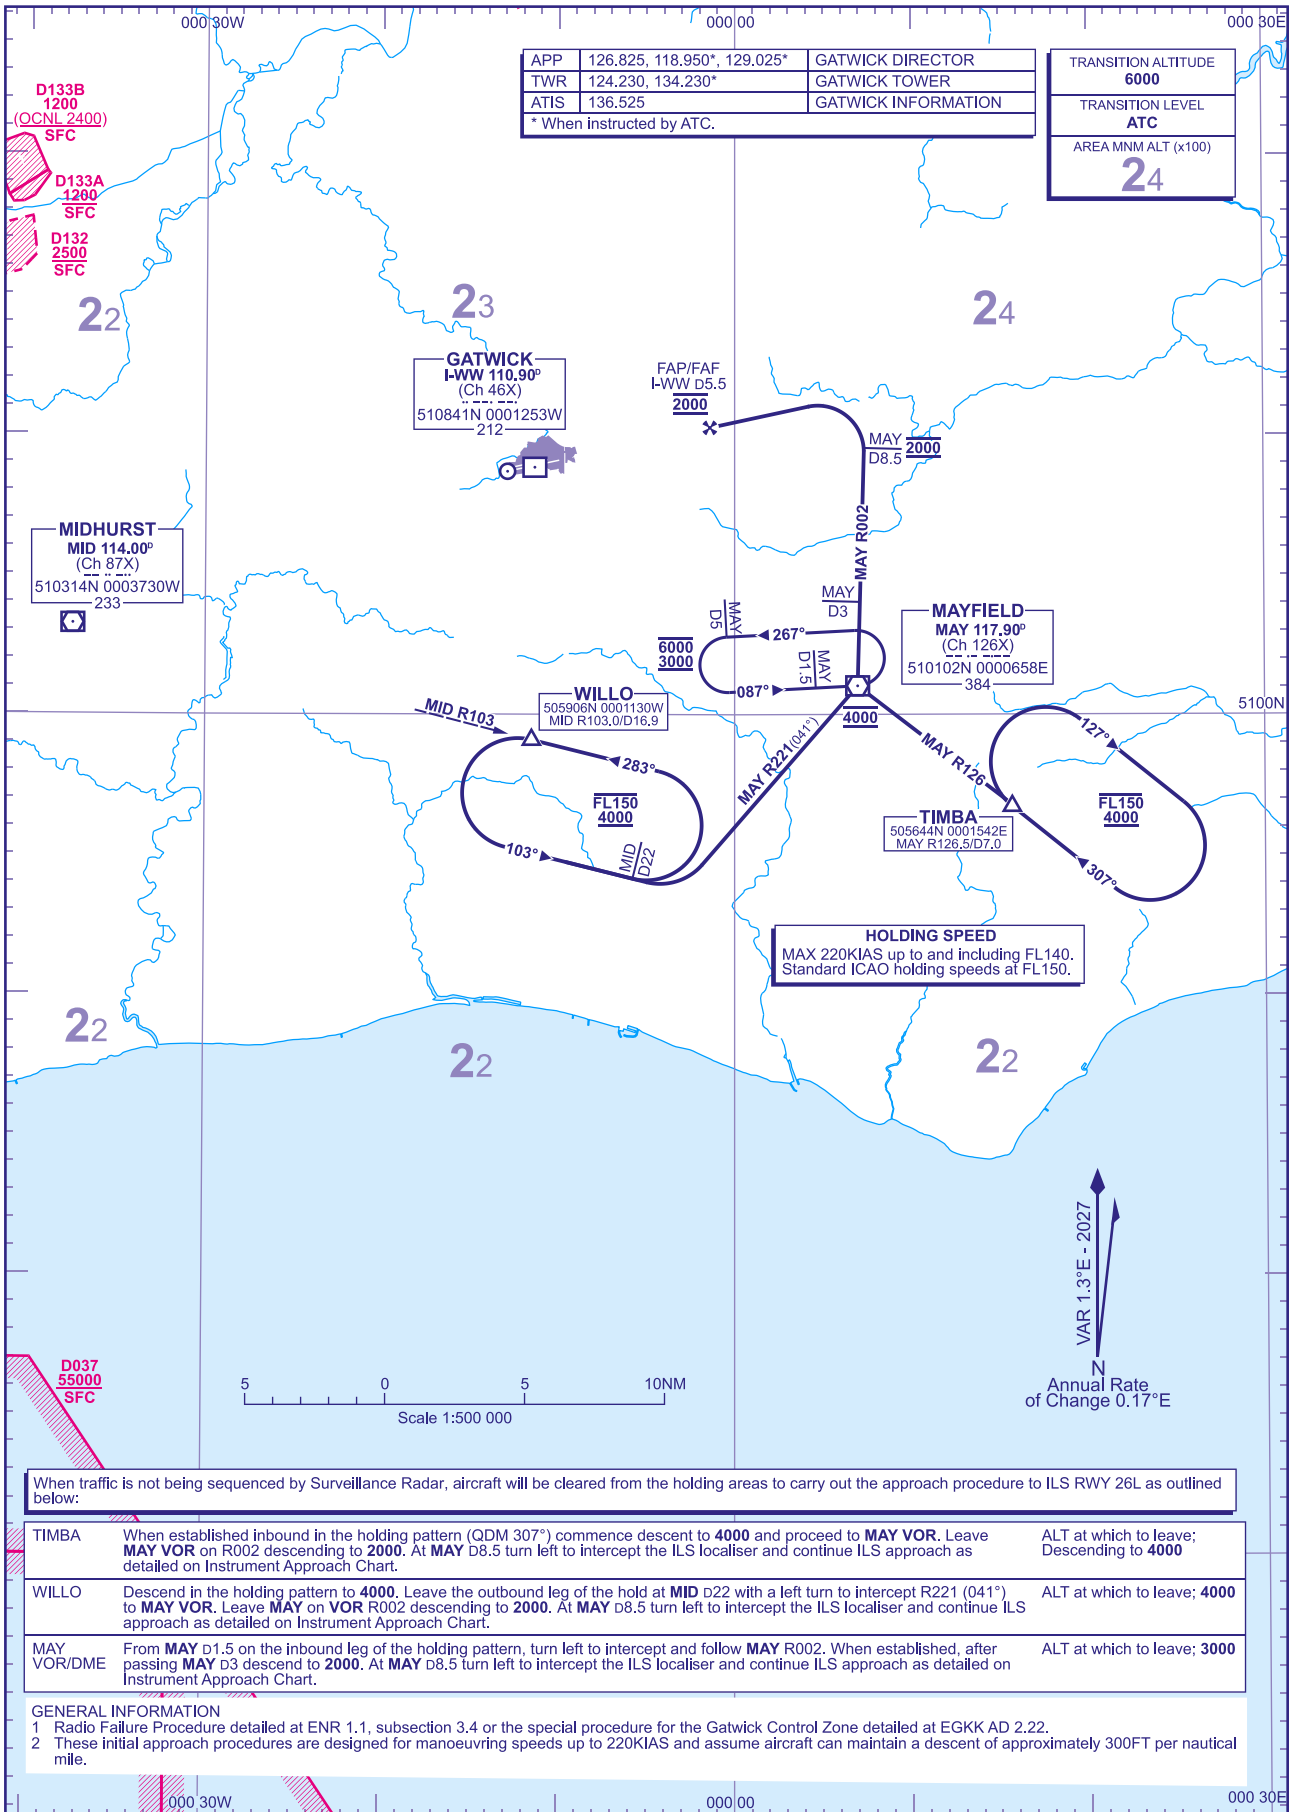
DISTANCES IN NAUTICAL MILES
BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ALTITUDES AND ELEVATIONS IN FEET

LONDON GATWICK

When traffic is not being sequenced by Surveillance Radar, aircraft will be cleared from the holding areas to carry out the approach procedure to ILS RWY 08R as outlined below:

TIMBA	When established inbound in the holding pattern (QDM 307°) commence descent to **4000** and proceed to **MAY VOR**. Leave **MAY VOR** on R273 continuing descent to **3000**. Cross **MAY** D18 at **3000**. At **MAY** D23 turn right to intercept the ILS localiser and continue ILS approach as detailed on Instrument Approach Chart.	ALT at which to leave; Descending to **4000**
WILLO	Descend in the holding pattern to **4000**. Leave **WILLO** on **MID VOR** R103 then descend to **3000**. Cross **MID** D11 at **3000**. At **MID** D5 turn right to intercept the ILS localiser and continue ILS approach as detailed on Instrument Approach Chart.	ALT at which to leave; **4000**
MAY VOR/DME	Overhead **MAY VOR/DME**. Continue outbound turn onto track 257° to intercept and follow **MAY** R273 at **3000**. At **MAY** D23 turn right to intercept the ILS localiser and continue ILS approach as detailed on Instrument Approach Chart.	ALT at which to leave; **3000**

GENERAL INFORMATION
1 Radio Failure Procedure detailed at ENR 1.1, subsection 3.4 or the special procedure for the Gatwick Control Zone detailed at EGKK AD 2.22.
2 These initial approach procedures are designed for manoeuvring speeds up to 220KIAS and assume aircraft can maintain a descent of approximately 300FT per nautical mile.



CHANGE (11/26): PROCEDURE TITLE REVISED. HOLLY WAYPOINT REMOVED. ALTITUDES REVISED. HOLDING SPEED BOX ADDED. NOTES REVISED.

AERO INFO DATE 04 AUG 26

INITIAL APPROACH PROCEDURES
ILS RWY 26L

DISTANCES IN NAUTICAL MILES
BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ALTITUDES AND ELEVATIONS IN FEET

LONDON GATWICK

When traffic is not being sequenced by Surveillance Radar, aircraft will be cleared from the holding areas to carry out the approach procedure to ILS RWY 26L as outlined below:

TIMBA	When established inbound in the holding pattern (QDM 307°) commence descent to **4000** and proceed to **MAY VOR**. Leave **MAY VOR** on R002 descending to **2000**. At **MAY** D8.5 turn left to intercept the ILS localiser and continue ILS approach as detailed on Instrument Approach Chart.	ALT at which to leave; Descending to **4000**
WILLO	Descend in the holding pattern to **4000**. Leave the outbound leg of the hold at **MID** D22 with a left turn to intercept R221 (041°) to **MAY VOR**. Leave **MAY** on **VOR** R002 descending to **2000**. At **MAY** D8.5 turn left to intercept the ILS localiser and continue ILS approach as detailed on Instrument Approach Chart.	ALT at which to leave; **4000**
MAY VOR/DME	From **MAY** D1.5 on the inbound leg of the holding pattern, turn left to intercept and follow **MAY** R002. When established, after passing **MAY** D3 descend to **2000**. At **MAY** D8.5 turn left to intercept the ILS localiser and continue ILS approach as detailed on Instrument Approach Chart.	ALT at which to leave; **3000**

GENERAL INFORMATION
1 Radio Failure Procedure detailed at ENR 1.1, subsection 3.4 or the special procedure for the Gatwick Control Zone detailed at EGKK AD 2.22.
2 These initial approach procedures are designed for manoeuvring speeds up to 220KIAS and assume aircraft can maintain a descent of approximately 300FT per nautical mile.

CHANGE (11/26): PROCEDURE TITLE REVISED. HOLLY WAYPOINT REMOVED. ALTITUDES REVISED. HOLDING SPEED BOX ADDED. NOTES REVISED.

EGLL AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Nose in parking is in operation throughout the airport. Heathrow Airport operates a variety of stand types and configurations such as Standard apron/stand, Multiple Aircraft Ramp System (MARS) and Multi Choice Apron (MCA). Standard Apron/stands will have a single yellow centre-line. Each stand will have an individual stand number. MARS stands consist of a main centre-line painted yellow and will have two subsidiary centre-lines either side of the main centre-line. These subsidiary centre-lines are painted yellow/white and are given the designation of the stand number with 'L' (Left) and 'R' (Right) added. Multi Choice Aprons use multiple centre-lines to allow the operation of a variety of different combinations of parked aircraft. The airline operative will select the assigned stand Advanced Visual Docking Guidance System (A-VDGS) to allow the aircraft to park, or a marshaller shall assist with the aircraft parking. Each stand will have an individual stand number. Illuminated stand number indicators are provided on most stands. The majority of stands are equipped with A-VDGS. A marshalling service will be provided for the minority of the remaining stands that do not have A-VDGS fitted. Flight crew must not attempt to self-park if the A-VDGS is not activated or calibrated for their aircraft type. In the event of there being no activated A-VDGS displayed upon approach to the stand, flight crews must: - Hold position on the taxiway centre-line. - Inform Ground Movement Control (GMC) they are awaiting stand entry guidance. - Contact company to arrange activation. Note: GMC may request aircraft to 'report parked' – this is not an instruction to self-park. In the event of a failure of the A-VDGS during parking, flight crews must: - Inform Ground Movement Control (GMC) of a stand entry guidance failure. - Contact company to arrange a marshaller.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 09L/27R: Full ICAO runway designation, threshold, centre-line, aiming point and touchdown zone. Lead-offs from the runway are marked by a continuous yellow line from the centreline of the runway. 09R/27L: Full ICAO runway designation, threshold, centre-line, aiming point and touchdown zone. Lead-offs from the runway are marked by a continuous yellow line from the centreline of the runway. Runway light(s): Colour coded amber/green lights indicate the runway turn-offs routes to the CAT III stop bars. Refer to AD 2.14 for further details. Taxiway marking aid(s): Yellow centre-line. Enhanced centreline markings are in place.
3	Stop bars and runway guard lights (if any)	Illuminated red stop bars and runway guard lights are in operation at all runway entry points, H24.
4	Other runway protection measures	-
5	Remarks	Tug Crews, when towing aircraft under the guidance of a marshaller, must not park on stand unless guided to do so by the use of daylight-fluorescent wands, marshalling bats, marshalling gloves. Illuminated wands shall be used at night or in low visibility. LGTD WDI are located at the following positions: 512749.74N 0002838.40W, 512750.27N 0002631.90W, 512843.08N 0002622.52W & 512835.39N 0002848.34W.

EGLL AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGLL AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use governed by regulations applicable to the London CTR.
b) The following conditions and procedures apply to single-engined and light twin-engined aircraft not fully equipped with radio apparatus (including ILS receiver) as specified at GEN 1.5 but carrying at least the VHF RTF frequencies to permit communication with London (Heathrow) Airport Approach/Director/Radar, Tower and Ground Movement Control:

   i. The flight must be made on a VFR or Special VFR clearance under the weather conditions and along the routes specified in the EGLL AD 2.22, paragraph 12.
   ii. The first VHF RTF communication with Approach Control must include the words 'Customs required' if the flight is an international one.

c) An operator which has not operated a scheduled service or a series charter service from Heathrow prior to 1 November 1992 shall only be permitted to commence a scheduled service or a series charter service from Heathrow to a destination which was not served from the

airport by any operator in the twelve months prior to 1 November 1992 if any jet aircraft to be used meets the requirements ICAO Annex 16, Chapter 3.

d) When applying for permission to commence a service falling within the terms of this Condition, documents attesting that jet aircraft comply with Chapter 3 Noise certification standards must be produced. If these documents are not produced the aircraft will be regarded as a non Chapter 3 aircraft.

e) All flights are at all times subject to PPR within the terms of the Heathrow Rule 1 Traffic Distribution Rules 1991. The filing of a flight plan with NATS or receipt of an ATC clearance does not constitute permission to use London Heathrow.

f) Availability: H24, subject to the approval of the Director of Operations, Heathrow Airport Ltd, and the acceptance of the flight by the coordinator (Airport Co-ordination Ltd). For the purposes of this paragraph, Scheduled Flights shall mean: commercial passenger flights; commercial all-cargo flights; positioning flights to operate a planned commercial service or to undergo essential maintenance; ambulance flights; other non-commercial flights operated in support of commercial operations including but, not limited to, air tests, training flights, technical stops. Subject to paragraph (g), the airport may not be used by aircraft other than those engaged on Scheduled Flights unless:

   i. prior written permission and a clearance number for each flight is obtained from the Director of Operations, Heathrow Airport Limited; and
   ii. a slot has been obtained in advance of each movement from the airport co-ordinator.

   Applications for prior permission must be made in writing not more than 10 days and not less than 24 hours before the proposed flight to the Director of Operations, The Compass Centre, Nelson Road, Heathrow Airport, Tel: 020-8757 4470. Once permission has been granted to an operator for a particular operation, permission will be deemed granted on subsequent occasions provided there is no material difference in the type of operation (in such cases a further application for prior permission must be made as above) and provided that the Director of Operations shall not have revoked the permission, which he shall be able to do in his absolute discretion.

   Applications for a slot must be made not less than 24 hours before the proposed flight, and should be addressed to the Manager, Airport Co-ordination LTD, by Tel: 020-8564 0613, Fax: 020-8564 0690, available during office hours; or by email: LONACXH@acl-uk.org.

   Both applications must include the following information.

   i. Aircraft owner/operator;
   ii. Aircraft type and registration;
   iii. Origin and/or destination;
   iv. ETA and ETD;
   v. Number of passengers;
   vi. A handling agent (Airline Operator or Handling Agent based at Heathrow) is a requirement for all flights including general aviation and helicopter movements;
   vii. Purpose of flight.

   Use is also subject to limitations imposed by Night Noise Restrictions (see current supplements).

g) For the purposes of this paragraph (g), 'General or Business Aviation' shall mean any air traffic not falling into any of the following categories:

   i. Scheduled Flights (as defined in paragraph (f));
   ii. Air-Taxi Services which shall mean: non-scheduled air transport operations for hire or reward in the case of passenger air transport operations where the seating capacity of the aircraft used exceeds 10;
   iii. Official Flights which shall mean: any traffic engaged on the King’s flight or on flights operated primarily for the purpose of the transport of Government Ministers or visiting Heads of State or dignitaries from abroad.

   Operators of General or Business Aviation aircraft may not operate at any time unless:

   i. they obtain prior written permission to do so from the Director of Operations, Heathrow Airport Limited; and
   ii. they obtain a slot in advance of each movement also from the airport co-ordinator; and
   iii. irrelevant of their time of arrival and departure, they operate the movement (departure and arrival) to the approved slot time.

   Those who fail to comply with (g) (i), (ii), or (iii), are liable to be prohibited from operating thereafter, unless the Director of Operations, Heathrow Airport Limited is satisfied that the movement amounted to an emergency or other circumstances beyond the control of the operator or the commander of the aircraft.

   Applications for prior permission must be made in writing not more than 10 days and not less than 24 hours before the proposed flight to the Director of Operations, The Compass Centre, Nelson Road, Heathrow Airport, Tel: 020-8757 4470. Once permission has been granted to an operator for a particular operation, permission will be deemed granted on subsequent occasions provided there is no material difference in the type of operation (in such cases a further application for prior permission must be made as above) and provided that the Director of Operations shall not have revoked the permission, which he shall be able to do in his absolute discretion.

   Applications for a slot must be made not less than 24 hours before the proposed flight, and should be addressed to the Manager, Airport Co-ordination LTD, by Tel: 020-8564 0613, Fax: 020-8564 0690, available during office hours; or by email: LONACXH@acl-uk.org.

   i. Aircraft owner/operator;
   ii. Aircraft type and registration;
   iii. Origin and/or destination;
   iv. ETA and ETD;
   v. Number of passengers;

vi. A handling agent (Airline Operator or Handling Agent based at Heathrow) is a requirement for all flights including general aviation and helicopter movements;
vii. Purpose of flight.

Flights for recreational, commemorative, charity and record breaking purposes, light twin engined private aircraft and all light single engined aircraft will not be permitted to use the airport. 'Light aircraft' shall be defined as any aircraft that has a maximum gross take-off weight of 12,500 lb (5,670 KG) or less.

h) Diversion Procedure – Airlines and other operators are advised to avoid filing London Heathrow as an alternate. However, where this is unavoidable, they are required to have made arrangements for ground handling with an airline from the appropriate terminal. It should be noted that during the night, ground handling facilities are very limited without prior arrangement. Nothing in this procedure shall, however, prevent an aircraft that has declared an emergency from landing.
i) The operation of the Antonov An225 is subject to prior approval of the Airside Operations AfDM, Tel: 0208-745 7373.
j) Fixed-wing and rotary aircraft using London Heathrow Airport do so in accordance with the Heathrow Conditions of Use document. A copy of the document is available at www.heathrowairport.com.
k) In order to provide a stable and deliverable schedule during times of disruption Heathrow Airport Ltd, in agreement with the AOC and Airline Operators (AOs), has developed the following mechanisms to assist with both short term and longer-term disruption. These interventions aim to minimise the impact of disruption to passengers and the local community, whilst providing participating airlines with the ability to pre-tactically cancel flights in advance of expected disruption and thus minimise the risk of tactical cancellations. Interventions are managed on behalf of Heathrow Airport by the Aircraft Operations Duty Manager (AODM). The AODM is available H24 via tel +44(0)208-757 3501.

i. Level One intervention – tactical tools and methodologies used to minimise the impact of short term capacity issues. These are applied under BAU conditions;
ii. Level Two intervention – When inclement weather is forecast the AODM, in conjunction with ATC, will assess the risk to the normal operations of the airfield. If disruption is expected the AODM will convene a conference call with the top 23 airlines (in terms of ATMs) where it may be agreed that airlines are required to make a pre-tactical reduction in their schedules. Heathrow may also decide not to accept diversions during a period of disruption, and ad-hoc slots may be suspended. All outcomes will be communicated via NOTAM. Airport Coordination Limited (ACL) is responsible for monitoring the utilisation of slots and applying the “use it or lose it” (80:20) rule as required under the European Union Regulation 95/93 amended by 794/2004. ACL will review each activation of the Demand v Capacity process on a case by case basis. ACL will look favourably on those air carriers that comply with the request by the airport to cancel in advance of predicted disruption following the issuing of a NOTAM and will provide alleviation for 80:20. ACL will review cancellations that occur in the same way it would for any other disruption, which may lead to further alleviations.
iii. Level Three intervention – if inclement weather is forecast for a more prolonged period (generally in excess of 24 hours) or if the airport has experience a loss of critical resource, systems or infrastructure and disruption is expected to last for greater than 24 hours the Head of Operations would instigate Heathrow Airport Demand and Capacity Balancing (HADACAB). A conference call is held with the top 50 airlines (in terms of ATMs) and under the Terms and Conditions of use of Heathrow a schedule reduction is mandated. Such reductions are also considered for 80:20 alleviation. Generally, a Level Three Intervention is preceded by a Level Two intervention.
iv. Level Four intervention – in the event of the loss of a significant asset or processing agent (including staff) resulting in disruption that is expected to last for a prolonged period (such as loss of terminal, loss of runway) then the Head of Operations would instigate Heathrow Airport Demand and Capacity Balancing (HADACAB). A conference call is held with all airlines and under the Terms and Conditions of use of Heathrow a schedule reduction is mandated. Such reductions are also considered for 80:20 alleviation. A Level Four intervention may not necessarily be preceded by a Level Two or Three intervention.

2 GROUND MOVEMENT

a) **General**

i. Ground Movement Control (GMC) is in continuous operation and all surface movement of aircraft, vehicles and personnel on the Manoeuvring Area is subject to ATC authority. Some vehicles are permitted to operate on taxiways without being under positive control from ATC. These vehicles are said to be ‘free ranging’ and must give way to aircraft at all times, maintaining a listening watch on the relevant GMC frequency.
ii. Directions issued by ATC should be followed specifically. RTF transmissions must be brief, concise and kept to the minimum number.
iii. Within the Movement Area, pilots will be cleared to and from the aircraft stands under general direction from GMC. Pilots are reminded of the extreme importance of maintaining a careful lookout at all times.
iv. Pilots are to use the minimum power necessary when manoeuvring on the taxiway system. This is of particular importance when manoeuvring in the apron cul-de-sacs, where jet blast can affect adjacent stands.
v. Flight crew are reminded of the extreme importance of maintaining a careful lookout at all times and are at all times responsible for wing tip clearance. The taxiway lighting system is an aid to pilots when they are operating on the manoeuvring area during darkness or in poor visibility. Notwithstanding the taxiway lighting system, pilots continue to remain responsible for wing tip clearance.
vi. In promulgated holding areas, ATC may require aircraft to pass each other. Avoidance of other aircraft is the responsibility of the flight crew involved. If doubt exists as to whether other aircraft can be safely overtaken, aircraft must stop, advise ATC, and request ATC for alternative instructions.
vii. Heathrow Airport is equipped with an advanced surface movement radar utilising Mode-S.

1. Aircraft operators intending to use London Heathrow Airport should ensure that Mode S transponders are able to operate when the aircraft is on the ground.
2. Flight crew should select XPDR, or equivalent, AUTO if available, and the assigned code:

a) From the request to push back or taxi, whichever is earlier;

b) After landing, continuously until the aircraft is parked on stand.

After parking the Mode A code 2000 must be set before selecting OFF or STDBY.

3. Flight crew of aircraft equipped with Mode S having an aircraft identification feature should also set the aircraft identification. This setting is the aircraft identification specified in Item 7 of the ICAO ATC Flight Plan. The aircraft identification should be entered from the request for push back or taxi, whichever is earlier, through the FMS or the Transponder Control Panel.

viii. Pilots are required to inform Heathrow Delivery if the aircraft livery conflicts with the aircraft callsign.
ix. For the safety of ground personnel, flight crews are requested not to flash or illuminate nose gear lights whilst on stand without prior warning to ground crew.

b) **Manoeuvring Area**

i. The manoeuvring area designation system is illustrated on page AD 2-EGLL-2-1. The taxiway designation system uses alphabetical letters to identify main taxiways. Stub taxiways that connect main taxiways are designated as 'Link'. The runway holding areas have named reporting points. Entrance/exits for the runways have alpha/numeric designations'.
ii. The Manoeuvring Area is equipped with the following forms of taxiway guidance:

1. Yellow painted taxiway centre-lines;
2. Yellow painted holding position lines at the approach to runways;
3. Yellow painted special holding position lines related to runway protection in CAT II/III;
4. Green taxiway centre-line lights and red stopbars controlled from the Tower;

(aa) During the hours of darkness or reduced visibility. Aircraft may be requested to ‘follow the greens’, in addition to being given a verbal clearance limit. This means aircraft should follow the green centre-line lights, until either the verbal clearance limit or a red stop bar is reached. Aircraft should not proceed past a verbal clearance limit without ATC approval, even if no red stop bar exists.

(bb) During daylight hours red stop bar lights will be illuminated at each runway entry point. Aircraft must not proceed past until the stop bar is extinguished and ATC permission is received. No green centre-line lights are provided during daylight hours.

5. An illuminated red stopbar means STOP. Aircraft must not proceed until the stopbar is extinguished and ATC permission is received;
6. Runway Guard Lights: Pairs of alternately flashing ground mounted yellow lights at each side of the taxiways, where they connect with a runway, operate H24.

iii. Ground movement of large aircraft:

1. A380 aircraft – taxiway routes available to the A380 are shown on chart AD 2-EGLL-2-3, marked in yellow. In addition, B747-800 aircraft are permitted to use taxiway Sierra west of S6 and Link 41. Reduced ‘taxiway centre-line to object clearance’ of 49 M applies on the following taxiways: Bravo between Foxtrot and Link 11; Echo between Bravo and Link 36; Whiskey between Sierra and Tango; Sierra between SY6 and Tango. Reduced clearance of 47.5 M to an airside road to the east of Taxiway Alpha at MORRA. Pilots are to ensure that aircraft remain on the taxiway centre-line at all times, it is recommended that judgemental steering is used at all times when manoeuvring on the taxiways. Pilots are to use minimum power when manoeuvring in Terminal 4.
2. Pilots of Code E aircraft must exercise caution when using Taxiway Sierra between Reporting Point SY6 and Taxiway Z as wing tip clearances to the south are minimal.
3. All B747/400 aircraft on Taxiway Zulu must be under tow.
4. Aircraft Code E and above - it is recommended that flight crews use judgemental steering at all times when manoeuvring on the taxiways. These aircraft are not permitted to use the following route; Eastbound on Taxiway Sierra at NESSY - turning right onto Link 41 to face west and vice-versa.

iv. Code E taxiway-taxiway separation of 80 M is not met as follows: Taxiways Alpha-Bravo between Hotel and AY5.
v. Code E taxiway to stand, or taxiway to object separation of 43.5 M is not met to the east of Taxiway Foxtrot between F1 and Taxiway Golf (42.5 - 43 M), and to the south of Taxiway Sierra between SY6 and Taxiway Z (37 M).
vi. Code F taxiway to stand, or taxiway to object separation of 51 M is not met to the south of Taxiway Bravo (N) between stands 336 and 357 (49 M).
vii. Taxiway Yankee between HANLI and Taxiway Alpha is restricted to aircraft with a maximum size of Code C.
viii. Link 56 restricted to aircraft with a maximum size Code D.

c) **Engine Ground Running**

Accountability for the control of ground noise at Heathrow rests with Heathrow Airport Limited (HAL). Various restrictions regarding aircraft operations are related to the planning conditions (as amended) for Terminals 4 and 5. In addition, the running of Auxiliary Power Units is controlled.

i. **Operations at Terminal 4**

1. **Stands 401-403 and 429-432**, except in an emergency, **between 2330 (2230) and 0600 (0500)**; no use of aircraft engines shall be permitted to, from or onto these stands;

2. **Taxiway route 'S' east of 'V' apron or through 'Link 41' to S1 and reverse.** Aircraft are prohibited from accessing and departing from the terminal site by taxiing on the route above between 2330 (2230) and 0600 (0500) except in an emergency or as a consequence of essential maintenance work on the alternative access routes.

ii. **Operations at Terminal 5**

Between 2330 (2230) and 0600 (0500):

1. Aircraft arriving at Terminal 5 and those scheduled to depart in that period, will use stands closest to the centre of the site in preference to outer stands;
2. Taxiing operations to the north and south of the T5 application site will be restricted to inner taxiways only, except in an emergency or for the maintenance of the runway and taxiway system.

iii. **Hierarchy of power sources**

The following hierarchy of power sources must be followed:

1. FEGP - to be used whenever supplied and serviceable;
2. GPU - only to be used when FEGP is not supplied or the unit is unserviceable;
3. APU - only to be used when neither FEGP nor GPU is supplied or both units are unserviceable.

iv. **Auxiliary Power Units (APU) procedures**

1. APU must be shut down at the earliest opportunity on arrival on stand.
2. APUs are not permitted to be used between 2330-0600 (2230-0500) on:

   Cargo Area stands 601-609 and 614-616;

   Stands 401-403 and 429-432, except in an emergency.

3. No APU is to be left running unless either a qualified person is in attendance or the APU has both an auto-shut down and auto-extinguishing facility.

v. Restrictions on the use of APUs are:

	Before Estimated Time of Departure - start	**Arrival terminating operation - shut down**
Narrow Body Aircraft	No more than 15 minutes †	10 minutes after arrival on stand †
Wide Body Aircraft (B747, B767, B777, B787, MD11, A300, A310, A330, A340)	No more than 30 minutes †	10 minutes after arrival on stand †
A380	No more than 60 minutes †	15 minutes after arrival on stand †

† Exemptions to these restrictions are:

1. When the aircraft is scheduled to be towed, the APU may be started if no other external power source is available but no earlier than 10 minutes prior to the planned movement.
2. When the planned towing movement as specified under 1 is delayed due ATC, then the APU may be left running.
3. Where no fourth FEGP plug is available on stand, A380 aircraft are permitted to use a GPU to support FEGP usage.
4. If the ambient cabin temperature is too high and the PCA (Pre-conditioned Air) is unable to bring the temperature to a desired value after an extended period of use, or the PCA cannot be used/is not available, such as during a strong wind warning (as promulgated through AOP (Airport Operations Plan) and the Airport Community Apps). APU may be used 30 minutes before ETD for Narrow-bodied Aircraft.
5. If the ambient cabin temperature is too high and the PCA is unable to bring the temperature to a desired value after an extended period of use, or the PCA cannot be used/is not available, such as during a strong wind warning (as promulgated through AOP and the Airport Community Apps). APU may be used 55 minutes before ETD for Wide-bodied Aircraft (Except for A380).
6. If the ambient cabin temperature is too high and the PCA is unable to bring the temperature to a desired value after an extended period of use, or the PCA cannot be used/is not available, such as during a strong wind warning (as promulgated through AOP and the Airport Community Apps). APU may be used 90 minutes before ETD for A380.

vi. If an Airline wishes to make use of the Engine Ground Run pens they should contact British Airways maintenance control on 020-8513 0880. Requests will only be accepted when there is spare capacity.

d) **Runway Crossing Procedure (Runway 09R/27L)**

i. Aircraft and vehicles which are required to cross active runways will be issued instructions by the Ground Movement Controller, which will include a holding point as a clearance limit, at which the aircraft or vehicle will be required to hold short of the active runway.
ii. When reaching the clearance limit specified in the taxiing instructions, the aircraft or vehicle will be instructed to change frequency to that of the Air Controller of the appropriate runway.

iii. After crossing the runway and having reported 'runway vacated' with the Air Controller, the aircraft or vehicle will be instructed to revert to the GMC frequency for further clearance. In the absence of further clearance pilots should turn onto the first available taxiway and come to a stop.

e) **Start-up Procedures**

i. General

1. ATC are responsible for clearance delivery as a separate function from Ground Movement Control (GMC). **Pushback approval must be obtained from GMC.** Pilots who wish to start engines on stand must request permission from GMC. Pushback approval includes permission to start engines during pushback.
2. Pilots are to report their aircraft type, stand number, QNH and the identification letter of the received ATIS information on first contact with 'Heathrow Delivery'.
3. All jet aircraft are to advise ATC if, for any reason, they are unable to accelerate after noise abatement procedures to 250 KT.
4. Any jet aircraft with a minimum clean speed of greater than 250 KT must inform Heathrow Delivery.
5. In Terminal 5 only (T5A, T5B, T5C and T5D Stands 501-596), Ramp Information Display System (RIDS) screens are situated in proximity to the head of stand area. The information provided on each screen will be unique to the flight on stand at any given time and will provide turnaround status information to the flight crew. The screens are for **information only and are not to be mistaken for Visual Docking Guidance System (VDGS).**

ii. **Airport - Collaborative Decision Making (A-CDM)**

1. TOBT/TSAT

(aa) Pilots should take note of the **TSAT** which they receive from their AO/GH or ATC and comply with it;

(bb) **If TOBT or TSAT** can no longer be met, at any time, then TOBT must be updated by AO/GH;

(cc) Pilot should ensure that the flight is ready to depart at **TOBT (window of -5 to +5 minutes).**

2. Start Request - Heathrow Delivery

(aa) Pilot should report ready to Heathrow Delivery at **TOBT (window of -5 to +5 minutes);**

(bb) ATC will then **approve start** or in the case of a delay will **advise the TSAT;**

(i) Pilots to monitor the frequency from this point, as TSAT can improve up to TOBT;

(ii) Start approval will be issued, based on TSAT and the prevailing traffic situation;

(iii) Pilots will be informed of an ATC delay to TSAT in excess of 5 minutes.

(cc) If at **TOBT + 5 minutes** ATC have not received a start up request the aircraft may lose its position in the sequence.

(i) ATC will advise the pilot that a new TOBT is required;

(ii) Once the new TOBT is entered the flight will be re-sequenced according to a new TOBT, with a subsequent delay;

(iii) The aircraft will not be allowed to depart until a valid TOBT is entered and revised TSAT given and complied with.

3. Pushback Request - Heathrow Ground

(aa) Pushback/Start clearance must be requested from Ground no later than 5 minutes after being transferred from Delivery;

(bb) If unable to meet this constraint, the aircraft will not be allowed to pushback. A valid TOBT must then be issued by the AO/GH and ATC will then issue a revised TSAT.

4. Remote Holding Request

(aa) If an eligible AO is aware of a CTOT and wishes to take the delay on a taxiway rather than on the stand, then they should contact the Heathrow Operational Efficiency Cell on +44 (0)208-750 2636 to arrange it;

(bb) In this instance, the TSAT will be adjusted to allow the aircraft to be transferred to GMC earlier for the remote hold.

5. Aircraft De-icing Requirements.

(aa) Annually, Heathrow publishes an Aircraft De-icing Plan (HADIP). All airline operators should ensure that they have read and understood this document. A copy of the plan can be downloaded from www.heathrow.com/airside.

(bb) During periods of high demand for de-icing, Heathrow activates the A-CDM ‘Winter Module’ which includes aircraft de-icing rig allocation capability.

(cc) In order to request de-icing, pilots should follow their company's standard procedure. In accordance with Heathrow's de-icing plan, operators will enter the requirement for de-icing into A-CDM, which will ensure that de-icing resources are allocated appropriately. If the aircraft is to be de-iced remotely, operating companies will pass this information to pilots prior to push. Remote de-icing facility locations are shown on chart AD 2-EGLL-2-8.

(dd) When doors are closed and ready to commence de-icing on gate, pilots must call Heathrow Delivery stating "Ready for de-icing". This call must be made at +/- 5 minutes from TOBT.

(ee) Once de-icing on the gate is complete, pilots should call Heathrow Delivery again, stating 'De-icing complete, ready to push and start'.

(ff) Pilots who have been allocated a remote de-icing area should contact Heathrow Delivery, stating 'Ready to push and start for remote de-icing'.

6. Coordination with Eurocontrol NM.

A permanent and fully automatic data exchange with the Eurocontrol NM (Network Management) is established. This data transfer enables highly accurate early predictions of landing and departure times. Furthermore, this allows for more accurate and efficient calculation of the CTOT due to the use of local target take-off times.

The following system-to-system messages are used:

Messages sent by NMOC to Airport via Publish & Subscribe Service:

- Flight Plan Messages;
- Flight Data Messages.

Messages sent by Airport to the NMOC for arrival flights:

- General Arrival Planning Information Messages (G-API) - up to 48 hours before the flight.

Messages sent by Airport to the NMOC for departure flights:

- Predicted Departure Planning Information Messages (P-DPI) - up to 48 hours before the flight;
- Early Departure Planning Information Messages (E-DPI);
- Target Departure Planning Information Messages (T-DPI);
- ATC Departure Planning Information Messages (A-DPI);
- Cancel Departure Planning Information Messages (C-DPI).

The basic Eurocontrol NM procedures continue to apply.

These DPI and API messages include TOBT, TSAT, TTOT as well as information on the arrival or departure flights and airport resources. The Network Operation will consider these TTOT when updating flight profile in its system and will try to adjust the CTOT accordingly, if possible. With the introduction of P-DPI and G-API messages exchanged with NM Systems, those messages may impact the ATFM Network earlier than the start of A-CDM (EOBT-3h) and up to 48 hours before EOBT, and these data may be used for air traffic flow management (ATFM) purposes.

iii. Clearance Delivery

1. ATC departure clearances may be obtained by Voice RTF or Data link Departure Clearance Service (DCL) (via SITA or ARINC (623)).
2. Voice RTF

(aa) Between 0630 (0530) and 1400 (1300) and between 1500 (1400) and 2200 (2100), pilots may call for ATC clearance up to 15 minutes prior to be being fully ready to push-back.

3. Datalink Departure Clearance Service (DCL) (via SITA or ARINC (623))

(aa) The DCL service is available from EOBT -25 until EOBT +15 minutes.

(bb) DCL Clearances will not be issued if requested later than EOBT +15 minute. Successful clearances must be ACCEPTED within 5 minutes of receipt or a 'Revert to voice' message will be received.

(cc) If any data errors are detected by the system or the controller a 'revert to voice' message will be received.

(dd) If the attempt to obtain a clearance is unsuccessful the aircraft should revert to voice RTF.

(ee) Further details of the DCL service may be obtained from ATC operations on + 44 (0)208-750 2621.

(ff) **Regardless of clearance source, departing aircraft must report their aircraft type, stand number, QNH and the identification letter of the received ATIS information to 'Heathrow Delivery' when fully ready for pushback and start**.

(gg) In strong crosswind conditions (crosswind component above 35 knots), pilots are requested to advise Ground Movement Planning, on start-up, of their aircraft crosswind limitations. This is to enable better tactical planning at the Runway Holding point and a more efficient departure rate. In those conditions, this requirement will be confirmed through ATIS broadcast and NOTAM (if sufficient time allows).

iv. RVR below 400 M

When the RVR is below 400 M pilots are not to request start-up clearance until the reported RVR is equal to or greater than the appropriate value in the following table:

AIRCRAFT TAKE-OFF MINIMA	MINIMUM RVR FOR START-UP CLEARANCE
350 Metres RVR	300 Metres RVR
300 Metres RVR	250 Metres RVR
250 Metres RVR	200 Metres RVR
200 Metres RVR	150 Metres RVR
150 Metres RVR	150 Metres RVR
100 Metres RVR	100 Metres RVR
75 Metres RVR	75 Metres RVR

It is emphasised that these measures will apply only when the reported RVR is below 400 M and the co-operation of all pilots is sought in maintaining the safety level in low minima operations.

v. During busy periods (normally following disruption), aircraft that are fully ready may be transferred to 'Heathrow Planning' prior to GMC. The 'Planning' controller will determine the order that start approvals are issued and will issue expected start times accordingly. Pushback approval must be obtained from GMC.

f) **Push-back procedure**

i. Following push-back from cul-de-sac stands, all aircraft must be pulled forward to a minimum of 100 M from the blast screen (indicated by a painted mark on the taxiway centre-line) before disconnecting the tug. Due to exhaust fume ingestion within the buildings at the ends of each cul-de-sac, engine start-up must be delayed until the aircraft has reached the 100 M point. Pilots should be aware that, in order to maximise capacity within the Kilo (S) Cul-de-sac, push-back clearances provided by ATC may include reference to a numbered 'Tug Release Point' TRP 1, TRP 2 or TRP 3, which should be passed to ground crew along with the clearance. Ground handlers will understand these clearances and perform the push accordingly.
ii. Before flight crew calls for push-back they must ensure that the tug driver is in the tug, ready to push, and able to listen to the communication with ATC.
iii. Flight crews should only illuminate aircraft anti-collision lights following engine start or push back clearance from ATC.

g) **Departures – Minimum Runway Occupancy Time**

i. On receipt of line-up clearance pilots should ensure, commensurate with safety and standard operating procedures, that they are able to taxi into the correct position at the hold and line up on the runway as soon as the preceding aircraft has commenced its take-off roll.
ii. Pilots in receipt of a conditional line up clearance on a preceding departing aircraft (for example; **'ABC123 behind the departing Sky Train A330, line up Runway 27L behind'**) should remain behind the subject aircraft but may cross the runway holding point (subject to there being no illuminated red stop bar) and enter the runway upon receipt of the clearance. There is no requirement for the subject aircraft to have commenced its take-off roll before entering the runway. **Pilots must be aware that there may be a blast hazard as the aircraft on the runway applies power**.

Pilots in receipt of a conditional line up clearance on a preceding arriving aircraft (for example; **'ABC123, behind the landing Sky Train A330, line up Runway 27L behind'**) may cross the runway holding point (subject to there being no illuminated red stop bar) as soon as the landing aircraft has passed the runway entry point.

Pilots are advised that there is an increased risk of Runway Incursions when holding at N11 and NB11. Pilots may mistakenly believe that when on reaching the front of the queue, they have been given permission to line up in turn. Pilots are to be extra vigilant as to whether they have received a line-up clearance from ATC and seek confirmation where there is doubt.

iii. Pilots who require to back-track the runway (including line up from N2W onto Runway 27L) must notify ATC prior to arrival at the holding point.
iv. Whenever possible, cockpit checks should be completed prior to line up and any checks requiring completion whilst on the runway should be kept to the minimum required. Pilots should ensure that they are able to commence the take-off roll immediately take-off clearance is issued.
v. Pilots not able to comply with these requirements should notify ATC as soon as possible once transferred to Heathrow Tower Departures Frequency.

h) **Intersection Departures**

i. Runway 27R; A4; Runway 27L, N3 and S3, Runway 09R; N8 and N10 are **NOT**, for the purposes of wake turbulence, considered by ATC to be intersection departures.

ii. Pilots in receipt of a conditional line up clearance holding at an intersection (for example; **'ABC123, behind the departing Sky Train from the full length, line up Runway 27L via NB3 behind'**) should remain behind the runway holding point until the subject aircraft has passed the intersection at which they are holding.

i) **Reduced Engine Taxi**

i. Whenever operationally and safely feasible, all aircraft are requested to shut down as many engines as possible while taxiing and holding on the ground, **EXCEPT** in the following circumstances:

aa. By any aircraft that is required to cross an active arrival runway;

bb. By any aircraft exiting T and turning west onto S, Link 44 and Link 42 due to jet blast;

cc. By B777 variants in G and H due to jet blast;

ii. Pilots who intend to execute Reduced Engine Taxi on departure **MUST** report their intention to Heathrow Delivery on first contact by data link or if not possible by RT. This is essential for safety and operational reasons.

In the apron areas minimum engine power shall be used as far as possible, and use of reverse thrust for manoeuvring to and from a stand is not permitted.

iii. Any aircraft with a CTOT should plan Reduced Engine Taxi to be ready for departure at CTOT - 5 minutes. This is essential for ATC sequencing.

3 CAT II/III OPERATIONS

a) Runways 09R, 09L, 27R and 27L, subject to serviceability of the required facilities, are suitable for Category II and III operations.
b) During Category II and III operations, special ATC procedures (ATC Low Visibility Procedures) will be applied. Pilots will be informed when these procedures are in operation by Arrival and Departure ATIS or by RTF. ATC Low Visibility Procedures will only be applied when the RVR is less than 600 M.
c) The ILS on the departure runway will be turned off when the IRVR is greater than 250 M. Pilots requiring the ILS for departure when the IRVR is in the range 275 M to 550 M must inform Heathrow Delivery.
d) Arriving Aircraft: Surface Movement Guidance and Control System (A-SMGCS) is normally available and all runway exits will then be illuminated. Pilots should select the first convenient exit.
e) Pilots are to delay the call 'runway vacated' until the aircraft has completely passed the end of the green/yellow colour coded taxiway centre-line lights.
f) When Low Visibility Procedures are in force a much reduced landing rate can be expected due to the requirement for increased spacing between arriving aircraft. In addition to the prevailing weather conditions, such factors as equipment serviceability may also have an effect on actual landing rates. For information and planning purposes, the approximate landing rates that can be expected are:

IRVR (M)	Expected landing Rate
Between 1000 and 600	34
Between 600 and 150	24
Less than 150	Less than 20

4 WARNINGS

a) Pilots are warned, when landing on Runway 27R in strong southerly/south westerly winds, of the possibility of building-induced turbulence and large windshear effects.
b) Similarly, Runway 27L arrivals may be affected by winds with a strong Northerly component. Building-induced turbulence may be experienced at the mid sections of each runway from winds with a strong Southerly, or strong Northerly component.
c) Electricity pylons running on a line NE/SW and 2.6 NM W from ARP at 182 FT AAL/262 FT AMSL.
d) Paramotor activity at Elm Farm, within the London CTR. Activity is restricted to 1000 FT AMSL within a circle of radius of 0.75 NM centred on 512151.00N 0001929.00W.
e) Model aircraft club activity within Heathrow FRZ. Activity is restricted to 475 FT AMSL within a radius of 0.16 NM centred on 512915.5N 0002459.79W.
f) Model aircraft club activity within Heathrow FRZ. Activity is restricted to 292 FT AMSL. The area of operation of the Small Unmanned Aircraft (SUAs) will be contained in a semi-circle of radius 0.157 NM radiating to the north, with the straight-line end points being located at 512923.9N 0002657.3W and 512922.5N 0002645.1W.
g) Cranes operating within an area bounded by co-ordinates:
513026N 0002321W - 513028N 0002327W - 513027N 0002329W - 513029N 0002328W.
Maximum elevation restricted to 328 FT AMSL. Height 223 FT AGL. Cranes will have obstruction lighting.

5 HELICOPTER OPERATIONS

a) General

i. Normal Flight Priority (defined in CAP 493 Manual of Air Traffic Services) helicopter arrivals, departures and overflights of Heathrow are only permitted on a VFR clearance provided that the Heathrow reported visibility is 5 KM or greater and the reported cloud ceiling 1500 FT or greater.

ii. Special VFR helicopter overflights, along with arrivals and departures via H9 south of Heathrow, are permitted provided that the Heathrow reported visibility is 2 KM or greater and cloud ceiling 600 FT or greater. SVFR helicopter overflights, arrivals and departures are normally restricted to High Flight Priority (A-E) helicopters.
iii. Helicopter operations at Heathrow commence and terminate at Sipson to the north and Bedfont or Feltham to the south. Helicopters must hold at these points unless instructed otherwise by ATC. See chart AD 2-EGLL-4-1.
iv. Whilst holding at Sipson or Feltham, helicopters are separated for both ATC and wake turbulence purposes from fixed wing aircraft landing on, departing from, or executing missed approaches to all runways.
v. When the meteorological conditions exist for VFR flight (detailed in (i)), helicopters approaching the airfield from the south will be held at Bedfont. These helicopters will be separated for wake turbulence but pilots must remain in visual contact with aircraft on approach to 27L. Pilots are warned that missed approach aircraft will turn left at 1000 FT AAL.
vi. When the meteorological conditions do not exist for VFR flight (detailed in (i)), helicopters may require IFR separation and will be held at Feltham to the south. Integration of this traffic will require an increased gap in the IFR arrival stream and the helicopter may incur a significant delay.
vii. Helicopters are not to cross Heathrow below altitude 800 FT.
viii. There are occasions when the departure runway is required for landing traffic. This will also incur extra delay as the helicopter crossing procedures cannot be carried out with aircraft inbound to both runways simultaneously.

b) Crossing procedures Runways 27L/R

i. Helicopters will normally be instructed to cross the departure runway to the east of the threshold. See chart AD 2-EGLL-4-1.
ii. When a suitable gap in the landing stream exists, ATC will pass traffic information on a fixed-wing landing aircraft and issue a crossing clearance behind. The helicopter will cross in the gap after the subject aircraft as close to the threshold as practicable and as expeditiously as possible. Once clear of the runway, route to the east of the departure runway and resume the route to Sipson/ Bedfont as appropriate to hold, unless otherwise instructed by ATC.
iii. Where the departure runway is crossed first, holding prior to crossing the landing runway will be permitted between the two main runways. For aircraft in a holding pattern, this operation must take place between the departure threshold and a line drawn east-west through the southern edge of the Virgin hangar. Chart AD 2-EGLL-4-1 refers. (The hangar has Virgin on all sides and is to the east of the fire training ground where the green ‘aircraft’ is sited). No helicopter is to cross this line until a clearance to cross the landing stream is received. Having crossed the landing runway route to Sipson/Bedfont as appropriate to hold, unless otherwise instructed by ATC.
iv. In the event of a loss of communication, see paragraph e.

c) Crossing procedures Runways 09L/R

i. The northbound route for helicopters is: Bedfont-Stanwell-West of Terminal 5-Longford-Sipson. See chart AD 2-EGLL-4-1.
ii. If there is inbound traffic to 09R, helicopters will be instructed by ATC to route Bedfont-Stanwell. The pilot will be instructed to hold at Stanwell and will wait for a suitable gap in the approach. If there is no 09R inbounds, helicopters will be routed Bedfont-Stanwell-hold West of Terminal 5. This operation is to take place between the departure threshold and a line drawn east-west through the mid-point of Terminal 5 main building. Chart AD 2-EGLL-4-1 refers. No helicopter is to cross this line until a clearance to cross the 09L landing stream is received. When a suitable gap in the 09L landing stream exists, ATC will pass traffic information on a fixed-wing aircraft and issue a crossing clearance behind. The helicopter will cross in the gap as close to the runway threshold as possible. Once clear of the landing stream, route Longford-Sipson to hold, unless otherwise instructed by ATC.
iii. The southbound route for helicopters is: Sipson-Longford-West of Terminal 5-Stanwell-Bedfont. See chart AD 2-EGLL-4-1.
iv. Helicopters will be instructed by ATC to route Sipson-Longford to hold. When a suitable gap in the 09L landing stream exists, ATC will pass traffic information on a fixed-wing landing aircraft and issue a crossing clearance behind. The helicopter will cross in the gap as close to the runway threshold as possible (this may be before Longford) and as expeditiously as possible. Once south of the runway the helicopter will route to the west of Terminal 5 and re-join the route; West of Terminal 5-Stanwell-Bedfont (and must remain west of 09R). If there is inbound traffic on the approach of 09R no clearance will be issued beyond Longford. On completion of the route, hold at Bedfont unless instructed otherwise by ATC.
v. Longford and Stanwell are separated for both wake vortex and ATC visual separations only. Whilst helicopters are transiting between Bedfont and Sipson and vice versa, traffic information will be passed to fixed-wing aircraft for the relevant runway.
vi. In the event of a loss of communication, see paragraph e.

d) Landing and Departing Procedures.

i. All helicopters to and from Heathrow are subject to **PPR**.
ii. Inbound and outbound helicopters will routinely use the helicopter aiming point (HAP). Procedures to/from the HAP are visual to/ from Bedfont. If prevailing weather conditions do not permit this, see Paragraph a (ii), Feltham will be used and standard separation will apply.
iii. If inbound from/outbound to the north, the helicopter will be instructed by ATC to cross both runways from/to Bedfont or Feltham, see paragraphs b or c.
iv. When instructed to route to the HAP from Bedfont or Feltham, or vice versa, remain south of 27L/09R at all times.
v. A 4 minute wake vortex separation exists for all helicopter movements to/from the HAP subsequent to any A380 departures to/from 27L/09R.
vi. The helicopter aiming point is located on the taxiway area east of Link 43. It is marked with an 18 M sided triangle with a conventional 'H'. This aiming point is lit and available for use throughout operational hours. The take-off and climb surface has been protected to 8% to the east and west of the aiming point (see Chart AD 2-EGLL-4-1). Pilots are advised of the presence of a radar tower located on grass area 170 M east of the aiming point. Tower height 31 FT AAL/107 FT AMSL.
vii. Caution must be exercised when using this aiming point which is on a live taxiway.
viii. Helicopters alighting at the aiming point will ground or air-taxi to the parking areas as directed by ATC.

e) Loss of Communications Procedures

i. If no onward clearance has been received before reaching, or when holding at, Sipson or Bedfont, **reverse track and leave the CTR** via: H2-H10-Cookham if approaching **Sipson** or H9 if approaching **Bedfont.**
Do not attempt to cross London Heathrow Airport.

ii. For helicopters overflying or landing at London Heathrow Airport.

1. Between Sipson and Bedfont:

aa if the landing runway has already been crossed, cross the departure runway downwind of the threshold, exercising extreme caution with regard to possible landing traffic; **and leave the CTR via H2-H10-Cookham or H9** to the south as appropriate.

bb if the departure runway has been crossed, with instructions given to hold at the Virgin hangar or West of Terminal 5 to, **reverse track** and to cross the departure runway downwind of the threshold, exercising extreme caution with regard to the possibility of landing traffic; and **leave the CTR via H2-H10-Cookham or H9** to the south as appropriate.

2. If landing at London Heathrow Airport by day or night, and having crossed the runways, if necessary as detailed above:

aa **Proceed to hold at Bedfont**;

bb **Wait for the Helicopter Aiming Point to illuminate;**

cc **Land with caution and await Leader vehicle escort.**

Note: *the selection of squawk 7600 will alert Air Traffic Control to your RTF failure.*

6 USE OF RUNWAYS

a) Preferential Runway System

i. In weather conditions when the tail wind component is no greater than 5 KT on the main Runway 27R and 27L, these runways will normally be used in preference to Runways 09R and 09L, provided the runway(s) surface is dry.
ii. Pilots who ask for permission to use the runway into wind when, in accordance with these procedures, Runway 27R or 27L are in use, should understand that their arrival or departure may be delayed.

b) Runway Vacation Guidelines

i. Arrivals – Minimum Runway Occupancy Time

Pilots are reminded that rapid exit from the landing runway enables ATC to apply minimum spacing on final approach, thereby achieving maximum runway utilisation and minimising the occurrence of missed approaches. All arrivals are to ensure that they are fully vacated before stopping.

ii. **Aircraft lands but cannot contact Heathrow Ground due to RTF congestion:** In this case the pilot should completely vacate the landing runway and taxi into the first taxiway available. The pilot should then hold position until contact with GMC can be established.

iii. A380 should plan to vacate at:

RWY 09L - TWY A6;
RWY 09R - TWY S4E and N4E;
RWY 27L - TWY S6 and N6;
RWY 27R - TWY A10E.

A380 unable to vacate at these exits shall inform approach on first contact.

Vacating beyond the following exits will infringe the localiser critical area. Except for safety reasons, A380 shall not vacate beyond:

RWY 09L - TWY A5;
RWY 09R - TWY S4E and N4E;
RWY 27L - TWY S6 and N7;
RWY 27R - TWY A11.

c) Aircraft Separation

i. Departures - Wake Turbulence Separation

Wake turbulence separations are applied in accordance with the RECAT-EU departure separations. The separations applied are described in EUROCONTROL document 'RECAT-EU European Wake Turbulence Categorisation and Separation Minima on Approach and Departure'. On departure, when in receipt of line up clearance, the pilot must inform ATC if greater wake turbulence separation than the minimum specified will be required behind the preceding aircraft. Failure to do so may result in additional delay.

ii. In certain weather conditions 2.5 NM spacing may be applied on final approach. The conditions when this spacing may be utilised are:

1. Visibility and cloud ceiling equal to or better than 10 KM and 1500 FT with a minimum recommended headwind component of approximately 10 KT.
2. Runway Condition Code is 5 or 6.
3. When aircraft involved in the procedure are being operated normally. It is the pilot's responsibility to inform ATC if they are operating their aircraft other than in the normal manner.
4. Speed on final approach and 2.5 NM spacing from preceding traffic must be stabilised by 8 NM.

7 TRAINING

Not applicable

EGLL AD 2.21 NOISE ABATEMENT PROCEDURES

Notice under Section 78(1) of the Civil Aviation Act 1982

Whereas:

(1) By virtue of the Civil Aviation (Designation of Aerodromes) Order 1981 (a) Heathrow Airport – London is a designated aerodrome for the purpose of Section 78 of the Civil Aviation Act 1982 (b);

(2) the requirements specified in this notice appear to the Secretary of State to be appropriate for the purpose of limiting, or of mitigating the effect of, noise and vibration connected with the taking off or, as the case may be, landing of aircraft at Heathrow Airport – London;

Now, therefore, the Secretary of State, in exercise of the powers conferred on him by Section 78 (1) and (12) of the Civil Aviation Act 1982, by this notice published in the manner prescribed by the Civil Aviation (Notices) Regulations 1978 (c), hereby provides as follows:

1 This notice may be cited as the Heathrow Airport – London (Noise Abatement Requirements) Notice 2010 and shall come into operation on 1 July 2010.

2. The Heathrow Airport – London (Noise Abatement Requirements) Notice 2004 (d) is hereby revoked.

3 It shall be the duty of every person who is the operator of any aircraft which is to take off or land at Heathrow Airport – London to secure that, after the aircraft takes off or, as the case may be, before it lands at the aerodrome the following requirements are complied with:

1. After take-off the aircraft shall be operated in such a way that it is at a height of not less than 1000 FT AAL at 6.5 KM from start of roll as measured along the departure track of that aircraft.

2. The sites of the noise monitoring terminals relating to Heathrow Airport – London are:

Description	OS Co-ordinates	Elevation above aerodrome	Latitude	Longitude
Site 6: Thames Water, Wraysbury	TQ 0207 7502	-6 M	*512754N	0003155W
Site 19 (A): Colnbrook	TQ 0263 7693	-4 M	*512855N	0003124W
Site 18 (B): Poyle	TQ 0278 7647	-4 M	*512840N	0003117W
Site 17 (C): Horton	TQ 0219 7570	-6 M	*512816N	0003148W
Site 15 (D): Coppermill	TQ 0198 7478	-7 M	*512746N	0003200W
Site 14 (E): Wraysbury Reservoir (South)	TQ 0173 7399	-7 M	*512721N	0003214W
Site 11 (F): Hounslow West	TQ 1148 7605	-3 M	*512821N	0002347W
Site 12 (G): Hounslow Cavalry Barracks	TQ 1167 7561	-3 M	*512806N	0002337W
Site 10 (H): Hounslow Heath	TQ 1163 7495	-3 M	*512745N	0002340W
Site 13 (I): East Feltham	TQ 1168 7399	-4 M	*512714N	0002338W
Site 20 (J): Hounslow Cavalry Barracks North	TQ 1173 7577	-3 M	*512812N	0002334W
Site 21 (K): Hobbledown	TQ 1152 7466	-1 M	*512736N	0002346W

3. Subject to sub-paragraphs (5) and (6) below, any aircraft shall, after take-off, be operated in such a way that it will not cause more than 94 dBA Lmax by day (from 0700 to 2300 hours local time) as measured at any noise monitoring terminal at any of the sites referred to in sub-paragraph (2) above.

4. Subject to sub-paragraphs (5) and (6) below, any aircraft shall, after take-off, be operated in such a way that it will not cause more than 89 dBA Lmax by night (from 2300 to 0700 hours local time) **and** that it will not cause more than 87 dBA Lmax during the night quota period (from 2330 to 0600 hours local time) as measured at any noise monitoring terminal at any of the sites referred to in sub-paragraph (2) above.

5. The limits specified in sub-paragraphs (3) and (4) above shall be adjusted in accordance with the following table in respect of any noise monitoring terminal at any of the sites referred to in the table in sub-paragraph (2) above to take account of the location of that terminal and its ground elevation relative to the aerodrome elevation.

Description	Adjustment dBA
Site 6	minus 0.3
Site 19 (A)	plus 2.3
Site 18 (B)	plus 4.8
Site 17 (C)	minus 0.3
Site 15 (D)	minus 0.6
Site 14 (E)	minus 1.0
Site 11 (F)	plus 0.9
Site 12 (G)	minus 0.1
Site 10 (H)	plus 1.2
Site 13 (I)	minus 0.3
Site 20 (J)	minus 0.2
Site 21 (K)	plus 1.5

6. For the purpose of determining an infringement of the limits specified in sub-paragraphs (3) and (4) above, if the aircraft was required to take-off with a tailwind, an amount of up to 2 dB of the noise recorded at the noise monitor should be disregarded. The amount to be disregarded shall be:

- 0.4 dB for a tailwind of up to 1 KT
- 0.8 dB for a tailwind exceeding 1 KT but not exceeding 2 KT
- 1.2 dB for a tailwind exceeding 2 KT but not exceeding 3 KT
- 1.6 dB for a tailwind exceeding 3 KT but not exceeding 4 KT
- 2.0 dB for a tailwind exceeding 4 KT.

For this purpose, tailwind is to be calculated from the wind data measured in the on-airfield anemometers and wind vanes according to the formula:

(windspeed x cosine (runway heading minus wind direction)) x – 1.

7. Where the aircraft is a jet aircraft, after passing the point referred to in sub-paragraph (1) above, it shall maintain a gradient of climb of not less than 4% to an altitude of not less than 4000 FT. The aircraft shall be operated in such a way that progressively reducing noise levels at points on the ground under the flight path beyond that point are achieved.

8. After the aircraft takes off from any runway specified in the first column of the following table, the aircraft shall follow the Noise Preferential Routeing Procedure specified in the third column of the table which relates to the ATC clearance previously given to the aircraft and specified in the second column of the table, whether flying in IMC or VMC:

a) Provided that nothing in this sub-paragraph (8) shall apply:

i. to any propeller driven aircraft whose MTWA does not exceed 5700 KG; or
ii. during the period between 0600 and 2330 hours (local time), any propeller driven aircraft whose MTWA does not exceed 17000 KG or any Dash 7 aircraft.

9. Where the aircraft is approaching the aerodrome to land it shall commensurate with its ATC clearance minimise noise disturbance by the use of continuous descent and low power, low drag operating procedures (referred to in Detailed Procedures for descent clearance in AD 2 paragraphs 3 and 4). Where the use of these procedures is not practicable, the aircraft shall maintain as high an altitude as possible. In addition, when descending on initial approach, including the closing heading, and on intermediate and final approach, thrust reductions should be achieved where possible by maintaining a ‘clean’ aircraft configuration and by landing with reduced flap, provided that in all the circumstances of the flight this is consistent with safe operation of the aircraft.

10. Subject to sub-paragraph (11) below:

a) Between 0600 and 2330 hours (local time) where the aircraft is approaching Runway 27 (L or R) and is using the ILS in IMC or VMC it shall not descend on the glidepath below an altitude of 2500 FT (Heathrow QNH) before being established on the localizer, nor thereafter fly below the glidepath. An aircraft approaching without assistance from the ILS shall follow a descent path which will not result in its being at any time lower than the approach path that would be followed by an aircraft using the ILS glidepath, and shall follow a track to intercept the extended runway centre-line at or above 2500 FT.
b) Between 2330 and 0600 hours (local time) where the aircraft is approaching runway 27 (L or R) and is using the ILS in IMC or VMC it shall not descend on the glidepath below an altitude of 3000 FT (Heathrow QNH) before being established on the localizer at not less than 10 NM from touchdown, nor thereafter fly below the glidepath. An aircraft approaching without assistance from the ILS shall follow a descent path which will not result in its being at any time lower than the approach path that would be followed by an aircraft using the ILS glidepath, and shall follow a track to intercept the extended runway centre-line at or above 3000 FT.
c) Between 0700 and 2300 hours (local time) where the aircraft is approaching Runway 09 (L or R) and is using the ILS in IMC or VMC it shall not descend on the glidepath below an altitude of 2500 FT (Heathrow QNH) before being established on the localizer, nor thereafter fly below the glidepath. An aircraft approaching without assistance from the ILS shall follow a descent path which will not result in its being at any time lower than the approach path that would be followed by an aircraft using the ILS glidepath, and shall follow a track to intercept the extended runway centre-line at or above 2500 FT.
d) Between 2300 and 0700 hours (local time) where the aircraft is approaching Runway 09 (L or R) and is using the ILS in IMC or VMC it shall not descend on the glidepath below an altitude of 3000 FT (Heathrow QNH) before being established on the localizer at not less than 10 NM from touchdown, nor thereafter fly below the glidepath. An aircraft approaching without assistance from the ILS shall follow a descent path which will not result in its being at any time lower than the approach path that would be followed by an aircraft using the ILS glidepath, and shall follow a track to intercept the extended runway centre-line at or above 3000 FT.

11. Nothing in sub-paragraph (10) above shall apply to any propeller driven aircraft whose MTWA does not exceed 5,700 KG.

12. Without prejudice to the provisions of sub-paragraphs (1) - (11) above, the aircraft shall at all times be operated in a manner which is calculated to cause the least disturbance practicable in areas surrounding the aerodrome.

13. The requirements set out in sub-paragraphs (1) - (12) above may at any time be departed from to the extent necessary for avoiding immediate danger or for complying with the instructions of an Air Traffic Control Unit.

4 In this notice, except where the context otherwise requires:

'local time' means, during any period of summer time, the time fixed by or under the Summer Time Act 1972 (e), and outside that period, Universal Co-ordinated Time;

'dBA' means a decibel unit of sound level measured on the A-weighted scale, which incorporates a frequency dependent weighting approximating the characteristics of human hearing;

'Lmax' means the highest instantaneous sound level recorded (with the noise monitoring terminal set at the slow meter setting);

other abbreviations used are defined in GEN 2-2 of the United Kingdom Aeronautical Information Publication (Air Pilot).

J Hotchkiss
Divisional Manager
Aviation Environmental Division
7 April 2010 **Department for Transport**

a) S.I. 1981/651.
b) 1982 c.16.
c) S.I. 1978/1303.
d) The Heathrow Airport – London (Noise Abatement Requirements) Notice 2004 signed by G Pendlebury on 24 March 2004.
e) 1972 c.6.

Notes

(These notes are not part of the notice)

1. The Noise Preferential Routeing Procedures specified in the above notice are compatible with normal ATC requirements. The use of the routeings specified above is supplementary to noise abatement take-off techniques as used by piston-engined, turbo-prop, turbo- jet and turbo-fan aircraft.

2. The attention of operators is drawn to the provisions of Section 78 (2) of the Civil Aviation Act 1982, under which if it appears to the Secretary of State that any of the requirements in this notice have not been complied with as respects any aircraft, he may direct the manager of the aerodrome to withhold facilities for using the aerodrome from the operator of the aircraft. However, the Secretary of State accepts that occasional and exceptional breaches of the noise limits, or of the height requirement, would not be expected to lead to sanctions under Section 78 (2). Such breaches would, however, run the risk of financial penalties.

3. Noise from ground running of aircraft engines is controlled in accordance with instructions issued by Heathrow Airport Limited.

4. In the interests of noise abatement, certain restrictions are imposed on the operation of training flights at this aerodrome. Operators concerned are advised to obtain details from Heathrow Airport Limited.

5. To minimise disturbance in areas adjacent to the aerodrome, commanders of aircraft are requested to avoid the use of reverse thrust after landing, consistent with the safe operation of the aircraft, between 2330 and 0600 hours (local time).

6. Full details concerning the maximum number of occasions and the types of aircraft which are permitted to take off or land at night during specified periods at this aerodrome are promulgated by Supplement.

7. For monitoring purposes, a descent will be deemed to have been continuous provided that no segment of level flight longer than 2.5 NM occurs below 6800 FT QNH and 'level flight' is interpreted as any segment of flight having a height change of not more than 50 FT over a track distance of 2 NM or more, as recorded in the airport Noise and track-keeping system.

8. For monitoring purposes, a departure will be deemed to have complied with the Noise Preferential Routeing (NPR) if, in the portion of flight below the appropriate vectoring altitude (see note 9 below), it is properly recorded by the airport's noise and track-keeping (NTK) system as having flown wholly within the Lateral Swathe (LS). The LS is defined from the centre-line of the relevant route coded in the NTK system, based upon a map accredited for this purpose by the Department for Transport, by the closer to the route centre-line depicted on the map of (a) a pair of lines either side, each diverging at an angle of 10° from a point on the runway centre-line 2000 M from start-of-roll; and (b) a pair of parallel lines representing a distance of 1.5 KM either side of the route centre-line. For avoidance of doubt, the depicted route and LS may include curved sections representing turns.

9. Aircraft which have attained an altitude of 4000 FT (Heathrow QNH) may be directed by air traffic controllers onto a different heading and commanders complying with any such direction will not by reason of so complying be deemed to have departed from the Noise Preferential Routeing.

EGLL AD 2.22 FLIGHT PROCEDURES

1 ARRIVAL ROUTES

a) Standard Arrival Routes (STARs) for aircraft inbound via the ATS Route System are detailed at AD 2-EGLL-7-1 to 7-14.
b) Aircraft inbound other than via the ATS Route System:

   i. Aircraft inbound to London Heathrow Airport direct from the London FIR will be required to use the procedures for flights via the ATS Routes System.
   ii. Aircraft departing from aerodromes outside the geographical boundary of the London TMA will normally be required to route via one of the Terminal Holding Points detailed in paragraph 2 (b).
   iii. Pilots of aircraft departing from an aerodrome less than 10 minutes flying time from the London CTR boundary are to contact the LTCC Group Supervisor Airports on 02380-401106 before departure.

c) Aircraft positioning from other London Airports:

   i. Aircraft positioning from London Gatwick Airport will be cleared via BIG VOR as detailed in AD 2-EGKK-6-2.
   ii. Aircraft positioning from London Luton Airport will be cleared via BNN VOR as detailed in AD 2-EGGW-1-14 paragraph 5.

2 HOLDING

a) Terminal Holding Fixes are established at Lambourne (LAM), Biggin (BIG), Bovingdon (BNN) & Ockham (OCK) as detailed on the appropriate STAR charts. Aircrew are not required to state time and level when entering/reaching the holding fix. →
b) Holding patterns for use following a missed approach are established as follows:

Holding Point	Holding Procedures
CHT NDB	Holding axis 293° M inbound, turning left, Maximum holding speed 220 KT, Holding level 3000 FT ALT
EPM NDB	Holding axis 274° M inbound, turning left, Maximum holding speed 220 KT, Holding level 3000 FT ALT

c) From the holding patterns, aircraft will normally be directed by the Radar Controller, as detailed in paragraph 3 below, to a position from which a straight-in final approach can be made. Exceptionally, when circumstances necessitate, pilots may be instructed to carry out the Initial Approach procedures as detailed in paragraph 4 below. Pilots are reminded of the Continuous Descent Approach noise abatement requirements detailed in AD 2.21.

3 APPROACH PROCEDURES WITH RADAR CONTROL

a) When arriving traffic is being sequenced under radar direction, that part of the approach between the holding fix and the Final Approach track will be flown under direction from the Radar Controller. Once the aircraft is under the jurisdiction of 'Heathrow Director' changes of heading or Flight Level/altitude will be made only on instructions from the Radar Controller except in the case of Radio Communications Failure in the aircraft or at the ATS Unit.
b) The procedures are designed to maximise runway capacity and to minimise noise disturbance in the areas overflown during the approach. Aircraft commanders are requested to conform to low power, low drag operating techniques to the maximum extent practicable.
c) Detailed Procedures

   i. Headings and flight levels at which to leave the holding facility will be passed by ATC. Radar vectors will be given and descent clearance will include an estimate of the track distance to touchdown. Further distance information will be given between initial descent and the intercept heading onto the ILS.

ii. **Descent profile:** On receipt of descent clearance the pilot should descend at the rate he judges will be best suited to the achievement of continuous descent, the objective being to join the glide path at the appropriate height for the distance without recourse to level flight.

Note: *Pilots of suitably equipped aircraft may monitor their route against the Initial Approach procedures in order to better judge their descent profile against distance to touchdown. However, if doing so pilots are reminded of the need to comply with the instructions of the radar controller at all times.*

iii. **Speed Control:** Adherence to speeds assigned by ATC is mandatory. Pilots should typically expect the following speed restrictions to be enforced: 220 KT from the holding facility during the initial approach phase; 180 KT on base leg/closing heading to final approach; between 180 KT and 160 KT when established on final approach and thereafter 160 KT to 4 DME. These speeds are applied for ATC separation purposes. In the event of a new (non speed related) ATC instruction being issued (eg an instruction to descend on ILS) pilots shall continue to maintain the previously allocated speed. All speed restrictions are to be flown as accurately as possible. Aircraft unable to conform to these speeds must inform ATC and state what speeds can be used. In the interests of accurate spacing, pilots are requested to comply with speed adjustments as promptly as is feasible within their own operational constraints. Pilots should advise ATC if circumstances necessitate a change of speed for aircraft performance reasons.

iv. **Final Approach:** Wake turbulence separation on final approach is based on the RECAT EU PWS wake scheme in place of UK published minima. No special procedures apply, and the importance of speed control adherence as described in paragraph (iii) above remains.

v. **Transfer to Tower:** Pilots are to report their callsign, distance from touchdown, type of approach and runway to which they are making their approach, on transfer to Heathrow Tower, (for example, ABC123, 7 miles, ILS, Runway 27L).

vi. **Runway Occupancy:** The spacing provided between aircraft will be designed to achieve maximum runway utilisation within the parameters of safe separation minima (including wake turbulence separation) and runway occupancy. It is important to the validity of the separation provided, and to the achievement of optimum runway capacity, that runway occupancy time is kept to a minimum consistent with the prevailing conditions.

vii. **Missed Approach:** Missed Approach procedures are detailed on the appropriate Instrument Approach Charts. Special procedures are also detailed for use in the event of a Radio Communications Failure following Missed Approach

d) Radar Failure: In the event of radar failure, new instructions will be issued to each aircraft under radar control and the procedures detailed in paragraph 5 will be brought into use.

e) Radio Communications Failure at the ATC Unit: If radio communications fails at the ATC Unit when under radar control, pilots are to contact 'Heathrow Tower' on 118.705 MHz for new instructions.

4 INITIAL APPROACH PROCEDURES

a) Exceptionally, when traffic is not being sequenced by radar direction, aircraft will be cleared from the holding facility to carry out the appropriate Initial Approach Procedure as detailed on the following charts;

i. AD 2.EGLL-7-20 INITIAL APPROACH PROCEDURES RWY 09L/R via BIG and OCK (RNAV SUBSTITUTION ONLY)
ii. AD 2.EGLL-7-21 INITIAL APPROACH PROCEDURES RWY 09L/R via BNN and LAM (RNAV SUBSTITUTION ONLY)
iii. AD 2.EGLL-7-22 INITIAL APPROACH PROCEDURES RWY 27L/R via BIG (RNAV SUBSTITUTION ONLY)
iv. AD 2.EGLL-7-23 INITIAL APPROACH PROCEDURES RWY 27L/R OCK (RNAV SUBSTITUTION ONLY)
v. AD 2.EGLL-7-24 INITIAL APPROACH PROCEDURES RWY 27L/R via BNN and LAM (RNAV SUBSTITUTION ONLY)
vi. AD 2.EGLL-7-25 INITIAL APPROACH PROCEDURES RWY 09L/R via CHT and EPM (RNAV SUBSTITUTION ONLY)
vii. AD 2.EGLL-7-26 INITIAL APPROACH PROCEDURES RWY 27L/R via CHT and EPM (RNAV SUBSTITUTION ONLY)

b) The procedures are profiled to be compatible with a Continuous Descent Approach vertical profile and assume aircraft can maintain a descent gradient of approximately 320 FT per NM (3° descent angle).

c) The procedures are, as far as is practicable using conventional navigation laterally and vertically profiled and incorporate speed control to approximate the nominal flight profiles used by aircraft when under radar direction. They may therefore assist pilots of suitably equipped aircraft to monitor their position and assist in the achievement of the Continuous Descent Approach noise abatement requirement when under radar direction.

5 LOSS OF COMMUNICATIONS PROCEDURES (ARRIVING AIRCRAFT)

a) In the event of a complete radio communications failure in an aircraft the pilot is to adopt the appropriate procedures detailed at ENR 1.1.3 except as detailed below.

b) When complete radio communications failure occurs in the aircraft before ETA, or before EAT when this has been received and acknowledged the aircraft will:

i. fly to the appropriate terminal holding point as detailed in the STAR;
ii. hold until the last acknowledged ETA plus 10 minutes, or EAT when this has been given;
iii. then commence descent for landing in accordance with the appropriate initial approach procedures as detailed at AD 2-EGLL-7 and appropriate instrument approach procedure detailed in AD 2-EGLL-8 and;
iv. land within 30 minutes (or later if able to approach and land visually).

c) If complete radio communications failure in the aircraft occurs after the aircraft has reported to ATC on reaching the holding point the aircraft will:

i. maintain the last assigned holding level at the terminal holding point until:

1. ATA over the holding point plus 10 minutes or 10 minutes after the last acknowledged communications with ATC, whichever is the later; or

2. EAT when this has been received and acknowledged.

ii. then commence descent for landing in accordance with the appropriate initial approach procedures as detailed at AD 2-EGLL-7 and appropriate instrument approach procedure detailed in AD 2-EGLL-8 and;
iii. land within 30 minutes (or later if able to approach and land visually).

d) If complete radio communications failure in the aircraft occurs during initial approach under radar direction, the procedures to be followed are detailed on the Chart at AD 2-EGLL-5-1.
e) If complete radio communications failure in the aircraft occurs following a missed approach the aircraft will:

i. fly to the appropriate missed approach holding point at 3000 FT ALT;
ii. complete at least one holding pattern;
iii. then commence an approach for landing in accordance with the appropriate initial approach procedures as detailed at AD 2-EGLL-7.

6 LOSS OF COMMUNICATIONS PROCEDURES (DEPARTING AIRCRAFT)

a) Outbound traffic operating on UMLAT 1F 1G: If a clearance to climb or re-routing instructions have not been given, comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedure detailed at AD 2-EGLL-6-4, then route via T418 to WOBUN; at WOBUN, commence climb to flight planned level.
b) Outbound traffic operating on MAXIT 1F 1G: If a clearance to climb or re-routing instructions have not been given, comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedure detailed at AD 2-EGLL-6-2.
c) Outbound traffic operating on MODMI 1J 1K: If a clearance to climb or re-routing instructions have not been given, comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedure detailed at AD 2-EGLL-6-2.
d) All outbound traffic except those operating in accordance with items a, b and c above: Comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedures listed on the relevant chart contained in AD 2-EGLL or ATC clearance issued. After this adopt the appropriate procedures as notified in ENR 1.1, Section 3.4.

7 DEPARTURE PROCEDURES

a) Standard Instrument Departure (SID) procedures for aircraft departing from London Heathrow Airport are detailed at AD 2-EGLL-6-1 to 6-7 and incorporate the Noise Preferential Routes (NPRs) detailed in AD 2.21.
b) Departure Speed Restriction: In order to optimise the departure flow and assist in the separation between successive departing aircraft a speed limit of 250 KT IAS below FL 100 is applicable until removed by ATC. ATC may remove the speed restriction by using the phrase 'No ATC Speed Restriction'. **Pilots are reminded that this phrase does not relieve the pilot of the responsibility to adhere to the ground track of the Noise Preferential Route, which may require a speed/power limitation.**
c) If for any reason pilots are unable to comply with the 250 KT IAS speed restriction the pilot should immediately advise ATC and state the minimum speed acceptable. If a pilot anticipates before departure that they will be unable to comply with the speed restriction, they should inform ATC when requesting start-up clearance, stating the minimum speed acceptable. In this case the pilot will be informed before take-off of any higher speed limitation.
d) Flight crew of aircraft unable to meet SID climb restrictions must inform Heathrow Delivery via voice prior to pushback. Restrictions/delays may apply.
e) Expect first CPDLC Data Link Authority to be EGTT.

8 VFR AND SPECIAL VFR CLEARANCE IN THE LONDON CTR

a) VFR and Special VFR clearances for flights within the London CTR may be requested and will be given whenever traffic conditions permit. These flights are subject to the general conditions laid down for VFR and Special VFR flights detailed at ENR 1.2 and will normally be given only to aircraft which carry RTF including the appropriate frequencies listed in EGLL AD 2.18.
b) The use of VFR and Special VFR clearances is intended for the following types of flight:

i. Light aircraft that wish to proceed to or from an aerodrome/landing site within the CTR or to transit the CTR;
ii. Aircraft using the local flying areas and the access lanes notified for Brooklands, Denham, Fairoaks and White Waltham and complying with the published procedures will be considered as complying with a VFR clearance;
iii. Aircraft carrying out non-standard flights, such as photographic survey flights, which may require penetration of the London CTR in VMC.

c) Weather minima for aircraft arriving, departing or helicopter crossing at Heathrow is as follows;

Type of Operation	Visibility Restriction	Cloud Restriction
VFR arrival/departure/heli crossing	5 KM or more	Cloud Ceiling 1500 FT or greater
SVFR arrival/departure/heli crossing	2 KM or more	Cloud Ceiling 600 FT or greater

Note: *SVFR helicopter crossings should normally be restricted to High Flight Priority (A-E) helicopters.*

d) Access to the Inner Area of the London CTR (see paragraph 11 and AD-2-EGLL-3-2) requires PPR by telephone on the day at least 60 minutes in advance. Prior notification of Inner Area flights, other VFR or Special VFR flights and general enquiries about flights in the London CTR may be made via the London Terminal Control Senior Watch Assistant, Tel: 02380-401110.
e) Pilots who wish to depart Heathrow on a VFR or Special VFR clearance should pass brief details of their flight to Heathrow ATC, by telephone 020-8750 2578, and not to ATC by RTF.
f) Non-scheduled arrival flights by single-engined and light twin-engined fixed wing aircraft which are unable to accept an IFR clearance will be cleared to London Heathrow on a VFR or Special VFR clearance, at an altitude below 2500 FT (London Heathrow QNH) subject to

the weather minima in (c). If the weather observations at London Heathrow are below either of these minima, clearance to enter the London CTR will not be granted.

g) It will remain the responsibility of the pilot to remain at all times in flight conditions which will enable him to determine his flight path and to keep clear of obstacles, and to ensure that he is able to comply with SERA.3105 Minimum Heights unless otherwise permitted by the CAA. Pilots must inform the Radar Controller if compliance with the above entails a change of heading or height.

h) VFR and Special VFR flights may be subject to delay when parts of the route are outside radar cover or when they cannot be fitted readily into gaps in the IFR traffic flow. Pilots should therefore always ensure that they have adequate fuel reserves and are able to divert to another aerodrome if necessary.

9 LOCAL FLYING ARRANGEMENTS AND SPECIAL ACCESS LANES FOR BROOKLANDS, DENHAM, FAIROAKS, LONDON HELIPORT, RAF NORTHOLT AND WHITE WALTHAM AERODROMES.

a) Flights within the Local Flying Areas (LFA) of aerodromes within, or adjacent to, the London CTR, may be made subject to certain conditions. Details of those for Denham, Fairoaks, London Heliport and White Waltham appear in the relevant AD sections, RAF Northolt can be found in the Military AIP. An additional local flying area is established for the unlicensed aerodrome at Brooklands and is detailed below.

b) Brooklands

i. Within a local flying area of 1 NM radius, centred on position 512103N 0002812W, but excluding that part to the east of the B374 road and a line bearing 180°T from the A245/B374 road junction and excluding the area south of the southern boundary of the London CTR, VFR flights may take place, subject to prior permission obtained from Brooklands Museum Trust Ltd.

1. Aircraft to remain below cloud with the surface in sight;
2. Maximum Altitude: 1500 FT QNH;
3. Prior permission **must** be obtained from Brooklands Museum Trust Ltd.

Note 1: *Pilots of aircraft flying in the local flying area are responsible for providing their own separation from other aircraft operating in the relevant airspace.*

Note 2: *In addition to paragraph (b), VFR flights must also comply with the VMC minima for Class D airspace detailed at ENR 1.2.*

Note 3: *Aircraft unable to operate VFR may operate Special VFR, subject to approval from Heathrow Radar, within the LFA subject to the conditions in paragraph (b) and the requirements for Special VFR flights detailed at ENR 1.2.*

Note 4: *The carriage of a Mode S Transponder within the LFA is encouraged, however there is currently no requirement for aircraft operating in the Brooklands LFA to comply with the requirements of the London CTR Mode S Transponder Mandatory Zone (TMZ). Pilots of suitably equipped aircraft shall utilise the transponder to the maximum serviceable extent with altitude information selected when fitted.*

10 VFR AND SPECIAL VFR HELICOPTER FLIGHTS IN THE LONDON CTR AND LONDON CITY CTR

a) General Arrangements

i. VFR and Special VFR helicopter flying in the London CTR is mostly constrained to flights at or below specified altitudes along defined routes, although off route clearances can normally be accommodated subject to ATC workload and other operational reasons which the pilot may not be aware of. These routes have been selected to avoid built up areas as much as possible. Details of the major landmarks on these routes, the altitudes and reporting points are listed at paragraph 12 and are illustrated at AD 2-EGLL-3-2. The precise routes are overprinted on the 1:50 000 chart entitled – Helicopter Routes in the London CTR & London City CTR. This chart may be obtained from NATS Ltd Chart Stockists - see www.nats.aero/ais for details.

ii. All VFR and Special VFR helicopter flying in the London CTR is subject to ATC clearance, except for the Local Flying Areas of Brooklands, Denham, Fairoaks and White Waltham where VFR flights may operate subject to agreed conditions which appear in the relevant AD sections.

iii. The following routes are not available to single-engined helicopters at night: H7, H9 (Hayes to Gutteridge) and H10 (Gutteridge to Kew Bridge).

iv. Pilots are reminded of the Restricted Areas within the London and London City CTRs as detailed in ENR 5.1.

1. EGR107
2. EGR156, EGR157, EGR158, EGR159
3. EGR160 – The Specified Area.

b) Procedures for flight along Helicopter Routes

i. Special VFR flights along Helicopter Routes in the London CTR and London City CTR are not to be operated unless helicopters can remain in a flight visibility of at least 1 KM. VFR flights shall operate in accordance with SERA 5001 or notified ORS4. Weather minima for crossing, taking-off from, or landing at London Heathrow are detailed at AD 2.20 paragraph 5. All VFR & SVFR flights, regardless of type, operating within EGR160, shall comply with the weather minima specified in ENR 5.1 (EGR160).

ii. VFR and Special VFR helicopters must remain clear of cloud with the surface in sight. All VFR & SVFR flights, regardless of type, operating within EGR160, shall comply with the weather minima specified in ENR 5.1 (EGR160).

iii. Altimeter setting will be London Heathrow QNH.

iv. Maximum route altitudes are shown in column 4 and 7 at paragraph 12. ATC will refer to these altitudes as ‘Standard Operating Altitudes’ when issuing clearances. Pilots may fly at altitudes below the maximum route altitude except for between Hanger Lane and Chiswick Bridge on H10 where the maximum published altitude must be flown accurately when operating SVFR. ATC may

restrict aircraft to altitudes below the published route maximum as necessary to provide separation from other aircraft. Pilots may request alternative operating altitudes which may be approved subject to ATC considering other operational conditions.

v. Pilots should fly the precise routes as depicted on the 1: 50 000 Map entitled Helicopter Routes in the London CTR & London City CTR. 'Corner cutting' is to be avoided. In order to obtain sufficient lateral separation from opposite direction traffic, pilots may temporarily deviate as required.
vi. When flying along the River Thames within the Specified Area (EGR160), pilots should normally fly over that part of the river bed lying between high water marks, but not so near the banks as to become a nuisance on account of noise. When deviating from the river, in accordance with paragraph (v) above, single-engined helicopters must at all times be able to return to the river in the event of engine failure, in order to alight clear of the Specified Area.
vii. For the purposes of SERA.3105 Minimum Heights and SERA.5005(f) an aircraft operated on the notified helicopter routes is permitted to fly below 1000 FT above the highest obstacle within a radius of 600 M but no closer than 500 FT to any person, vessel, vehicle or structure.

c) Noise

i. On all notified helicopter routes, in order to minimize noise nuisance, pilots should maintain the maximum altitude compatible with their ATC clearance and with the prevailing cloud conditions.
ii. Pilots are requested wherever possible to avoid overflying hospitals, palaces, schools and prisons.

d) Air Traffic Control Clearance

i. Pilots must obtain a VFR or Special VFR clearance from Heathrow Radar (125.625 MHz). Heathrow Radar provides a service to transit aircraft operating in the London CTR and London City CTR/CTA. Pilots are requested to contact Heathrow Radar a minimum of three minutes before reaching the Zone Boundary, giving details of call sign, aircraft type, route, ETA at the CTR boundary, entry point and destination.
ii. ATC Clearances do not absolve the pilot of their responsibility to comply with the Rules of the Air and they should notify ATC if unable to accept a clearance.

e) Holding

i. VFR and Special VFR helicopters, particularly those using London Heathrow or the routes close to it, may be required to hold at any of the locations on the route, shown in column 1 at paragraph 12 and on the illustration at AD 2-EGLL-3-2 except on that portion of H4 that lies between Vauxhall and Westminster Bridges.

f) Communications

i. Helicopters using London Heliport via the Local Flying Area or any other routes that traverse the London Heliport ATZ, must be able to communicate with the Heliport (Battersea Tower 134.280 MHz).
ii. Helicopters flying along the routes in the London CTR and London City CTR must be able to communicate with Heathrow Radar. In the case of H9 and H10, aircraft must also be able to communicate with Northolt Approach Control (126.450 MHz), this also includes those aircraft operating off the helicopter routes within or in the vicinity of the Northolt RMA.
iii. Helicopters using London Heathrow must also be able to communicate with Heathrow Tower.

g) Loss of Communications Procedures

i. In the event of a communications failure in a helicopter operating in accordance with these procedures, the pilot is to adopt the procedure detailed at ENR 1.1 except as described below.
ii. If a VFR or Special VFR clearance has been received to transit the CTR along a Helicopter Route continue the flight in accordance with the clearance.
iii. Where an intermediate clearance limit has been given (or clearance issued for only a part of the requested transit), proceed to the specified clearance limit and hold for 3 minutes. Then proceed via the requested Helicopter Route at the published maximum altitude for the Route.
iv. If no onward clearance has been received before reaching, or when holding at, Sipson or Bedfont, **reverse track and leave the CTR** via H2-H10-Cookham if approaching **Sipson**, or **H9 if approaching Bedfont. Do not attempt to cross London Heathrow Airport.**
v. For helicopters overflying or landing at London Heathrow Airport, see EGLL AD 2.20 paragraph 5.

h) Separation between Special VFR helicopters

i. Separation may be agreed between Special VFR helicopters on the Helicopter Routes, on the basis that pilots of helicopters will be asked by ATC to maintain visual separation from other helicopter traffic, provided that:

1. the visibility at London Heathrow is 5 KM or more and the helicopters can operate clear of cloud and in sight of the surface and remain in a flight visibility of at least 5 KM;
2. there is agreement between the helicopter pilots concerned;
3. the current route structure, the altitudes applicable and communication procedures are adhered to;
4. appropriate traffic information is passed to the helicopter pilots. (Normally for this purpose it will only be necessary for ATC to pass general traffic information eg..... 'Two helicopters westbound along H10 at 1000 FT in the vicinity of Perivale - acknowledge.').

ii. If a pilot refuses or considers that the conditions are such that he is unable to maintain visual separation, he will be provided with the Special VFR separation requirements currently in force.

11 INNER AREA OF THE LONDON CTR

a) The Inner Area of the London CTR is that part of the London CTR from surface to altitude 2500 FT contained within the area enclosed by: BUR NDB – Iver RP – Helicopter Route H10 – Barnes RP – Helicopter Route H3 – Thorpe RP – Ascot Heliport – BUR NDB.
b) With the exception of those aircraft categories listed below, all VFR and Special VFR aircraft requesting to enter the Inner Area of the London CTR are subject to Prior Permission Required (PPR) from London Terminal Control, via the Senior Watch Assistant on 02380-401110:

i. Flight Priority Category A, B, C, D, E traffic who shall follow their own notification procedures where appropriate;
ii. Aircraft subject to an Airspace Coordination Notice (ACN) who shall follow the notification process detailed within the ACN;
iii. Aircraft subject to a Non-Standard Flight (NSF) who shall follow the notification process detailed within the NSF;
iv. Helicopters that remain on the published helicopter routes without landing or departing inside the Inner Area;

All other VFR and Special VFR aircraft are required to obtain PPR (by telephone) to enter the Inner Area of the London CTR on the same day at least 60 minutes before entry clearance is required. Approved aircraft will be given a PPR approval code to quote over the radio when requesting entry clearance from controllers.

c) Due to the intense Heathrow IFR operations and very high ATC workload within the Inner Area of the London CTR during the hours 0430-2300 local time, it is unlikely that aircraft will receive approval to operate inside the Inner Area within these times, unless there is a specific task that can only be completed within that airspace, e.g. helicopters accessing private landing sites.
d) The following procedures have been established to ensure safe integration with IFR traffic, avoid excessive airborne holding, and reduce delays to both Heathrow movements and helicopter operators wishing to use landing sites within the Inner Area of London CTR.

i. Inbound

1. Contact the London Terminal Control Senior Watch Assistant (02380-401110) on the day of operation at least 60 minutes prior to the estimated time of arrival;
2. Provide the name, latitude and longitude of the landing site, the requested routing, the estimated time of arrival and a contact telephone number;
3. Heathrow Tower Supervisor and Heathrow Radar will be consulted to determine the route that the pilot can expect (subject to the Heathrow runway configuration, meteorological conditions and the likelihood of being able to utilise reduced separation in the vicinity of the aerodrome);
4. If the safe integration of the inbound flight will cause delay to Heathrow traffic it will be subject to the equivalent Heathrow delay. The pilot will be contacted by telephone and advised the route that can be expected and, if appropriate, an amended ETA incorporating the Heathrow inbound delay;
5. The pilot must arrange the flight to arrive at the site within 10 minutes of the approved ETA. Failure to adhere to this time window may result in further delay or, in extreme circumstances, refusal of clearance. Upon establishing two-way communications the helicopter will be cleared to the landing site as soon as practicable commensurate with the safe integration with IFR traffic.

ii. Outbound

1. Prior to departing the site contact LTC SWA at least 60 minutes in advance of the estimated time of departure from the site to provide the name, latitude and longitude of the site, requested routing, planned ETD and a contact telephone number;
2. If the outbound flight will cause delay to Heathrow traffic it will be subject to the equivalent Heathrow delay. The pilot will be contacted by telephone and advised the route that can be expected and, if appropriate, an amended ETD incorporating the Heathrow outbound delay;
3. Within 10 minutes of the approved ETD, the pilot must contact ATC on the ground. If two way contact with ATC cannot be established on the ground either directly or via relay from other aircraft, the pilot must remain on the ground and contact London Terminal Control Group Supervisor Airports (02380-401106) to agree an exact departure time and initial altitude with the controllers concerned in order that safe integration with IFR traffic can be ensured.

Note: *If the intention is to be on the ground for less than 60 minutes, both the inbound and outbound arrangements may be agreed during the initial contact with LTC SWA.*

12 HELICOPTER ROUTES IN THE LONDON CTR AND LONDON CITY CTR

a) Abbreviations:

H — Holding Point ▲ — Compulsory Reporting Point ∆ — On Request Reporting Point

Map references are to the 1: 50 000 Ordnance Survey Map of Great Britain

b) The precise routes which must be adhered to are portrayed on the 1: 50 000 Map entitled Helicopter Routes in the London CTR & London City CTR. An indication of the routes network is shown on the illustration at AD 2-EGLL-3-2.
c) Pilots are required to be at or below the lower altitudes on arrival at the reporting point at which the lower altitude applies.
d) On all notified helicopter routes within the London CTR and London City CTR and for the purposes of SERA.3105 Minimum Heights and SERA.5005(f) Visual Flight Rules an aircraft operated on the notified helicopter routes is permitted to fly below 1000 FT above the highest obstacle within a radius of 600 M but no closer than 500 FT to any person, vessel, vehicle or structure.
e) In support of (d) suggested minimum altitudes detailed in column 5 at paragraph 12 are given for aircraft operating on the centreline of the routes, however pilots remain responsible for obstacle clearance and are encouraged to operate as high an altitude allowable on the routes, subject to any overriding ATC Clearance. Those minimum altitudes detailed in column 5 at paragraph 12 are based on the VFR

Obstacles List produced by AIS and should be used for guidance only as they do not take into account the surrounding ground elevation nor new/temporary obstacles not captured within the Obstacle List. Pilots operating on H4 should be cognisant that when operating outside of the high water marks greater minimum altitudes than those listed in column 5 at paragraph 12 may be required to ensure compliance with the 500 FT rule.

Note 1: *Between Hanger Lane and Chiswick Bridge, pilots must fly at the published maximum altitude when operating SVFR.*

Note 2: *Between Iver and Hanger Lane, pilots may be required to communicate with Northolt Approach (126.450 MHz).*

Note 3: *The holding manoeuvre is to be carried out to the south of the Northolt Aerodrome Boundary.*

Note 4: *When Heathrow Runways 09L/09R are in use, Route H10 between Gutteridge and Kew Bridge is subject to delays due to slow climbing departures from Heathrow.*

Helicopter pilots are recommended to obtain Heathrow runway information on the ATIS frequency 128.080 MHz before contacting Heathrow Radar on 125.625 MHz, or London Heliport on 134.280 MHz.

Note 5: *Between Target and Brentford the route alignment turns from the A40 to the A406 at the Hanger Lane intersection (Hanger Lane). Pilots should ensure correct visual identification of the turn point due to the interaction with Heathrow Runway 27R final approach track.*

Note 6: *Caution - large number of tall structures above 500 FT lie within 600 M of the high water marks of the River Thames. Pilots are reminded that aircraft operated on the notified helicopter routes are not permitted to fly closer than 500 FT to any person, vessel, vehicle or structure.*

Note 7: *All VFR & SVFR flights, regardless of type, operating within EGR160, shall comply with the weather minima specified in ENR 5.1 (EGR160).*

13 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

Note: *Refer also to VRPs in use at London City.*

14 LONDON CTR TRANSPONDER MANDATORY ZONE (TMZ)

a) The London CTR is notified as a Mode S Elementary Transponder Mandatory Zone (TMZ) as detailed at GEN 1.5, paragraph 5.3.
b) The London CTR TMZ has the same vertical and lateral dimensions as the London CTR, see EGLL AD 2.17.
c) TMZ exceptions are detailed in GEN 1.5 paragraph 5.3.4, AD-2 EGLD, AD-2 EGTF, AD-2 EGLM and for Brooklands see EGLL AD 2.22 paragraph 9.

15 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside the London CTR within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Thames Director frequency, 132.700 MHz, are encouraged to select SSR code 0012.

513630N 0001545E - 514111N 0001345W -
514027N 0003627W - 514015N 0005348W -
513444N 0005508W - 512335N 0005516W -
511422N 0003506W - 511957N 0001917E -
513630N 0001545E.

b) Selection of 0012 does not imply the receipt of an ATC service. Pilots of aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the London CTR at all times.
c) Whilst squawking 0012, pilots should be aware that Thames Director may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 0012 shall be deselected.

EGLL AD 2.23 ADDITIONAL INFORMATION

1 MODE S BAROMETRIC PRESSURE SETTING DATA

a) London Terminal Control has the ability to downlink Mode S Barometric Pressure Setting (BPS) data. Therefore, if the downlinked pressure data is at variance with the BPS expected by Air Traffic Control, pilots can expect additional challenge. When Air Traffic Control pass a reminder of the appropriate BPS, it is anticipated that the aircrew will cross check the altimeter settings and confirm set.

2 TIME BASED SEPARATION (TBS) FOR FINAL APPROACH

a) Time based separation minima are in permanent use for wake turbulence separation in place of UK fixed distance minima. These are based on the RECAT EU PWS minima.
b) In stronger headwinds, a moderate reduction in separation distances between lead and follower aircraft may be observed in comparison to RECAT EU PWS distanced based wake turbulence minima.
c) Requests for RNAV (GNSS) approaches may be refused by Heathrow Director to ensure runway efficiency is maintained.

3 AERODROME SAFETY REPORTING

a) Aircraft operators are required to share with Heathrow any occurrence reports for reportable incidents which occur on the ground at Heathrow, or during the initial (take-off) or final (approach and landing) phases of flight to or from Heathrow.
b) Copies of Air Safety Reports or Mandatory Occurrence Reports filed by aircraft operators must be sent to the Aerodrome Safety and Assurance team at airside_safety@heathrow.com. Heathrow also encourages voluntary safety reports and observations as these may help to improve safety. Any such reports or observations should also be sent to the aforementioned address.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1184
HEIGHTS IN FEET AGL (393)

LONDON HEATHROW

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **1800** in the sector defined by the lateral limits; 513331N 0005917W - 513742N 0005019W - 513819N 0004830W thence anticlockwise by an arc of a circle radius 3NM centred on 513905N 0004351W to 514106N 0004017W - 514334N 0003259W - 514044N 0001141W - 513846N 0000906E - 512225N 0000302E - 512556N 0000036E - 513040N 0000026W then anticlockwise by an arc of a circle radius 3NM centred on 513016N 0000512W to 513022N 0001000W - 512426N 0001026W - 512049N 0000840W - 511818N 0002650W - 511624N 0005911W - 513331N 0005917W.

b) **1900** in the sector defined by the lateral limits; a circle radius 3NM centred on 513119N 0001542W .

c) **1900** in the sector defined by the lateral limits; 513819N 0004830W - 514106N 0004017W thence clockwise by an arc of a circle radius 3NM centred on 513905N 0004351W to 513819N 0004830W.

d) **2000** in the sector defined by the lateral limits; 511624N 0005911W - 511818N 0002650W - 512049N 0000840W - 511548N 0000613W - thence anticlockwise by an arc of a circle radius 4NM centred on 511651N 0000005W to 511252N 0000025W - 511101N 0000106W - 510853N 0001125W - 511624N 0005911W.

e) **2000** in the sector defined by the lateral limits; 513022N 0001000W thence clockwise by an arc of a circle radius 3NM centred on 513016N 0000512W to 513040N 0000026W - 512556N 0000036E - 512225N 0000302E - 512049N 0000840W - 512426N 0001026W - 513022N 0001000W.

f) **2100** in the sector defined by the lateral limits; 512049N 0000840W - 512225N 0000302E - 511252N 0000025W thence clockwise by an arc of a circle radius 4NM centred on 511651N 0000005W to 511548N 0000613W - 512049N 0000840W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed to **EPM NDB**† (RWY 09R, 27L) or **CHT NDB** (RWY 09L, 27R) or last assigned level if higher.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **EPM NDB**† (RWY 09R, 27L) or **CHT NDB** (RWY 09L, 27R).

†In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4 or the Modified Procedure for the Missed Approach Radio Failure detailed at AD 2-EGLL-1-18.

For **GENERAL INFORMATION** see EGLL 5-2.

CHANGE (1/26): RESTRICTED AREA EGR161 ADDED.

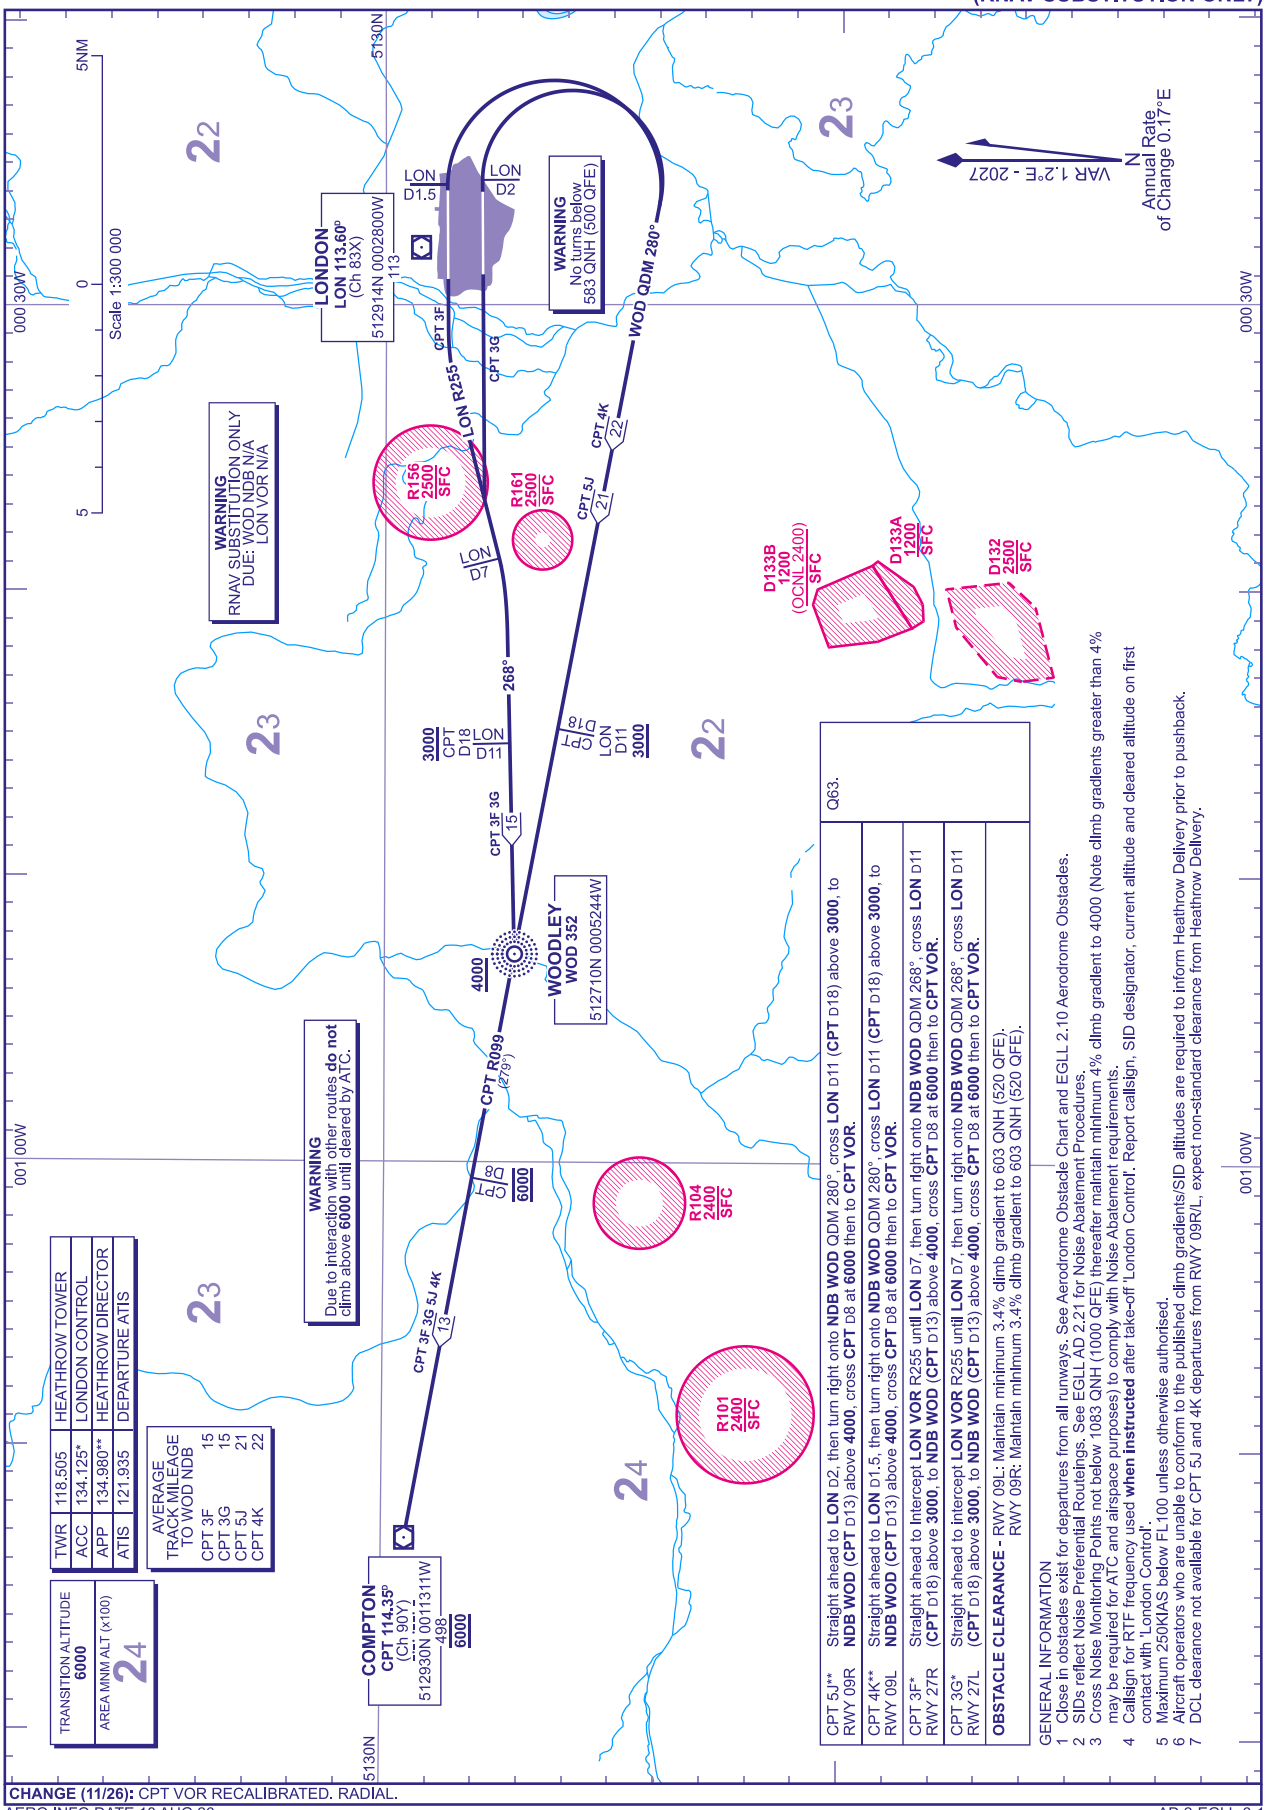
AERO INFO DATE 03 NOV 25

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

LONDON HEATHROW

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. 913FT vertical separation approved against the Crystal Palace mast to meet ATS operational requirements.
7. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
8. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of instrument approaches other than SRA is cleared to intercept the final approach track.**



CHANGE (14/20): NOTE 3 UPDATED.

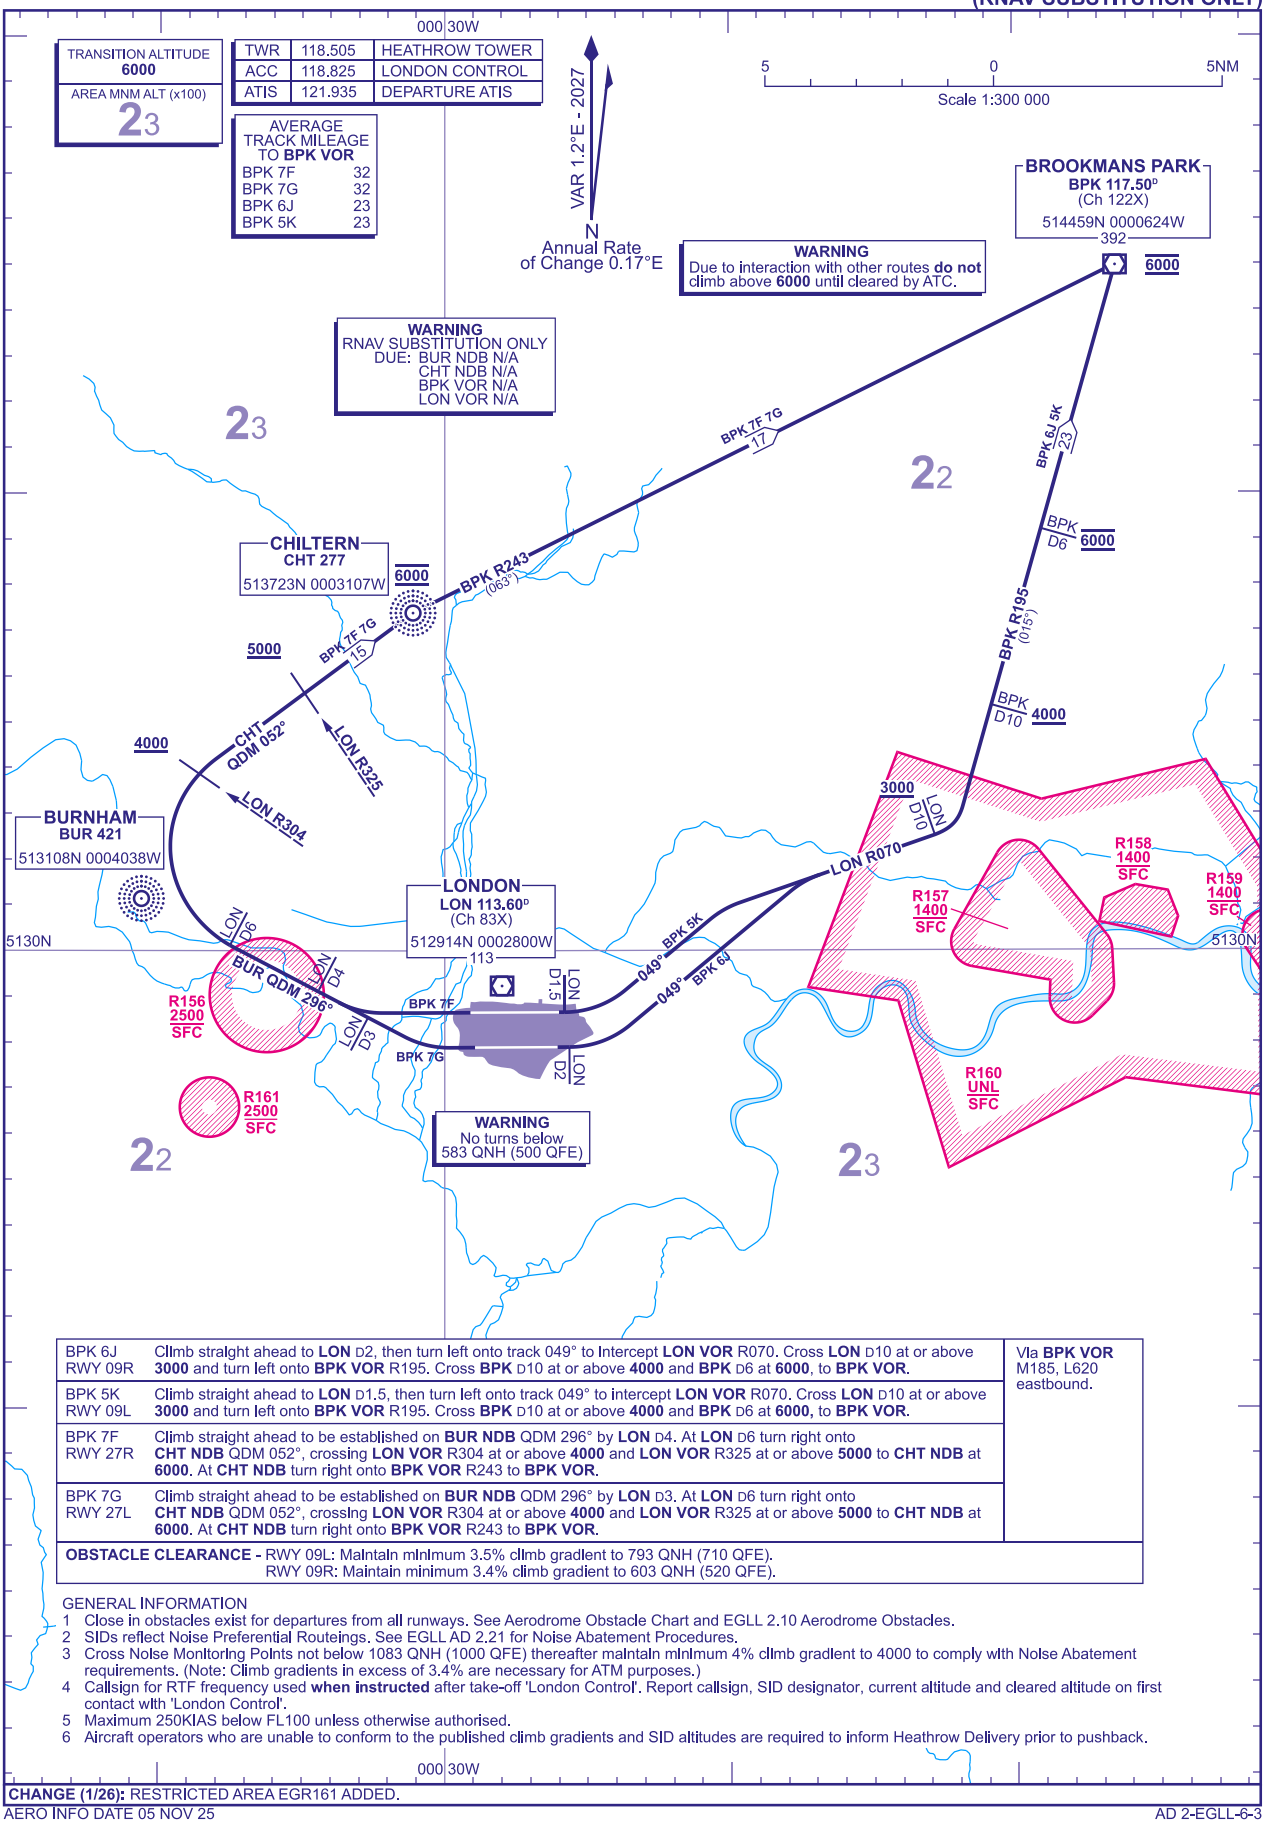
OBSTACLE CLEARANCE - RWY 09L: Maintain minimum 3.4% climb gradient to 603 QNH (520 QFE). RWY 09R: Maintain minimum 3.4% climb gradient to 603 QNH (520 QFE).		



GENERAL INFORMATION
1 Close in obstacles exist for departures from all runways. See Aerodrome Obstacle Chart and EGLL AD 2.10 Aerodrome Obstacles.
2 SIDs reflect Noise Preferential Routeings. See EGLL AD 2.21 for Noise Abatement Procedures.
3 Cross Noise Monitoring Points not below 1083 QNH (1000 QFE) thereafter maintain minimum 4% climb gradient to 4000 (Note climb gradients greater than 4% may be required for ATC and airspace purposes) to comply with Noise Abatement requirements.
4 Callsign for RTF frequency used **when instructed** after take-off 'London Control'. Report callsign, SID designator, current altitude and cleared altitude on first contact with 'London Control'.
5 Maximum 250KIAS below FL100 unless otherwise authorised.
6 Aircraft operators who are unable to conform to the published climb gradients and SID altitudes are required to inform Heathrow Delivery prior to pushback.

BPK 6J RWY 09R	Climb straight ahead to **LON** D2, then turn left onto track 049° to Intercept **LON VOR** R070. Cross **LON** D10 at or above **3000** and turn left onto **BPK VOR** R195. Cross **BPK** D10 at or above **4000** and **BPK** D6 at **6000**, to **BPK VOR**.	Via **BPK VOR** M185, L620 eastbound.
BPK 5K RWY 09L	Climb straight ahead to **LON** D1.5, then turn left onto track 049° to intercept **LON VOR** R070. Cross **LON** D10 at or above **3000** and turn left onto **BPK VOR** R195. Cross **BPK** D10 at or above **4000** and **BPK** D6 at **6000**, to **BPK VOR**.	
BPK 7F RWY 27R	Climb straight ahead to be established on **BUR NDB** QDM 296° by **LON** D4. At **LON** D6 turn right onto **CHT NDB** QDM 052°, crossing **LON VOR** R304 at or above **4000** and **LON VOR** R325 at or above **5000** to **CHT NDB** at **6000**. At **CHT NDB** turn right onto **BPK VOR** R243 to **BPK VOR**.	
BPK 7G RWY 27L	Climb straight ahead to be established on **BUR NDB** QDM 296° by **LON** D3. At **LON** D6 turn right onto **CHT NDB** QDM 052°, crossing **LON VOR** R304 at or above **4000** and **LON VOR** R325 at or above **5000** to **CHT NDB** at **6000**. At **CHT NDB** turn right onto **BPK VOR** R243 to **BPK VOR**.	
OBSTACLE CLEARANCE - RWY 09L: Maintain minimum 3.5% climb gradient to 793 QNH (710 QFE). RWY 09R: Maintain minimum 3.4% climb gradient to 603 QNH (520 QFE).		

GENERAL INFORMATION
1 Close in obstacles exist for departures from all runways. See Aerodrome Obstacle Chart and EGLL 2.10 Aerodrome Obstacles.
2 SIDs reflect Noise Preferential Routeings. See EGLL AD 2.21 for Noise Abatement Procedures.
3 Cross Noise Monitoring Points not below 1083 QNH (1000 QFE) thereafter maintain minimum 4% climb gradient to 4000 to comply with Noise Abatement requirements. (Note: Climb gradients in excess of 3.4% are necessary for ATM purposes.)
4 Callsign for RTF frequency used **when instructed** after take-off 'London Control'. Report callsign, SID designator, current altitude and cleared altitude on first contact with 'London Control'.
5 Maximum 250KIAS below FL100 unless otherwise authorised.
6 Aircraft operators who are unable to conform to the published climb gradients and SID altitudes are required to inform Heathrow Delivery prior to pushback.

CHANGE (1/26): RESTRICTED AREA EGR161 ADDED.

(RNAV SUBSTITUTION ONLY)

BIG	Leave **BIG** on **BIG VOR** R272 maintaining MNM holding level. At **BIG** D9 westbound turn right onto track 090° at MAX 180KIAS. On passing **BIG VOR** R276 descend in the turn to cross **BIG VOR** R292 **not below 6000** descending to **not below 3500**. On passing **BIG VOR** R300 turn left onto localiser **I-LL** (Rwy 27L) or **I-RR** (Rwy 27R), as instructed by ATC, crossing **BIG** D9 **not below 3500** descending to **3000** and to be established by **I-LL/I-RR** D10. At **I-LL/I-RR** D10 descend to **2500**, then continue the ILS/DME or LOC/DME instrument approach procedure as detailed on the instrument approach charts.	FL at which to leave; MNM Holding Level (See Note 1)

GENERAL INFORMATION
1 Minimum holding level (Flight Level Equivalent of 7000) is above the Transition Altitude and will be allocated by ATC.
2 Continuous descent approach should be used whenever practicable unless otherwise instructed by ATC.
3 See Loss of Communication Procedures (Arriving Aircraft) in EGLL AD 2.22 Flight Procedures.

CHANGE (6/26): CHART TITLE. PROCEDURE RNAV SUBSTITUTION ONLY.

EGGW — LONDON LUTON

EGGW AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGGW — LONDON LUTON

EGGW AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 515229N Long: 0002206W Mid point of Runway 07/25.
2	Direction and distance from city	1.5 NM E of Luton. 30.5 NM N of London.
3	Elevation / Reference temperature / Mean Low Temperature	527 FT / 19 °C / -
4	Geoid undulation at AD ELEV PSN	152 FT
5	Magnetic Variation / Annual Change	1.23°E (2027) / 0.17°E
6	AD Administration Address Telephone	LONDON LUTON AIRPORT OPERATIONS LTD Percival House, Percival Way, Luton, Bedfordshire LU2 9NU. 01582-395229 (NATS Ltd) 01582-395029 (NATS Ltd - ATC Watch Manager) 01582-395451 (Airport Manager) 01582-395525 (Operations) 01582-405100 (Switchboard)
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	Telephone calls to ATC are recorded.

EGGW AD 2.3 OPERATIONAL HOURS

1	AD Administration	H24
2	Customs and immigration	H24
3	Health and sanitation	-
4	AIS Briefing Office	Unattended Briefing System.
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	Unattended Briefing System.
7	ATS	H24 See also AD 2.18.
8	Fuelling	H24
9	Handling	H24
10	Security	H24
11	De-icing	H24
12	Remarks	Refer to AD 2.20 item 1.

EGGW AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Yes. Nearest railway siding: Luton 2.5 NM
2	Fuel and oil types	AVTUR JET A-1 100, W80, W100.
3	Fuelling facilities/capacity	Bowser
4	De-icing facilities	By arrangement with handling companies
5	Hangar space for visiting aircraft	By arrangement with based companies.
6	Repair facilities for visiting aircraft	Yes. By arrangement with local companies.

7	Remarks	Oxygen and related servicing: By arrangement with Luton based airlines. Fuel: Subject to surcharge. Out of hours contact: 01582-722244 (Shell UK Ltd). A nominated handling agent is Mandatory for all visiting aircraft. Any aircraft operator or aircrew requiring an aircraft and/or passenger handling service can obtain details from the following companies: Harrods Business Aviation 01582-589317; Frequency 131.450 MHz. Signature Flight Support: Terminal 1 01582-724182; Frequency 130.175 MHz; Terminal 2 01582-692330; Frequency 130.650 MHz. Swissport 01582-700900; Frequency 130.600 MHz. Menzies 07985-891605; Frequency 131.400 MHz. GH London 01582-395291; Frequency 131.935 MHz.

EGGW AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotel at the Airport and other hotels in Luton.
2	Restaurants	Yes.
3	Transportation	Nearest railway station: Automated Guided People Mover (DART) to/from Luton Airport Parkway. Buses and Taxis.
4	Medical facilities	Limited first aid treatment and emergency services response.
5	Bank and Post Office	Bureau de Change.
6	Tourist Office	-
7	Remarks	-

EGGW AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A7 RFF Category 8 and 9 by prior arrangement. RFF Category 9 provided with RFF Category 8 under remission.
2	Rescue equipment	In accordance with UK (EU) Regulation 139/2014, as per Aerodrome Manual.
3	Capability for removal of disabled aircraft	Limited recovery available. Contact 01582-395451.
4	Remarks	National airlines and/or larger independent airlines should plan to fly in appropriate salvage equipment and should be part of the airline pooling arrangement or have recovery procedures in place.

EGGW AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, Chemical de-icing, Sanding/Gritting.
2	Clearance priorities	Standard. See AD 1.2.2
3	Remarks	-

6	Remarks	Longitudinal slopes: Taxiway Echo exceeds 1.5% slope (1.7%) Transverse slopes: Alpha A4 to A6 1.52% to 1.59% Golf 1 to A4 1.52% to 1.59% Bravo 1.53% to 1.63% Between Charlie 1 and RWY 1.53% Delta 1.51% to 1.65%

EGGW AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	All stands are marked for nose in parking, with the exception of stands 54, 56, 58, 62, 71, 80 and 81. London Luton Airport operates a combination of stand configurations such as Standard Apron/Stand, and Multiple Aircraft Ramp System (MARS). All stands will have a single yellow centre-line. Each stand has an individual stand number. MARS stands consist of a main centre-line and have two subsidiary centre-lines either side of the main centre-line. These subsidiary centre-lines are given the designation of the stand number with L (Left) and R (Right) added. Aircraft parking on all stands is by marshallers' instructions, pilots must hold on the taxiway centreline until signalled to enter their designated stand by a marshaller. The presence of a marshaller should indicate a safety check of the stand has been made by the handling agent prior to aircraft arrival and indicates it is safe to enter the stand. No aircraft is permitted to enter the stand without a marshaller present. Aircraft may be instructed to park on Taxiway Foxtrot at holding points F1, F2, F3 and F4 under their own power without the guidance of a marshaller. Main Apron stands: Transverse slopes 1 = 1.08%, 2 = 1.31%, 3-4 = 1.45% Longitudinal Slopes 5 = 1.45% to 1.30%, 6 = 1.08% to 1.63%, 7 = 1.24% to 1.45%, 8 = 1.38% to 1.49% Delta Apron stands: Transverse slopes 90 = 1.01% to 1.19%, 91 = 1.04% to 1.13%, 92 = 1.01% to 1.23% North Apron stands: Transverse slopes 77 = 1.3%, 78 = 1.4%, 79 = 1.1% Longitudinal slopes. Stand 79 = 1.5% ERUB stands: Transverse slopes 101 = 1.23%, 102 = 1.03% Cargo Apron stands: On Stand 31 the transverse slope at the rear of stand is 1.67% to 1.97% and the longitudinal is 1.10%.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 07/25: Runway designation, runway threshold, runway centre-line and touchdown zone markings. Lead-offs from the runway are marked by a continuous yellow line from the centre-line of the runway. Runway light(s): Threshold - HI green lights. Edge - HI white lights. Centreline - HI colour coded white/red lights. Touchdown zone - HI white lights. Stop end - HI red lights. Colour coded amber/green lights indicate the runway turn-off routes to the CAT III stop bars. Taxiway marking aid(s): Enhanced centre-line and Runway Ahead Markings at A1, G1, B1, C1 & H1. Taxiway light(s): Amber guard lights at runway/taxiway intersections.
3	Stop bars and runway guard lights (if any)	Stop bars are installed at RWY 07/25 holding points and most intermediate holding points. RWY 07/25 holding point stop bars are operated H24.
4	Other runway protection measures	-
5	Remarks	WDI (LGTD) RWY 07 THR: 515225.58N 0002246.40W. WDI (LGTD) RWY 25 THR: 515238.29N 0002131.17W. WDI adjacent to Airport Fire Station (515232.48N 0002231.51W) is not reliable for aeronautical purposes.

EGGW AD 2.10 AERODROME OBSTACLES

EGGW AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use governed by regulations applicable to Luton CTR.
b) All flights operating at London Luton Airport require a slot allocation by Airport Coordination Ltd (ACL). Requests for ad-hoc slot allocations should be made to ACL during working hours 0830-1700 (0730-1600) Monday to Friday by SITA: LONACXH; e-mail: lonacxh@acl-uk.org; Tel: 0208-564 0614; or Fax: 0208-564 0691 or at all other times to London Luton Airport Operations Control Centre: 01582-395525. OCS account holders can add, change and cancel slots at any time on the online coordination portal: https://www.online-coordination.com/default.aspx?AspxAutoDetectCookieSupport=1.
c) Aircraft operators are required to have made prior arrangements for ground handling with an Airline or Ground Handling Agent based at London Luton Airport. This includes diversion events, however nothing in this procedure shall prevent an aircraft that has declared an emergency from landing.
d) Aircraft operating at London Luton Airport without the required acceptance from Airport Co-ordination Ltd and/or without prior arrangement for ground handling services will incur a financial penalty payable to the Airport Authority prior to the aircraft leaving London Luton.

e) Aircraft using London Luton Airport do so in accordance with London Luton Airport's Conditions of Use document available on request from London Luton Airport Operations Ltd. http://www.london-luton.co.uk/en/content/8/1259/operations.html.
f) The airport is available only to pilots holding a current licence. The minimum required is a Private Pilot Licence.
g) Aircraft unable to communicate with ATC by radio will not be accepted.
h) London Luton Airport is not equipped to handle radioactive materials and therefore aircraft carrying such material will not be accepted. In the event that an aircraft carrying radioactive materials has no alternative but to divert to Luton, the pilot must inform Luton ATC on first contact.
i) VFR aircraft operating into or out of Luton Airport should file a flight plan in advance. In exceptional circumstances 'booking out' may be made with ATC by telephone on 01582-395029; 'booking out' of flights by RTF will not be accepted.
j) Cross-bleed engine starts are not permitted on any stand. All such engine starts must be undertaken on the adjacent taxiway or apron taxiway centre-line and approval must be obtained from ATC in advance. Cross-bleed engine starts on the East Apron must only be undertaken with the approval of ATC, at the entrance to the apron.
k) Fixed-wing aircraft except when in the service of a police authority and authorised by ATC, must not operate over any apron below a height of 1000 FT.
l) It is a mandatory requirement that all aircrew and ground staff wear high visibility clothing (minimum standard being a high visibility waistcoat) at all times in external airside areas of the airport. It is the responsibility of the aircraft captain to ensure that their passengers are escorted by aircrew or ground staff at all times when on foot in external airside areas of the airport.
m) Aircraft operators are informed that the use of DECT 6.0 version cordless phones operating on the 1.9 GHz frequency is prohibited at London Luton Airport.

2 GROUND MOVEMENT

a) Ground Movement Control (GMC) is in continuous operation and surface movement of aircraft, vehicles and personnel on the Manoeuvring Area is subject to ATC authority. All operators should state their location in the initial contact with GMC.
b) Pre-departure clearance by Data Clearance Link using ARINC (623) is available at London Luton Airport for suitably equipped aircraft. DCL is available from EOBT minus 30 to EOBT minus 1. Flight crew should ensure that stand information is entered in the request correctly. Earliest response will be EOBT minus 18 minutes. Successful clearances must be ACCEPTED within 5 minutes of receipt or a 'Revert to voice' message will be received. If an attempt to obtain DCL is unsuccessful the aircraft must instead request via RTF. Further details of the DCL service may be obtained from ATC on 01582-395029.
c) Flight crew should request start-up and/or pushback only when imminently ready to do so. This should include doors and hatches closed, steps removed, tug attached and communications established with ground crew with confirmation that they are ready. To prevent back of stand vehicle traffic congestion, anti-collision beacons should only be switched on once start clearance has been obtained.
d) Engine start-up and pushback from stands must not take place until positive clearance to do so has been received from ATC.
e) Within the Manoeuvring area, pilots will be cleared to proceed under general direction from GMC and are reminded of the extreme importance of maintaining a careful lookout at all times. ATC instructions will normally specify the taxi route to be followed. To avoid conflict between inbound and outbound traffic Luton Tower issue instructions to aircraft to hold at intermediate taxiway holding points. Pilots should pay particular attention to the clearance limit issued and ensure they are familiar with, and have a current copy of, the taxiway map to avoid any breach of taxi clearance limits. All breaches will be reported by ATC and an investigation into the cause will be required.
f) It is the aircraft Commander's responsibility not to accept an ATC clearance into an area not approved for the type of aircraft.
g) Aircraft pushing-back from stands 43L, 44L, 44R, 45R, 46, 47, 48 and 49 must not infringe Taxiway Delta without specific clearance from ATC.
h) All stands are Nose-in/Pushback with the exception of aircraft parking at holding points F1, F2, F3 and F4 who may be instructed to depart from the holding point under their own power. ATC will specify the direction of pushback as required by the tactical traffic situation. Flight crew must ensure that ground crew are aware of the required pushback direction. If flight crew are unable to communicate via headset with ground crew they must advise GMC before start-up. Pushback directions will be specified as one of the following:

   i. Main Apron stands: face north towards Echo 1 or face south towards Bravo 7.
   ii. North Apron stands: unless an alternative pushback is given with the clearance, pushback directions will be specified as one of the following - push to tug point Elder to face east towards Echo 3 or push to tug point Willow to face west towards Echo 2.
   iii. East Apron stands: standard push and start within the East Apron facing east toward Delta.
   iv. South Apron stands: face east towards Alpha 7 or face west towards Alpha 8.
   v. Delta Apron stands: face south towards Delta 1 or face north towards Delta 2.
   vi. Stands 16, 17, 18, 19: face north towards Echo 1 or face south towards Bravo 7.
   vii. Stand 60: face east towards Echo 1 or face west towards Main Apron.
   viii. Stand 61: face west towards Echo 2 or east towards Echo 3.
   ix. Stand 62: pushback within the stand area to face west towards Juliet 1.
   x. Engine Run-Up Bay (ERUB) Apron stands: face east towards Alpha 5 or face west towards Alpha 6.

i) **Alternative Pushback Procedure**.

   i. Stands 72, 74, 75, 76, 77, 78, 79 – dependent on prevailing traffic, ATC may instruct to pushback to holding point Delta 4 to face south on Taxiway Delta.
   ii. Stand 73 Code D and E are required to pushback to holding point Delta 4 to face south on Taxiway Delta and pulled forward to D3.
   iii. Stands 30 and 31: Aircraft up to Code C are required to pushback into Taxiway Echo to face east at Holding Point Echo 3.
   iv. Stands 30 and 31: Code D up to max size Airbus A300 are required to pushback into Taxiway Echo and pull forward onto Delta facing south.
   v. Stand 31 Code E are required to push to East Apron then pull forward on to Delta facing south.
   vi. Stand 31 B767 are required to push to East Apron for taxi.
   vii. Stand 71 Aircraft up to Code C, ATC may instruct to pushback to Delta 4 facing south.

j) **Taxiing Restrictions - Taxiways Bravo and Echo**.

i. Wide-bodied aircraft must not route via Echo 1 in any direction. Maximum size aircraft under power between Echo 1 and Echo 3 is Code C.
ii. Wide-bodied aircraft are not permitted to taxi in either direction via Bravo 8 without the guidance of a Follow-Me vehicle.

k) **Additional Visual Holding Points.**

Bravo 8 (northbound - Taxiway Bravo), Juliet 1 (Exit from Stand 62), Charlie 2 (northbound - Taxiway Charlie) and Alpha 8 (eastbound - Taxiway Alpha) are additional visual holding points.

l) **Holding Points Restrictions**.

i. Limited Remote Holding capacity is available on request to GMC, for aircraft up to B737/A321 size that are subject to ATFM departure delays.
ii. Pilots of departing aircraft approaching holding point Hotel 1 should exercise caution due to the unusual alignment of the taxiway and runway entry point, particularly when holding in a queue of aircraft. The area immediately to the west of Hotel 1 is not a designated holding area. Aircraft must not cross the Hotel 1 holding point or enter this area unless positive clearance to do so has been received from ATC, and the stopbar at Hotel 1 has been extinguished.
iii. Hold A6E is not available for aircraft larger than the Boeing 737-800/BBJ/A321. Access is only permitted eastbound routeing via hold A6.

m) **Remote De-icing - Aircraft Engines Running**.

i. There are two locations identified as de-icing pads to enable the remote de-icing of aircraft with engines running. They are managed and coordinated by the London Luton Airport Operations Ltd (LLAOL) de-icing service providers and there is an agreed process in place for the operation of these pads.
ii. The two locations are located on Taxiway Foxtrot and the South Apron and are available for use by both commercial and General/ Business Aviation up to Code C. Both will have resource to coordinate the operations, communication with pilots and de-icing rigs operatives and an electronic signage board for visual communications.

1. **Taxiway Foxtrot** (4 positions) - All aircraft are positioned to face south. Taxiway Foxtrot can accommodate 4 aircraft simultaneously (F1, F2, F3 & F4) with aircraft entering via F5 & K1 (from Delta) and exit via F1 onto taxiway Alpha or K1 on to Delta. There may be occasions where parts of Taxiway Foxtrot is used for aircraft parking.
2. **South Apron** (3 positions) - All aircraft are positioned to face east. The South Apron can accommodate a maximum of 3 aircraft simultaneously, these aircraft will be able to taxi in/out independently of one another under the guidance of a follow me and marshaller.

3 CAT II/III OPERATIONS

a) Runways 07 and 25, subject to serviceability of the required facilities, are suitable for Category II/III operations by operators whose minima have been accepted by the Civil Aviation Authority.
b) During Category II/III operations, special ATC procedures (ATC Low Visibility Procedures) will be applied. Pilots will be informed by ATIS broadcast or by RTF when these procedures are in operation.
c) Departing Aircraft:

- Runway 25 - ATC will require departing aircraft to use the Alpha 1 holding point.
- Runway 07 - ATC will require departing aircraft to use the Bravo 1 holding point.

Occasionally it may be necessary for other departure points to be used due to work in progress or at the discretion of ATC.

d) Arriving Aircraft:

The appropriate runway exit will be illuminated. Pilots should report 'Runway Vacated' when the aircraft has passed the last of the alternate yellow and green centre-line lights, which denote the extent of the ILS localizer sensitive area.

4 WARNINGS

a) Bird dispersal takes place regularly including the use of pyrotechnics.
b) Grass cutting will take place as required during the summer months.
c) Radio-controlled model aircraft flying takes place during daylight hours, at Coles Lane, Harpenden, adjacent to the M1 between Junctions 9 (VRP) and Junction 10. Pilots should be aware that model aircraft up to 7 KG may be operating in these areas below altitude 1000 FT.
d) Unmanned Aerial Vehicle (UAV) activity takes place during daylight hours, operating on the south western border of Harpenden, adjacent to the M1 between Junction 9 (VRP) and Junction 8 (VRP). Pilots should be aware that UAVs up to 20 KG may be operating in these areas below altitude 1000 FT.
e) In order to minimise possible damage to adjacent aircraft, equipment and structures, pilots of departing propeller-driven aircraft exceeding MTOM 5700 KG and all jet aircraft must use minimum breakaway power if self-manoeuvering off any stand.
f) Possible light distraction on approach to Runway 07. Lights positioned at 515215.44N 0002406.90W.
g) Radio-controlled model aircraft flying and Unmanned Aerial Vehicle (UAV) activity takes place during daylight hours at Harris Lane, Offley, 0.5 NM southeast of Offley VRP. Pilots should be aware that model aircraft and UAVs up to 7 KG may be operating in these areas below altitude 1000 FT.
h) Unmanned Aerial Vehicle (UAV) operations take place within the aerodrome boundary, details of operating times and exact location will be passed by ATC.

5 HELICOPTER OPERATIONS

a) A helicopter landing area is not designated. Helicopters must route inbound and outbound as directed by ATC and should avoid overflying all built-up areas to the south of the Airport.
b) Arriving helicopters must transition over the runway before air or ground taxiing to parking; Departing helicopters must air or ground taxi to a runway holding point and must subsequently, transition over the runway before departing, as instructed by ATC.
c) Helicopter Aiming Point Procedure - Helicopters arriving from or departing to, locations south of the Airport may be cleared to land at or take-off from, either Hotel 1 or Charlie 1. Such helicopters must transition perpendicular over the runway but must not land or take-off using the runway QDM. All other helicopters are required to land or take-off using the runway, for which ATC may issue modified circuit joining and leaving instructions.
d) Helicopters arriving and departing during Low Visibility Procedures must use the runway in use. After arrival, helicopters will taxi to the parking area as directed by ATC. Helicopters parking on the main apron may be provided with guidance by a marshaller.
e) Helicopters inbound from the south may be cleared by ATC to hold at the aerodrome boundary to await onward clearance to cross the runway after departing or landing fixed-wing aircraft. In such circumstances, to avoid interference to ground-based navigation equipment, such helicopters must remain at or south of the aerodrome boundary until able to cross the runway without further holding, and must not hover below 100 FT AAL over the grass area between the southern aerodrome boundary and the runway.
f) Helicopters, except when air taxiing or in the service of a police or health authority and authorised by ATC, must not operate over any apron below a height of 500 FT or fly closer than 500 FT to any associated buildings, vehicle or aircraft.

6 USE OF RUNWAYS

a) Minimum Runway Occupancy Time - Departing Aircraft.

   i. On receipt of back-track/line-up clearance, pilots should ensure, commensurate with safety and standard operating procedure, that they are able to taxi into the correct position if not already at the hold, and back-track/line-up on the runway as soon as the preceding aircraft has commenced either its take-off roll or completed its landing run and has passed the holding point. The crew of departing aircraft must inform ATC if they are not ready for departure when instructed by ATC to enter the runway for take-off.
   ii. Whenever possible, cockpit checks should be completed prior to line-up and any checks requiring completion when lined-up on the runway should be kept to the minimum required. Pilots should ensure that they are able to commence the take-off roll immediately take-off clearance is issued.
   iii. Pilots not able to comply with these requirements should notify ATC as soon as possible once transferred to the Luton Tower frequency.
   iv. Pilots are not to cross any illuminated Holding Point Red Stop bars unless specifically instructed to do so by ATC.
   v. RWY 07 - Pilots requiring the full runway length should advise ATC when requesting departure clearance.

b) Minimum Runway Occupancy Time - Arriving Aircraft.

   i. Pilots are reminded that rapid exit from the runway enables ATC to apply minimum spacing on final approach that will achieve maximum runway utilisation and will minimise the occurrence of 'go-arounds'.
   ii. Aircraft vacating the runway via Taxiway Alpha must hold at Holding Point Alpha 6 until further instructed by Luton Ground.
   iii. Aircraft vacating the runway via Taxiway Bravo must hold at Holding Point Bravo 5 until further instructed by Luton Ground.
   iv. Aircraft vacating the runway via Taxiway Hotel must hold at Holding Point Bravo 6 until further instructed by Luton Ground.
   v. Turn-offs from the runway onto Taxiway Charlie are prohibited except when authorised by ATC.
   vi. Aircraft vacating the runway via Taxiway Golf must hold at Holding Point Alpha 6 until further instructed by Luton Ground.

7 TRAINING

a) Conditions of Use.

   i. Daily: Available for training 0800-2000 (0700-1900).
   ii. Use of the aerodrome for training purposes is subject to prior permission from London Luton Airport Operations Ltd and acceptance by Air Traffic Control having regard to tactical traffic situation.
   iii. All visiting and Luton based operators and aircrew requesting to undertake training flights at Luton whether landing or not, must contact Airport Operations by telephone: 01582-395525. The filing of a flight plan for a training flight does not in itself imply permission or ATC acceptance.
   iv. Training aircraft using Runway 25 must climb straight ahead to 500 FT AAL, must track 215º M until reaching height 1500 FT; aircraft using Runway 07 must not turn crosswind until reaching height 1500 FT AAL, unless otherwise instructed by ATC.
   v. The simulation of engine failures is not permitted.

b) Circuits.

   i. Circuits by propeller-driven aircraft whose Maximum Take Off Mass exceeds 5700 KG and by all jet aircraft on training flights will be carried out at the minimum circuit height of 2500 FT QFE, unless otherwise instructed by ATC. Runway 07 – right hand circuits Runway 25 – left hand circuits.
   ii. Circuits by propeller-driven aircraft whose MTOM does not exceed 5700 KG shall be carried out at the minimum circuit height of 1000 FT QFE.

EGGW AD 2.21 NOISE ABATEMENT PROCEDURES

All aircraft inbound or outbound from this aerodrome are required to conform to the following procedures, for more details please refer to Aircraft Noise Control at LLA available on: http://www.london-luton.co.uk/corporate/community/noise/minimising-noise. Notwithstanding that these may at any time be deviated from to the extent necessary for avoiding immediate danger.

1 GENERAL

a) Every operator of aircraft whilst within or directly above the aerodrome shall ensure that aircraft are operated in a manner calculated to cause the least disturbance practicable in areas surrounding the aerodrome.
b) Unless on radar vectors, aircraft shall avoid any populated areas.
c) Any aircraft shall, after take-off, be operated in such a way that it will not cause more than 79 dBA by day (0700-2300 (0600-2200)) or 78 dBA by night (2300-0700 (2200-0600)) at any noise monitoring terminal at any of the sites referred to in the table below:

Description	Postcode	OS Co-ordinates	Latitude (DMS)	Longitude (DMS)
NMT1: Frogmore, Stagenhoe Bottom Farm	SG4 8JN	TL 1767 2251	51°53’20N	0°17’30W
NMT2: Grove Farm, Slip End	LU1 4DB	TL 0766 1774	51°50’52N	0°26’18W
NMT3: Pepsal End Farm, Pepperstock	LU1 4LH	TL 0836 1745	51°50’43N	0°25’42W

2 TAKE-OFF AND MISSED APPROACH

a) Every jet aircraft using the aerodrome shall, after take-off or 'go-around' attain as soon as safety permits, a rate of climb of at least 500 FT per minute at power settings which will ensure progressively decreasing noise levels at points on the ground under the flight path.

3 CONTINUOUS DESCENT APPROACHES

a) All jet aircraft and all propeller-driven aircraft whose MTOM exceeds 5700 KG, are expected to apply Continuous Descent Approach (CDA) procedures to all approaches to Runway 07 and Runway 25. Subject to ATC clearance, inbound aircraft are to minimise noise disturbance by the use of continuous descent and low power, low drag operating procedures.
b) Where the use of these procedures is not practicable, the aircraft shall maintain as high an altitude as possible. Radar vectors will be given, and descent clearance will include an estimate of track distance to touchdown.
c) In addition, when descending on initial approach, including the closing heading, and on intermediate and final approach, thrust reductions should be achieved where possible by maintaining a clean aircraft configuration and by landing with reduced flap, provided that in all the circumstances of the flight this is consistent with safe operation of the aircraft.
d) CDA will commence from 5000 FT QNH and will be deemed to have been continuous provided that no segment of level flight longer than 2.5 NM.

4 VISUAL CIRCUITS/APPROACHES

a) Aircraft approaching without assistance from ILS or radar shall follow a descent path no lower than the normal approach path indicated by the PAPIs.
b) With the exception of training aircraft as described in Local Traffic Regulations, paragraph 7 'Training' above, propeller-driven aircraft whose MTOM exceeds 5700 KG and all jet aircraft carrying out visual circuits/approaches to Runways 07 and 25 shall establish on final approach no closer than 7 NM from touchdown. Additionally, such aircraft shall not, unless otherwise instructed by ATC, descend below 2500 FT (Luton QNH) before commencing final approach.
c) Aircraft must not join the final approach track to any runway at an altitude of less than 2500 FT (Luton QNH), orbits on final approach will not be authorised by ATC, except when the safety of an aircraft would be compromised.

5 NOISE PREFERENTIAL ROUTINGS

a) The Noise Preferential Routings and Procedures specified in the table below are compatible with ATC requirements and shall apply in both VMC and IMC. The tracks are to be flown by all departing jet aircraft and by all other aircraft with a maximum certified weight exceeding 5700 KG unless otherwise instructed by ATC or unless deviations are required in the interests of safety.
b) The obligations of Noise Preferential Routings for conventional SIDs cease when a height of 3000 FT QNH (between 0700-2300 (0600-2200)) and 4000 FT QNH (during night time, 2300-0700 (2200-0600)) has been reached. The obligations of Noise Preferential Routings for the RNAV1 SIDs cease when a height of 4000 FT QNH has been reached.
c) A departure will be deemed to have complied with the Noise Preferential Routing if, in the portion of flight below the appropriate vectoring altitude (see 5 (b) above), it is properly recorded by the airport’s noise and track monitoring system as having flown wholly within the Lateral Swathe (LS). Where the aircraft is clearly flying outside the LS, the aircraft is identified as causing a “possible” track violation and is subject to a nominal fine, as defined in LLA’s Charges and Conditions of Use.

Take-off Run-way	ATC Clearance	Procedure	Take-off Run-way	ATC Clearance	Procedure
25	OLNEY	Climb straight ahead to 500 FT (AAL) turn left to intercept BNN VOR R031. At BNN D7 turn right onto HEN QDM 254°. At BNN VOR R003 turn right onto BNN VOR R343. Crossing BNN R343/ D6 at 4000.	07	OLNEY	Climb straight ahead. At I-LTN D3.4 turn left to intercept BPK VOR R313.
	RODNI	Climb straight ahead to 500 FT (AAL) turn left to intercept BNN VOR R031. At BNN D7 (WICEK) turn right onto HEN QDM 254° ensuring that BNN DME does not decrease below 4 NM.		RODNI	Climb straight ahead. At I-LTN D3.8 turn right onto HEN QDM 255°. Ensure that BNN DME does not decrease below 4 NM. (See Note 3)
	RNAV MATCH/ Detling	Climb straight ahead to 1030 FT QNH, then turn left direct GWS01, then to GWS06, left to GWS12, right to GWE16, GWE19, BPK VOR. (See Note 2)		MATCH/ Detling	Climb straight ahead to I-LTN D4.7, then turn right to intercept BPK VOR R335.

Note 1: *The Noise Preferential Routeings specified above are compatible with normal ATC requirements, however in individual cases ATC may vary them when necessary. The use of the routeings is supplementary to noise abatement take-off techniques as used by piston-engined, turboprop and turbo-jet aircraft.*

Note 2: *Unless otherwise instructed by ATC, aircraft departing from Runway 25 for RNAV MATCH/DETLING will be routinely kept within the NPR corridor until crossing the railway line (GWE) between St. Albans and Harpenden.*

Note 3: *Unless otherwise instructed by ATC, aircraft departing from Runway 07 for RODNI must remain at 4000 FT (Luton QNH) until west of Radial 037 (OSWAH) from Bovingdon VOR.*

Note 4: *The crossing points and altitudes are detailed at AD 2-EGGW-6-1 to 6-6 charts of the Standard Instrument Departure procedures for aircraft departing the airport via the Airways System. Aircraft departing outside the Airways System IFR may be given amended vertical SID clearances at a lower altitude. These flights are exempt from NPR requirements.*

Note 5: *Positioning flights to London Heathrow Airport or Northolt from Runway 25, to London Stansted from Runway 07 or aircraft departing outside of the airways system are exempt from NPR requirements.*

6 GROUND RUNNING AND TESTING OF AIRCRAFT ENGINES

a) The ground running and testing of the engines of any aircraft other than at ground idle power setting shall be carried out only in the designated areas.
b) The aircraft shall be positioned in such a manner that the jet blast will not impinge on any runway, taxiway, aircraft, equipment installation, or other property of the airport or third party.
c) ATC shall be notified by radio at the commencement and cessation of each run and the following information should be provided:

   i. The aircraft's registration number or letters;
   ii. The aircraft's position on the airport;
   iii. The percentage power setting anticipated; and
   iv. The expected duration of the engine run.

d) A single engine run at ground idle power settings may be undertaken provided that:

   i. the aircraft is positioned so as to cause no damage or inconvenience to persons or property;
   ii. the engine run does not exceed 10 minutes;
   iii. a person is at all times in attendance outside the aircraft to ensure the safety of persons and property during the engine run;
   iv. Continuous radio contact is maintained with air traffic control, from whom permission to start the engine(s) must be obtained and to whom notification must be given when the engine run is completed.

e) Engine ground running and testing will normally be permitted within the following periods:

   i. Weekdays: between 0600-2300 (0500-2200)
   ii. Saturdays, Sundays and Public Holidays: between 0700-2300 (0600-2200);
   iii. In exceptional circumstances, operators can apply to Airport Operations for permission to operate outside this period.

7 NIGHT NOISE RESTRICTIONS

a) Chapter 2 aircraft are not permitted to operate during the periods of 2300-0700 (2200-0600);
b) The aircraft with a QC value of greater than 1 must not operate during the night period.
c) All departure flights recording a level above 78 dB, 6.5 KM from 'start of roll' during the night period will be subject to a nominal fine, as defined in LLA's Charges and Conditions of Use.
d) Aircraft scheduled (SIBT) to arrive during the early morning shoulder period 0610-0705 (0510-0605), will not be accepted earlier than 0600 (0500).

e) Aircraft scheduled (SIBT) to arrive during the day period 0710-2300 (0610-2200) will not be accepted earlier than 0700 (0600).

8 NOISE ABATEMENT PROCEDURES FOR HELICOPTERS

a) Fixed-wing aircraft and helicopters operating under VFR or SVFR to the south of Luton Airport should endeavour to avoid overflying built-up areas and isolated properties south of the boundary.

EGGW AD 2.22 FLIGHT PROCEDURES

1 THE ARRIVAL CODE OF PRACTICE (ACOP) AND DEPARTURE CODE OF PRACTICE (DCOP)

The voluntary Code of Practice has been compiled by Flight Operations and Air Traffic Control to give advice on the operational techniques aimed at improving the environmental impacts of aircraft operations through operational best practice. The Arrival Code of Practice (ACOP) and Departure Code of Practice (DCOP) can be found on the LLA website - https://www.london-luton.co.uk/corporate/lla-publications/operations. Nothing in this Code shall take precedence over the requirement for safe operation and control of aircraft at all times. For the avoidance of doubts, all recommendations are to be read as being subject to the requirements of safety and manufacturer/aircraft flight manual limits.

2 PROCEDURES FOR INBOUND AIRCRAFT UNDER IFR

a) Inbound via the ATS Route Network

i. The Standard Arrival Routes (STAR) for aircraft inbound to London Luton are shown at AD 2-EGGW-7-STAR Charts.
ii. The Terminal Holding facility at ABBOT is shared with arrivals to both London Stansted and Cambridge airports and therefore some STAR designators are shared. The Terminal Holding facility at ZAGZO is for London Luton arrivals only.

b) Inbound other than on Airways

i. Aircraft wishing to enter the Luton CTR/CTA direct from the London FIR should obtain ATC clearance at least 10 minutes before reaching the CTR or CTA boundary, when they will be advised of the route to be followed consistent with the current traffic situation.
ii. Aircraft arriving from the north and northeast should expect to route via a Reporting Point BIGLI (520748N 0001430W, BKY VOR/DME fix R309/D14; BNN VOR/DME fix R027/D27) established beneath the London TMA (base 5500 FT QNH).
iii. For aircraft receiving a service from London Military Radar, co-ordination procedures have been agreed between Luton ATC and London Military involving the use of BIGLI. There is no holding procedure associated with BIGLI.
iv. Aircraft must not enter Controlled Airspace unless specific clearance to do so has been given.

c) Approach Procedures – with Radar Control

i. When inbound traffic is being sequenced by Radar, the Approach procedure will be flown from under directions from the appropriate Radar Controller, and will consist of that part of the approach between the holding pattern and the Final Approach Track.
ii. Once the aircraft is under Approach Radar Control, changes of Flight Level/Altitude and heading will be made only under instructions from the Radar Controller, except in cases of radio communications failure in the aircraft or at the Radar Unit.
iii. Headings and Flight Levels/Altitudes will be passed by ATC. When holding is not necessary, radar vectors will be given prior to the aircraft reaching the holding pattern and descent clearance will include an estimate of track distance to touchdown.
iv. Further distance information will be given between initial descent clearance and intercept heading to the ILS. On receipt of descent clearance, the pilot will descend at the rate he judges will be best suited to the achievement where possible, of continuous descent, the objective being to join the glidepath at the appropriate height for the distance, without recourse to level flight.
v. Between the hours of 2300-0700 (2200-0600), all jet aircraft and all propeller driven aircraft whose MTOM exceeds 5700 KG, irrespective of the type of approach, are to be vectored onto a closing heading which will position the aircraft for Runway 25 on final approach no closer than 8 NM from touchdown and for Runway 07 no closer than 10 miles from touchdown. Descent below 3000 FT QNH is not to be given until 10 NM from touchdown.
vi. Pilots should typically expect the following speed restrictions to be enforced:
220 KT from the holding facility during the intermediate approach phase;
180 KT on base leg/closing heading to the ILS;
180-160 KT when first established on the ILS;
165 KT +/-5 to 5 DME.
vii. These speeds are applied for ATC separation purposes and are mandatory. In the event of a new (non-speed related) ATC clearance being issued (eg an instruction to descend on ILS), pilots are not absolved from a requirement to maintain a previously allocated speed. All speed restrictions are to be flown as accurately as possible. Aircraft unable to conform to these speeds should inform ATC and state what speeds will be used. In the interests of accurate spacing, pilots are requested to comply with speed adjustments as promptly as feasible within their own operational constraints, advising ATC if circumstances necessitate a change of speed for aircraft performance reasons.
viii. The spacing provided between aircraft will be designed to achieve the maximum runway utilisation within the parameters of safe separation minima (including wake turbulence) and runway occupancy. It is important to the validity of the separation provided that runway occupancy time is kept to a minimum consistent with the prevailing conditions.
ix. Pilots of IFR flights inbound to Luton airport will be vertically or laterally separated from all gliding activity north of and below final approach track to Runway 07.
x. In the event of radio communications failure at the Radar Unit, pilots should contact Luton Tower for further instructions.

3 PROCEDURES FOR OUTBOUND AIRCRAFT

a) All jet aircraft and all propeller driven aircraft whose MTOM exceeds 5700 KG departing London Luton Airport, whether routing inside or outside Controlled Airspace, are required to follow Noise Preferential Routes.
b) The Standard Instrument Departure Procedures for aircraft departing from London Luton Airport via the Airways System are detailed at AD 2-EGGW-6-1 to 6-6. Aircraft departing IFR outside the Airways System will be issued a Standard Instrument Departure Procedure with amended vertical clearances to facilitate leaving Controlled Airspace.
c) ATC clearance is available from Luton Ground RTF 121.755 MHz, up to 20 minutes prior to aircraft flight planned departure time.
d) Departure Speed Restriction: In order to optimise the departure flow and assist in the separation between successive departing aircraft a speed limit of 250 KT IAS below FL 100 is applicable until removed by ATC. ATC may remove the speed restriction by using the phrase 'No ATC Speed Restriction'. Pilots are reminded that this phrase does not relieve the pilot of the responsibility to adhere to the ground track of the Noise Preferential Route, which may require a speed/power limitation. See AD 2-EGGW-6-2 and 6-3.
e) If for any reason pilots are unable to comply with the 250 KT IAS speed restriction the pilot should immediately advise ATC and state the minimum speed acceptable. If a pilot anticipates before departure that they will be unable to comply with the speed restriction, they should inform ATC when requesting start-up clearance, stating the minimum speed acceptable. In this case the pilot will be informed before take-off of any higher speed limitation
f) Positioning flights to London Heathrow Airport or Northolt will be cleared on a RODNI Standard Instrument Departure as far as WICEK/ OSWAH direct to BNN (514334N 0003259W) and will be allocated a level within controlled airspace prior to departure.
g) Positioning flights to London Stansted Airport will be cleared on an OLNEY Standard Instrument Departure as far as OXPAC/OFGOM direct to BKY (515923N 0000343E) and will be allocated a level within controlled airspace prior to departure.
h) It is imperative that pilots of departing aircraft inform ATC on start-up if they anticipate an initial climb and/or acceleration performance that is likely to be significantly less than 'normal' for their aircraft type.

4 RADIO COMMUNICATIONS FAILURE PROCEDURES

In the event of complete radio communication failure in an aircraft, the pilot is to adopt the appropriate procedures notified in ENR 1.1 Section 3 Paragraph 3.4, with the exceptions described below.

a) Inbound Aircraft via ZAGZO †

i. When complete communication failure occurs in the aircraft before ETA, or before EAT, when this has been received and acknowledged the aircraft will:

1. fly to the ZAGZO † holding point (as detailed at AD 2-EGGW-7-STAR Charts);
2. hold at the last assigned level until the last acknowledged ETA plus 10 minutes, or EAT when this has been given;
3. then commence descent for landing in accordance with the RNAV1 Approach Transitions from ZAGZO.

ii. If complete radio communication failure occurs after an aircraft has reported to ATC on reaching the holding point the aircraft will:

1. hold the last assigned level at ZAGZO † until:

ATA over the holding point plus 10 minutes or 10 minutes after the last acknowledged communication with ATC whichever is the later; or

EAT when this has been received and acknowledged;

2. then commence descent for landing in accordance with the RNAV1 Approach Transitions from ZAGZO.

iii. When radio communication failure occurs during intermediate approach (initial) under radar control.

In the event of radio failure after instructions to leave the ZAGZO † hold with the intention of a direct radar assisted approach, but before being given approach clearance, the following procedure should be adopted:

1. continue descent to the assigned altitude or maintain last assigned altitude;
2. proceed to the LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13);
3. hold at the LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13) for 5 minutes (as shown in the AIP charts);
4. descend in the holding pattern to 2000 FT QNH and commence an ILS/NDB approach;
5. in the event of a missed approach, follow the Missed Approach procedure to LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/ D13) and adopt the basic radio failure procedure detailed at ENR 1.1 Section 3 Paragraph 3.4.

iv. The route and level to be used when leaving CAS in accordance with the procedures given at ENR 1.1 Section 3 Paragraph 3.4 are shown in the table below:

Position at time of decision	Route
ZAGZO LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13)	Turn right onto track 360° M at last assigned level. Turn onto track 334° M at not above 3000 FT ALT.

b) Inbound Aircraft via ABBOT ‡‡

i. When complete communication failure occurs in the aircraft before ETA, or before EAT, when this has been received and acknowledged the aircraft will:

1. fly to the ABBOT ‡‡ holding point (as detailed at AD 2-EGGW-7-6 and AD 2-EGGW-7-7 STAR Charts);
2. hold at the last assigned level until the last acknowledged ETA plus 10 minutes, or EAT when this has been given;
3. then commence descent for landing in accordance with the Initial Approach Procedures from ABBOT. For Runway 07 arrivals from ABBOT, descend in the LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13) holding pattern from 4000 FT ALT to 2000 FT ALT and then carry out the appropriate instrument approach procedure for the runway in use and effect a landing within 30 minutes (or later if able to continue visually).

ii. If complete radio communication failure occurs after an aircraft has reported to ATC on reaching the holding point the aircraft will:

1. hold the last assigned level at ABBOT ‡‡ until:

ATA over the holding point plus 10 minutes or 10 minutes after the last acknowledged communication with ATC whichever is the later; or

EAT when this has been received and acknowledged;

2. then commence descent for landing in accordance with the Initial Approach Procedures from ABBOT. For Runway 07 arrivals from ABBOT, descend in the LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13) holding pattern from 4000 FT ALT to 2000 FT ALT and then carry out the appropriate instrument approach procedure for the runway in use and effect a landing within 30 minutes (or later if able to continue visually).

iii. When radio communication failure occurs during intermediate approach (initial) under radar control. In the event of radio failure after instructions to leave the ABBOT ‡‡ hold with the intention of a direct radar assisted approach, but before being given approach clearance, the following procedure should be adopted:

1. Continue descent to the assigned altitude or maintain last assigned altitude;
2. proceed to the LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13);
3. hold at the LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13) for 5 minutes (as shown in the AIP charts);
4. descend in the holding pattern to 2000 FT QNH and commence an ILS/NDB approach;
5. in the event of a missed approach, follow the Missed Approach procedure to LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13) and adopt the basic radio failure procedure detailed at ENR 1.1 Section 3 Paragraph 3.4.

iv. The route and level to be used when leaving CAS in accordance with the procedures given at ENR 1.1 Section 3 Paragraph 3.4 are shown in the table below:

Position at time of decision	Route
ABBOT LUT NDB (I-LTN D4.7/I-LJ D3.9, BKY VOR R244/D13)	Turn right onto track 360° M at last assigned level. Turn onto track 334° M at not above 3000 FT ALT.

c) Outbound Aircraft

i. Comply with the route and altitude limitations detailed in the allocated Luton Instrument Departure Procedure detailed at AD 2-EGGW-6 or ATC clearance and commence climb to flight planned level after the last position at which an altitude is specified.
ii. When a radar heading has been issued, climb on the assigned heading to the first altitude of Flight Level detailed in the clearance, maintain the heading and level for three minutes, then adopt the basic procedure detailed at ENR1.1 Section 3 Paragraph 3.4.

5 SPECIAL VFR FLIGHT

a) Special VFR clearance for flights within the London Luton CTR may be requested and will be given whenever the traffic conditions permit. These flights are subject to the general conditions laid down at ENR 1.2.

Note: *Note: Pilots holding a Private Pilot Licence (Aeroplanes) are reminded of the flight visibility requirements for Special VFR flight laid down in Schedule 7 of the Air Navigation Order 2009 and the related notification at ENR 1-4.*

b) Aircraft may be given radar vectoring whilst within the CTR if, due to the traffic situation, ATC considers it necessary. Pilots are reminded that they must at all times when operating on a Special VFR Clearance, remain clear of cloud and in sight of the surface, and in flight conditions which will enable them to determine their flight path and remain clear of obstacles. Pilots must inform the radar controller if compliance with these requirements entails a change of heading or level.
c) Pilots are reminded that a Special VFR clearance applies only to flight within the CTR and does not extend to flight within the surrounding airspace of the London TMA or London Stansted Airspace.
d) In order to reduce conflict with IFR flights, Special VFR flights will normally be cleared not above 1500 FT (Luton QNH).

6 VFR FLIGHTS

a) VFR flights in the London CTR/CTA will be given routeing instructions and/or altitude restrictions in order to integrate VFR flights with other traffic.
b) Pilots should anticipate clearance and routeing instructions via Entry/Exit Lanes and VRPs detailed below. Additionally, pilots of fixed-wing VFR and Special VFR aircraft inbound from the north may be instructed by ATC to route via or hold at Offley VRP in order to integrate with landing traffic.
c) Traffic information will not normally be given to aircraft operating outside the London Luton CTR/CTA, and not in receipt of a LARS from Luton Radar, due to the large amount of traffic operating in adjacent areas.
d) Entry/Exit Lanes

i. North/South Lanes

1. A lane 1.5 NM wide known as the North Lane, with centre-line being a line joining the Church at Pirton (Pirton VRP) the bridge over the A505 at Offley (Offley VRP) and the mid-point of Luton Runway 07/25;
2. A lane 1.5 NM wide known as the South Lane, with centre-line being a line joining M1 Junction 8 VRP, the railway bridge at East Hyde (Hyde VRP) and the mid-point of Luton Runway 07/25;

ii. use of the lanes is subject to Special VFR clearance being obtained from Luton ATC;
iii. pilots are responsible for providing their own separation from other aircraft within the entry/exit lanes, however, traffic information will be given when requested or as deemed necessary by Luton ATC;

e) VFR Helicopters

i. VFR helicopters inbound to, departing from or overflying London Luton Airport will normally be required to route via tracks joining the following VRPs, in order to minimise noise impact on the ground and to ensure integration with arriving and departing flights.

- From/To the North:

  Pirton VRP- Offley VRP.

- From/To the South and Southeast:

  A1(M), Junction 4 VRP - Kimpton Hall VRP - Hyde VRP.

- From/To the South and Southwest

  M1, Junction 8 VRP - M1, Junction 9 VRP - Hyde VRP.

- From/To London Stansted:

  Puckeridge A10/A120 INT VRP - Kimpton Hall VRP - Hyde VRP.

  † VFR helicopters departing London Luton should identify their preferred routing when booking out. See AD 2-EGGW-4-1 for Luton CTR/CTA chart.

ii. Helicopters will typically be issued with VFR clearances not above 1500 FT AMSL, however pilots are requested to maintain the highest possible level in accordance with the clearance to minimise noise impact on the ground.

7 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

8 GLIDING, HANG-GLIDING, PARAGLIDING AND MICROLIGHT ACTIVITY - LUTON CTR/CTA

Pilots are advised that by arrangement with Luton ATC:

a) Intense gliding, hang-gliding and paragliding activity takes place with winch cables up to 2500 FT QNH during daylight hours at Dunstable Downs (515200N 0003254W) within the following areas (as depicted in AD 2-EGGW-4-1):

Area 1 bounded by: 515227N 0004006W - 515511N 0002426W - 515240N 0002704W - 515133N 0003327W - 515135N 0003730W - 515114N 0003938W - 515227N 0004006W up to 3500 FT QNH.

Area 2 bounded by: 515134N 0003516W - 515133N 0003327W - 515151N 0003144W - 515132N 0003135W - 515056N 0003459W - 515134N 0003516W up to 1500 FT QNH.

Area 3 bounded by: 515131N 0003754W - 515135N 0003730W - 515134N 0003516W - 515056N 0003459W - 515031N 0003726W - 515131N 0003754W up to 2000 FT QNH.

Area 4 bounded by: 515258N 0003709W - 515522N 0003427W - 515350N 0003212W - 515258N 0003709W up to 4500 FT QNH.

Area 5 bounded by: 515150N 0004336W - 515227N 0004006W - 515114N 0003938W - 515135N 0003730W - 515133N 0003327W - 515240N 0002704W - 514942N 0003313W - 514810N 0004155W - 515150N 0004336W up to 3500 FT QNH.

Area 6a bounded by: 515131N 0003754W - 515310N 0003116W - 514942N 0003313W - 514634N 0003538W - 515131N 0003754W up to 1500 FT QNH.

Area 6b bounded by: 515244N 0003828W - 515350N 0003212W - 515310N 0003116W - 515131N 0003754W - 515244N 0003828W up to 2500FT QNH.

With the exception of the Class G airspace below CTA-3 (from surface to 2500 FT), use of these areas is strictly controlled by a Letter of Agreement with the London Gliding Club, the Dunstable Hang-gliding and Paragliding Club and other parties. Visiting pilots wishing to

use these areas must be fully briefed by either the London Gliding Club or the Dunstable Hang-gliding and Paragliding Club as to the conditions imposed upon gliding operations and hang-glider and paragliding operations.

Some areas are not in force when Luton Runway 07 is in use, however for the purposes of this paragraph, all of the above areas can be assumed to be active.

b) Microlight and fixed wing activity takes place during daylight hours at Graveley (515628N 0001212W) within the following area (as depicted in AD 2-EGGW-4-1) and this is also governed by a Letter of Agreement.

Area 7 bounded by: 515841N 0001606W - 515857N 0001434W - thence clockwise by the arc of a circle radius 8 NM centred on 515228N 0002206W - 515556N 0001025W - 515541N 0001129W - 515541N 0001311W - 515646N 0001243W - 515841N 0001606W up to 1000 FT QNH.

c) Pilots of IFR flights inbound to Luton airport will be vertically or laterally separated from all gliding or microlight activity within these areas through the application of normal ATC procedures.

d) Pilots of aircraft operating under VFR, or on a Special VFR clearance are advised to avoid these areas if at all possible. In addition, pilots operating on a Special VFR clearance are advised that due to the nature of these activities they cannot be given separation from gliders, aircraft towing gliders, hang-gliders, paragliders or microlights within these designated areas. Traffic information will NOT be passed by ATC.

9 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside Luton controlled airspace within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Luton Radar frequency, 129.550 MHz, are encouraged to select SSR code 0013.

514459N 0000624W - 520311N 0000141W -
521109N 0000102W - 521104N 0002159W -
521126N 0002220W - 520316N 0003441W -
515749N 0004048W - 515356N 0005006W -
514015N 0005348W - 514027N 0003627W -
514111N 0001345W - 514459N 0000624W.

b) Selection of 0013 does not imply the receipt of an ATC service. Pilots of aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Luton controlled airspace at all times.

c) Whilst squawking 0013, pilots should be aware that Luton Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.

d) When a pilot ceases to maintain a listening watch, code 0013 shall be deselected.

EGGW AD 2.23 ADDITIONAL INFORMATION

a) Mode S Barometric Pressure Setting Data

London Terminal Control has the ability to downlink Mode S Barometric Pressure Setting (BPS) data. Therefore, if the downlinked pressure data is at variance with the BPS expected by Air Traffic Control, pilots can expect additional challenge. When Air Traffic Control pass a reminder of the appropriate BPS, it is anticipated that the aircrew will cross check the altimeter settings and confirm set.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 982
HEIGHTS IN FEET AGL (328)

LONDON LUTON

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is **2000** in the sector defined by the lateral limits; 515838N 0003424W - 520140N 0001649W thence clockwise by an arc of a circle radius 8NM centred on 515359N 0001322W to 514617N 0000956W - 514316N 0002725W thence clockwise by an arc of a circle radius 8NM centred on 515057N 0003054W to 515838N 0003424W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and
b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at last assigned level, to **NDB(L) LUT** and adopt the procedure detailed at EGGW AD 2.22.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) LUT** at **3000** and continue in accordance with the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart should only be used for the cross-checking of assigned altitudes whilst in receipt of an ATC Surveillance service.**
7. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of instrument approaches other than SRA is cleared to intercept the final approach track.**
8. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
9. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.

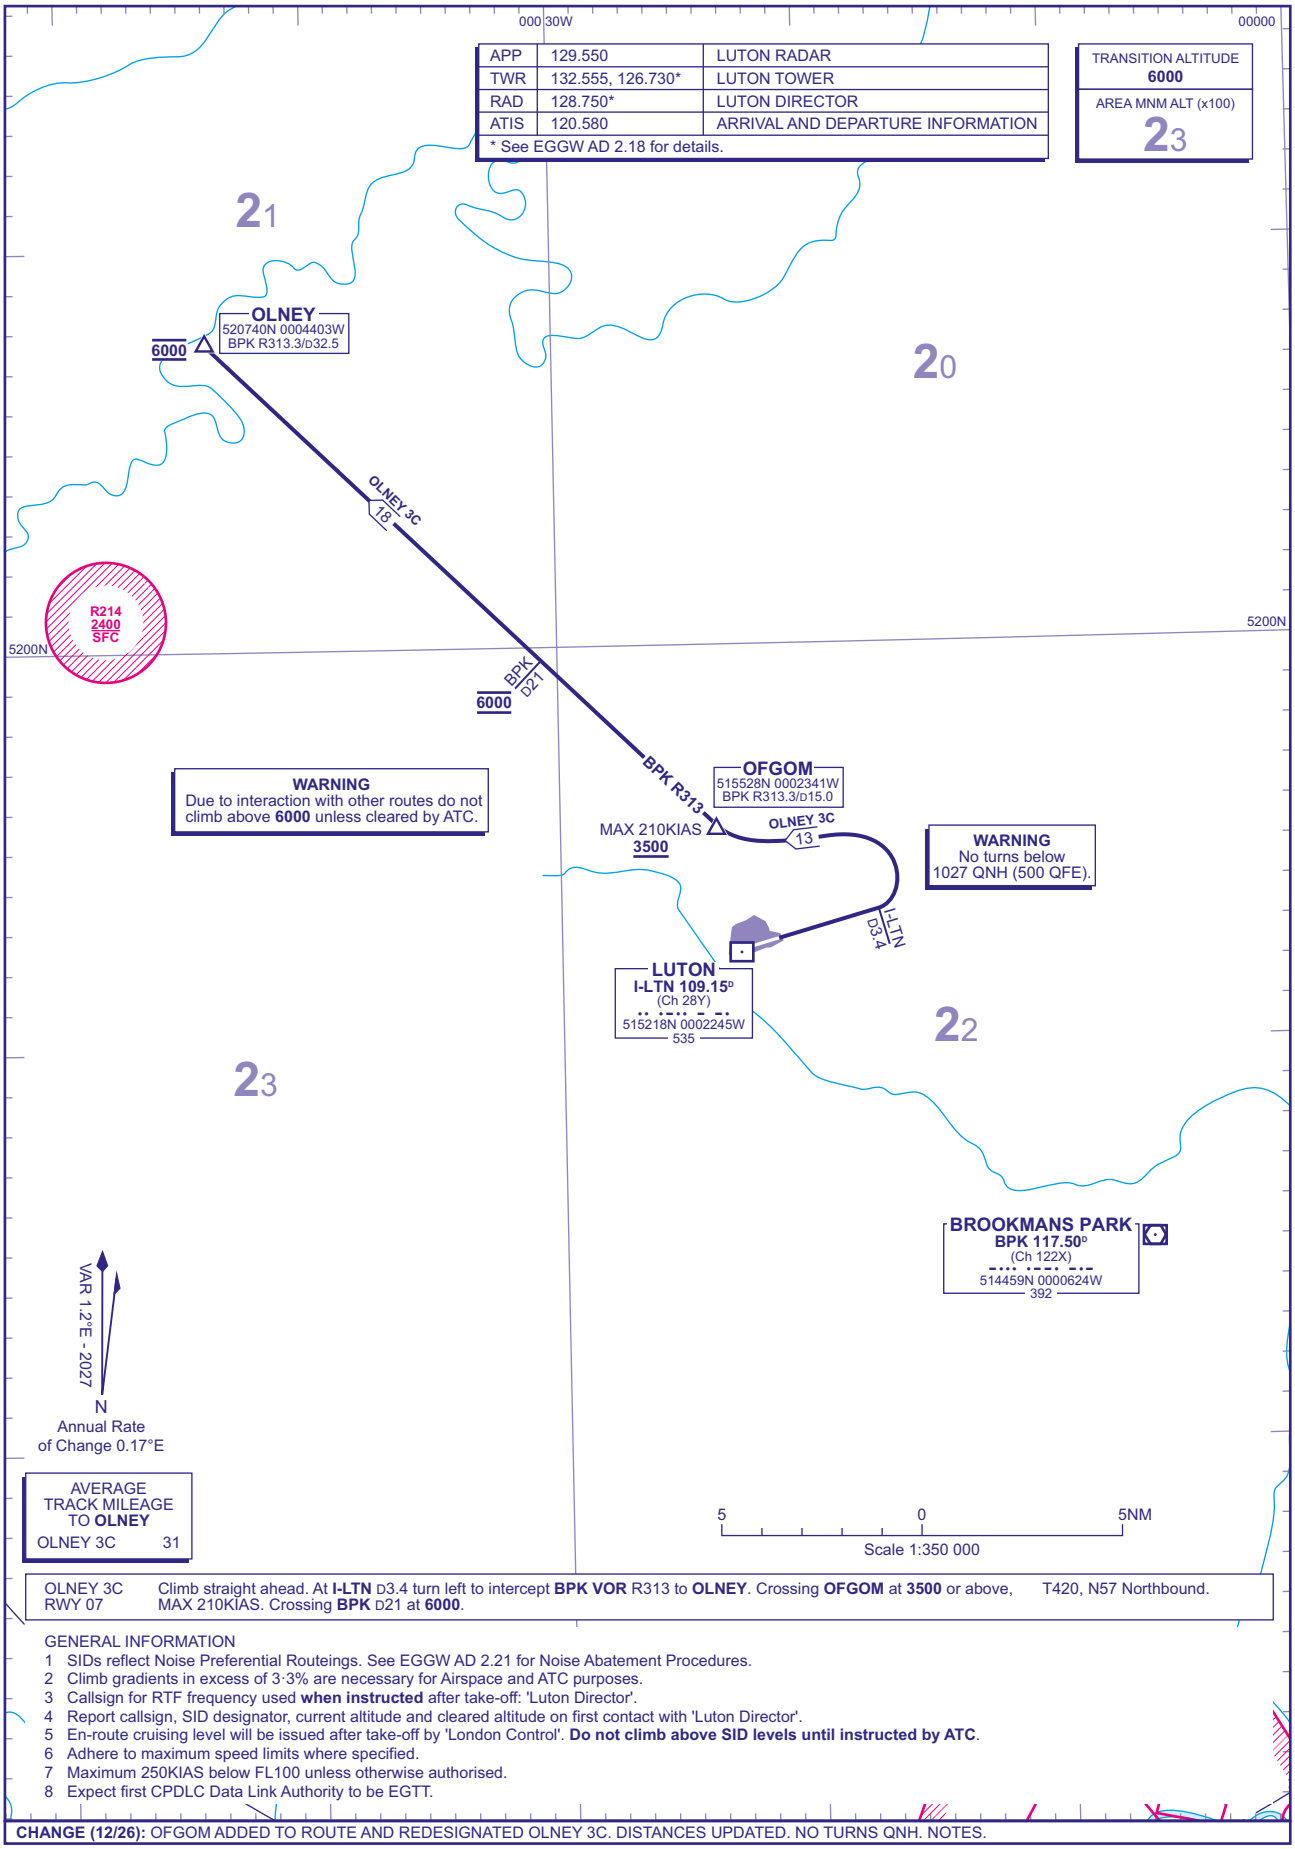
GENERAL INFORMATION
1 Close-in obstacles exist for RWY 25 departures. See Aerodrome Obstacle Chart and EGGW AD 2.10 Aerodrome Obstacles.
2 SIDs reflect Noise Preferential Routeings. See EGGW AD 2.21 for Noise Abatement Procedures.
3 RWY 25 Obstacle Clearance Requirements: Minimum Climb Gradient 4·5% to 200 AAL.
4 Climb gradients in excess of 3·3% are necessary for Airspace and ATC purposes.
5 Callsign for RTF frequency used **when instructed** after take-off is 'London Control'. Occasionally aircraft may be required to communicate with Luton Director as instructed by ATC.
6 Report callsign, SID designator, current altitude and initial cleared altitude on first contact with 'London Control'.
7 En-route cruising level will be issued after take-off by 'London Control'. **Do not climb above SID levels until instructed by ATC**.
8 Adhere to maximum speed limits where specified.
9 Maximum 250KIAS below FL100 unless otherwise authorised.
10 Expect first CPDLC Data Link Authority to be EGTT.



CHANGE (12/26): OXPAC ADDED TO ROUTE AND REDESIGNATED OLNEY 3B. NO TURNS QNH. NOTES.

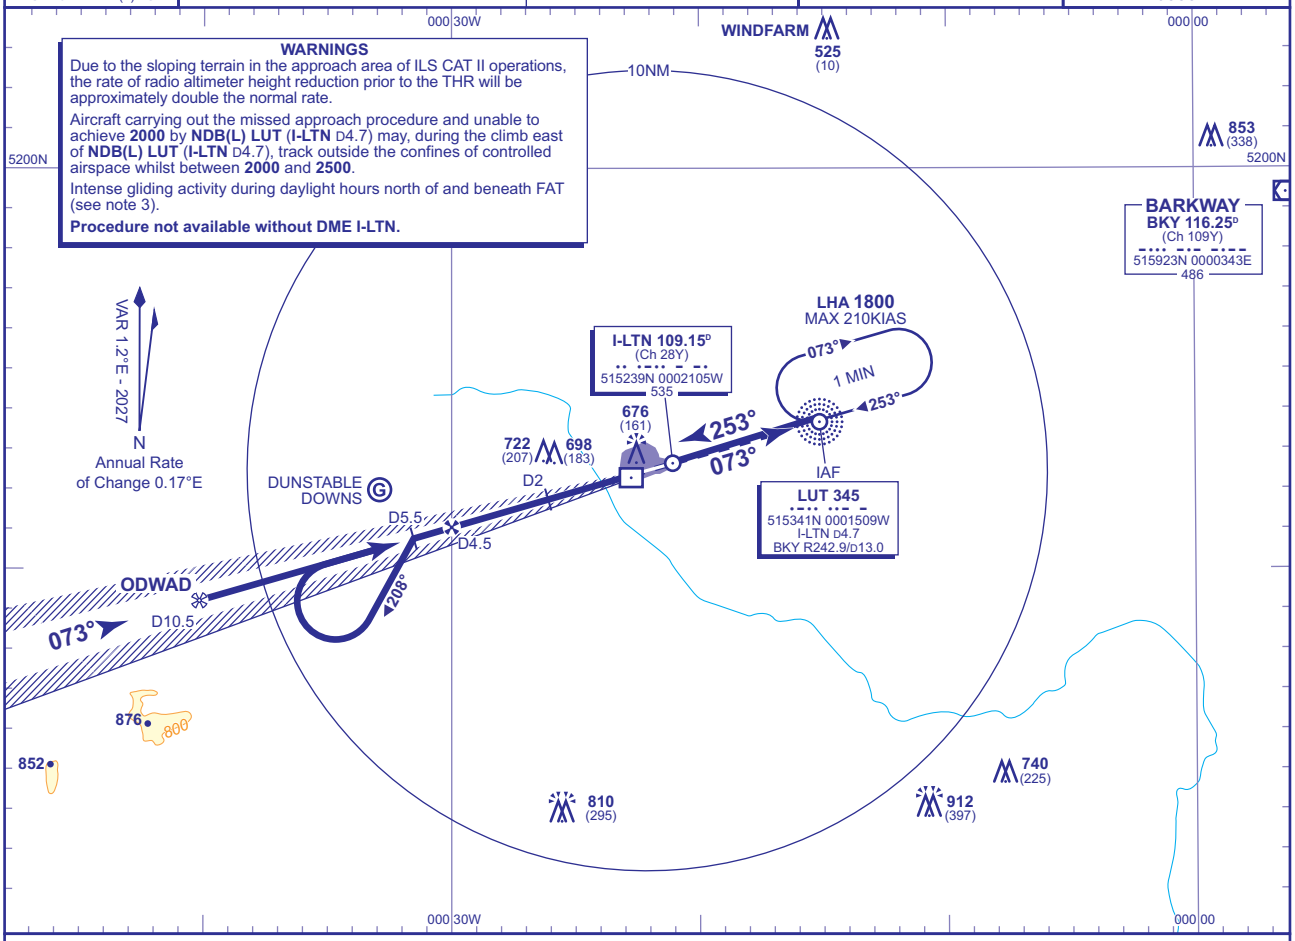
	121.755	LUTON GROUND	OBSTACLE ELEVATION 912 AMSL (397) (ABOVE THR)		
RAD	128.750	LUTON DIRECTOR			
ATIS	120.580	ARRIVAL INFORMATION	BEARINGS ARE MAGNETIC		

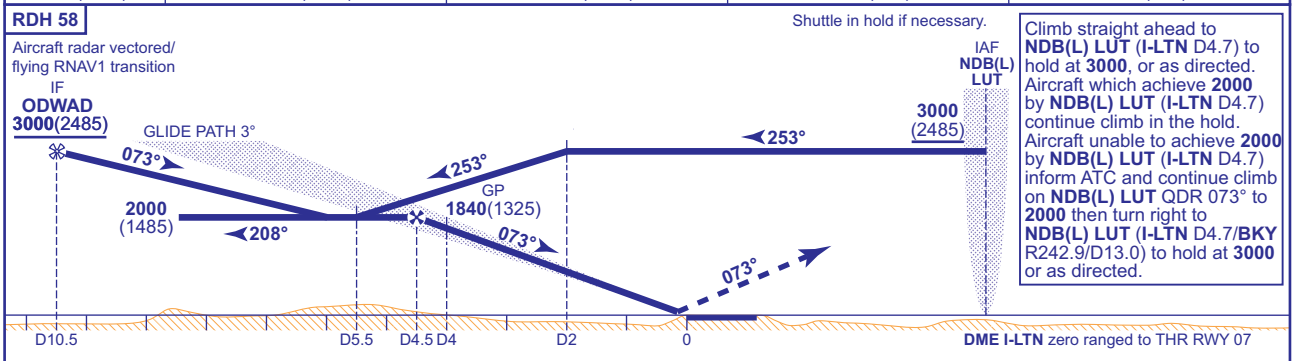


WARNINGS

Due to the sloping terrain in the approach area of ILS CAT II operations, the rate of radio altimeter height reduction prior to the THR will be approximately double the normal rate.

Aircraft carrying out the missed approach procedure and unable to achieve **2000** by **NDB(L) LUT** (**I-LTN** D4.7) may, during the climb east of **NDB(L) LUT** (**I-LTN** D4.7), track outside the confines of controlled airspace whilst between **2000** and **2500**.

Intense gliding activity during daylight hours north of and beneath FAT (see note 3).



Procedure not available without DME I-LTN.

RECOMMENDED PROFILE GLIDE PATH 3°, 320FT/NM

DME I-LTN	4	3	2	1
ALT(HGT)	**1840**(1325)	**1520**(1005)	**1210**(685)	**890**(375)

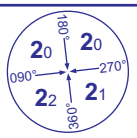
RDH 58

Climb straight ahead to **NDB(L) LUT** (**I-LTN** D4.7) to hold at **3000**, or as directed. Aircraft which achieve **2000** by **NDB(L) LUT** (**I-LTN** D4.7) continue climb in the hold. Aircraft unable to achieve **2000** by **NDB(L) LUT** (**I-LTN** D4.7) inform ATC and continue climb on **NDB(L) LUT** QDR 073° to **2000** then turn right to **NDB(L) LUT** (**I-LTN** D4.7/**BKY** R242.9/D13.0) to hold at **3000** or as directed.

Aircraft Category		A	B	C	D
OCA (OCH)	CAT I	**667**(152)	**679**(164)	**693**(178)	**707**(192)
	CAT II	**569**(54)	**579**(64)	**593**(78)	**611**(96)
VM(C)OCA (OCH AAL)	Total Area	**1100**(573)	**1100**(573)	**1300**(773)	**1300**(773)

Rate of descent	G/S KT	160	140	120	100	80
	FT/MIN	850	740	630	530	420

NOTE 1 Aircraft can normally expect to be radar vectored onto final approach.
2 Aircraft will normally be required to hold not lower than **3000**.
3 Gliding takes place in ceded airspace north of and beneath LOC. Pilots are warned not to descend below the GP/recommended descent profile. Page EGGW AD 2.22 Paragraph 6 refers.



CHANGE (1/26): MAG VAR, MAG TRACKS UPDATED.

AERO INFO DATE 10 NOV 25 AD 2-EGGW-8-6

EGSS — LONDON STANSTED

EGSS AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGSS — LONDON STANSTED

EGSS AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 515306N Long: 0001406E Mid point of Runway 04/22.
2	Direction and distance from city	2.5 NM ENE of Bishops Stortford.
3	Elevation / Reference temperature / Mean Low Temperature	348 FT / 19 °C / -
4	Geoid undulation at AD ELEV PSN	150 FT
5	Magnetic Variation / Annual Change	1.43°E (2027) / 0.17°E
6	AD Administration Address Telephone	STANSTED AIRPORT LTD. Enterprise House, Stansted Airport, Stansted, Essex CM24 1QW. 0808-169-7031 (STAL) 01279-669328 (NATS Ltd) 01279-669325 (ATIS)
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	Telephone calls to NATS Ltd operational areas may be recorded.

EGSS AD 2.3 OPERATIONAL HOURS

1	AD Administration	H24
2	Customs and immigration	H24 Prior notice by 2100 (2000) required for movements between 2300-0700 (2200-0600).
3	Health and sanitation	Health Control Officers in attendance for High Risk Flights. H24 Answerphone. Animal Border Inspection Post available.
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	-
7	ATS	H24 See also AD 2.18.
8	Fuelling	H24 for aircraft stands on the southside of the airport. 0600-2100 (0500-2100) for aircraft stands on the northside of the airport. Out of hours prior booking with fuelling provider listed at EGSS AD 2.4, Section 7.
9	Handling	H24
10	Security	H24
11	De-icing	H24
12	Remarks	Refer to AD 2.20 item 1.

EGSS AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Full. Nearest railway siding: Stansted 2.2 NM.
2	Fuel and oil types	AVTUR JET A-1. Various by arrangement with fuel companies.
3	Fuelling facilities/capacity	Southside, full hydrant facility except Stands D70, D71, D72, D73, D74. Northside, bowser refuelling.
4	De-icing facilities	Available H24 by arrangement with local companies.
5	Hangar space for visiting aircraft	By arrangement with local companies.
6	Repair facilities for visiting aircraft	Maintenance and repair by arrangement.

7	Remarks	Oxygen and related servicing, by arrangement with local companies. The following companies provide a handling service for all executive and private aircraft: Harrods Business Aviation Ltd, Tel: 01279-665312. Fax: 01279-681367. e-mail: stnops@harrodsaviation.com Universal Aviation (UK) Ltd, Tel: 01279-680349. Fax: 01279-680372. e-mail: uk@universalaviation.aero Inflite Ltd, Tel: 01279-831000. Fax: 01279-837900. e-mail: operations@inflite.co.uk Diamond Hangar Ltd, Tel: 01279-680161. e-mail: operations@diamondhangar.com AVTUR JET A-1, oxygen and related servicing available by arrangement with Handling Agent. Prior Permission Required (PPR) not less than 4 hours before intended movement. General Aviation operators must notify the following details of each flight in advance through their nominated handling agent who will obtain prior permission (Handling Agent requirement is mandatory). 1 – Aircraft type, registration and operator; 2 – Point of origin; 3 – Date/time of ETA and ETD Stansted; 4 – Nominated Handling Agent.

EGSS AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels in the vicinity.
2	Restaurants	Buffet and bar.
3	Transportation	Trains, buses, taxis and hire cars. Nearest railway station: Stansted Airport (connected to passenger terminal).
4	Medical facilities	Limited first aid treatment available.
5	Bank and Post Office	Bureau de Change in Terminal. No post Office.
6	Tourist Office	-
7	Remarks	-

EGSS AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A7 RFF Category 8, 9 and 10 on request.
2	Rescue equipment	In accordance with EASA Regulations.
3	Capability for removal of disabled aircraft	The registered owner or aircraft operator retains complete responsibility for the removal of a disabled aircraft. Airlines and aircraft operators are to have aircraft recovery plans and/or a confirmed contract in place. Aircraft recovery arrangements must be submitted to Airside Operations, Stansted Airport Ltd.
4	Remarks	-

EGSS AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, Chemical de-icing, Sanding.Gritting.
2	Clearance priorities	Standard. See AD 1.2.2.
3	Remarks	Latest Information from SNOWTAM/STAL AODM Tel: 01279-662378.

EGSS AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Azimuth and stopping guidance is provided as follows: AGNIS/Double stop arrows. Stands D72L, D72R, D73L, D73R, Z204R, Z204L, Z205R, Z205L, Z213L, Z213R, Z214L, Z214R, 520. Safedock: A1, A1L, A1R, A2, A3, A4, A5, A6, A7, A8, A9L, A9C, A9R, A10, A11, A11L, A11R, A12L, A12C, A12R, A13L, A13C, A13R, A15L, A15C, A15R, B20, B21, B22, B23L, B23C, B23R, B24L, B24C, B24R, B30, B31, B32L, B32R, B33L, B33R, B34L, B34R, C40, C41, C42L, C43L, C43R, C44L, C44R, C50L, C50R, C51L, C51R, C52L, C52R, C53L, C53R, D61R, D62L, D62R, D63L, D63R, D64L, D64R, E81L, E81R, E82L, E82R, E83L, E83R, E84L, E84R, E90L, E90R, E91L, E91R, E92L, E92R, E93L, E93R, J25L, J25R, J45R, J65L, J65R, J85L, J85R, Z204, Z205, Z213, Z214. Marshaller instructions: B32C, B33C, B34C, C42C, C42R, C43C, C44C, D70L, D71L, D71C, D71R, D72C, D73C, D74, E81, E82, E90, E91, E92, E93, J45L, Z204F. Painted Stop Arrows and centre-line Stands: H03L, H03C, H03R, 501, 503, 504, 505L, 505R, 506, 507, 509. Stand Number indicator board provided on all stands except E81, E82, E90, E91, E92, E93, 501, 502, 507 and 509. East and West centre-lines in Alpha, Bravo, Charlie, Echo and Zulu Cul-de-Sacs available for H24 and limited to aircraft with a maximum wingspan of 36 M. Taxi-lanes Link Delta restricted to aircraft with a maximum wingspan of 51.9 M.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 04/22: Runway designation, runway threshold, (04/22) runway centre-line and touchdown zone markings and runway edge markings. Runway light(s): Lights are LED. Taxiway light(s): Green centre-line lighting with selective route switching is provided on Taxiways Golf, Juliet and Hotel. Blue edge lighting is available on Taxiway Foxtrot, Taxilane Foxtrot Alpha and the Western Apron. Illuminated lead-on/off routes are provided at: Golf, Uniform, Victor, Whiskey, Hotel, Kilo, Lima, Lima Romeo, November Romeo, Papa Romeo, Papa, Quebec Romeo, Quebec, Romeo and Sierra holding points. Green Lead-on/off lighting is suppressed when red hold bars are illuminated. Guard lights at all runway entry points. Lights are LED.
3	Stop bars and runway guard lights (if any)	At all CAT I and CAT II/III runway holding points. Hotel and Juliet have stop bars along their length and within all cul-de-sacs. No stop bars on Taxiways Foxtrot and Golf. Stop bars at runway holding points are in operation H24.
4	Other runway protection measures	-

5	Remarks	The main aprons are marked for nose-in parking only. All operators should ensure that their handling agents can supply tractor push-back facilities. Taxiway Juliet: An Airside Operations marshaller is required for aircraft under their own power with a maximum wingspan greater than 51.9 M when routing behind stands J25L/R, J45L/R, J65L/R and J85L/R. Western Apron: Is restricted to aircraft with a maximum wingspan of 36 M. Delta Cul-de-Sac wingspan restriction of 38.10 M. Painted taxiway intermediate holding points to be used at ATC's discretion are located on Taxiways Foxtrot and Golf and are designated: F1, FA1 and G4. For marshaller contact, Tel: 01279-662478. Pilots should not enter an aircraft stand unless Stand Entry Guidance is illuminated or a marshaller has signalled clearance to proceed. In the event of there being no activated SEG displayed upon approach to the stand, flight crews should inform Ground Movement Control (GMC) and contact their handling agent. Aircrew must not attempt to self-park if the SEG is not illuminated or calibrated for their aircraft type. Safedock Advanced Visual Docking Guidance System The safedock advanced visual docking guidance system (A-VDGS), provides both pilots with guidance for manoeuvring the aircraft into the gate to the correct centre-line and stop position under all operational conditions. Alpha Middle line has blue paint markings to assist decision making when entering the Alpha Cul-de-Sac. Note: In case of malfunction in the docking guidance system stop taxiing and contact Stansted Ground/Tower and request assistance. 3x WDI: 515318.58N 0001405.52E - 515336.99N 0001503.18E (LGTD) - 515235.91N 0001333.68E (LGTD).

EGSS AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGSS AD 2.11 METEOROLOGICAL INFORMATION PROVIDED

1	Associated MET Office	MET OFFICE EXETER
2	Hours of service MET Office outside hour	H24 -
3	Office responsible for TAF preparation Periods of validity	MET OFFICE EXETER 30 hours
4	Trend forecast Interval of issuance	-
5	Briefing/consultation provided	Self briefing/telephone.
6	Flight documentation Language(s) used	Charts abbreviated plain language text. TAFs/METARs. English.
7	Charts and other information available for briefing or consultation	-
8	Supplementary equipment available for providing information	-
9	ATS units provided with information	LONDON STANSTED
10	Additional information (limitation of service, etc.)	Surface wind data (2 minute average) is available for both ends of the runway. Normally, only touchdown surface wind will be passed. Stopend surface wind and instantaneous surface wind available on request for both ends. AUTO METARs are provided over the 24 hour period and verified by a certificated Met Observer.

EGSS AD 2.20 LOCAL AERODROME REGULATIONS

1 AERODROME REGULATIONS

a) Pilots of non-commercial (General Aviation) flights arriving from abroad are required to report to Customs at the Designated Customs Clearance Office in the Business Aviation Terminal.
b) Use governed by regulations applicable to Stansted CTR.
c) All aircraft must be able to communicate by radio.
d) Pilots must be specially attentive to RTF callsigns used by ATC on the Ground Frequency. Although the RTF channel is shared by aircraft and vehicular traffic, pilots may not hear the transmissions of vehicle drivers, only the responses from ATC.
e) H24, subject to the prior approval of the Chief Executive Officer (CEO), Stansted Airport Ltd.
f) All flights operating at Stansted require a slot allocation by the airport co-ordinator, (ACL). Operators are advised to review current Stansted Directors Notices on ad-hoc slot allocations and Night restrictions which reflect the airports co-ordinated status.
g) Requests for ad-hoc slot allocations should be made to ACL during working hours Mon-Fri 0900-1700 (0800-1600) by telephone: 020-8564 0600 or outside of these times to Stansted Airside Operations, by telephone: 01279-662478. Operators are advised that the availability of ad-hoc slots during peak periods is likely to be extremely limited.
h) Fixed Based Operators are normally available 0600-2200 (0500-2100), and may be available outside of these times with prior arrangement with those handling agents listed at EGSS AD 2.4, Section 7. Customs and Immigration are routinely available 0730-2130 (0630-2030). Control Authority coverage outside of these times may be arranged through the nominated handling agent. Additional charges may apply.
i) Planned Diversion Procedure - airline and other operators are advised that before selecting Stansted as an alternate, prior arrangements for ground handling, maintenance and aircraft recovery should be in place. Nothing in this procedure shall, however, prevent an aircraft that has a declared emergency from landing.

j) Fixed Electrical Ground Power (FEGP) must be used whenever available and serviceable. Use of aircraft Auxiliary Power Units (APUs), and diesel Ground Power Units is subject to strict controls as set out in published airport regulations. Between the hours 0600-2330 (0500-2230), APUs should be shut down as soon as practicable following arrival and not restarted until 10 minutes prior to departure, except when the outside air temperature (as promulgated by ATC) is below +5°C or above +20°C. Between 2331-0559 (2231-0459), except when immediately prior to departure, APUs may not be run without notification to Stansted Airside Operations Tel: +44(0)1279-662478.

k) Aircraft engine testing is permitted subject to the restrictions detailed in the Aerodrome Manual, contact Stansted Airside Operations, Tel: +44(0)1279-662478 for further advice.

2 GROUND MOVEMENT

a) General

i. All requests for clearance, start-up and taxi should be made directly with ATC. Directions issued by ATC should be followed precisely. RTF transmissions must be brief, concise and kept to a minimum.
ii. Within the manoeuvring area pilots will be cleared to and from the stands under general direction from GMC and are reminded of the importance of maintaining a good lookout at all times.
iii. Departing aircraft, on first contact with Stansted ATC, must state aircraft type, stand number, ATIS code letter, QNH received, and then maintain a listening watch at all times.
iv. Clearance is available for departing aircraft approximately 22 minutes before departure on the Delivery frequency (when open-status broadcast on ATIS), otherwise Ground, and must be obtained at least 10 minutes before start up to allow data to be processed - failure to do may incur delays.
v. Pre-departure clearance by datalink is available at Stansted for suitably equipped aircraft. For further information contact ATC Operations, Tel: +44 (0)1279-669302.
vi. Stansted Airport is equipped with an advanced surface movement radar utilising Mode-S.

1. Aircraft operators intending to use London Stansted Airport should ensure that Mode-S transponders are able to operate when the aircraft is on the ground.
2. Flight crew should select XPNDR or the equivalent according to specific installation, AUTO if available, not OFF or STDBY, and the assigned Mode-A code:

(aa) From the request for push back or taxi, whichever is earlier.
(bb) After landing, continuously until the aircraft is fully parked on stand.

3. After parking the Mode-A code 2000 must be set before selecting OFF or STDBY.
4. Flight crew of aircraft equipped with Mode-S having an aircraft identification feature should also set the aircraft identification. This setting is the aircraft identification specified in Item 7 of the ICAO ATC Flight Plan. The aircraft identification should be entered from the request for pushback or taxi, whichever is earlier, through the FMS or the Transponder Control Panel.

b) Aprons

i. Pilots should only request push back (with tug attached) when they are actually ready to do so.
ii. Within the Alpha, Bravo, Charlie, Echo and Zulu cul-de-sacs aircraft should take care to use the taxilane as directed by the GMC controller (ie: East, West or middle). Pilots are responsible for ensuring they do not accept a clearance to use a taxilane centre-line which is not approved for their aircraft type.
iii. Caution, Western Apron is uncontrolled.

c) De-icing Pad Operations

i. Remote de-icing operations will occur when snow is falling and accumulating and shall be promulgated by Stansted Airport Ltd Airside Operations.
ii. Remote de-icing is only available to operators who have a pre-agreement with Stansted Airport Ltd.
iii. Remote de-icing – Operation

1. Flight crew shall notify ATC that remote de-icing will be required prior to aircraft pushback via datalink where available.
2. Flight crew shall simultaneously contact their respective handling agent to request remote de-icing.
3. Flight crew shall request push and start as per normal. ATC shall direct the aircraft to the de-icing pad.
4. Upon entering the pad, flight crew shall park the aircraft in line with the respective Painted Stop Arrow and Omni-directional Red Lights.
5. Once parked the flight crew shall contact the pad controller via the appropriate frequency, and confirm that the parking brake is set, engines are at idle power and the de-icing required.
6. The pad controller shall confirm the de-icing requirements, and shall authorise the de-icing vehicles to approach the aircraft and begin de-icing operations. The pad controller shall park their vehicle in front of the aircraft, in line-of-sight of the flight crew to manage de-icing operations.
7. On completion of de-icing operations, the pad controller shall confirm that all de-icing operations have been completed, that vehicles have vacated the manoeuvring area, advise the anti-icing code, the litreage used and areas treated. Once this has been acknowledged by the flight crew the pad controller shall vacate the manoeuvring area. Flight crew shall contact ATC for further taxi.

iv. Remote de-icing – Emergency Procedures

1. Should an aircraft emergency develop during de-icing pad operations, flight crews are to select all nose landing lighting and contact ATC. Upon seeing the illuminated lights, all de-icing vehicles shall vacate manoeuvring area.

d) **It is the Commander's responsibility not to accept an ATC clearance into an area not approved for the type of aircraft.**
e) Pilots are reminded that RTF contact must be maintained with ATC whilst engaged in compass swings on the Compass Base or engine runs in the Ground Run Pen.
f) Runway 04 during CAT II/III operations, aircraft on Golf taxiway with wingspan greater than 36 M may be required to cross the runway at Victor for departure.
g) Aircraft are not to stop on any runway exit awaiting instructions from Ground Movement Control. If a landing aircraft cannot contact GMC due to RTF congestion the pilot should fully vacate the runway and taxi into the first available taxiway block. The pilot should then hold position until contact with GMC can be established.
h) Link D, at its intersection with Taxiway Hotel, has a maximum permitted wingspan of 51.9 M.
i) Taxiway Hotel between abeam Link Delta and Link Echo, including Link Echo has a maximum wingspan of 36 M.
j) Airport-Collaborative Decision Making (A-CDM) - Definitions of Commonly Used A-CDM Terms:

i. Calculated Take-Off Time (CTOT);
ii. Target Off-Blocks Time (TOBT);
iii. Target Start Approval Time (TSAT);
iv. Target Take-Off Time (TTOT);
v. Estimated Off-Block Time (Flight Plan EOBT);
vi. Minimum Departure Interval (MDI);
vii. Advanced Visual Docking Guidance System, Ramp Information Display Screen (AVDGS RIDS).

TOBT/TSAT

i. Pilots must be aware of the TOBT and TSAT and comply with it. It is visible on AVDGS RIDS where provided, in the Airport Community App and from the Ground Handling Agent.
ii. If TOBT or TSAT can no longer be complied with then TOBT must be updated by the Aircraft Operator via the dispatcher/Ground Handling Agent Ops.
iii. Pilots must report that the flight is READY to depart at TOBT (tolerance window of -5 to +5 minutes). Failure to do so may see TOBT & TSAT deleted.
iv. Reporting READY when not ready will see the READY status rescinded and TOBT & TSAT may get automatically deleted.
v. Pilots planning to be READY more than 5 minutes before TOBT must update the TOBT to an earlier time first (up to 10 minutes before EOBT or SCHEDULED time).
vi. If at TOBT + 6 minutes ATC have not received a valid READY or start up request the aircraft may lose its position in the departure sequence and a new TOBT may be required.
vii. ATC cannot update TOBT or TSAT values.
viii. A TSAT can never be improved to earlier than the TOBT.

EOBT Compliance

i. It is essential that the Flight Plan EOBT and TOBT are kept aligned. A-CDM alarm CDM08 is triggered to the handling agent if they are more than 10 minutes difference. Failure to align may see unachievable CTOTs for which a further delay may occur if the values need to be updated late. An out-of-date EOBT may also receive a Flight Plan suspension from Eurocontrol if there is a taxi delay.
ii. ATC cannot easily update (delay) a Flight plan EOBT - it is the airline's responsibility.
iii. A request can be made to the airport for an airline operator's TOBTs to automatically trigger EOBT updates with Eurocontrol.

Start Request – Stansted ATC (Delivery, Ground or Tower as appropriate)

i. If already within the TSAT window when calling READY, ATC will then approve start. In the case of a TSAT delay beyond TOBT, ATC will advise of the TSAT. A TSAT can commonly be later than TOBT due to a CTOT but can also be delayed due to runway capacity or MDI restrictions.
ii. Pilots are to monitor the ATC frequency from this point and must continue to be READY as the TSAT can potentially improve to as early as the TOBT.
iii. Start approval will be issued based on TSAT compliance and the prevailing traffic situation.
iv. Pilots will be informed of an ATC delay to TSAT of more than 5 minutes. In such cases, the TOBT must not be updated further once READY has been acknowledged by ATC.
v. If a new TOBT is entered the flight will be re-sequenced (new TSAT issued automatically).
vi. The aircraft will not be allowed to start until a valid TOBT has been entered and revised TSAT assigned, with the window of -5 to +5 minutes applicable to both.

Remote Holding Request

i. Stansted Airport has remote holding areas available. If an eligible Aircraft Operator is aware of a significant CTOT delay (20 mins+) and wishes to take the delay off stand rather than on the stand, then they should contact ATC for approval and advise their Ground Handling Agent so that the pushback tug remains available.
ii. In this instance, once approved by ATC and recorded as a Remote Hold request which will be indicated on the AVDGS RIDS screen if it's active, the pushback will be allowed at TOBT and the TSAT will be adjusted to account for expected departure from the remote hold location.
iii. Airlines and ATC must remain open to an airport or Handling Agent request to seek pushback at TOBT for a delayed flight should there be operational demand for the stand or turnaround resources, though it remains at the discretion of ATC.

Aircraft De-icing Requirements

i. Stansted airport publishes an aircraft de-icing protocol as detailed within the Aerodrome manual. All Aircraft operators should ensure that they have read and understood this document. A copy can be downloaded from www.stanstedairport.com/airfield-operations/aerodrome-manual/.
ii. To request de-icing, pilots should follow their company's standard procedure which must include liaison with their ground handler who will additionally enter the requirement for de-cing into A-CDM. It is important to note that pre-boarding de-icing is not relevant to A-CDM and so does not need to be captured. Post-boarding aircraft de-icing time is not included in the TOBT calculation. i.e. this de-icing takes place after TOBT.
iii. If the aircraft is to be de-iced remotely, details for this are held within the London Stansted Airport Winter Operations Plan. A copy can be obtained from your Ground Handling Agent.
iv. Where de-icing is indicated, A-CDM expects that at TOBT when doors are closed, staff are ready to commence de-icing on stand. Pilots must update their Handling Agent if there is a delay to this as the issued TSAT is relative to the expected start and end of de-icing time. A call must also be made to the Ground Handler to update if the de-icing is taking longer or less time than expected as the start-up at TSAT +/- 5 minutes compliance is still required.
v. Once de-icing on the stand is complete, and assuming TSAT compliance, pilots should call Stansted ATC stating, 'de-icing complete, ready to push and start'.
vi. Pilots who have been allocated a remote de-icing area should contact Stansted ATC at TOBT, stating 'ready to push and start for remote de-icing'. The TSAT becomes the expected time to exit the remote de-icing location.
vii. There is a process for Handling Agents to follow to re-set the TOBT if de-icing has been completed and TSAT was not complied with i.e. TOBT and TSAT were subsequently deleted at TSAT+6. This should be avoided by updating the anticipated de-icing start and end times through the Handling Agent.

3 CAT II/III OPERATIONS

a) Runways 04 and 22, subject to serviceability of the required facilities, are suitable for Category II/III operations by operators whose minima have been accepted by the Civil Aviation Authority.
b) During Category II/III operations, special ATC procedures (ATC Low Visibility Procedures) will be applied. Pilots will be informed when these procedures are in operation by ATIS broadcast or by RTF.
c) Departing aircraft: ATC will require departing aircraft to use the following Category II/III holding points:

Runway 04 – Golf 3, Whisky 3, Hotel 3, Kilo 3 or Lima 3;
Runway 22 – Quebec 3, Romeo 3 or Sierra 3.
Occasionally, it may be necessary for other departure points to be used at the discretion of ATC.

d) Arriving aircraft: All appropriate runway exits are illuminated, and pilots should select the first convenient exit. Runway vacation will be assessed as being when the aircraft has passed the last of the alternate yellow and green centre-line lights. These lights denote the extent of the ILS Localizer sensitive area. Surface Movement Radar (SMR) is available to monitor pilot 'runway vacated' reports.
e) When Low Visibility Procedures are in force a much reduced landing rate can be expected due to the requirement for increased spacing between arriving aircraft. In addition to the prevailing weather conditions, such factors as equipment serviceability may also have an impact on actual landing rates. For information and planning purposes, the approximate landing rates that can be expected are:

IRVR (M)	Expected Landing Rate
Greater than 1000	24
Between 1000 and 600	20
Between 550 and 350	15
Less than 300	12 or less

f) Runways 04 and 22 are suitable for Lower than Standard Category I operations subject to the ILS radiating at CAT III and LVPs being declared in force by ATC, by Operators whose minima have been accepted by the Civil Aviation Authority. Crews wishing to conduct this approach should inform Stansted Radar on first contact.
g) Runway 04 during CAT II/III operations, aircraft on Golf taxiway with wingspan greater than 36 M may be required to cross the runway at Victor for departure.

4 WARNINGS

a) Extensive instrument flying takes place in vicinity of airport.
b) Trees in 22 Approach/04 Take-off relate to highest in large wooded area.
c) Due to runway undulation and line of site issues on Runway 04, aircraft may lose two way communication with ATC. Should this occur when on the runway, pilots should consider aligning with Kilo 1 on the runway.
d) Pilots are advised that a short section of Taxiway Quebec has a longitudinal slope locally in excess of 2%. Aircraft crews should exercise appropriate caution when taxiing through this area.

5 HELICOPTER OPERATIONS

a) All inbound and outbound helicopters must use the runways. Helicopter handling agents are to obtain slot allocation for all flights. Helicopters may not carry out direct approaches to or take-off from apron areas or taxiways. After landing, helicopters will ground taxi or air taxi to an allocated parking area. While helicopters are operating on the manoeuvring area extreme caution must be exercised regarding wingtip clearance and turbulence.
b) Departures from the runway unless otherwise directed by ATC are required to follow the routes below in accordance with chart in AD 2.EGSS-4-3 Helicopter VFR arrival/departure routes:

i. North - Audley End Railway Station VRP via M11 Motorway;
ii. East & South - Canfield A120/B1256 INTERCHANGE VRP;
iii. West - Puckeridge A10/A120 INTERCHANGE VRP via Hazelend Wood VRP and the north side of A120 trunk road, avoiding Bishop's Stortford;
iv. BKY - Nuthampsted AD VRP via Hazelend Wood VRP.

c) Approach to the runway from the west via Hazelend Wood VRP, or the north from Audley End Railway Station VRP shall remain north of Bury Lodge Hotel and remain clear of Burton End.
d) Helicopters landing from or departing to the west are to avoid overflight of Birchanger, Stansted Mountfitchet and Bishop's Stortford.
e) Pilots of inbound helicopters should contact the Terminal Control Group Supervisor (North) on 023-8048 1103 before departure to obtain an indication of likely delays and if necessary to obtain an EAT. Pilots of all inbound helicopters should note they may be required to hold outside CAS until they can be integrated into the traffic sequence and that in the event of a high controller workload such holding may have to be carried out without radar service.

6 USE OF RUNWAYS

a) Special runway utilisation procedures are detailed at GEN 3.3.3.
b) When Runway 04 is in use a right hand circuit is in force.
c) Wake Turbulence – Departures

i. The following sets of holding points are considered to be the same point for the purposes of departure wake turbulence separation:

Runway 04 - H1/H3 and G1/G3
Runway 22 - S1/S3 and R1/R3

ii. On departure, when in receipt of a line up clearance, the pilot must inform ATC before entering the runway, if greater wake turbulence separation will be required behind preceding aircraft than that laid down in UK AIC P 001/2015. Failure to do so may result in additional delay.

d) Wake Turbulence – Arrivals

For the purposes of spacing in the approach phase the following aircraft types are classified as Upper Medium for Wake Turbulence separation: B707, B757, DC-8 and IL62. All other ‘Medium’ aircraft types are classified as Lower Medium. Wake turbulence separations are in accordance with the 5 Group Scheme and are detailed in UK AIC P 001/2015.

e) Minimum Runway Occupancy – Departures

i. On receipt of line up clearance, pilots should ensure commensurate with safety and standard operating procedures, that they are able to taxi into the correct position at the hold and line up on the runway as soon as the preceding aircraft has commenced either its take off roll or landing run.
ii. Whenever possible cockpit checks should be completed prior to line up and any checks requiring completion whilst on the runway should be kept to the minimum required. Pilots should ensure that they are able to commence the take off roll as soon as clearance is issued
iii. Pilots not able to comply with these requirements should notify ATC as soon as possible once transferred to the Stansted Tower frequency.
iv. Pilots of aircraft with wingspan greater than 36 M should not proceed beyond the Cat III holding points G3 and W3 unless instructed to do so by ATC. This may result in fluctuations in the glidepath signal and, subject to weather conditions, inbound traffic established on the ILS may be asked to make a visual approach or localiser only approach whilst the restricted area is infringed.
v. Pilots should never cross Holding Point Red Stop bars.

f) Minimum Runway Occupancy – Arrivals

Runway 04	Taxiway PR	Taxiway QR	Taxiway Q
Distance from threshold (M)	1566	1844	2240
Design exit speed (KT)	52	52	N/A

Runway 22	Taxiway NR	Taxiway LR	Taxiway L
Distance from threshold (M)	1276	1891	2336
Design exit speed (KT)	52	52	N/A

i. Pilots are reminded that rapid exit from the runway will enable ATC to apply minimum spacing on final approach and will minimise the risk of ‘go-arounds’.
ii. Commensurate with safety, pilots should expedite their landing roll to vacate via the first available RET at the design exit speed.
iii. Where possible, pilots should exit at PR during Runway 04 operations. Tactical extension to the landing roll of any distance is prohibited unless authorised by ATC.
iv. Aircraft expecting to park on the north side of the airfield may be required to vacate via a RET to the south side during high intensity operations. ATC will advise the pilot accordingly on final approach.
v. Alternative vacating preferences may only be given at the discretion of ATC.

g) Runway Vacation Guidelines

i. Due to high intensity Runway Operations at Stansted it is necessary to ensure pilots adhere to the following guidelines:

Aircraft are not to stop on any runway exit awaiting instructions from Ground Movement Control. If a landing aircraft cannot contact GMC due to RTF congestion the pilot should fully vacate the runway and runway exit, and then hold position until contact with GMC can be established. Pilots should not anticipate a particular taxiway on vacating as there are no standard routeings at Stansted. On Runway 22, pilots should not assume Taxiway Juliet will be available.

ii. Taxiway November is not available as an entry/exit point from the runway for landing or departing fixed wing aircraft.

h) Runway Crossing Procedure

i. Aircraft and vehicles which are required to cross active runways will be issued instructions by the Ground Movement Controller, which will include a holding point as a clearance limit, at which the aircraft or vehicle will be required to hold short of the active runway.
ii. When reaching the clearance limit specified in the taxiing instructions, the aircraft or vehicle will be instructed to change frequency to that of the Air Controller of the appropriate runway.
iii. After crossing the runway and having reported 'Runway Vacated' with the Air Controller, the aircraft or vehicle will be instructed to contact the GMC frequency for further clearance. In the absence of further clearance it is essential that the aircraft or vehicle HOLD position when clear of the runway.

7 REDUCED DISTANCE OPERATIONS

a) To allow runway maintenance to take place, Runway 04/22 may be operated in a reduced distance configuration. There are two configurations both of which affect the runway declared distances, ground lighting, navigational aids and instrument flight procedures available. There will also be block closures on the taxiway system to safeguard the closed section of runway and facilitate contractor access. At the beginning and prior to the end of each night's working period the runway will be closed for approximately 15 minutes to enable the lighting changes to be undertaken. Time periods when these procedures are in use will be notified by SUP & NOTAM.
b) During these periods, reduced Aeronautical Ground Lighting services are provided as outlined in the table in AD 2.14. The lighting configuration will comply with the criteria laid down for non-precision approaches and take-offs where Instrumented Runway Visual Range (IRVR) is in excess of 400 M. DME will radiate throughout the working period. DME will continue to provide distance guidance for all departures and RNP Z and Y Instrument Approach Procedures (IAP) missed approaches. The RNP Z IAPs will provide distance information to the normal thresholds, while the RNP Y IAPs will provide distance information to the maintenance thresholds. DME is only used for the RNP Z and Y IAP missed approaches. Revised Aerodrome Charts will be published within a SUP as required.
c) Threshold Naming and IAPs available

The maintenance runway thresholds are designated with a 'C' suffix to distinguish them from the normal thresholds:

i. THR 04 (RW04) is the normal threshold for Runway 04 and RNP Z RWY 04 IAP.
ii. THR 04C (RW04C) is the maintenance threshold for Runway 04C and RNP Y RWY 04C IAP.
iii. THR 22 (RW22) is the normal threshold for Runway 22 and RNP Z RWY 22 IAP.
iv. THR 22C (RW22C) is the maintenance threshold for Runway 22C and RNP Y RWY 22C IAP.

Note: RW04, RW22, RW04C, RW22C are MAPt WPTs in RNP Z and Y IAPs respectively.

d) Use of Runways 04C & 22C

i. Runways 04C & 22C have maintenance thresholds with reduced distances available and will only be used by reason of planned pre-notified runway maintenance.
ii. Instrument Approach Procedures RNP Y RWY 04C and RNP Y RWY 22C to the maintenance thresholds RW04C and RW22C will be conducted at 3.5°.
iii. ILS CAT I/II/III operations not available during maintenance threshold/Reduced Distance Operations.

e) When Runway 04C in use:

i. A maintenance threshold (RW04C) will be introduced for Runway 04C. Throughout any working period, the section of runway between the THR 22 and the edge of the works area (abeam LR) will remain operational for aircraft.
ii. The following Holding Points and Rapid Exit Taxiways will be closed during the working period:

Golf 1, Hotel 1 and 3, Kilo 1 and 3, Lima 1 and 3 and Lima Romeo.

iii. Holding point November 1 and 3 will remain available for use. However, in the absence of a painted or lit lead on/off curve, temporary blue edge lights will be positioned to highlight the pavement edge and all aircraft movements via this holding point will be escorted onto and off the runway under the guidance of a Leader vehicle. Taxiway Hotel from Hotel 1 and 3 to, but not including Taxiway Lima, will be closed during the working period to safeguard the works area and provide access for contractors to it.

f) When Runway 22C in use:

i. A maintenance threshold (RW22C) will be introduced for Runway 22C. Throughout the working period, the section of runway between the THR 04 and the edge of the works area (abeam PR) will remain operational for aircraft.
ii. The following Holding Points and Rapid Exit Taxiways will be closed during the working period:

Papa 3, Quebec Romeo, Quebec 1 and 3, Romeo 1 and 3 and Sierra 1 and 3.

g) During any period when Reduced Distance Operations are in force:

i. ILS will not be available.
ii. DME will radiate throughout the working period. It will continue to provide guidance for all departures and RNP Z and Y IAP missed approaches.
iii. RNP Y IAPs PAPIs are set to 3.5° and will only serve the maintenance thresholds RW04C/RW22C.
iv. RNP Z IAPs PAPIs are set to 3° and will only serve the normal thresholds RW04/RW22.
v. Aircraft must be able to turn within the 46 M width of the runway as it may be necessary to back-track. If required to back-track for departures, pilots should commence the turn at the latest abeam the red stop end wing bars. These are coincident with the start of the declared Runway take off distance. This procedure will ensure persons and equipment within the works area are not exposed to excessive jet blast.
vi. Pilots should note that there will be vehicles with rotating/flashing amber obstruction lights inside the works site.
vii. All runway lighting outside the area available for landing/take-off will be extinguished.

h) Charts and coding table data relating to RNP Z and RNP Y IAPs are contained within AD 2.24.
i) Notification of Runway in Use:

The configuration of reduced distance in use at any time will be notified by NOTAM.

8 TRAINING

a) The use of this aerodrome for training is prohibited. The deliberate simulation of engine failure is not permitted whilst on approach to or departure from the aerodrome. It is not permitted to fly an approach to the aerodrome with the intention to execute a missed approach from training purposes.

EGSS AD 2.21 NOISE ABATEMENT PROCEDURES

Notice under Section 78(1) of the Civil Aviation Act 1982

Whereas:

(1) The Civil Aviation (Designation of Aerodromes) Order 1981 (a) provides that Stansted Airport – London is a designated aerodrome for the purpose of Section 78 of the Civil Aviation Act 1982 (b);

(2) The requirements specified in this notice appear to the Secretary of State to be appropriate for the purpose of limiting, or of mitigating the effect of, noise and vibration connected with the taking off or, as the case may be, landing of aircraft at Stansted Airport – London

Now, therefore, the Secretary of State, in exercise of the powers conferred by Section 78 (1) and (12) of the Civil Aviation Act 1982, by this notice published in the manner prescribed by the Civil Aviation (Notices) Regulations 1978 (c), provides as follows:

1. This notice may be cited as the Stansted Airport – London (Noise Abatement Requirements) Notice 2022 and shall come into force on 01 April 2022.

2. The Stansted Airport – London (Noise Abatement Requirements) Notice 2007 (d) is revoked.

3. It shall be the duty of every person who is the operator of any aircraft which is to take off or land at Stansted Airport – London to secure that, after the aircraft takes off or, as the case may be, before it lands at the aerodrome the following requirements are complied with:

1. After take-off the aircraft shall be operated in such a way that it is at a height of not less than 1000 FT AAL at 6.5 KM from start of roll as measured along the departure track of that aircraft.

2. Subject to sub-paragraphs (4) and (5), any aircraft shall, after take-off, be operated in such a way that it will not cause more than 89 dBA Lmax by day 0700-2300 (0600-2200) as measured at any noise monitoring terminal at any of the sites in the table below. Any exceedance of the daytime noise limit will incur a charge as detailed in the Airport Fees and Charges document.

Site	OS Co-ordinates	Elevation above aerodrome	Latitude	Longitude
Site 11: Chickney Hall Villas, Broxted	TL 5743 2767	-15 M	*515531N	0001718E
Site 10: Goodacres, Broxted	TL 5760 2696	9 M	*515508N	0001725E
Site 8: Anglian Water, Broxted	TL 5775 2651	-16 M	*515453N	0001732E
Site 9: Moor End Farm, Broxted	TL 5822 2600	-16 M	*515436N	0001756E
Site 3: Howe Green School, Great Hallingbury	TL 5106 1874	-21 M	*515048N	0001130E
Site 4: Thames Water, Bishop's Stortford	TL 5012 1963	-36 M	*515118N	0001042E
Site 5: Woolcott Restaurant, Great Hallingbury	TL 5033 1892	-26 M	*515055N	0001052E
Site 6: Morley, Woodside Green	TL 5153 1860	-26 M	*515043N	0001154E

3. Subject to sub-paragraphs (4) and (5), any aircraft shall, after take-off, be operated in such a way that it will not cause more than 84 dBA Lmax by night between 2300-0700 (2200-0600) as measured at any noise monitoring terminal at any of the sites in sub-paragraph (2). Any exceedance of the nighttime noise limit will incur a charge as detailed in the

Airport Fees and Charges document.

4. The limits specified in sub-paragraphs (2) and (3) shall be adjusted in accordance with the following table in respect of any noise monitoring terminal at any of the sites referred to in the table in sub-paragraph (2) to take account of the location of that terminal and its ground elevation relative to the aerodrome elevation.

Site	Adjustment dBA
Site 11: Chickney Hall Villas, Broxted	minus 1.3
Site 10: Goodacres, Broxted	plus 0.2
Site 8: Anglian Water, Broxted	minus 0.6
Site 9: Moor End Farm, Broxted	minus 0.8
Site 3: Howe Green School, Great Hallingbury	minus 1.0
Site 4: Thames Water, Bishop's Stortford	minus 1.4
Site 5: Woolcott Restaurant, Great Hallingbury	minus 1.4
Site 6: Morley, Woodside Green	minus 1.1

5. For the purpose of determining an infringement of the limits specified in sub-paragraphs (2) and (3), if the aircraft was required to take-off with a tailwind, an amount of up to 2dB of the noise recorded at the noise monitor should be disregarded. The amount to be disregarded shall be:

- 0.4 dB for a tailwind of up to 1 KT
- 0.8 dB for a tailwind exceeding 1 KT but not exceeding 2 KT
- 1.2 dB for a tailwind exceeding 2 KT but not exceeding 3 KT
- 1.6 dB for a tailwind exceeding 3 KT but not exceeding 4 KT
- 2.0 dB for a tailwind exceeding 4 KT.

For this purpose, tailwind is to be calculated from the wind data measured in the on-airfield anemometers and wind vanes according to the formula:

(windspeed x cosine (runway heading minus wind direction)) x – 1.

6. Where the aircraft is a jet aircraft, after passing the point referred to in sub-paragraph (1), it shall:

a) Between 0600-2330 (0500-2230) maintain a gradient of climb of not less than 4% to an altitude of not less than 4000 FT, unless it has been cleared via Barkway, in which case it shall maintain a gradient of climb of not less than 4% to an altitude of not less than 3000 FT.
b) Between 2330-0600 (2230-0500) maintain a gradient of climb of not less than 4% to an altitude of not less than 4000 FT.

The aircraft shall be operated in such a way that progressively reducing noise levels at points on the ground under the flight path beyond that point are achieved.

7. This paragraph applies to aircraft other than any propeller driven aircraft whose MTWA does not exceed 5700 KG:

a) With the exception of those aircraft mentioned in sub-paragraph (b), any aircraft which takes off from any runway specified in the first column of the following table, the aircraft shall follow the Noise Preferential Routeing Procedure specified in the third column of the table which relates to the ATC clearance previously given to the aircraft and specified in the second column of the table, whether flying in IMC or VMC. Aircraft persistently flying outside of the Noise Preferential Route maybe subject to a charge as detailed in the Airport Fees and Charges document.
b) Where any aircraft has taken off on a VFR flight plan, it shall follow the applicable Noise Preferential Routeing Procedure before turning onto the intended track.

ATC CLEARANCE	PROCEDURE
BKY 6R	As per the BKY 6R SID described in AD.2.EGSS 6-1 as far as BKY D5 or passing 3000 FT whichever is the sooner (see Note 9)
BKY 3S	As per the BKY 3S SID described in AD.2.EGSS 6-2 as far as BKY D5 or passing 3000 FT whichever is the sooner (see Note 9)
CLN 2E	As per the CLN 2E SID described in AD.2.EGSS 6-6 as far as SSE11 or 4000 FT whichever is the sooner (see Note 8)
CLN 9R	As per the CLN 9R SID described in AD.2.EGSS 6-3 as far as CLN D28 or 4000 FT whichever is the sooner (see Note 8)
CLN 5S	As per the CLN 5S SID described in AD.2.EGSS 6-3 as far as BKY D17 or 4000 FT whichever is the sooner (see Note 8)
JUGSE 1D	As per the JUGSE 1D SID described in AD.2.EGSS 6-8 until passing 4000 FT (see Note 8)
JUGSE 1R	As per the JUGSE 1R SID described in AD.2.EGSS 6-5 until passing 4000 FT (see Note 8)
JUGSE 1S	As per the JUGSE 1S SID described in AD.2.EGSS 6-5 until passing 4000 FT (see Note 8)
GASBA 1E	As per the GASBA 1E SID described in AD.2.EGSS 6-7 as far as SSE11 or 4000 FT whichever is the sooner (see Note 8)

ATC CLEARANCE	PROCEDURE
GASBA 1R	As per the GASBA 1R SID described in AD.2.EGSS 6-4 as far as CLN D28 or 4000 FT whichever is the sooner (see Note 8)
GASBA 1S	As per the GASBA 1S SID described in AD.2.EGSS 6-4 as far as BKY D17 or 4000 FT whichever is the sooner (see Note 8)
NUGBO 1R	As per the NUGBO 1R SID described in AD.2.EGSS 6-1 as far as BKY D5 or passing 3000 FT whichever is the sooner (see Note 9)
NUGBO 1S	As per the NUGBO 1S SID described in AD.2.EGSS 6-2 as far as BKY D5 or passing 3000 FT whichever is the sooner (see Note 9)
UTAVA 1R	As per the UTAVA 1R SID described in AD.2.EGSS 6-1 as far as BKY D5 or passing 3000 FT whichever is the sooner (see Note 9)
UTAVA 1S	As per the UTAVA 1S SID described in AD.2.EGSS 6-2 as far as BKY D5 or passing 3000 FT whichever is the sooner (see Note 9)

8. Where the aircraft is departing the aerodrome it shall, commensurate with its ATC clearance, minimise noise disturbance by the use of continuous climb where practicable.
9. Aircraft shall maintain as high an altitude as practicable, shall avoid flying over Bishop's Stortford and shall avoid flying over Sawbridgeworth and Stansted Mountfitchet at an altitude of less than 2500 FT and shall avoid flying over St Elizabeth's Home (*514949N 0000523E) at an altitude of less than 4000 FT (Stansted QNH).
10. Where the aircraft is approaching the aerodrome to land on Runway 22 it shall, commensurate with its ATC clearance, minimise noise disturbance by the use of continuous descent and low power, low drag operating procedures (referred to in Detailed Procedures for descent clearance in AD 2.22). Where the use of these procedures is not practicable, the aircraft shall maintain as high an altitude as possible. In addition, when descending on initial approach, including the closing heading, and on intermediate and final approach, thrust reductions should be achieved where possible by maintaining a 'clean' aircraft configuration and by landing with reduced flap, provided that in all the circumstances of the flight this is consistent with safe operation of the aircraft.
11. All aircraft approaching Runway 22 or Runway 04 shall:

    a) If using the ILS in IMC or VMC not descend below 2000 FT (Stansted QNH) before intercepting the glidepath nor thereafter fly below the glidepath;
    b) If flying without assistance from the ILS shall not join the final approach to either runway at a height of less than 1500 FT AAL (unless they are propeller-driven aircraft whose MTWA does not exceed 5700 KG when the minimum height shall be 1000 FT AAL) and thereafter shall follow a descent path which will not result in its being at any time lower than the height of the approach path normally indicated by the PAPI.

12. All aircraft which are to land at Stansted Airport – London between 2330-0600 (2230-0500) shall not descend below 3000 FT (Stansted QNH) until:

    a) In the case of aircraft other than a relevant propeller driven aircraft, it is established on final approach and is less than 10 NM from touchdown.
    b) If a relevant propeller driven aircraft, it is established on final approach and thereafter must fly below the approach path indicated by the PAPI.

13. Where the aircraft is flying on visual circuits of the aerodrome for missed approach purposes, it shall:

    a) Not descend below 2000 FT (Stansted QNH) on the downwind leg;
    b) Avoid flying over Great Dunmow or Takeley;
    c) As far as possible commence its final approach to the aerodrome after visual circuit at a distance of 3 NM from the landing threshold and at a height of 1000 FT AAL so as to avoid flying over Thaxted if making its final approach to Runway 22, and to avoid flying over Sawbridgeworth if making its final approach to Runway 04.

14. Without prejudice to the provisions of sub-paragraphs (1)-(13), the aircraft shall at all times be operated in a manner which is calculated to cause the least disturbance practicable in areas surrounding the aerodrome.

15. The requirements set out in sub-paragraphs (1)-(14) may at any time be departed from to the extent necessary for avoiding immediate danger or for complying with the instructions of an Air Traffic Control unit.

4. In this notice, except where the context otherwise requires:

'local time' means, during any period of summer time, the time fixed by or under the Summer Time Act 1972 (e), and outside that period, Universal Co-ordinated Time;

'dBA' means a decibel unit of sound level measured on the A-weighted scale, which incorporates a frequency dependent weighting approximating the characteristics of human hearing;

Lmax' means the highest instantaneous sound level recorded (with the noise monitoring terminal set at the slow meter setting);

'relevant propeller driven aircraft' means a propeller driven aircraft whose MTWA does not exceed 25000 KG and which has ATC clearance to make a visual approach for the purpose of landing at Stansted Airport – London;

other abbreviations used are defined in GEN 2.2 of the United Kingdom Aeronautical Information Publication (Air Pilot).

Ian Elston

Deputy Director
Airspace, Noise & Resilience Division
01 February 2022 **Department for Transport**

a) S.I. 1981/651.
b) 1982 c.16.
c) S.I. 1978/1303.
d) The Stansted Airport - London (Noise Abatement Requirements) Notice 2007 signed by M Capstick on 16 October 2007.
e) 1972 c.6 as amended by S.I 2002/262.

Notes

(These notes are not part of the notice)

1. The Noise Preferential Routeing Procedures specified in the notice are compatible with normal ATC requirements. The use of the routeings specified is supplementary to noise abatement take-off techniques as used by piston-engined, turbo-prop, turbo-jet and turbofan aircraft.

2. The attention of operators is drawn to the provisions of Section 78 (2) of the Civil Aviation Act 1982, under which if it appears to the Secretary of State that any of the requirements in this notice have not been complied with as respects any aircraft, he may direct the manager of the aerodrome to withhold facilities for using the aerodrome from the operator of the aircraft. However, the Secretary of State accepts that occasional and exceptional breaches of the noise limits, or of the height requirement, would not be expected to lead to sanctions under Section 78 (2) of that Act. Such breaches would, however, run the risk of financial penalties under Section 78 (A).

3. Noise from ground running of aircraft engines is controlled in accordance with instructions issued by Stansted Airport Limited.

4. To minimise disturbance in areas adjacent to the aerodrome, commanders of aircraft are requested to avoid the use of reverse thrust after landing, consistent with the safe operation of the aircraft, between 2330-0600 (2230-0500).

5. Full details concerning the maximum number of occasions and the types of aircraft which are permitted to take off or land at night during specified periods at this aerodrome are promulgated by Supplement to the United Kingdom Aeronautical Information Publication.

6. For monitoring purposes, a descent will be deemed to have been continuous provided that no segment of level flight longer than 2.5 NM occurs below 6000 FT QNH and 'level flight' is interpreted as any segment of flight having a height change of not more than 50 FT over a track distance of 2 NM or more, as recorded in the airport Noise and track-keeping system.

7. For monitoring purposes, a departure will be deemed to have complied with the Noise Preferential Routeing (NPR) if, in the portion of flight below the appropriate vectoring altitude (see notes 8 and 9 below), it is properly recorded by the airport's noise and track-keeping (NTK) system as having flown wholly within the Lateral Swathe (LS). The LS is defined from the centre-line of the relevant route coded in the NTK system, based upon a map accredited for this purpose by the Department for Transport, by the closer to the route centre-line depicted on the map of (a) a pair of lines either side, each diverging at an angle of 10° from a point on the runway centre-line 2000 M from start-of-roll; and (b) a pair of parallel lines representing a distance of 1.5 KM either side of the route centre-line. For avoidance of doubt, the depicted route and LS may include curved sections representing turns.

8. Aircraft which have attained an altitude of 4000 FT (Stansted QNH) may be directed by air traffic controllers onto a different heading and commanders complying with any such direction will not by reason of so complying be deemed to have departed from the Noise Preferential Routeing. This applies:

a) Between 2330-0600 (2230-0500) to all take-offs, and;
b) Between 0600-2330 (0500-2230) to all take-offs other than those cleared via Barkway.

9. Between 0600-2330 (0500-2230) aircraft which have taken off cleared via Barkway and which have attained an altitude of 3000 FT (Stansted QNH) may be directed by air traffic controllers onto a different heading and commanders complying with any such direction will not by reason of so complying be deemed to have departed from the Noise Preferential Routeing.

EGSS AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT UNDER IFR

a) Inbound via the ATS Route Network

   i. The Standard Arrival Routes (STAR) for aircraft inbound to London Stansted are shown at AD 2-EGSS-7-STAR Charts.
   ii. The Terminal Holding facilities at LOREL and at ABBOT are shared with arrivals to both London Stansted and Cambridge airports.
   iii. Aircraft may be vectored off the routes for separation purposes and instructed to rejoin at an appropriate point.

b) Inbound other than via the ATS Route Network

   i. Aircraft wishing to enter the London Stansted CTR/CTA direct from the London Flight Information Region are required to obtain ATC clearance at least 10 minutes before reaching the CTR or CTA boundary, when they will be advised of the route to be followed consistent with the current traffic situation.

ii. Except where required by the Instrument Approach Procedures, inbound aircraft to London Stansted, whether in VMC or IMC, should comply with the Noise Abatement procedures for arriving aircraft as detailed in Section AD 2.21.

c) Approach Procedures - with Radar Control

i. When inbound traffic is being sequenced by Radar, the Approach procedure will be flown under directions from the appropriate Radar Controller, and will consist of that part of the approach between the holding pattern and the Final Approach Track.
ii. Once the aircraft is under Approach Radar Control changes of heading or Flight Level/Altitude will be made only on instructions from the Radar Controller, except in the case of radio communications failure in the aircraft or at the Radar Unit
iii. Headings and Flight Levels/Altitudes to leave the holding facility will be passed by ATC. When holding is not necessary, radar vectors may be given prior to the aircraft reaching the holding pattern and descent clearance will include an estimate of track distance to touchdown.
iv. Procedures specific to Runway 22 arrivals via LOREL and ABBOT STARs.

Further distance information will be given between initial descent clearance and intercept heading to the ILS. On receipt of descent clearance the pilot will descend at the rate he judges will be best suited to the achievement of continuous descent, the object being to join the glidepath at the appropriate height for the distance without recourse to level flight.

v. Pilots should typically expect the following speed restrictions to be enforced: 220 KT from the holding facility during the intermediate approach phase; thereafter, and until established on final approach, the highest possible speed within the band 160-180 KT; when established on the ILS and thereafter until 5DME, 165 KT with a tolerance of +/- 5 KT.

These speeds are applied for ATC separation and runway capacity purposes and are mandatory. In the event of a new (nonspeed related) ATC clearance being issued (eg an instruction to descend on ILS), pilots are not absolved from a requirement to maintain a previously allocated speed. All speed restrictions are to be flown as accurately as possible. Aircraft unable to conform to these speeds should inform ATC and state what speeds will be used. In the interests of accurate spacing, pilots are requested to comply with speed adjustments as promptly as feasible within their own operational constraints, advising ATC if circumstances necessitate a change of speed for aircraft performance reasons.

vi. The spacing provided between aircraft will be designed to achieve the maximum runway utilisation within the parameters of safe separation minima (including vortex effect) and runway occupancy. It is important to the validity of the separation provided that runway occupancy time is kept to a minimum consistent with the prevailing conditions.
vii. In the event of radar failure, new instructions will be issued to each aircraft under radar control and the procedures as defined for Approach without radar control, will be put into effect.
viii. In the event of radio communications failure at the Radar Unit, pilots should contact Aerodrome Control for further instructions.

d) Procedures Specific to Runway 22 arrivals via LOREL and ABBOT STARs

i. Continuous descent procedures are employed for all Runway 22 arrivals via the LOREL and ABBOT stacks. Upon receipt of descent clearance, the pilot will descend at the rate commensurate with a continuous descent approach in accordance with the track miles provided, at speeds which require minimum use of flap. This is to minimise noise disturbance and fuel consumption during the approach phase and maximise runway capacity by the use of speed control.
ii. Pilots should typically expect the following speed restrictions to be enforced: 220 KT from the holding facility during the intermediate approach phase; thereafter, and until established on final approach, the highest possible speed within the band 160-180 KT; when established on the ILS and thereafter until 4DME, 165 KT with a tolerance of +/- 5 KT. These speeds are applied for ATC separation and runway capacity purposes and are mandatory. In the event of a new (non-speed related) ATC clearance being issued (eg an instruction to descend on ILS), pilots are not absolved from a requirement to maintain a previously allocated speed. All speed restrictions are to be flown as accurately as possible. Aircraft unable to conform to these speeds should inform ATC and state what speeds will be used. In the interests of accurate spacing, pilots are requested to comply with speed adjustments as promptly as feasible within their own operational constraints, advising ATC if circumstances necessitate a change of speed for aircraft performance reasons.
iii. The spacing provided between aircraft will be designed to achieve the maximum runway utilisation within the parameters of safe separation minima (including wake turbulence vortex effect) and runway occupancy. It is important to the validity of the separation provided that runway occupancy time is kept to a minimum consistent with the prevailing conditions.
iv. In the event of radar failure, new instructions will be issued to each aircraft under radar control and the procedures and the Initial Approach Procedures published at AD.2 EGSS 7-17/7-18 shall be followed as defined for Approach without radar control, will be put into effect.
v. In the event of radio communications failure at the Approach Radar Unit, pilots should contact Stansted Tower Aerodrome Control for further instructions

e) Approach Procedures without Radar Control

i. When inbound traffic is not being sequenced by Radar, aircraft will be cleared from the Holding Fix to carry out the appropriate Instrument Approach procedure detailed at AD 2-EGSS-7-Initial Approach Procedures Charts.

f) RNP Z IAPs and RNP Y IAPs during Reduced Distance Operations

i. See AD 2.20 Section 6 (i) for further information.

2 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Standard Instrument Departure Procedures are detailed at AD 2-EGSS-6-1 to AD 2-EGSS-6-8.

b) Departure Speed Restriction: In order to optimise the departure flow and assist in the separation between successive departing aircraft a speed limit of 250 KT IAS below FL 100 is applicable until removed by ATC. ATC may remove the speed restriction by using the phrase 'No ATC Speed Restriction'. Pilots are reminded that this phrase does not relieve the pilot of the responsibility to adhere to the ground track of the Noise Preferential Route, which may require a speed/power limitation or level restrictions stipulated on the SID profile.
c) If for any reason pilots are unable to comply with the 250 KT IAS speed restriction the pilot should immediately advise ATC and state the minimum speed acceptable. If a pilot anticipates before departure that they will be unable to comply with the speed restriction, they should inform ATC when requesting start-up clearance, stating the minimum speed acceptable. In this case the pilot will be informed before take-off of any higher speed limitation.
d) Flights via the ATS Route Network to Luton are to file BKY-BUSTA-EGGW in accordance with UK SRD.
e) Operators are reminded that all CLN SIDs incorporate stepped climbs which must be strictly adhered to, unless directed otherwise by ATC.

3 RADIO COMMUNICATIONS FAILURE PROCEDURES

In the event of complete radio communication failure in an aircraft, the pilot is to adopt the appropriate procedures notified in ENR 1.1 para 3.4.2, with the exceptions described below:

a) Aircraft inbound to London Stansted or Cambridge via LOREL † or ABBOT ‡

i. When complete communication failure occurs in the aircraft before ETA, or before EAT, when this has been received and acknowledged the aircraft will:

1. continue to the appropriate holding point LOREL † or ABBOT ‡ as detailed at AD 2-EGSS-7-1 to 7-15;
2. hold until the last acknowledged ETA plus 10 minutes, or EAT when this has been given;
3. then commence descent for landing in accordance with the approach procedure for the runway in use and effect a landing within 30 minutes (or later if able to continue visually).

ii. If complete radio failure occurs after an aircraft has reported to ATC on reaching the holding point the aircraft will:

1. Maintain the last assigned level at LOREL † or ABBOT ‡ until:

a) ATA over the holding point plus 10 minutes or 10 minutes after the last acknowledged communication with ATC whichever is the later; or
b) EAT when this has been received and acknowledged.

2. then commence descent for landing in accordance with the approach procedure for the runway in use and effect a landing within 30 minutes (or later if able to continue visually).

iii. Radio failure during a Radar Directed Initial Approach to London Stansted

If complete radio failure occurs after clearance to descend to an altitude has been given during a radar directed initial approach, the following procedure should be adopted:

1. continue visually or by means of an appropriate final approach aid;
2. if not possible, maintain 3000 FT ALT or last assigned altitude if higher and proceed to BKY, then;
3. hold at BKY for 5 minutes (Holding axis 270° MAG inbound track, turning left at the facility, Max IAS 220 KT), then;
4. descend in the holding pattern if necessary to 3000 FT ALT, then;
5. leave BKY track 197° (Runway 04) or track 070° (Runway 22) to join the Initial Approach Procedure detailed at AD 2-EGSS-7-Initial Approach Procedures Charts;
6. in the event of a missed approach, follow the Missed Approach Procedure to BKY and adopt the basic radio failure procedure detailed at ENR 1.1 para 3.4.2

b) Outbound Aircraft

i. All outbound traffic except those operating on NUGBO 1R/1S or JUGSE 1D/1R/1S: Comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedures listed at AD 2-EGSS-6 or ATC clearance and commence climb to flight planned level after the last position at which an altitude is specified.
ii. Outbound traffic operating on NUGBO 1R/1S: If a clearance to climb or re-routing instructions have not been given, comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedures listed at AD 2-EGSS-6-1/6-2, then route via M183 maintaining SID altitude to SILVA; at SILVA, commence climb to flight planned level.
iii. Outbound traffic operating on JUGSE 1R/1S/1D: If a clearance to climb or re-routing instructions have not been given, comply with the route and altitude limitations detailed in the allocated Standard Instrument Departure Procedures listed at AD 2-EGSS-6-4/6-7, then route via L6 maintaining SID altitude to DET; at DET, commence climb to flight planned level.

4 VFR AND SPECIAL VFR FLIGHT

a) VFR flights inbound to London Stansted or transiting the Stansted CTR/CTA should contact Stansted Radar at least five minutes prior to the CTR/CTA boundary and must not enter the CTR/CTA unless clearance has been given.
b) VFR flights will be given routeing instructions and/or altitude restrictions in order to integrate VFR flights with other traffic. Clearance may be subject to delay or re-routeing. Pilots should anticipate clearance with reference to the Stansted VRPs, in particular Audley End Railway Station, Canfield A120/B1256 Interchange, Debden disused AD, Hazelend Wood, Puckeridge A10/A120 Interchange, Spriggs Solar Farm. A complete list is available on www.nats.aero/ais
c) Pilots are reminded of the Stansted Transponder Mandatory Zones and of the close proximity of busy minor aerodromes.

d) Special VFR Flight

i. Clearance may be requested for Special VFR flight within the London Stansted CTR and will be given whenever the traffic situation permits. Special VFR flights are subject to the general conditions laid down at ENR 1.4

i. Note: Pilots holding a Private Pilot's Licence (Aeroplanes) are reminded of the flight visibility requirements for Special VFR flight laid down in Schedule 7 of the Air Navigation Order 2009 and the related notification at ENR 1-4, para 2.4.

ii. Aircraft may be subject to radar vectoring whilst within the CTR if, due to the traffic situation, ATC considers it necessary. Pilots are reminded that they must at all times when operating on a Special VFR Clearance, remain clear of cloud and in sight of the surface and in flight conditions which will enable them to determine their flight path and remain clear of obstacles. Pilots must inform the radar controller if compliance with these requirements entails a change of heading or level.

iii. Pilots are reminded that a Special VFR clearance applies only to flight within the CTR and does not extend to flight within the surrounding airspace of the London TMA or London Luton airspace.

iv. In order to reduce conflict with IFR flights, Special VFR arriving and departing flights will normally be cleared via the following routes:

1. North - Audley End Railway Station VRP via M11 Motorway;
2. East & South - Canfield A120/B1256 INTERCHANGE VRP;
3. West - Puckeridge A10/A120 INTERCHANGE VRP via Hazelend Wood VRP and the north side of A120 trunk road, avoiding Bishop's Stortford;
4. BKY – Nuthampstead AD VRP via Hazelend Wood VRP.

5 VISUAL REFERENCE POINTS (VRP)

a) VRPs have been established to facilitate the routes detailed in paragraphs 4d and 5b and to enable pilots of transit flights to plan alternative routes around the CTR/CTA when traffic conditions require.

b) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

6 FREQUENCY MONITORING CODE (FMC)

a) Due to the high number of controlled airspace infringements, pilots operating in the vicinity of, but intending to remain outside Stansted controlled airspace within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Stansted Radar frequency, 120.625 MHz, are expected to select SSR code 7013.

514111N	0001345W	-	514459N	0000624W	-
520311N	0000141W	-	521109N	0000102W	-
521104N	0003242E	-	520226N	0004040E	-
515246N	0004658E	-	513630N	0001545E	-

514111N 0001345W.

b) Selection of 7013 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Stansted controlled airspace at all times.

c) Whilst squawking 7013, pilots should be aware that Stansted Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.

d) Pilots operating at adjacent aerodromes such as Cambridge, Duxford, Andrewsfield and Stapleford are to select the most appropriate frequency to their location and Rules of the Air.

e) When a pilot ceases to maintain a listening watch, code 7013 shall be deselected.

7 HELICOPTERS

a) Helicopters inbound to or overflying London Stansted Airport may be required to hold at the following additional VRPs within the aerodrome boundary for integration with arriving and departing flights:

- **From the north:** North end of Hangar 12 VRP †.
- **From the south:** Diamond Hangar (Hangar 8) VRP.
- **From/to the west:** Helicopters arriving/departing via the Puckeridge A10/A120 INTERCHANGE VRP are to route to Hazelend Wood VRP avoiding overflying the built-up areas, of Birchanger, Stansted Mountfitchet and Bishop's Stortford.

† See AD 2.20, Section 5 and AD 2-EGSS-4-1.

b) Helicopters positioning from the VRPs to the runway shall maintain at least 500 FT AGL until aligned with the let down point.

8 TRANSPONDER MANDATORY ZONE ACCESS

a) Suitably equipped aircraft may access a Stansted TMZ without ATC approval although such traffic is strongly recommended to afford itself of either a UK Flight Information Service or make use of an appropriate Monitoring Code (see ENR 1.6, para 2.2.5) if available.

b) The pilot of an aircraft that wishes to operate in a Stansted TMZ without serviceable transponder equipment as defined in GEN 1.5 para 5.3 may be granted access to the TMZ subject to specific ATC approval. This approval may be obtained from Farnborough Radar on frequency 132.800 during their hours of operation 0800-2000 (0700-1900) or from Stansted Radar on frequency 120.625, at other times.

9 FIXED WING, GLIDING, HANG-GLIDING, PARAGLIDING AND MICROLIGHT ACTIVITY - STANSTED CTR/CTA

a) Microlight and fixed wing activity takes place during daylight hours at Audley End. The Audley End Operating Area is delineated by reference to the eastern and southern boundaries of an easily identified forest area defined as the airspace from the surface to 1500 FT AMSL including that portion of the Stansted CTR contained within the following positions:

- 520009N 0001341E (CTR boundary) then clockwise to 515937N 0001351E - 515926N 0001347E - 515920N 0001329E - 515919N 0001225E (CTR boundary).

b) Intense gliding activity within the Andrewsfield ATZ, a circle, 2 NM radius centred at 515342N 0002657E. Refer to AD 2 EGSL for more details.

c) Microlight activity takes place during daylight hours at Hunsdon Aerodrome and part of the Stansted CTR up to altitude 1000 FT within the area defined by straight lines joining successively the following points:

- 514927N 0000226E - 515001N 0000415E - 514929N 0000537E - 514705N 0000357E - 514706N 0000157E - 514654N 0000123E - 514824N 0000051W - 514905N 0000030W - 514917N 0000127W - 515041N 0000039W - 514927N 0000226E.

EGSS AD 2.23 ADDITIONAL INFORMATION

a) Mode S Barometric Pressure Setting Data

London Terminal Control has the ability to downlink Mode S Barometric Pressure Setting (BPS) data. Therefore, if the downlinked pressure data is at variance with the BPS expected by Air Traffic Control, pilots can expect additional challenge. When Air Traffic Control pass a reminder of the appropriate BPS, it is anticipated that the aircrew will cross check the altimeter settings and confirm set.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 920
HEIGHTS IN FEET AGL (500)

LONDON STANSTED

MINIMUM INITIAL ALTITUDE
Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is **1700** in the sector defined by the lateral limits; 515452N 0000052W - 520212N 0001006E thence clockwise by an arc of a circle radius 8NM centred on 515646N 0001935E to 515119N 0002902E - 514401N 0001803E thence clockwise by an arc of a circle radius 8NM centred on 514927N 0000837E to 515452N 0000052W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA
The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:
a) within 5NM of the aircraft*, and
b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.
*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES
Initial Approach
Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **3000**, or last assigned level if higher, to **BKY VOR** and adopt the procedure detailed at EGSS AD 2.22.
Intermediate and Final Approach
Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure and then proceed to **BKY VOR** at **3000** and continue in accordance with the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION
1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart should only be used for the cross-checking of assigned altitudes whilst in receipt of an ATC Surveillance service.**
7. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of instrument approaches other than SRA is cleared to intercept the final approach track.**
8. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
9. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.

LONDON STANSTED TELTU 1L

ROUTE DESIGNATOR	VIA	ROUTE	LEVELS	
TELTU 1L	(U)M185, N17, L982, (U)N6	TELTU - VATON - BPK - BKY - BUSTA, then turn left to intercept course 186° to LOREL.	TELTU LOREL	FL190 FL070

GENERAL INFORMATION
1 Standard Routes may be varied at the discretion of ATC.
2 Adhere to maximum speed limits where specified by waypoint constraints.
3 Maximum 250KIAS below FL100 unless authorised by ATC.
4 Aircraft may be instructed "Direct to" (waypoint) following radar vectoring.
5 The routes shown above also apply to aircraft inbound to **Cambridge**.
6 As the lowest holding level at **LOREL** is above Transition Altitude, aircraft will be instructed by ATC to fly at the appropriate Flight Level.
7 En-route holding may be required at **ADLOG** or **VATON** as directed by ATC.

INITIAL APPROACH PROCEDURES
ILS RWY 04 Without Radar Control

DISTANCES IN NAUTICAL MILES
BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ALTITUDES AND ELEVATIONS IN FEET

LONDON STANSTED

ABBOT	Establish inbound in the hold at **FL080**. At **BKY** D22.5 (IAF) descend on **BKY VOR** R084 (264°) to cross **BKY** D15 level at **6000**. Intercept and establish on **BPK VOR** R042 (222°) maintaining **6000** to **BPK** D18, then descend to **2500**, crossing **BPK** D9 not above **3000**. At **BPK** D5 turn left onto DR track 133°, MAX 200KIAS, then from lead radial **BPK VOR** R070 turn left to establish on localizer at **2500** and continue the ILS/DME or LOC/DME instrument approach procedure as detailed on the Instrument Approach Charts.	ALT at which to leave; Descending to **6000**
LOREL	Leave **LOREL** (IAF) on DR track 143° commencing descent not below **3000**. Intercept and establish on **BKY VOR** R193. Cross **BKY** D8 level at **3000**, then continue descent to **2500**. At **BKY** D12 turn left, MAX 200KIAS, to establish on localizer at **2500** and continue the ILS/DME or LOC/DME instrument approach procedure as detailed on the Instrument Approach Charts.	ALT at which to leave; **6000**

GENERAL INFORMATION
1 Lowest holding level at **LOREL** is **7000** (Flight Level equivalent). However when radar is out of service **6000** may be used as instructed by ATC.
2 Initial Approach Procedures are designed for manoeuvring speeds up to 220KIAS and assume aircraft can maintain a descent gradient of approximately **300** per NM.
3 **WARNING - Procedure contains stepped descent for ATC and airspace requirements. Departure routes cross beneath these procedures. Strict compliance with altitude requirements is essential.**

CHANGE (10/26): MAG INFO REVISED. MAG HEADINGS.

INITIAL APPROACH PROCEDURES
ILS RWY 22 Without Radar Control

DISTANCES IN NAUTICAL MILES
BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ALTITUDES AND ELEVATIONS IN FEET

LONDON STANSTED

ABBOT	From the outbound end of the hold at **FL080** descend to **6000**. Establish inbound on **BKY VOR** R084 (264°). At **BKY** D22.5 (IAF) descend not below **4000**. Cross **BKY** D16.5 at **4000** continue descent to **2500** and turn left to establish on localizer, then continue the ILS/DME or LOC/DME instrument approach procedure as detailed on the Instrument Approach Charts.	ALT at which to leave; Descend not below **4000**
LOREL	Leave **LOREL** (IAF) at **6000**, to **BKY VOR** commencing descent not below **3000**. From **BKY VOR** fly outbound on **BKY VOR** R066 descending to **3000**. Cross **BKY** D10 level at **3000** then continue descent to **2500**. At **BKY** D11 turn right onto DR track 133° then from lead radial **BKY VOR** R074 turn right to establish on localizer, then continue the ILS/DME or LOC/DME instrument approach procedure as detailed on the Instrument Approach Charts.	ALT at which to leave; **6000**

GENERAL INFORMATION
1 Lowest holding level at **LOREL** is **7000** (Flight Level equivalent). However when radar is out of service **6000** may be used as instructed by ATC.
2 Initial Approach Procedures are designed for manoeuvring speeds up to 220KIAS and assume aircraft can maintain a descent gradient of approximately **300** per NM.
3 Continuous descent approach should be used whenever practicable unless otherwise instructed by ATC. Procedures from **ABBOT** are compatible with a 3° descent continuous descent from the outbound end of the holding pattern.

CHANGE (10/26): MAG INFO REVISED. MAG HEADINGS.

8	Fuelling	Mon 0530-1815 (0430-1715); Tue-Fri 0530-1800 (0430-1700); Sat 0530-1545 (0430-1445); Sun 0800-2045 (0700-1945); and by arrangement. Times may change at short notice and will be based around scheduled and pre-booked refuels. (Tel 028-71813338 / 028-71813336).
9	Handling	As AD hours.
10	Security	H24 DOT. List B Airport.
11	De-icing	As AD hours.
12	Remarks	This aerodrome is PPR. To obtain permission telephone Ground Handling on 028-7181 3336. AD hours are also the times at which the airspace and ATC services will become available. Operators should take this into consideration when planning arrival times.

EGAE AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Up to 10 tonnes.
2	Fuel and oil types	AVTUR JET A-1, AVGAS 100LL W80, W100.
3	Fuelling facilities/capacity	76,000 LT AVTUR JET A-1 stored in bulk tanks/36,000 LT in mobile bowsers. 20,000 LT AVGAS 100LL stored in a bulk tank/2,000 LT in a mobile bowser.
4	De-icing facilities	Mobile aircraft de-icing rig. Available from City of Derry Ground Handling.
5	Hangar space for visiting aircraft	Available.
6	Repair facilities for visiting aircraft	Light aircraft by arrangement. Troughton Engineering: 07752-142696.
7	Remarks	City Of Derry Airport Corporate Aviation handle all GA and Corporate flights. Tel: 028-7181 0784, Ext 456; SITA: LDYAPXH; Freq: 131.505 MHz; Callsign: EGLINTON HANDLING. AVTUR JET A-1 arranged through Ground Handling, Tel: 028-7181 0784, Ext 456.

EGAE AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels in vicinity
2	Restaurants	In Terminal buildings.
3	Transportation	Taxis, car hire and buses.
4	Medical facilities	First aid facilities.
5	Bank and Post Office	-
6	Tourist Office	Yes.
7	Remarks	-

EGAE AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A6 RFF Category 6 is limited to operators using Category 6 aircraft with seating capacity up to 50 passengers. Category 6 aircraft with greater than 50 passenger seat capacity, or increase to Category 7, on request. Reductions to the promulgated category occur where there is no impact on scheduled or other agreed traffic.
2	Rescue equipment	N/A See AD 2.20 For Details.
3	Capability for removal of disabled aircraft	N/A See AD 2.20 For Details.
4	Remarks	As AD hours. To ensure that the rescue and fire fighting services are maintained for 15 minutes after departures, aircraft are required to be airborne 15 minutes prior to the published AD closing time unless otherwise arranged.

EGAE AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	3 snow ploughs. 5 snow brushes. 2 surface de-icing rigs. 1 snow blower. Runway De-icer Fluid used ISOMEX type III and GLYCOMEX. Runway De-icer Solid used Cryotech NACC.
2	Clearance priorities	Runway 08/26. Apron. Taxiway B.
3	Remarks	Latest information from ATC Tel: 028-7181 3314.

EGAE AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	MAIN APRON Surface: Concrete PCR 547/R/D/W/U WEST APRON Surface: Concrete and asphalt PCR 92/R/B/W/U

2	Taxiway width, surface and strength	Taxiway B: 23 M Surface: Asphalt PCR 499/F/D/W/U Taxiway D: 15 M Surface: Asphalt PCR 97/F/D/W/U Taxiway E: 15 M Surface: Asphalt PCR 97/F/D/W/U
3	Altimeter checkpoint location and elevation	Main Apron 11 FT
4	VOR checkpoints	-
5	INS checkpoints	-
6	Remarks	Taxiway D is restricted to aircraft MTOW 20,000 KG or less. Taxiway E is restricted to aircraft MTOW 15,000 KG or less.

EGAE AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Surface marking of taxi route across apron. Stands 1-4: Nose-in parking with pushback. Stand 4A: Westerly facing with self-manoeuvering off stand using minimal power. Marshalling is provided for all docking/parking guidance system of aircraft stands. A marshaller is present at the head of the stand or stopping position. This procedure allows a foreign object check to take place and ensures that aircraft are correctly parked and the taxiways not obstructed.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 08/26: Displaced threshold markings on Runway 08. Runway designators and centre-line markings, edge lines. TDZ markings and aiming point markings on Runway 08/26. Yellow lead-off/on lines to all runways. Runway guard lights positioned at Holding Points B, D, E and G and at the disused Runway 02/20 intersection with Runway 08/26.
3	Stop bars and runway guard lights (if any)	At B, D and E holding points.
4	Other runway protection measures	-
5	Remarks	WDIs (LGTD): 550236.78N 0070904.09W and 550225.02N 0071011.67W.

EGAE AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All aircraft using this aerodrome or its facilities are required to have third party liability insurance cover in the sum of £1,000,000. Proof of this insurance should be available for inspection.
b) This aerodrome may only be used whilst ATC and RFFS facilities are being provided.
c) Aircraft unable to communicate by radio are subject to ATC approval.
d) The use of this aerodrome is subject to the published terms and conditions of use and Airport Byelaws, a copy of which is available on request.
e) Aircraft departing and arriving from and to destinations outside of Northern Ireland are required to use the main terminal building for Customs, Immigration and Special Branch clearances, as appropriate.
f) Flight crews are reminded that the apron is a 24 hour mandatory high visibility clothing area. All flight crews are to wear high visibility clothing for all apron activities (including aircraft walk-arounds).
g) Nose-in parking is the preferred method of parking all aircraft of more than 5700 KG MTOW. Requests for into wind parking should be made to ATC.
h) It is a requirement that all airlines using Londonderry Aerodrome must have local orders compatible with Londonderry Aerodrome - Emergency Orders. Airlines, General Aviation operators and Flying clubs should also note that it is their responsibility to recover disabled aircraft and aircraft wreckage and must have appropriate arrangements in place before commencing flying operations into the aerodrome. Londonderry Aerodrome will act as the co-ordinating body throughout the recovery operation and has only very limited equipment supplied by a 3rd Party which might be used to salvage disabled aircraft.
i) Departing and arriving aircraft, on first contact with Eglinton ATC must state, ATIS code letter, QNH received and maintain a listening watch.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) No ground signals except light signals.
b) Aerodrome habitat work takes place on the grass areas periodically throughout the year.
c) Pilots are warned of the presence of large congregations of sea-birds in the approach area to Runway 26 (take-off area for Runway 08). There is a constant bird hazard on the surrounding terrain and tidal mud flats adjacent to the aerodrome, which can increase at short notice as concentrations of migratory birds move through the area. During the months of October to April pilots are advised of the presence of large species Whooper Swans in the vicinity of the aerodrome mainly flying at an altitude of approx 25-100 FT AGL. On aerodrome bird dispersal including use of pyrotechnics is in operation throughout the aerodrome operational hours.
d) Pilots are reminded of the close proximity of Ballykelly disused aerodrome 5 NM to the east-north-east of this aerodrome. Pilots of aircraft en-route and in the circuit should positively identify Londonderry/Eglinton before committing the aircraft to landing.
e) Single-engined aircraft should avoid overflying a chemical plant 2 to 3 NM west of the aerodrome below 1500 FT.
f) A single-track railway line passes through the overrun RESA for Runway 08, and approach RESA for Runway 26. An ATC operated railway signal system is used to stop trains under normal conditions as follows:

    i. Landing Aircraft

        1. Public transport aircraft landing on Runway 26 or Runway 08 priority is given to the aircraft and trains are stopped.
        2. General aviation aircraft landing on Runway 26 or Runway 08 priority is given to the train. Aircraft will be delayed for up to 5 minutes.

    ii. Departing Aircraft

        1. For all departures from Runway 08 or Runway 26 priority is given to the passing train ATC will sequence movements accordingly, delays of up to 5 minutes may be experienced.

g) High ground 120°T to 240°T south of aerodrome rising to 1300 FT AMSL 142°T, 4.4 NM from ARP.

5 HELICOPTER OPERATIONS

Not applicable

6 Use of Runways

a) In calm wind conditions Runway 08 is the preferred departure runway and Runway 26 is the preferred arrival runway.
b) Landing on Runways 08 and 26

    i. Runway 08 – Aircraft that are unable to turn off at Taxiway Bravo will be required to turn on the runway and back track to Taxiway Bravo. To avoid surface damage B737, A320 or larger aircraft must slow to taxi speed before moving fully to the left or right of the centre-line and then using the maximum available width of the runway to make a slow 180° turn to the opposite side of the runway before returning to the centre-line avoiding wheel locks or excess engine power consistent with good aviation practice.
    ii. Runway 26 – To avoid surface damage B737, A320 or larger aircraft will be required to continue to the end of the runway and turn on Runway 08 threshold turnpad unless instructed otherwise by ATC. Turning pad designed for right hand turns.

c) Except where an AOC holder has less restrictive state authorised take-off minima, departures in RVR conditions of less than 400 M are not permitted.
d) In winter conditions, runway ant-icing and snow clearance operations will take priority over all other operations at the discretion of the airport authority. ATC will inform pilots of expected delays.

7 TRAINING

a) Use of the aerodrome for training purposes is subject to the following:

    i. Training is not permitted between 0000-0700 (2300-0600);
    ii. Circuit and instrument approach training is only available by prior arrangement with ATC. Operators must submit a request by telephone (028-7181-3314) or email (atc@cityofderryairport.com) no later than 1600 (1500) on the preceding day. Requests for all other local general aviation movements must be submitted at least one hour prior to the proposed movement;
    iii. Filing of a flight plan does not constitute a booking and failure to make a booking may result in the aircraft being refused use of the facilities;
    iv. Operators are to inform ATC of booking cancellations;
    v. Circuit direction for all training aircraft will be varied by ATC for air traffic and noise nuisance avoidance purposes.

EGAE AD 2.21 NOISE ABATEMENT PROCEDURES

The following procedures may be departed from only to the extent necessary for avoiding immediate danger and for complying with ATC instructions.

1 NOISE ABATEMENT PROCEDURES - ALL AIRCRAFT

a) Operators of all aircraft using the airport are to ensure that their operations are conducted in a manner calculated to cause the least disturbance practicable in areas surrounding the airport.
b) Where the surface wind is calm, jet movements, when possible, should use Runway 26 for arrivals and Runway 08 for departures, particularly at night.
c) At night the circuit heights will be increased to 1500 FT AAL.
d) The use of Runway 08/26 for circuit training at night is prohibited between 0000-0700 (2300-0600).
e) Aircraft shall not execute inflight turns within the Airport Boundary unless otherwise instructed by ATC.

2 NOISE ABATEMENT PROCEDURES - AIRCRAFT OF 5700 KG MTOW OR LESS

a) All pilots should arrange their flight so as to minimise noise disturbance. Pilots should not carry out manoeuvres which attract attention to their aircraft;
b) landing aircraft shall follow a descent path that will not result in it being below the visual approach path as indicated by the PAPI.

3 NOISE ABATEMENT PROCEDURES - AIRCRAFT OF MORE THAN 5700 KG MTOW

a) **Arrivals:**

i. Jet aircraft must not join the FAT to any runway at a height less of than 1500 FT (QFE), except that jet aircraft carrying out visual circuit training may descend from circuit height on base leg and join the FAT not less than 1000 FT (QFE)
ii. Propeller driven aircraft of more than 5700 KG MTOW must not join the FAT to any runway at a height of less than 1000 (QFE).
iii. Unless otherwise instructed by ATC, aircraft using the ILS in IMC or VMC shall not descend below the heights specified above before intercepting the glidepath nor thereafter fly below it. Aircraft approaching without assistance from ILS shall follow a descent path which will not result in its being at any time lower than the approach path which would be followed by an aircraft using the ILS glidepath.

b) **Departures:**

i. Runway 26. Departing aircraft maintain the runway centre-line until passing altitude 3100 FT;
ii. Runway 08. Departing aircraft maintain the runway centre-line until passing altitude 3100 FT.

EGAE AD 2.22 FLIGHT PROCEDURES

1 INSTRUMENT APPROACH PROCEDURES

a) Instrument Approach Procedures (IAP) for this aerodrome within the Scottish FIR are established outside controlled airspace. See ENR 1.5, paragraph 6.
b) Instrument Approach Procedures (IAP) for this aerodrome within the Shannon FIR are established within controlled airspace (Eglinton CTA areas) - see ENR 2.2 paragraph 1.9.2 and AD 2.17. Aircraft are permitted to enter the Eglinton CTA areas whilst using these procedures and under the control of Eglinton ATC.
c) There are three Holds established for use with the Londonderry/Eglinton Direct Arrivals as shown below:

i. COLRE - 550659N 0064402W;
ii. DUNGV - 545344N 0064724W;
iii. LUNEX - 545036N 0071531W.

2 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Following completion of the noise abatement procedure Runway 26 departing aircraft are permitted to enter the Eglinton CTA West under the control of Eglinton ATC.

3 NORTH ATLANTIC DEPARTURES

a) Due to the proximity of the Shanwick Oceanic boundary to Londonderry/Eglinton, pilots must consider timescales for submitting an ’RCL’. Refer to ENR 2.2, paragraph 3.8.2 for details.

4 CIRCUIT DIRECTIONS AND HEIGHTS

a) Runway 08; 1000 FT for LH and 1200 FT for RH. Runway 26; 1200 FT for LH and 1000 FT for RH.

5 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

Note: *Flights using Londonderry Eglinton Airport under VFR must be prepared to route via VRPs and to route clear of instrument approaches if so instructed by ATC. ATC may request that inbound and outbound aircraft follow the following visual routes:*

a) Dungiven - Claudy Crossroads - Londonderry/Eglinton.
b) Moville Quay - Carrowkeel - Londonderry/Eglinton.

7	ATS	As AD hours. See also AD 2.18
8	Fuelling	Available up to 15 minutes before closing.
9	Handling	Available by arrangement through FAL Aviation.
10	Security	H24
11	De-icing	By arrangement through FAL Aviation.
12	Remarks	All movements strictly PPR by telephone to ATC. Caution SAR helicopter and UAS operations may take place when AD is closed. Electronic General Aviation Report may be processed via the Pilot Information section of the Lydd Airport website.

EGMD AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	By arrangement with FAL Aviation 01797-322400. Nearest railway siding: Appledore, 6 NM.
2	Fuel and oil types	AVTUR JET A-1 F35 (does not contain AL48), AVTUR JET A-1 F34 (FSII), AVGAS 100LL Castrol AD 80, AD100, S80, S100, Mulitgrade.
3	Fuelling facilities/capacity	AVTUR JET A-1 F34/F35 54,000 LT, mobile capacity 36,000 LT. AVGAS 100LL 54,000 LT, mobile capacity 13,000 LT. No aircraft defuelling services available.
4	De-icing facilities	By arrangement with handling agent.
5	Hangar space for visiting aircraft	By arrangement.
6	Repair facilities for visiting aircraft	Limited - by arrangement.

7	Remarks	Fuel Type: FSII additive available separately on request. Handling is mandatory for aircraft larger than 4000 KG MTOW. Training or military aircraft may be exempted from this requirement. Handling provided by: FAL Aviation Ltd. Tel: 01797-322400, Fax: 01797-322419 Email: FAL@lydd-airport.co.uk Website: www.lydd-airport.co.uk Ops Frequency: 131.705 MHz, callsign FAL Operations.

EGMD AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels in the vicinity. By arrangement through FAL Aviation.
2	Restaurants	Light refreshments available from Customer Services. VIP/Executive catering by arrangement through FAL Aviation.
3	Transportation	Trains, buses, taxis, limousines and car hire. Nearest railway stations: Ashford International and Appledore.
4	Medical facilities	First aid, oxygen therapy, defibrillator, entonox analgesic gas.
5	Bank and Post Office	Post box in terminal.
6	Tourist Office	Local information available in terminal.
7	Remarks	Executive lounge in FAL terminal building.

EGMD AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A2 RFF Category 3, 4 or 5 available by arrangement. The aircraft operator shall accept responsibility for ensuring that the Fire Category is appropriate to their particular operation. Occasionally Category 2 may be provided for Category 3 under remission.
2	Rescue equipment	Standard equipment for Category 1 to Category 5.
3	Capability for removal of disabled aircraft	By arrangement with local removal company.
4	Remarks	-

EGMD AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical.
2	Clearance priorities	Standard. See AD 1.2.2.
3	Remarks	Latest information from: ATC Tel: 01797-320881.

EGMD AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

EGMD AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Apron Bravo has 6 self-manoeuvring stands for aircraft up to B737-800 dimensions. Apron Charlie is available to GA aircraft, with apron taxilanes marking out 3 rows. Apron Delta is available to light aircraft as directed by ATC. Marshalling assistance available if required.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 03/21: Runway designation, displaced threshold 21, centre-line, TDZ, fixed distance markings, edge stripes. Taxiway marking aid(s): Yellow centre-line, hatched edge line on Taxiways Bravo and Charlie, holding point markings and boards. Taxiway light(s): Illuminated holding point signs on Taxiways Bravo and Charlie.
3	Stop bars and runway guard lights (if any)	Guard lights at holds Bravo and Charlie.
4	Other runway protection measures	-
5	Remarks	WDIs adjacent to touchdown zone for Runways 03 and 21: 505710.54N 0005601.51E (LGTD) - 505735.93N 0005627.55E (LGTD).

EGMD AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) This aerodrome is not available to aircraft unable to communicate by radio with ATC.
b) Practice EFATO is not permitted on Runway 03 at any time, or on Runway 21 when a train is passing through the overshoot. This restriction applies to both single-engine and multi-engine piston aeroplanes.
c) High visibility clothing must be worn on the apron and manoeuvring area at all times except for passengers under escort.

2 GROUND MOVEMENT

a) The responsibility for wingtip clearance during taxiing and parking remains with the flight crew.
b) Apron Bravo is available to aircraft up to B737, A319, helicopters and for long stay parking.
c) Apron Charlie is available for light aircraft parking.
d) Marshalling assistance may be available if required.
e) Taxiways Alpha and Delta are only available to aircraft with MTOW not exceeding 5700 KG. Taxiway Alpha is restricted to aircraft with a wingspan not exceeding 15 M.

3 CAT II/III OPERATIONS

Not applicable.

4 WARNINGS

a) Caution, Lydd Ranges EGD044 and Hythe Ranges EGD141. DAAIS available on 120.705 MHz and ATIS on 129.230 MHz.
b) Aircraft departing from or intending to land at Lydd shall remain at least 1.5 NM from Dungeness Power Station 505449N 0005717E (ENR 5.1 refers).
c) Instrument transitional surface infringed by terminal building. Maximum penetration 1.54 M
d) ATC procedures will be applied to ensure deconfliction of aircraft movements and the very infrequent trains that utilise the NW-SE orientated railway track 187 M SW of Runway 03 threshold.

5 HELICOPTER OPERATIONS

a) All helicopters shall use Runway 03/21 for landing or take-off, with minimum possible runway occupancy time.
b) Light helicopters e.g R44, B06, EC145, will air taxi to/from Apron B as directed by ATC.
c) Larger helicopters shall (if equipped with wheeled undercarriage) ground taxi to/from Apron B in order to minimise downwash to other taxiing or parked aircraft.
d) Helicopters should avoid overflying built up areas when joining or departing the airport.
e) Helicopter training circuits will normally be LH on Runway 21 and RH on Runway 03, but may be varied by ATC. Circuit height 1000 FT QNH.
f) Fuel is delivered to stand by mobile bowser. Rotors-running refuel available on request to SAR, Police, Air Ambulance, Military helicopters when operating on high priority flights.

6 USE OF RUNWAYS

a) Aircraft will carry out power checks at Hold B or C as directed by ATC.
b) Light aircraft circuits are normally LH on Runway 21; RH on Runway 03, but may be varied by ATC. Aircraft above 5700 KG MTOW RH on Runway 21; LH on Runway 03. Circuit height 1000 FT QNH.
c) Except where a public transport operator has a lower State authorised minima, the Aerodrome Authority cannot approve departures in RVR conditions of less than 400 M.

7 TRAINING

a) The number of aircraft in the visual circuit will be determined by ATC subject to prevailing weather conditions and other commercial or corporate traffic. A ‘waiting list’ system will be introduced during busy periods during which pilots will be advised of their number in the queue and the approximate delay before they commence circuit training.
b) The following training is PPR through ATC by telephone 01797-320881 or 322417.

   i. ILS, RNAV and NDB practise instrument approaches;
   ii. Circuit training by non-based aircraft;
   iii. Qualifying Cross Country inbound flights.

EGMD AD 2.21 NOISE ABATEMENT PROCEDURES

a) Operators of aircraft using the aerodrome shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable to surrounding areas. The following Noise Procedures and Routings will apply to all aircraft, unless otherwise instructed by ATS, whether landing, taking-off or 'going around' in both VMC and IMC. These requirements may be departed from to the extent necessary for avoiding immediate danger. These noise routeing procedures are supplementary to the noise abatement take-off techniques as used by piston engined, turbo-prop and turbo jet aircraft and laid down in their Operations Manual.

   i. Take-Off Runway 03

      Climb straight ahead to at least 500 FT; or until passing upwind end of runway, whichever is later, before turning right or left as instructed by ATC.

   ii. Take-Off Runway 21

Climb straight ahead to at least 500 FT or until passing upwind end of the runway, whichever is later, before turning left or right as instructed by ATC. Aircraft turning left are to maintain a track which will ensure they remain at least 1.5 NM clear of the Dungeness Power Station. Caution, remain clear of EGD044 if active.

iii. Landing Runways 03 and 21

An aircraft approaching to land shall not descend below the PAPI indicated approach slope of 3 ° (Runway 03) or 3.5 ° (Runway 21).

EGMD AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR ARRIVING AIRCRAFT

a) VFR Arrivals

i. Inbound VFR aircraft should make their initial call for joining instructions before reaching Rye (9 NM West of Lydd), Tenterden (15 NM NW), Ashford (12 NM N), Folkestone (12 NM NE) or 10 NM to Lydd if approaching over the sea.
ii. Pilots are responsible for their own separation from EGD141, EGD044, EGR063 and the runway final approach/departure areas, although ATC may provide assistance.
iii. Basic Service will be provided by default
iv. Lydd VFR transponder conspicuity code 7066 should be selected if possible. It should be noted that Lydd is not radar equipped and is unable to provide any form of surveillance. The transponder code is to assist neighbouring ATS Units.
v. Joining aircraft will be requested to report at 4 NM to the Lydd overhead (NB not to the LYD VOR)
vi. Light aircraft joining via Rye, Tenterden, Ashford or those routeing inland from Folkestone will, unless otherwise instructed, join overhead at 1500 FT QNH, descend crosswind, and turn downwind at 1000 FT. DO NOT DESCEND DEADSIDE.
vii. Aircraft inbound from E, SE or S, having made the 4 mile report, can anticipate instructions to join the circuit downwind or base leg, subject to traffic.

b) IFR Arrivals - from Airways/Controlled Airspace

i. The appropriate LACC sector will normally coordinate an acceptance level at Lydd in advance of release and transfer of communication. The initial approach fix and instrument procedure will be confirmed by Lydd Approach once the aircraft has been released by London, this usually coinciding with leaving CAS by descent.
ii. The ILS is the preferred instrument approach when runway 21 is in use, or if 03 is in use for landing and take-off but EGD044 is active. ILS approaches may be flown via ROMTI, a 14 DME arc direct arrival or via LZD (then outbound track 358°) depending on direction of arrival, order of traffic and the distance of the aircraft to Lydd when released. Late release to Lydd Approach reduces the number of options available to the controller.
iii. When runway 03 is in use, and EGD044 is not active, the preferred instrument approach is RNAV (GNSS) Runway 03.
iv. Visual approaches or IFR cancellation and subsequent VFR approach may be accepted, subject to traffic and weather.
v. Procedural Service will be provided by default unless IFR is cancelled.
vi. Lydd IFR transponder conspicuity code 7067 will be allocated when outside CAS. No form of surveillance service is available.

c) IFR Arrivals – Outside Controlled Airspace

i. Arrivals from outside controlled airspace are to establish communication by 20 NM to Lydd whenever possible, the type of approach requested, with an estimate for the initial approach fix.
ii. Sub paragraphs (b) (ii) to (b) (vi) above are also applicable to this section.
iii. Due to the unpredictable nature of traffic levels in Class G airspace and because radar is not available, controllers may have to direct aircraft to the hold, give deconfliction instructions that the pilot might not have at first expected, or utilize VMC climb/descent techniques when appropriate.
iv. Practise instrument approaches are PPR by telephone to ATC 01797-320881 or 322417
v. Gliding activity from the North exists.

2 PROCEDURES FOR DEPARTING AIRCRAFT

a) VFR Departures

i. Aircraft that have not filed a flight plan should obtain PPR on 01797-320881 and listen to ATIS 129.230 prior to calling the appropriate ATC channel.
ii. When making the initial call, pilots should end their message with “Outbound” if landing away, “Local” if departing and landing back at Lydd or “Circuits” if for circuit training. Once ATC has responded, the flight details are to be passed. Aircraft departing ‘local’ are to state persons on board and initial direction of departure.
iii. VFR departures will be provided with Basic Service by default.
iv. Lydd VFR Transponder conspicuity code 7066 should be operated if possible.
v. Aircraft will be transferred to an onward ATS frequency at reporting points Rye, Tenterden , Ashford, Folkestone or 10 miles E or SE as appropriate to the direction of flight.

b) IFR Departures via Airways/Controlled Airspace

i. Pilots shall request start up after listening to ATIS, and with regard to any CTOT issued by DNM. The take-off time tolerance applied by controllers is CTOT –5/+10 minutes.

ii. A Procedural Service will be provided by default.
iii. As Lydd is situated in Class G airspace, it does not have Standard Instrument Departure Procedures. However, pilots may anticipate the following initial routes to join controlled airspace:

Departure to	Via	Route
N	N57	DET
NE/E	L10/Q63/Y803	DVR
SW/W	Y803	SFD
SW/S	M189	HASTY or WAFFU

iv. London ACC may occasionally offer Lydd ATC other waypoints according to the traffic situation.
v. In order to avoid amending a clearance to account for a changing traffic situation, pilots can expect an airways clearance to be passed during taxi or when at the holding point. The clearance will comprise the initial clearance limit (route), level, squawk, and airways contact frequency.

c) IFR Departures Outside Controlled Airspace

i. Flights not operating on a flight plan should obtain PPR on 01797-320881 and listen to ATIS 129.230 prior to calling the appropriate ATC channel.
ii. Unless otherwise requested, a Basic Service will be provided to aircraft landing away and a Procedural Service to training aircraft departing straight into an approach procedure.
iii. Lydd IFR transponder code 7067 will only be applied to local training flights going straight into an instrument approach procedure.
iv. Lydd transponder conspicuity code 7066 will be operated by aircraft landing away, or local training flights conducting general handling on a basic service. This includes VMC training flights at night.
v. ATC will endeavour to approve the requested route/level unless the traffic situation requires otherwise for separation purposes, when a Procedural Service has been requested by the pilot.

4	VOR checkpoints	-
5	INS checkpoints	See Aircraft Ground Movement/Parking/Docking Chart.
6	Remarks	Taxiway November-Charlie may be used for aircraft parking. In darkness or if Low Visibility Procedures are in force a 'Follow-Me' vehicle will be provided. When aircraft are parked on Stands 70-74, Taxiway Delta between Intermediate Holding Positions D9 and D10 will be closed.

EGCC AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Terminal 2 has a frontage serving Stands 301-310. Stands 301, 303, 307 and 309 have a single centre-line. Stands 302, 304, 306, 308 and 310 have two centre-lines. The main widebody centre-line is designated by the stand number only. The subsidiary is designated Left. For example: Stand 306 and 306L. Terminal 2, Pier 1 serves Stands 101, 103, 105, 107, 109, 111, 113, 113L and 113R on the western side, and Stands 104, 106, 106R, 108, 110, 110L, 112, 112R, 114, 116 and 116L on the eastern side. Stands 113, 113L, 113R, 114, 116 and 116L are remote, without an airbridge. Aircraft docking on all Pier 1 stands is by Safedock. Terminal 2, Pier 2 serves Stands 203L, 203, 205, 207, 207R, 209L, 209, 211, 213 and 213R on the western side and Stands 204, 206, 206L, 208, 210L, 212, 214, 214L and 215 on the eastern side. Stand 212 is remote, without an airbridge. Aircraft docking on all Pier 2 stands is by Safedock. Terminal 2, Pier C serves Stands 22, 23, 24, 25, 26, 27, 28, 29, 31 and 32. Aircraft docking on all Terminal 2 Pier C stands is by Safedock. Terminal 3 comprises pier served Stands 1, 5, 7, 9, 11, 16, 17, 41-44 and 47-55, and remote Stands 57 and 58. Stands 44 and 55 have additional centre-lines designated 44L, 44R, 55L and 55R. Aircrews are to note that Stands 44L, 44R, 55L and 55R are demarked by alternate yellow/white dashed painted centre-lines. Aircraft docking on all Terminal 3 stands is by Safedock (except Stands 44, 44L, 44R, 57 and 58). Aircraft docking on Stands 44, 44L, 44R, 57 and 58 is by Marshaller's instructions. Remote Stands 74, 80 and 231 have additional centre-lines designated Left and Right. Stands 70-73, 81, 233, 901-919 and 925-929 have single centre-lines. Aircraft docking on Stands 901-919 and 925-929 is by Safedock. Aircraft docking on all other remote stands is by Marshaller's instructions. Stands 2, 4 ,6 ,8 10, 12 and 15 are classed as Terminal 2 remote stands. Stand 12 has additional centre-lines designated Left and Right. Aircraft docking on these stands is by Safedock. Aircrew are to note that all Stand Entry Guidance Systems are activated by their ground handling agent. Pilots must not enter an aircraft stand unless the Stand Entry Guidance has been activated and the correct aircraft type is displayed, or a Manchester Airport Marshaller has signalled clearance to proceed. In the event of there being no activated SEG upon approach to a stand, flight crews must hold position on the taxiway and advise GMC. Flight crews must not attempt to self-park.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 05L/23R: Runway designation. Runway threshold, runway centre-line, edge, TDZ and fixed distances. Runway width is designated by side stripe markings. 05R/23L: Runway designation. Runway threshold, runway centre-line, edge, TDZ and fixed distances. Runway width is designated by side stripe markings. Turning circle has unlit painted yellow centre-line and inset blue edge lighting beyond runway edges.

		Taxiway light(s): Green centreline with blue edge on sharp curves, red stop bars at holding positions. Runway exits have alternate green/yellow centreline lights to the edge of the Localiser Sensitive Area. Runway Holding Position. Runway Guard Lights. Taxiway November-Charlie has a painted centreline only – during Sunset to Sunrise this taxiway only to be used with a Follow-Me service. Taxiways Zulu, November-Alpha and November-Bravo have three centrelines comprising a central centreline painted yellow for use by aircraft up to and including ICAO Code E (Taxiways Zulu and November-Alpha) or ICAO Code F (Taxiway November-Bravo), and dual colour-coded centrelines designated 'Blue' and 'Orange' for use by aircraft up to and including ICAO Code C. Pilots are to follow the relevant centreline as instructed by ATC.
3	Stop bars and runway guard lights (if any)	Stopbars at runway entrance points are in operation H24.
4	Other runway protection measures	-
5	Remarks	Some obstacle marking. WDI (LGTD) - 532057.17N 0021651.06W, 532001.19N 0021845.55W, 532122.88N 0021554.81W. Pilot attention is drawn to the use of additional paint markings at specified runway entrance and exit points. These markings are provided as an additional measure to raise situational awareness and to reduce the runway incursion risk. All Ground Movement is under ATC Control.

EGCC AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use governed by regulations applicable to Manchester CTR.
b) All aircraft inbound to Manchester are to report aircraft type, latest ATIS received and cleared level on first contact with Manchester Radar.
c) All flights are at all times subject to PPR. The filing of a flight plan with NATS Ltd does not constitute permission to use Manchester Aerodrome.
d) Available H24, subject to the procedure and requirements listed at paragraph (f).
e) Subject to paragraph g Operators of General and Business Aviation aircraft may only operate it they obtain permission to do so from the aerodrome operator in advance of each movement.
f) Applications for prior permission and runway slots should be addressed as follows:

i. All requests for slots during office hours 0830-1700(0730-1600) are to be directed to Airport Co-ordination Ltd (ACL) Tel: 0161-493 1850, E-mail: manchester@acl-uk.org, email address for SCR's lonacxh@acl-uk.org;
ii. Slots outside office hours can be requested from Manchester Airport Plc, Airfield Operations, Tel: 0161-489 3657.

These applications must include the following information:

1. Aircraft Owner/Operator;
2. aircraft type and registration;
3. flight number (if applicable);
4. Requested time of arrival and departure at Manchester;
5. Nominated handling agent at Manchester.

g) Diversion Procedure.

i. All operators are advised that before planning Manchester as an alternate, they are required to have ground handling available at the airport; for non-based carriers, this arrangement is subject to the agreement of the Airport Management. Operators should note that off-loading and ACFT turnaround may be subject to significant delays due to stand availability. Nothing in this procedure shall, however, prevent an ACFT that has declared an emergency from landing.

h) Fixed Electrical Ground Power must be used wherever available and serviceable. Use of GPU and APU should be limited to minimise environmental impact.
i) Due to aerodrome capacity and associated works in progress, operators of aircraft with wingspan greater than 36 M (ICAO Code D, E and F) scheduled to arrive between 0300 (0200) and 0800 (0700) are advised to plan for arrival in accordance with scheduled in blocks time (SIBT). Aircraft estimated to arrive before SIBT may be subject to extended air and ground holding delays.

2 GROUND MOVEMENT

a) All surface movement of aircraft, vehicles and persons on the Manoeuvring area is subject to ATC authority.
b) Start-Up Procedures.

i. ATC are responsible for clearance delivery.
ii. Pilots are requested to call Manchester Delivery for ATC clearance (stating aircraft type, stand number and code letter of latest ATIS received) at least 10 minutes, but not more than 15 minutes before start-up to allow for departure data to be processed.
iii. Start up and push-back clearance is given by Ground Movement Control. **Start-up approval does not imply approval to push-back**.
iv. Pilots are required to inform Clearance Delivery when ready to start. Aircrew shall include their cleared departure SID in this call.
v. When requesting start-up or push-back pilots should give the full call sign, type and stand number. Aircraft must be ready in all respects to start and if necessary push-back before calling on the appropriate frequency. **Pilots should only request push-back when they are actually ready to do so**.
vi. When requesting push-back clearance, pilots are to inform ATC if headset communication with ground crew is not established. Push back clearance must not be requested until the ground crew has confirmed to the flight deck that the aircraft is closed up and the tug is manned and fully ready to move.
vii. If within 30 minutes of a previously issued CTOT the flight is unable to comply with that CTOT, the pilot should advise Manchester Delivery as soon as possible.
viii. Pilots are advised that delays in excess of 10 minutes can be expected at the Holding Point during busy morning and evening periods. Sufficient time should be allowed for start, push-back and taxi to take account of such a delay especially if to comply with an CTOT.

c) **Manchester Delivery.**

i. Manchester Delivery will be responsible for passing ATC clearance to aircraft prior to start-up. **Push-back approval will only be given on the GMC frequency;**
ii. Pre-departure clearance by datalink is available at Manchester for suitably equipped aircraft. For further information contact ATC Operations, Tel: +44-(0)161-209 2825.

d) **Ground Movement Control (GMC)** will be responsible for:

i. the surface movement of all aircraft on the manoeuvring area excluding the runway(s) in use;
ii. issuing start-up and push-back/taxi clearance within the apron areas;
iii. the control of arriving aircraft after they leave the runway(s) in use, except in the case of landing on Runway 05R when aircraft will be transferred to Manchester Tower on 118.630 MHz for crossing Runway 05L;
iv. Communicating allocated parking stand number.

e) **Airport-Collaborative Decision Making (A-CDM).**

i. Definitions of Commonly Used A-CDM Terms:

1. Calculated Take-Off Time (CTOT);
2. Target Off-Blocks Time (TOBT);
3. Target Start Approval Time (TSAT);
4. Target Take-Off Time (TTOT).

ii. TOBT/TSAT.

1. Pilots should take note of the TSAT which they receive and comply with it.
2. If TOBT or TSAT can no longer be met then TOBT must be updated by the Aircraft Operator/ Ground Handling Agent.
3. Pilots must report that the flight is READY to depart at TOBT (tolerance window of -5 to +5 minutes). Failure to do so will see TOBT & TSAT deleted.
4. Reporting READY when not ready will see the READY status rescinded and TOBT & TSAT may get deleted.

iii. A-CDM Start Request – Manchester ATC (Delivery, Ground or Tower as appropriate).

1. Pilots should report READY to Manchester ATC at TOBT (window of -5 to +5 minutes).
2. If within the TSAT window, ATC will then approve start or in the case of a TSAT delay, will advise the TSAT.
3. Pilots to monitor the frequency from this point, as TSAT can improve up to TOBT.
4. Start approval will be issued based on the TSAT and the prevailing traffic situation.
5. Pilots will be informed of an ATC delay to TSAT in excess of 5 minutes. In such cases, the TOBT must not be updated further once READY has been recorded.
6. If at TOBT + 6 minutes ATC have not received a valid READY or start up request the aircraft may lose its position in the departure sequence and a new TOBT is required.
7. Once the new TOBT is entered the flight will be re-sequenced (new TSAT).
8. The aircraft will not be allowed to depart until a valid TOBT has been entered and revised TSAT assigned, with the window of -5 to +5 minutes applicable to both.

iv. A-CDM De-icing Requirements.

1. Manchester airport publishes an aircraft de-icing protocol as detailed within the Aerodrome manual. All Aircraft operators should ensure that they have read and understood this document. A copy can be downloaded from https:// www.manchesterairport.co.uk/aviation-professionals/aerodrome-manual/.
2. In order to request de-icing, pilots should follow their company's standard procedure which must include liaison with their ground handler. It is important to note that aircraft de-icing time must not be included in the lead up to TOBT. i.e. it takes place after TOBT. De-icing teams will enter de-icing times into A-CDM which will then adjust TSAT accordingly.
3. At TOBT, when doors are closed and staff are ready to commence de-icing on stand, pilots must call Manchester ATC stating "Ready for de-icing". This call must be made at +/- 5 minutes from TOBT. Once de-icing on the stand is complete, pilots must call Manchester ATC again at +/- 5 minutes from TSAT, stating 'De-icing complete, ready to push and start'.

f) **Push-back Procedures**.

i. All aircraft making requests for taxiing or towing clearance on the GMC frequency should state their location in the initial call.
ii. Aircraft requesting push-back must be in direct communication with the tug crew, via a headset person. Aircraft must inform ATC if they have no direct communication with a headset person.
iii. Aircraft will not be permitted to reverse off pier-served stands under their own power. Aircraft may be permitted to reverse off remote stands at the discretion of the aerodrome authority. Permission must be obtained from the Airfield Operations Duty Manager (ext. 3331) via ATC prior to manoeuvre.
iv. Aircraft that require to depart from T1 on Runway 23L for performance reasons must inform Manchester Delivery prior to requesting push-back.

g) **Push and Hold Procedures**.

i. A policy is in force at Manchester where flights subject to en-route ATC delays may request, or may be required, to push off stand and re-position to a remote location awaiting CTOT.
ii. Airlines must co-ordinate push and hold requests via Handling Agent, who must liaise with Airfield Control (telephone (0)161-489 3695).
iii. Requests to push and hold are to be made on the Clearance Delivery frequency.
iv. ATC clearance for push and hold manoeuvre will be given on the GMC frequency to the flight deck crew. Flight deck crew should monitor GMC frequency and note the instructions given.
v. Pushback will be allowed at TOBT (or shortly after depending on demand) and the TSAT will be adjusted to account for expected departure from the remote hold location.
vi. Remote locations for push and hold are limited and subject to the conditions stated in the Manchester Airport Aerodrome Manual.
vii. When in position at the remote location flight crew must monitor Clearance Delivery frequency.

viii. Aircraft may taxi away from a remote parking location with caution and using minimum power.

h) **Ground Movement Restrictions**.

i. Vehicular traffic operating on apron roadways to the rear of aircraft stands, parallel to taxi-lanes. Distance from taxi-lane centre-line to roadway varies between 34 M and 38.5 M for Code E taxi-lanes, the closest being alongside Taxiways J, L and R. There are also several roadway crossings of taxi-lanes (vehicular traffic on these roadways is not under ATC control but is required to give way to aircraft. Pilots should be aware of the proximity of road traffic whilst manoeuvring around the apron taxi-lanes).
ii. Taxiways November-Charlie and Taxiway Delta (between Intermediate Holding Positions D9 and D10) may be used during peak movement rates. Taxiway November-Charlie is unlit; during hours of darkness and/or if low visibility procedures are in force a 'Follow Me' service will be provided.
iii. The following taxiways are restricted to aircraft with maximum wingspan of 36 M or less: November-Alpha Blue, November-Alpha Orange, November-Bravo Blue, November-Bravo Orange, Zulu-Blue, Zulu-Orange, Lima (south of Stand 6), Juliet-Echo, Juliet Foxtrot, Golf (east of Stand 55) and Delta (between Intermediate Holding Positions D9 and D10).
iv. AN-124 aircraft will be provided with wing-tip escort vehicles on taxiways northside of Runway 05L/23R.
v. Pilots of long wheelbase aircraft such as B777-300 and A350-1000 should exercise caution when negotiating taxiway curves and intersections as main-gear to pavement edge clearance may be limited.
vi. A380 aircraft – Taxiway routes available to A380 are shown on aerodrome chart AD 2-EGCC-2-3, marked in yellow. Reduced taxiway centre-line to object clearance of 49 M applies along Taxiways Alpha and Juliet (between J1 and J4).

i) **Ground Manoeuvring Restrictions**.

i. ATC instructions will normally specify the taxi route to be followed. This does not necessarily guarantee clearance from other aircraft, vehicles and obstructions on the manoeuvring area.
ii. Pilots are reminded of the need to exercise caution on wingtip clearances from other aircraft when manoeuvring in close proximity on the ground. Particular care should be taken in the runway holding areas and at runway crossing points.
iii. Pilots are reminded not to cross red stop bars unless authorised to do so by ATC.
iv. It is the Commander's responsibility not to accept an ATC clearance into an area not approved for the type of aircraft.

j) **Aircraft Blast Warnings**.

i. Jet aircraft are to engage minimum power when using Taxiways Alpha, Bravo and Papa (vicinity of holding position P1) due to the proximity of light aircraft operations in this area.
ii. Aircraft using Taxiways Lima, November-Alpha and November-Bravo are to use minimum power.
iii. Minimum power to be used by outbound aircraft using Taxiway November-Delta between holding position ND2 and abeam Stand 32 (Pier C).

k) **General Apron Safety**.

i. The wearing of high visibility clothing by all employed on the apron areas, including flight crew and flight attendants is mandatory.

l) **Operational Towing**.

i. It may not be recommended by aircraft manufacturers to conduct 'operational towing'. Operational towing is described as manoeuvring an aircraft under tow (with or without tow bar) that contains passengers, cargo or fuel. Airline operators shall satisfy themselves that operational towing can be conducted on their aircraft and ensure any restrictions to undertake towing manoeuvres are communicated to the relevant ground handling agent and Manchester Airport. It remains the airline operator's responsibility to assess the risks posed to its aircraft associated with any push-back or towing procedures.

m) **De-icing**.

i. Manchester has three remote de-icing pads:

1. Taxiway November-Charlie between Taxiways November-Delta and Echo, controlled by Maverick, which can accommodate up to a maximum 1 x B757 aircraft.
2. Taxiway Bravo between Intermediate Holding Positions B4 and B5, controlled by Iceman, which can accommodate up to a maximum 1 x B757 aircraft.
3. Taxiway Juliet between Intermediate Holding Position J2 and Runway Holding Position J1, controlled by Goose, which can accommodate 1 x Code E aircraft.

ii. Aircraft intending to use the remote de-icing pad will inform delivery on frequency 121.705 MHz when they request start-up.
iii. De-icing of aircraft is performed with engines running.
iv. Propeller aircraft are de-iced on the apron ramp. De-icing is performed with engines switched off.
v. The ATC frequency 121.855 MHz has to be monitored during de-icing on Taxiway November-Charlie and Taxiway Bravo.
vi. Due to its proximity to the runway, the ATC frequency 118.630 MHz has to be monitored during de-icing on Taxiway Juliet.

n) **Surface Movement Radar.**

i. Manchester Airport is equipped with an advanced surface movement radar utilising Mode-S.
ii. Aircraft operators intending to use Manchester Airport should ensure that Mode-S transponders are able to operate when the aircraft is on the ground.
iii. Flight crew should select XPNDR or the equivalent according to specific installation, AUTO if available, not OFF or STDBY, and the assigned Mode-A code:

1. From the request for push back or taxi, whichever is earlier.
2. After landing, continuously until the aircraft is fully parked on stand.

iv. After parking the Mode-A code 2000 must be set before selecting OFF or STD BY.
v. Flight crew of aircraft equipped with Mode-S having an aircraft identification feature should also set the aircraft identification. This setting is the aircraft identification specified in Item 7 of the ICAO ATC Flight Plan. The aircraft identification should be entered from the request for pushback or taxi, whichever is earlier, through the FMS or the Transponder Control Panel.

3 CAT II/III OPERATIONS

a) Runways 05L and 23R, subject to serviceability of the required facilities are suitable for Category II and III operations. However due to terrain profile, 05L Category II approaches may only be made by aircraft in ICAO Category A and B (VAT no greater than 120 KT) and when the ILS status is Category III.
b) During Category ll and lll operations, special ATC procedures (ATC Low Visibility Procedures) will be applied. Pilots will be informed when these procedures are in operation by Arrival and Departure ATIS or by RTF.
c) Departing Aircraft: ATC will require departing aircraft to use the following runway holding points:

Runway 05L - Alpha 1, Alpha-Golf 1, Alpha Foxtrot 1.
Runway 23R - Juliet 1, Mike 1.

d) Arriving Aircraft: All appropriate runway exits will be illuminated, and pilots should select the first convenient exit. Pilots are to delay the call 'runway vacated' until the aircraft has completely passed the end of the green/yellow colour coded taxiway centre-line lights. These lights denote the extent of the ILS Localizer sensitive area. Surface Movement Radar (SMR) is available to monitor pilot ‘runway vacated’ reports.
e) Taxiways lit stopbar block-to-block aircraft separation in operation at or below IRVR 200 M.
f) When Low Visibility Procedures are in force a much reduced landing rate can be expected due to the requirement for increased spacing between arriving aircraft. In addition to the prevailing weather conditions such factors as equipment serviceability may also have an effect on actual landing rates. For information and planning purposes, the approximate landing rates that can be expected are:

IRVR (m)	Approximate Landing Rate
Between 1000 and 600	20
Between 600 and 400	12
Less than 400	10

4 WARNINGS

a) In addition to normal bird activity throughout the year, flocks of racing pigeons may be encountered flying across the airfield below 100 FT during the racing season, April - September.
b) Pilots of aircraft equipped with radio altimeters are warned that such altimeters may show large height fluctuations when approaching to land on Runway 05L due to the aircraft flying over the Bollin Valley at the south western end of the runway.
c) 4 high visibility bright lights from golf driving range. 1500 M left of threshold of Runway 23R. (SS-2130 (SS-2030)).
d) Pilots are warned, when landing on Runway 23R in strong north westerly winds, of the possibility of turbulence and large windshear effects.
e) For wildlife hazard management purposes, a bird scaring laser is deployed and utilised by the Airside Operations team.

5 HELICOPTER OPERATIONS

a) All rotary-wing aircraft will be treated as fixed wing operations and will be instructed to land and take-off on a runway. Aircraft unable to ground-taxi will be escorted by an Airfield Operations vehicle whilst in the hover.

6 USE OF RUNWAYS

a) General operating principles for two runway segregated operations. The two runways at Manchester are 390 M apart and staggered by 1850 M in order to comply with ICAO rules for Simultaneous Operations on parallel or near-parallel Instrument Runways (SOIR). Therefore in normal operations arrivals can operate independently on one runway whilst departures use the other.

i. Dual runway segregated operations are normally in force during peak times. At all other times, single runway, mixed-mode operations are in force using Runway 05L/23R.
ii. Pilots requiring use of Runway 05R/23L for aircraft performance reasons outside dual runway segregated hours should advise ATC at the earliest opportunity. Efforts will be made to make Runway 05R/23L available, however, some delay may be experienced. Returning this runway to service may take in excess of 30 minutes and it should not be assumed to be available as a diversion alternate to Runway 05L/23R.
iii. Due to local planning constraints, Runway 05R/23L is not normally available between the hours of 2200-0600 (2100-0500) daily.

Note: *Pilots are required to read back all ATC ‘hold short’ instructions.*

b) Pilots should note that Runway 05L/23R has a convex ‘hump-backed’ profile, the highest point of which is abeam Link Hotel-Zulu. This characteristic has these significant operational implications:

i. When lined up for take-off the full length of the runway surface may not be visible from the flight deck.
ii. When landing on Runway 23R, the apex of the runway lies 700 M into the TDZ. Should the aircraft still be flared beyond this point the runway surface will be falling away at a significant rate, with the risk of a late touchdown.

c) Special runway utilisation procedures are detailed at GEN 3.3.
d) Minimum Runway Occupancy Time.

i. Departures:

1. Whenever possible, cockpit checks should be completed prior to line up and any checks requiring completion whilst on the runway should be kept to the minimum required. Pilots should ensure that they are able to commence the take-off roll immediately after take-off clearance is issued.
2. Wake Turbulence Departures: The CAA (SARG) has deemed the following intersections to be treated as the same departure points for wake turbulence separation purposes:

Runway	Links
23R	Juliet and Mike
23L	Tango, Victor Alpha and Victor Bravo
	Victor Alpha, Victor Bravo and Uniform
	Victor Bravo and Uniform
05L	Alpha and Alpha Golf
05R	Whiskey and Yankee

3. When in receipt of a line-up clearance, the pilot must inform ATC **before** entering the runway if greater wake vortex separation will be required behind the preceding aircraft. Failure to do so may result in additional delay.

ii. Arrivals:

1. Wake Turbulence Separation - Arrival: For the purposes of spacing in the approach phase certain aircraft types are classified as Upper Medium and following aircraft will be provided with additional separation. All other 'Medium' aircraft types are classified as Lower Medium. Wake turbulence separations are in accordance with the 5 group scheme.
2. Pilots are reminded that rapid exits from the landing runway enable ATC to apply minimum spacing on final approach that will achieve maximum runway utilisation and will minimise the occurrence of 'go-arounds'. Pilots should pre-plan their landing and roll-out to target the first suitable exit point that provides for a safe and expeditious exit from the runway.

23R	BD	AE	AG
Distance from Threshold (M)	1376	1908	2574
Design Exit Speed (KTS)	52	52	N/A
Note: *Landing aircraft are to vacate expeditiously. Arriving aircraft are to ensure fully vacated before stopping. Links P & F are not available as runway exits. Link AG is not a rapid exit taxiway.*			

05L	F	H	M
Distance from Threshold (M)	1447	1778	2249
Design Exit Speed (KTS)	N/A	N/A	N/A
Note: *Landing aircraft are to vacate expeditiously. Arriving aircraft are to ensure fully vacated before stopping. Link F is available as a runway exit in daylight hours only. Link P is not available as a runway exit. Links F, H and M are not rapid exit taxiways.*			

05R	VD	VC	U
Distance from Threshold (M)	1954	2254	2738
Design Exit Speed (KTS)	52	52	N/A
Note: *Landing aircraft are to vacate expeditiously. When applicable, a suitable roll-out speed is to be maintained to RET VD to minimise runway occupancy time. Arriving aircraft are to ensure fully vacated before stopping. Link U is not a rapid exit taxiway.*			

3. Runway 05R arrivals. All aircraft must vacate the runway no later than Victor Bravo and proceed direct to Taxiway Victor. Aircraft remaining on the runway to vacate at Victor Alpha or Tango will infringe the ILS LOC critical area. Similarly, Taxiway Sierra is not to be used.
4. During dual-runway operations, in the event of a blockage/unserviceability on the arrival runway, ATC may offer pilots a visual switch of approach from Runway 23R to 23L, or from Runway 05R to 05L. This will only happen when the landing aircraft is more than 4 NM from touchdown and when visibility is greater than 5 KM.

e) Runway 23R/05L only. The hard shoulders outboard of the runway side stripes have only 25% of the runway bearing strengths and should not be used by aircraft turning on the runway or when backtracking. The grass verges are unstrengthened and when wet unlikely to sustain loads.

7 TRAINING

a) Simulated engine failure training is not to be carried out by aircraft departing from Runway 05L/05R.

EGCC AD 2.21 NOISE ABATEMENT PROCEDURES

1 GENERAL

All aircraft inbound or outbound from this airport are required to conform to the following procedures, not withstanding that these may at any time be departed from to the extent necessary for avoiding immediate danger.

a) Every operator of aircraft using the airport shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in areas surrounding the airport.
b) After take-off every jet aircraft shall, in addition to complying with the Noise Preferential Routeings specified for each runway, be operated in such a way that it is at a height of not less than 1000 FT AAL, at the point nearest to the relevant noise monitoring terminal. Details of noise monitoring locations and performance are obtainable from the Flight Evaluation Unit. Email: flightevaluationunit@magairports.com.
c) Unless otherwise authorised by ATC, aircraft using the ILS in IMC and VMC shall not descend below 2000 FT before intercepting the glidepath, nor thereafter fly below it. An aircraft approaching without assistance from ILS or radar shall follow a descent path which will not result in its being at any time lower than the approach path which would be followed by an aircraft using the ILS glidepath.
d) Every jet aircraft using the airport shall, after take-off or 'go-around', maintain after passing the relevant monitoring point, a rate of climb of at least 500 FT per minute at power settings which will ensure progressively decreasing noise levels at points on the ground under the flight path beyond the monitoring point.
e) For visual approaches, or following a visual circuit, to Runway 23R/23L the following additional limitations apply:

   i. Jet aircraft shall not join the final approach at a height of less than 1500 FT AAL.
   ii. Propeller driven aircraft whose MTWA exceeds 5700 KG shall not join the final approach at a distance of less than 3 NM from the landing threshold and at a height of less than 1000 FT AAL.

f) To minimise disturbance in areas adjacent to the airport, Captains are requested to avoid the use of reverse thrust after landing, consistent with safe operation of the aircraft, especially between 2300-0700 (2200-0600).

2 NOISE PREFERENTIAL ROUTES

a) The Noise Preferential Routes specified in the following table are compatible with ATC requirements and the tracks are to be flown by all departing aircraft until the level defined in the table below is reached, except:

   i. Aircraft whose MTWA does not exceed 5700 KG;
   ii. Those aircraft instructed by ATC to make early turns in order to expedite traffic flow, such instructions may be issued during the period 0700-2300 (0600-2200), to propeller aircraft whose MTWA does not exceed 23,000 KG and the following jet aircraft types: All aircraft up to 35,000 KG MTOW plus BAe 146 (Avro RJ Series), CRJ1, CRJ2, CRJ7, CRJ9, EMB-135/145, BD700 Global Express and Gulfstream 5;
   iii. Unless otherwise instructed by ATC or deviations are required in the interests of safety.

   The use of these routes is supplementary to noise abatement take-off techniques. After take-off, pilots should ensure that they are at a minimum height of 500 FT AAL before commencing any turn.

ATC CLEARANCE	PROCEDURE
ASMIM 1S	As per the ASMIM 1S SID described in AD 2.EGCC-6-1 until passing 4000 FT
ASMIM 1Z	As per the ASMIM 1Z SID described in AD 2.EGCC-6-1 until passing 4000 FT
DESIG 1S	As per the DESIG 1S SID described in AD 2.EGCC-6-5 until passing 4000 FT
DESIG 1Z	As per the DESIG 1Z SID described in AD 2.EGCC-6-5 until passing 4000 FT
EKLAD 1R	As per the EKLAD 1R SID described in AD 2.EGCC-6-1 until passing 3000 FT
EKLAD 1Y	As per the EKLAD 1Y SID described in AD 2.EGCC-6-1 until passing 3000 FT
KUXEM 1R	As per the KUXEM 1R SID described in AD 2.EGCC-6-1 until passing 3000 FT
KUXEM 1Y	As per the KUXEM 1Y SID described in AD 2.EGCC-6-1 until passing 3000 FT
LISTO 2R†	As per the LISTO 2R SID described in AD 2.EGCC-6-3 until passing 5000 FT
LISTO 2S	As per the LISTO 2S SID described in AD 2.EGCC-6-2 until passing 5000 FT
LISTO 2Y†	As per the LISTO 2Y SID described in AD 2.EGCC-6-3 until passing 5000 FT
LISTO 2Z	As per the LISTO 2Z SID described in AD 2.EGCC-6-2 until passing 5000 FT
POL 5R	As per the POL 5R SID described in AD 2.EGCC-6-4 until passing 4000 FT
POL 4S	As per the POL 4S SID described in AD 2.EGCC-6-4 until passing 4000 FT
POL 1Y	As per the POL 1Y SID described in AD 2.EGCC-6-4 until passing 4000 FT
POL 1Z	As per the POL 1Z SID described in AD 2.EGCC-6-4 until passing 4000 FT
SANBA 1R	As per the SANBA 1R SID described in AD 2.EGCC-6-6 until passing 5000 FT
SANBA 1Y	As per the SANBA 1Y SID described in AD 2.EGCC-6-6 until passing 5000 FT
SONEX 1R	As per the SONEX 1R SID described in AD 2.EGCC-6-5 until passing 4000 FT
SONEX 1Y	As per the SONEX 1Y SID described in AD 2.EGCC-6-5 until passing 4000 FT

† LISTO 2R/2Y SIDs only available to:

(aa) Non-Jet aircraft; and

(bb) The following jet aircraft.

All aircraft up to 35,000 KG MTOW, plus BAe 146 (Avro RJ series), Embraer E135, E145, Bombardier CRJ1, CRJ2, CRJ7, CRJ9, BD700 Global Express and Gulfstream 5.

iv. Unless otherwise required by ATC, Runway 23R/23L shall be used for all movements when there is a head wind component and when a tail wind component is not greater than 5 KT on either runway or at 2000 FT.

v. Link Alpha should be used for all jet aircraft and all large propeller-driven aircraft departing from Runway 05L. However, between the hours 0600-2330 (0500-2230) any aircraft may depart from Links AG, AF and B subject to operational requirements by ATC/ pilots. Between the hours 2330-0600 (2230-0500), all jet aircraft and large propeller-driven aircraft shall depart from the most westerly link available.

vi. Every aircraft using the airport shall, after take-off, be operated in the quietest possible manner. Aircraft exceeding the following noise levels will be subject to a penalty as detailed in the airport conditions of use. Noise limits at specific monitors are adjusted as shown in paragraph viii. This is due to adjustments at each monitor made with reference to the height and distance relative to 6.5 KM from start of roll, and the departure route flown. The maximum noise limits are defined as follows.

Period (local time)	QC Category	Proposed Limit dB(A)
0700 to 2300	-	89
2300 to 0700	QC 0.25 and below	80
	QC 0.5 and 1	82
	QC 2 and above	84

vii. These levels shall be recorded at any of the noise monitoring sites as listed in the table below:

Runway	Site	Latitude	Longitude
23R	Site 2: Broad Oak Farm	531916.74N	0022031.94W
23R	Site 3: Mobberley School	531907.73N	0021853.62W
23L	Site 21: Parkgate Industrial Estate	531851.89N	0022115.14W
23L	Site 22: Pavement Lane	531839.28N	0022017.16W
05L	Site 6: Together Trust	532301.36N	0021248.60W
05L	Site 7: Cheadle Catholic School	532234.36N	0021236.72W
05R	Site 14: Daisy Bank	532218.54N	0021420.05W

viii. The limits shall be adjusted in accordance with the following table to take account of the location of the terminal and its ground elevation and equipment tolerance relative to the aerodrome elevation.

Site	Adjustment dBA
Site 2: Broad Oak Farm	Minus 0.8
Site 3: Mobberly School	Plus 0.3
Site 21: Parkgate Industrial Site	Plus 1.7
Site 22: Pavement Lane	Plus 6.5
Site 6: Together Trust	Plus 0.4
Site 7: Cheadle Catholic School	Plus 0.3
Site 14: Daisy Bank	Plus 3.1

3 AIRCRAFT NOISE QUOTA SYSTEM

Manchester Airport operates and manages a Night Noise Quota System, which is based on the CAA Supplement to the UK AIP, pertaining to the Airport Noise Restrictions Notice for London Heathrow, London Gatwick and London Stansted. The quota count value for the take-off and landing by individual aircraft types is shown in the Annexe to the above-mentioned Supplement.

4 NIGHT FLIGHTS

a) In the interests of noise abatement, certain restrictions are imposed on night jet flights at this airport; operators concerned are advised to obtain details from the Airfield Operations Duty Manager. The full night noise policy can be found on our website: www.manchesterairport.co.uk/community/environmental-management.

b) Night Jet Restrictions/Allocations

i. Runway 23L/05R will not normally be used between 2200-0600 (2100-0500) except when Runway 23R/05L is closed for maintenance.

ii. Manchester Airport operates a night Jet Policy restricting operations of certain types of aircraft during the periods of 2300-0700 (2200-0600).

iii. The penalty scheme will be administered by a panel set up under the auspices of the Scheduling Committee which includes members of the Airlines Operators Committee and the Airport Authority.

iv. Records of night infringements for this purpose will be available to the co-ordinators at the IATA scheduling conferences for summer seasons.

v. Between the hours of 2300-0700 (2200-0600), visual approaches will not be permitted. Aircraft shall be positioned, by radar, to join the final approach at a distance of not less than 7 NM from touchdown. This restriction does not apply to non-jet aircraft whose MTWA is 5700 KG or below.

c) Operational Restrictions

i. Between 2300-0659 (2200-0559) QC16, QC8 and QC4 aircraft will not be allowed to arrive or depart, except in case of emergency or where exempt.
ii. Between 2300-0659 (2200-0559) there will be a scheduling ban on all QC2 aircraft. QC2 aircraft that do not hold historic slots will not be allocated slots in the 8-hour night period.

d) Manchester Airport has strict limits on the numbers of QC points for each operational season between the hours of 2330-0600 (2230-0500) and 2300-0700 (2200-0600).
e) Due to aerodrome capacity and to maintain compliance with the night noise limits, any arriving aircraft with a scheduled time of 0615 (0515) or later will not be allowed to land until after 0600 (0500), and as such will be subject to airborne holding until a landing time can be achieved of after 0600 (0500). Departing aircraft with a scheduled time of 0555 (0455) will not be permitted to take-off before 0600 (0500).

5 CONTINUOUS DESCENT APPROACHES

Jet and turbo-prop aircraft approaching Manchester Airport are expected to minimise noise disturbance by the use of low power, low drag continuous descent approach procedures. For monitoring purposes, a descent will be deemed to have been continuous provided that no segment of level flight longer than 2.5 NM occurs below 5000 FT QNH and 'level flight' is interpreted as any segment of flight having a height change of not more than 50 FT over a track distance of 2 NM or more, as recorded in the airport noise and track-keeping system.

6 ENGINE TESTING

ATC will approve idle ground engine runs. A safety man must be positioned behind the aircraft to warn road traffic. Engine testing above ground idle is subject to the permission of the Airfield Operations Duty Manager and maybe subject to operational restrictions. For further information, please contact the Airport Authority. All engine tests above idle must commence in the Engine Test Bay. Times of operation are 0600-2200 (0500-2100) Monday to Friday and 0730–2200 (0630–2100) Saturday and Sunday. Engine testing on the open airfield will only be allowed for Chapter 3 aircraft between Mon-Fri 0900-1700 (0800-1600); Sat-Sun 0730-2200 (0630-2100). Chapter 4 and 14 aircraft 0600-2200 (0500-2100). Propeller driven aircraft are to be classified as Chapter 3.

7 TRAINING FLIGHTS

Training flights by all aircraft shall be subject to the approval of the Airfield Operations Duty Manager.

EGCC AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT

a) **Standard Terminal Arrival Routes (STARs)**

i. Standard Arrival routes for aircraft inbound from the UK ATS Route Network will be routed via the Standard Terminal Arrival Routes (STARs) detailed at AD 2-EGCC-7 and summarised below.
ii. Where STARs are designated as RNAV1 Only, Non-RNAV 1 aircraft should file via the existing route structure as detailed in the UK Standard Route Document (SRD).
iii. Aircraft shall not proceed beyond DAYNE/ ROSUN or MIRSI (as appropriate) without ATC clearance. Inbound holding can be expected during busy periods.

b) **Clearance to enter the CTR/TMA**

i. Aircraft inbound from the UK ATS Route Network will be cleared into the CTR/TMA without having to request a specific entry clearance. Aircraft not arriving via the UK ATS Route Network shall remain outside controlled airspace until in receipt of a clearance from ATC.

c) **Type of Approach**

i. All inbound IFR aircraft will be radar vectored to an ILS approach unless otherwise informed by ATIS/ATC.

d) **Holding**

i. Holding aircraft will be directed by ATC to Final Approach.

e) **Radar Vectoring Procedures**

i. Radar vectoring and descent instructions will be in accordance with the procedures detailed in ATSMAC Chart 5-1. When cleared to descend, aircraft should descend at a rate of at least 500 FT per minute.
ii. Pilots should typically expect the following speed restrictions to be enforced: 220 KT from the holding facility during the intermediate approach phase; thereafter, and until established on final approach, the highest possible speed within the band 160-180 KT; when established on the ILS and thereafter until 4DME, 165 KT with a tolerance of +/- 5 KT. These speeds are applied for ATC separation and runway capacity purposes and are mandatory. In the event of a new (non-speed related) ATC clearance being issued (e.g. an instruction to descend on ILS), pilots are not absolved from a requirement to maintain a previously allocated speed. All speed restrictions are to be flown as accurately as possible. Aircraft unable to conform to these speeds should inform ATC and state what

speeds will be used. In the interests of accurate spacing, pilots are requested to comply with speed adjustments as promptly as feasible within their own operational constraints, advising ATC if circumstances necessitate a change of speed for aircraft performance reasons. The spacing provided between aircraft will be designed to achieve the maximum runway utilisation within the parameters of safe separation minima (including wake turbulence separation) and runway occupancy. It is important to the validity of the separation provided that runway occupancy time is kept to a minimum consistent with the prevailing conditions.

iii. ATC shall advise pilots of an estimate of the track distance to run to touchdown when clearance to descend below the Transition Altitude is given. Further information on the distance from touchdown will be given between this descent clearance and the instruction to turn onto the intercept heading to the ILS Localizer.

iv. In circumstances where pilots are unable to comply with assigned speeds, they should advise ATC immediately.

f) **Approach Procedures Without Radar Control**

i. Not available at Manchester.

2 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Speed Limit

i. A speed limit of 250 KT applies to all departures whilst flying below FL 100 unless previously removed by ATC.

ii. In certain weather conditions and perhaps for other reasons of safety, pilots may not be able to comply with the speed limit. When such circumstances are anticipated, the pilot should inform ATC when requesting start-up clearance, stating the minimum speed acceptable. In this event, pilots will be informed before take-off of any higher speed limitation. Similarly, should such circumstances arise during flight, the pilot should immediately advise ATC, stating the minimum speed acceptable.

b) Allocation of Cruising Levels

i. When a re-clearance of Altitude/Flight Level is issued after take-off by ATC, it is the responsibility of the pilot to comply with at least the minimum altitudes shown in the SID procedure during the climb to the new assigned Altitude/Flight Level.

ii. Exceptionally, when ATC issue a re-clearance below the final SID altitude pilots must not climb above this revised altitude until further clearance is received. Aircraft on certain SIDs will be required to ‘confidence check’ the departure routing.

c) Communications

i. To reduce flight-deck workload immediately after take-off from Manchester Airport, the appropriate 'Scottish Control' frequency to be used is detailed on the SID Chart. This will enable pilots to pre-select the frequency on an alternative communications channel. **It is essential that the frequency change is not made until instructed to do so by 'Manchester Tower' and the instruction has been acknowledged by the pilot. Due to interaction with go-arounds all departures can expect to stay on Tower frequency until passing 2500 FT.** When the aircraft is not operating on a SID clearance the appropriate 'Scottish Control' frequency to be used, when instructed, will be included in the ATC clearance message.

d) Navigation

i. In the event of an inability to navigate the published SIDs, crews are to advise ATC prior to requesting a departure clearance.

e) Procedures for flights between Manchester and Liverpool

i. IFR flights between Manchester and Liverpool Airports will be cleared via the appropriate EKLAD or ASMIM Standard Instrument Departure.

3 RADIO COMMUNICATIONS FAILURE PROCEDURE

a) In the event of complete radio communication failure in an aircraft, the pilot will adopt the appropriate procedure notified at ENR 1.1, Para 3.4.2.

b) Initial/Intermediate/Final Approach: See also Loss of Communication Procedures AD 2.EGCC-5-1

LOSS OF COMMUNICATION PROCEDURES

In the event of radio communication failure flight crews should plan to land on the landing runway last acknowledged from Manchester Radar or as promulgated by ATIS. If this is not possible, flight crews should plan to land on runway 23R/05L. Should runway 23R/05L not be available, this will be indicated by means of ATC extinguishing the approach lights for 23R/05L and illuminating the approach lights for landing on runway 23L/05R. 'Blind' ATC communications will also be transmitted.

Initial Approach

Proceed at FL70, or last assigned level if higher, to DAYNE, MIRSI or ROSUN, hold as appropriate and then continue visually or by means of an appropriate final approach aid. If this is not possible, from the hold route direct and self-position to a 10D/12D Final as appropriate, complying with all published MSAs, †.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid and land. If landing is not possible, follow the Missed Approach Procedure to DAYNE or ROSUN hold climbing to FL70. From DAYNE/ROSUN proceed direct to a 10D/12D Final as appropriate, complying with all published MSAs,†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1. Para 3.4.2.

Note: *No visual signals available at Manchester.*

4 VFR AND SPECIAL VFR FLIGHTS

a) Special VFR clearance for flights within the Control Zone may be requested and may be given in accordance with rules applicable to Class D airspace.
b) The use of Special VFR clearances is intended to be confined to light aircraft below 5700 KG MTWA which cannot comply with full IFR requirements.
c) VFR clearance in the Control Zone will be given for flights operating in VMC. Routeing instructions and/or altitude restrictions may be specified in order to integrate VFR flights with other traffic. Pilots are reminded of the requirement to remain in VMC at all times and to comply with the relevant parts of SERA and the Rules of the Air Regulations 2015, and must advise ATC if at any time they are unable to comply with the clearance instructions issued.
d) Aircraft operating VFR or Special VFR in the Manchester CTR inbound to Barton (EGCB) must not assume that co-ordination has taken place to allow aircraft to enter the Barton ATZ. Manchester Radar will, whenever possible, permit an aircraft to leave the frequency temporarily to establish two-way communication with Barton. If this is not possible, aircraft must leave the CTR clear of the Barton ATZ and route to Barton from outside controlled airspace.
e) Pilots requiring a VFR or Special VFR clearance to transit the Manchester CTR must remain clear of controlled airspace until a clearance has been obtained by RTF from Manchester Radar.
f) VFR and Special VFR Routes to/from Manchester Airport

i. In order to integrate VFR and Special VFR flights to/from Manchester Airport with the normal flow of IFR traffic, a number of Standard Routes are established along which ATC VFR and Special VFR clearances will be issued subject to the conditions specified above. These routes are defined by prominent ground features (e.g Motorways) and are detailed below.
ii. In order to reduce RTF congestion of Clearance Delivery frequencies, the standard outbound Visual Routes are allocated Route Designators. Pilots are to ensure that they are familiar with the route alignment and altitude restrictions prior to departure.

Standard Outbound Visual Routes

Exit Point	Runway	Route Designator	Route	Maximum Altitude (QNH)	Remarks
Thelwall Viaduct VRP	05L/05R	Thelwall 2 Visual	Cross M56 Motorway. Route north of M56 and leave the CTR via Thelwall Viaduct VRP.	1300 FT	a) Avoid overflying Lymm. b) Inbound traffic operates south of M56 for RWY 05L and 05R.
Macclesfield South VRP	23R/23L	Macclesfield 1 Visual	Left turn towards Alderley Edge Hill VRP. Route west then south of Alderley Edge Hill and join the Macclesfield Entry/Exit Lane at Prestbury Station. Keep the railway line on the left and leave the CTR via Macclesfield South VRP	2500 FT (Notes 1, 2 and 6)	a) Maximum altitudes 1500 FT between Manchester and the northern edge of Macclesfield, 2500 FT south of the northern edge of Macclesfield to the CTR Boundary. b) **Warning:** High ground to the east of the Entry/Exit Lane. c) Aircraft may be routed direct from Manchester to Prestbury Station, or via disused Woodford aerodrome. d) Aircraft must not leave the confines of the Entry/Exit Lane without prior co-ordination with ATC. e) **Caution:** Alderley Edge 650 FT AMSL.

Standard Inbound Visual Routes

Entry Point	Runway	Route Designator	Route	Maximum Altitude (QNH)	Remarks
Stretton (Disused AD) VRP	05L/05R	Stretton 1 Visual	From Stretton (Disused AD) VRP, route via M56 Motorway, keeping the Motorway on the left. Join left base Runway 05L.	1300 FT	a) Outbound traffic operates north of M56. b) Aircraft may be held at Stretton (Disused AD) VRP or Rostherne VRP.

Entry Point	Runway	Route Designator	Route	Maximum Altitude (QNH)	Remarks
Macclesfield South VRP	23R/23L	Macclesfield 1 Visual	From CTR Boundary east of Macclesfield VRP, route via the Macclesfield Entry/Exit Lane (keeping railway line on left) to disused Woodford Aerodrome. Join left base for Runway 23R/ 23L.	2500 FT (Notes 1, and 5)	a) Maximum altitudes 2500 FT between CTR Boundary and the northern edge of Macclesfield, 1500 FT north of Macclesfield. b) Aircraft may be held at Hilltop VRP, which is defined as the open area 1 NM North West of the disused Woodford aerodrome factory. Pilots must hold by visual reference to ensure that the holding pattern does not deviate to the north, which would come into conflict with Runway 23R final instrument approach, particularly in a southerly wind. c) When Runway 23L is in use as the landing runway, Hilltop VRP will not be used. VFR inbound aircraft can expect to hold overhead disused Woodford aerodrome. d) Pilots should contact Manchester Radar initially on 118.580 MHz. e) **Warning:** High ground to the east of the Entry/Exit Lane. f) Aircraft must not leave the confines of the Entry/Exit Lane without prior co-ordination with ATC. g) Aircraft experiencing a radio failure **inbound** to Manchester whilst in the Macclesfield Entry/Exit Lane, or holding at Hilltop, are to carry out the Radio Communication Failure procedure detailed at ENR 1-2-2, paragraph 2.9 ***Note:*** *No visual signals available at Manchester.*

5 VISUAL REFERENCE POINTS (VRP)

a) Remain to the east of Burtonwood Services/M56 Junction 11 VRPs to remain clear of Liverpool CTR.
b) Remain to the west of Stretton (Disused AD)/Thelwall Viaduct VRPs to remain clear of Manchester CTR.
c) Remain to the west of Winsford Flash VRP to avoid over flying Winsford.
d) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

6 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating outside the Manchester CTR/CTA within the airspace bounded by the following coordinates:

533723N 0023744W - 534459N 0020433W -
533650N 0015216W - 532510N 0014456W -
530412N 0015647W - 530253N 0023751W -
533723N 0023744W

are encouraged to select SSR code 7366 (7367 for student solo pilots) and maintain a listening watch on Manchester Radar, frequency 118.580 MHz.

b) Whilst squawking 7366/7367, pilots should be aware that Manchester Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
c) Selection of SSR code 7366/7367 does not imply the provision of an ATC service. Pilots of aircraft displaying the code are not expected to contact ATC under normal circumstances; they are to remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Manchester CTR/CTA at all times.
d) When a pilot ceases to maintain a listening watch, SSR code 7366/7367 shall be deselected.

7 EGR323 NORTH WEST TRANSIT CORRIDOR (NWTC)

a) The EGR323 North West Transit Corridor lies immediately to the west of the Manchester CTR and beneath Manchester CTA airspace. EGR323 procedures are described at ENR 5.1 PROHIBITED, RESTRICTED AND DANGER AREAS.

Hot Spot
HS4
Caution - Complex junctions in close proximity. Pilots to be aware of misrouting potential.

Hot Spot
HS2
Hold J1 faces 23R approach and is located 200m from the runway centreline.

Excursion Hot Spot
HS3
Rwy 05L-23R has very wide shoulders. Pilots of departing aircraft to ensure aircraft are lined up with centreline, not the runway edge.

Hot Spot
HS5
Pilots are responsible for wingtip clearance and should exercise caution when manoeuvering close to other aircraft particularly in runway holding areas.

Hot Spot
HS1
Hold FZ1 has sharp turn from Twy V. Markings and stopbar lights may not be visible until close to the junction.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL **2502**
HEIGHTS IN FEET AGL (771)

MANCHESTER

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **2500** in the sector defined by the lateral limits; 533037N 0023746W - 533349N 0021004W - 532621N 0015958W - 531403N 0021120W - thence anti-clockwise by an arc of a circle radius 3.6NM centred on 531222.49N 0020602.21W to 530847N 0020617W - 530706N 0020723W - 531108N 0023744W - 533037N 0023746W.

b) **2800** in the sector defined by the lateral limits; 533349N 0021004W - 533430N 0020400W - 532934N 0015657W - 532621N 0015958W - 533349N 0021004W.

c) **2900** in the sector defined by the lateral limits; 532541N 0020035W - 532100N 0015817W - 530847N 0020617W thence clockwise by an arc of a circle radius 3.6NM centred on 531222.49N 0020602.21W to 531403N 0021120W - 532541N 0020035W.

d) **3100** in the sector defined by the lateral limits; 532541N 0020035W - 532934N 0015657W - 532730N 0015400W - 532100N 0015817W - 532541N 0020035W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

In the event of radio communication failure flight crews should plan to land on the landing runway last acknowledged from Manchester Radar or as promulgated by ATIS. If this is not possible, flight crews should plan to land on runway 23R/05L. Should runway 23R/05L not be available, this will be indicated by means of ATC extinguishing the approach lights for 23R/05L and illuminating the approach lights for landing on runway 23L/05R. 'Blind' ATC communications will also be transmitted.

Initial Approach

Proceed at **FL70**, or last assigned level if higher, to **DAYNE**, **MIRSI** or **ROSUN**, hold as appropriate and then continue visually or by means of an appropriate final approach aid. If this is not possible, from the hold route direct and self-position to a 10D/12D Final as appropriate, complying with all published MSAs.†

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid and land.

If landing is not possible, follow the Missed Approach Procedure to **DAYNE** or **ROSUN** hold climbing to **FL70**. From **DAYNE/ROSUN** proceed direct to a 10D/12D Final as appropriate, complying with all published MSAs.†

†In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
7. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less and is cleared to intercept the final approach track.**
8. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
9. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.

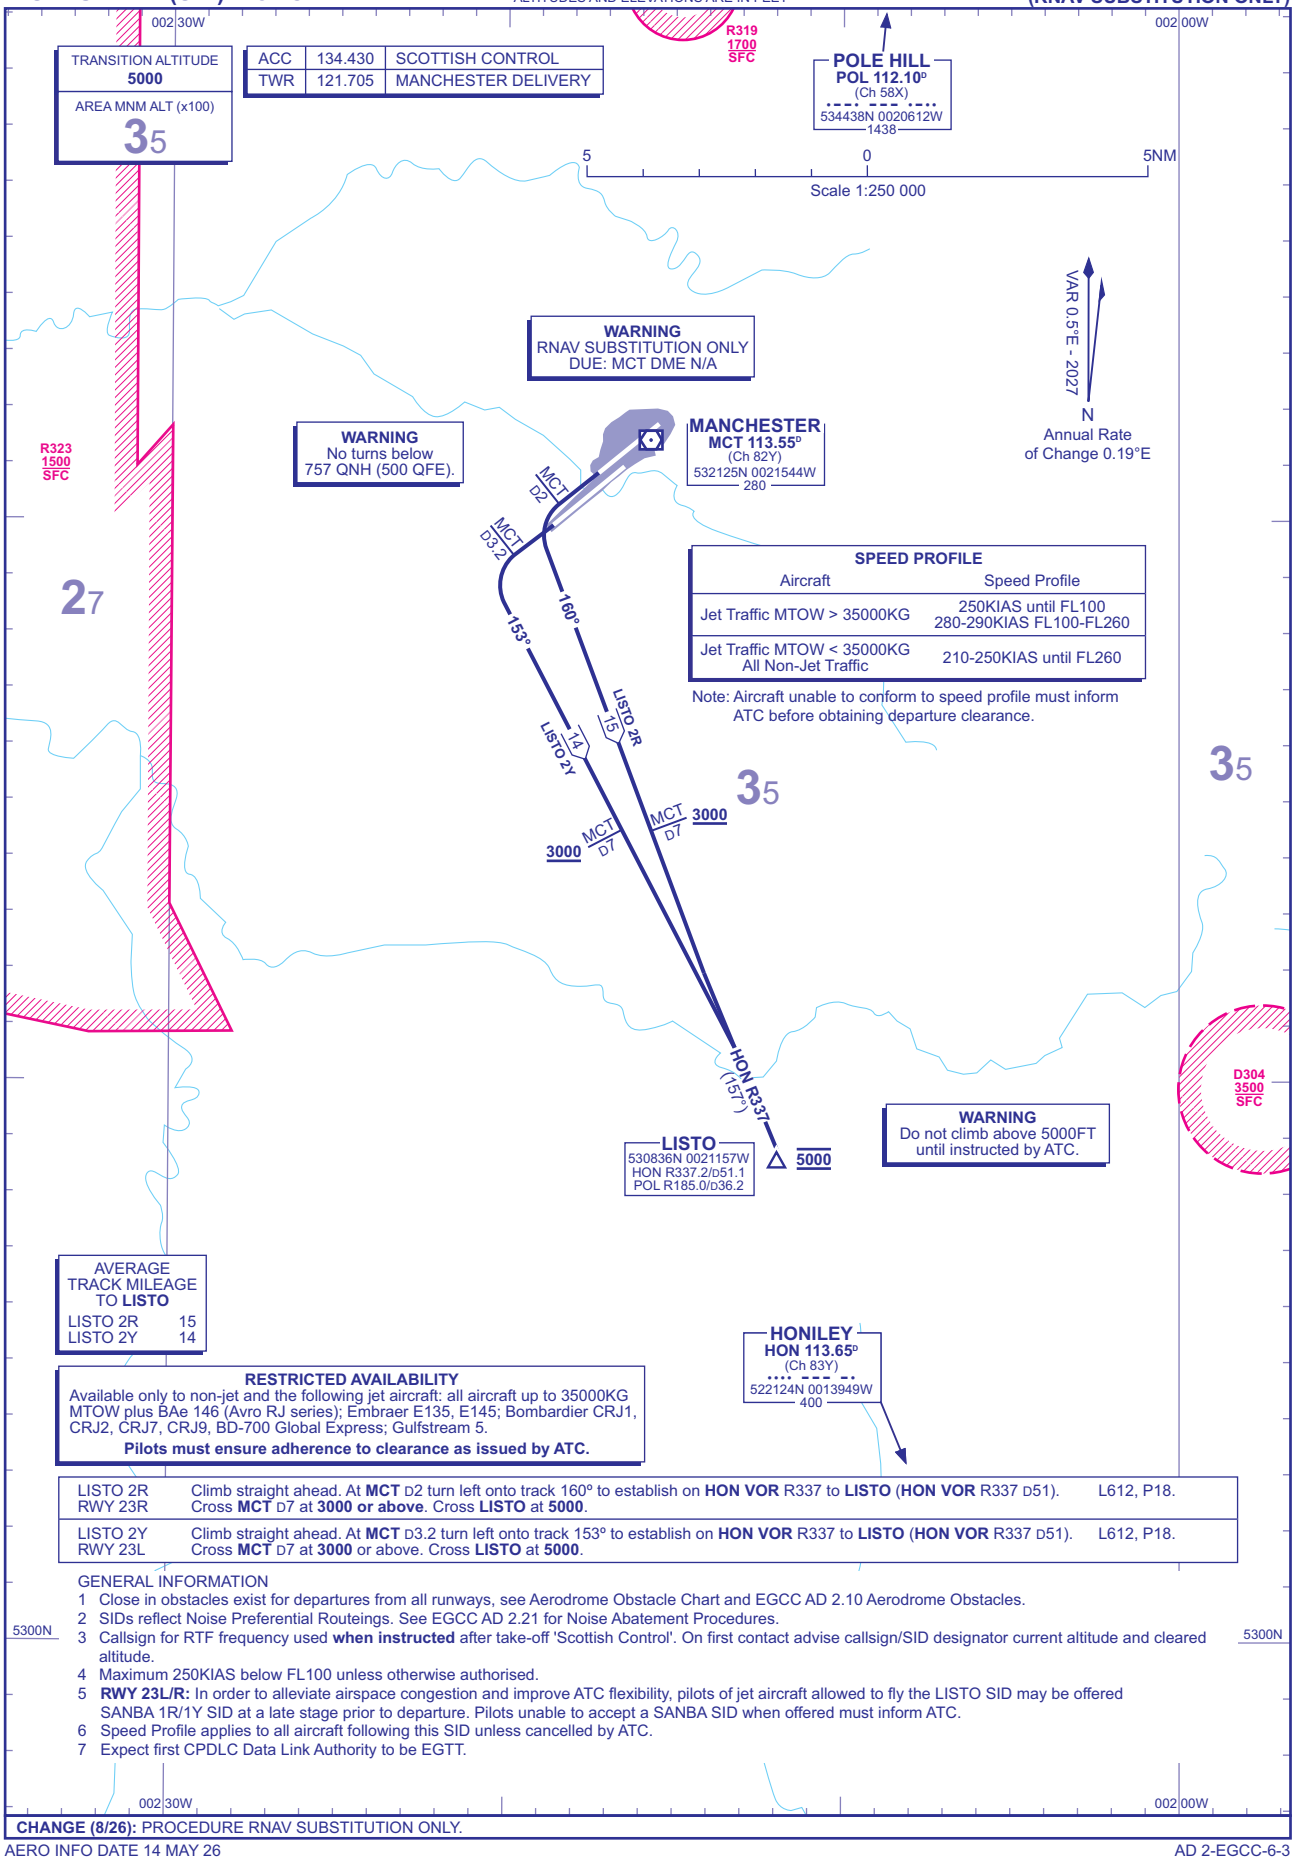
Cross **POL** D24 at **2000** or above. Cross **POL** D28 at **3000** or above. Cross **POL** D33 at **4000** or above. Cross **LISTO** at **5000**.	L612, P18.
LISTO 2Z RWY 05R	Climb straight ahead. At **MCT** D1.2 turn right onto **POL VOR** R185 to **LISTO** (**HON VOR** R337 D51). Cross **POL** D24 at **2000** or above. Cross **POL** D28 at **3000** or above. Cross **POL** D33 at **4000** or above. Cross **LISTO** at **5000**.	L612, P18.

GENERAL INFORMATION

1 Close in obstacles exist for departures from all runways, see Aerodrome Obstacle Chart and EGCC AD 2.10 Aerodrome Obstacles.
2 SIDs reflect Noise Preferential Routeings. See EGCC AD 2.21 for Noise Abatement Procedures.
3 Callsign for RTF frequency used **when instructed** after take-off 'Scottish Control'. On first contact advise callsign/SID designator current altitude and cleared altitude.
4 Maximum 250KIAS below FL100 unless otherwise authorised.
5 Speed Profile applies to all aircraft following this SID unless cancelled by ATC.
6 Expect first CPDLC Data Link Authority to be EGTT.



CHANGE (8/26): PROCEDURE RNAV SUBSTITUTION ONLY. PEDIG REMOVED. NOTES.

EGCB — MANCHESTER BARTON

EGCB AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGCB — MANCHESTER BARTON

EGCB AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 532818N Long: 0022323W Mid-point of Runway 08R/26L
2	Direction and distance from city	5 NM W of Manchester.
3	Elevation / Reference temperature / Mean Low Temperature	73 FT / 18 °C / -
4	Geoid undulation at AD ELEV PSN	168 FT
5	Magnetic Variation / Annual Change	0.40°E (2027) / 0.19°E
6	AD Administration Address Telephone E-mail address Web address	MANCHESTER BARTON AERODROME Barton Aerodrome , Liverpool Road, Eccles, Manchester, M30 7SA. Manchester Heliport, Liverpool Road, Eccles, Manchester, M30 7RU. 0161-789 1362 (Administration and Operations) ops@bartonaerodrome.co.uk http://www.bartonaerodrome.co.uk
7	Type of Traffic permitted (IFR/VFR)	VFR
8	Remarks	VFR (See AD 2.22).

EGCB AD 2.3 OPERATIONAL HOURS

1	AD Administration	Mon-Thu 0900-1800 (0800-1700) or SS, whichever is earlier; Fri-Sun 0900-1900 (0800-1800) or SS, whichever is earlier; and by arrangement.
2	Customs and immigration	By arrangement. Customs: 4 hours notice required inbound/24 hours outbound. Immigration: 24 hours inbound/outbound. CTU (Special Branch): 24 hours inbound/outbound.
3	Health and sanitation	-
4	AIS Briefing Office	As AD hours.
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	As AD hours. Website: https://www.egcbatis.co.uk
7	ATS	As AD hours.
8	Fuelling	Mon-Thu 0845-1745 (0745-1645) or SS-15, whichever is earlier; Fri-Sun 0845-1845 (0745-1745) or SS-15, whichever is earlier; and by arrangement.
9	Handling	By arrangement for helicopters using Manchester Heliport facility.
10	Security	-
11	De-icing	-
12	Remarks	This aerodrome is PPR.

EGCB AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	-
2	Fuel and oil types	AVTUR JET A-1 F-34, AVGAS 100LL Oil: 15/50, 80, (W)80, (W)100
3	Fuelling facilities/capacity	Aerodrome Fixed Bowser AVGAS 100LL 28,500 LT. Heliport Fixed Bowser AVTUR JET-A1 18,000 LT. Mobile Bowser AVTUR JET-A1 20,000 LT (Pressurised AVTUR JET-A1 by arrangement).
4	De-icing facilities	-
5	Hangar space for visiting aircraft	Limited by prior arrangement.
6	Repair facilities for visiting aircraft	Westair Aircraft Maintenance, Tel: 0161-787 8811.
7	Remarks	-

EGCB AD 2.5 PASSENGER FACILITIES

1	Hotels	In vicinity.
2	Restaurants	Cafe/Bar.
3	Transportation	Taxis, Buses. Nearest Railway Station: Eccles: 2.8 miles.
4	Medical facilities	Limited First Aid.
5	Bank and Post Office	Bank within 2.0 miles. Post Office within 1.5 miles.
6	Tourist Office	-
7	Remarks	Transport arrangements can be made via aerodrome operations.

EGCB AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A1 RFF Category A2 accepted under remission by prior arrangement.
2	Rescue equipment	-
3	Capability for removal of disabled aircraft	Limited
4	Remarks	-

EGCB AD 2.7 SEASONAL AVAILABILITY - CLEARING

INTENTIONALLY BLANK

EGCB AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

INTENTIONALLY BLANK

EGCB AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	-
2	Runway and taxiway markings and lighting	-
3	Stop bars and runway guard lights (if any)	-
4	Other runway protection measures	-
5	Remarks	Wind direction indicators - 532812.94N 0022330.90W (LGTD); 532815.83N 0022259.73W.

EGCB AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGCB AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Fixed wing twin engine aircraft and fixed wing aircraft over 1500 KG MTOW must obtain briefing via telephone with ATS prior to flight.
b) During adverse weather conditions, the AD and associated services may be withdrawn, the aerodrome becoming unavailable during these times.
c) High visibility jackets recommended whilst airside.
d) A full copy of the Aerodrome Rules and Procedures (Pilot Handbook) is available on the aerodrome website.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Pilots should exercise caution as runway and taxiway surfaces undulate in places and may not be suitable for all aircraft types/weights. Surface may become soft during prolonged periods of wet weather. Further information may be sought by contacting the ATS.
b) There are 35 FT high lamp standards on the A57 road to the Southeast and Southwest of the aerodrome.
c) Red/White Marker boards or non-standard markings (cones) may be used to indicate areas of soft ground. Pilots must exercise extreme caution as not all soft areas may be indicated.
d) Bird Hazard: Herons regularly flying across the aerodrome at heights between 100 and 500 feet. Additionally, Bird activity (Gulls and Pigeons) increases during periods of wet weather and grass seeding. All Bird Strikes must be reported.
e) Windshear and Turbulence can be expected on approaches to all runways. In particular, conditions may be more prominent during the following conditions:

    i. Runway 26L/26R Approach and 08L/08R Climbout - Additional turbulence/windshear during strong winds (any direction) and/or high temperatures.
    ii. Runway 20 Approach - Additional turbulence/windshear particularly during southeast to south winds.
    iii. Runway 31 Approach - Additional turbulence /windshear during strong winds (any direction) and when crossing dual carriageway (A57) prior to the threshold.
    iv. Runway 02 Approach - Additional turbulence/windshear particularly when crossing dual carriageway (A57) prior to the threshold.

f) Taxilane adjacent to AVGAS fuel installation has a reduced clearance of 10 M (from taxilane centre-line to fuel pumps).
g) Aerodrome is used unlicensed by helicopters H24.
h) Category A Police and Air Ambulance helicopter flights take place H24 from the Aerodrome.
i) Paramotors operate non-radio from a site approximately 2.5 NM West of the airfield during daylight hours.
j) Runway 08R/26L transitional surface is impinged by Control Tower building by 0.72 M.

5 HELICOPTER OPERATIONS

a) Helicopter circuit height 500 FT.
b) Helicopter circuit training is flown in accordance with the chart on page EGCB 4-1.
c) Helicopters must not fly above 500 FT as shown on page EGCB-4-1 unless practicing emergency procedures and only once ATS has been informed.
d) Helicopters are to arrive via the specific entry/exit point as displayed on page EGCB 4-1, reporting prior to reaching and at the appropriate point. Pilots must inform ATS if performing a non-standard join prior to entering the ATZ.
e) Helicopters must ensure that they give adequate safety clearance (minimum 50 M) with consideration for downwash when operating in the hover close to runways, taxilanes and parked aircraft.
f) Helicopter Fuelling

    i. JET A1 – Aerodrome facility – A mobile tanker is available for gravity-fed and pressurised fuelling:

        1. A landing pad is available next to the main apron.
        2. Fuelling may take place on the East Apron.

    ii. AVGAS – Helicopters should position on pads 1-3 as directed by ATS ensuring safe separation from adjacent helicopters. Caution is advised when manoeuvring in this area close to parked aircraft.

g) Manchester Heliport

    i. A dedicated heliport facility known as Manchester Heliport is located on the SW corner of the Aerodrome.
    ii. The heliport is not available for flights that require the use of a licensed aerodrome.
    iii. Use of the heliport is subject to PPR. Terms and conditions available on request.
    iv. JET A1 Heliport facility – A landing apron with two marked pads and a remote third pad are adjacent to the fuel facility. The hose length allows for the fuelling of helicopters parked on all three pads.

1. The marked pads act as a visual guide to ensure adequate hose reach only.
2. The marked pads do not guarantee any clearance from helicopters parked adjacent. The pilot remains responsible for ensuring safe operation from adjacent helicopters.

h) Helicopter Operations During Darkness

i. 8 low intensity white lights mark a night landing area FOR HELICOPTER USE ONLY on 08L/08R, these are operated using PTT clicks on VHF channel 131.580. 3 clicks for low, 5 clicks for medium and 7 clicks for high intensity. The lights will remain active for 15 minutes before switching off automatically unless operated again.
ii. Delta taxiway is marked with green reflective markers.
iii. The heliport apron is floodlit.
iv. The fence line of the adjacent ASU displays obstacle lighting.
v. Heliport briefing document available on request - contact operations.

6 USE OF RUNWAYS

a) Computer ATIS.

i. A Computer ATIS Display is provided. This provides the following information via https://www.egcbatis.co.uk:

Runway in use — QFE / QNH — Unofficial Weather — Met Warnings — Runway State — Briefing Notes.

ii. Prior to departure, pilots should obtain the current aerodrome information from the Computer ATIS Display.
iii. On initial RTF call, pilots should advise the information received and the appropriate pressure (QFE/QNH).

b) Runway availability subject to suitable surface conditions as determined by Duty FISO. Information available from the ATS.

7 TRAINING

Not applicable

EGCB AD 2.21 NOISE ABATEMENT PROCEDURES

a) Pilots are to avoid overflying the cemetery to the Northeast of the aerodrome.
b) Helicopters should avoid overflying the built up areas South and East of the aerodrome, indicated at AD 2.24.
c) Climbing turns after take off should not normally be commenced below a height of 500 FT AGL except as indicated at c(i). Should pilots wish to make an early turn below 500 FT AGL on take-off, this may be permitted for safety reasons only. In this case, the ATS should be informed prior to commencement of the take-off roll.

i. To minimise local noise disturbance when departing from Runway 20 and when safe to do so, upon reaching the Manchester Ship Canal aircraft should commence a right turn onto crosswind to avoid overflying the residential areas of Flixton and Irlam.

EGCB AD 2.22 FLIGHT PROCEDURES

1 COMMUNICATIONS AND SSR

a) Aircraft in communication with Barton ATS may be allocated a conspicuity squawk of 7365. Aircraft **must not** select this squawk unless instructed to do so by ATS.
b) Allocation of this conspicuity squawk does not constitute any radar service.
c) Non radio aircraft not accepted.
d) Aircraft operating VFR or Special VFR in the Manchester CTR inbound to Barton must not assume that co-ordination has taken place to allow aircraft to enter the Barton ATZ. Manchester Radar will, whenever possible, permit an aircraft to leave the frequency temporarily to establish two-way communication with Barton. If this is not possible, aircraft must leave the CTR clear of the Barton ATZ and route to Barton from outside controlled airspace.
e) Pilots requiring a VFR or Special VFR clearance to transit the Manchester CTR must remain clear of controlled airspace until a clearance has been obtained by RTF from Manchester Radar.

2 FIXED WINGED

a) Fixed winged circuit height is 1000 FT (Barton QFE).
b) Fixed winged standard join is overhead at 1700 FT Barton QFE. Pilots must inform ATS if performing a non-standard join prior to entering the ATZ.
c) Variations on circuit direction are permitted for training, weather or operational requirements providing the ATS is informed of the pilots intentions.
d) Circuit directions: Runways 13, 20, 26L, 26R - RH; Runways 02, 08L, 08R and 31 - LH.
e) Orbits within the circuit are not permitted unless required for safety reasons.
f) Visitors can expect to be parked on the yellow parking "T"s north of the control tower.
g) Go-Arounds

i. Approaches to runways must not be continued below 300 FT AAL if:

1. The approach ahead or runway is occupied or obstructed by aircraft, vehicles or personnel.

h) Go-Around Procedure (at or above 300 FT AAL)

i. To initiate the go-around, manoeuvre the aircraft to the dead side of the runway, climb parallel to the runway in use, and climb to circuit height (1000 FT AAL) before turning crosswind.
ii. Do not climb initially above 600 FT AAL until you have passed the upwind end of the runway in use. This ensures separation between you and the aircraft joining overhead, flying crosswind at circuit height.
iii. Exercise caution when low flying in the go-around over aircraft on the ground, including helicopters, personnel, vehicles and control line model flying.
iv. Ensure aircraft ahead are kept in sight.
v. Caution, helicopter operations up to a maximum of 500 FT AAL are permitted on both the live and dead side.

i) Pilots must not carry out 'run and break' manoeuvres within the circuit.
j) As part of our noise abatement and bird avoidance procedures, long low, or fast intentional go-arounds/fly-bys along the runway must not be carried out. Pilots having to go-around because of runway occupation must not fly low over landing aircraft.
k) IFR Procedures

i. The aerodrome does not have any instrument or approach/navigational aids. All arrivals and departures must operate under VFR / VMC only.
ii. Pilots flying IFR should plan routings that avoid controlled airspace and for arrivals must plan a suitable alternative in the event that flight conditions preclude flight in VMC on arrival.

3 HELICOPTER PROCEDURES

a) **Helicopter Arrival Procedures** - Refer to page EGCB-4-1

i. Astley or Worsley: Pilots should enter the published helicopter circuit (not above 500 FT AGL) or as requested by ATS.
ii. Irlam Bridge: Pilots should route along the Manchester Ship Canal (not above 500 FT AGL within 1 NM of the aerodrome) and follow the published procedure on page EGCB-4-1 or as requested by ATS.

Note: *Subject to circuit traffic and to aid traffic separation ATS may request an alternative routing.*

iii. M60/Junc 9: Pilots should route from M60/Junc 9 (not above 500 FT AGL once within 1 mile of the aerodrome), and then proceed to Runway 02, 31 or 26 threshold as requested by ATS.

b) **Helicopter Departure Procedures** (Refer to page EGCB-4-1)

i. Helicopters must request rotor start from ATS.
ii. Helicopters must not lift until positive instruction has been obtained.
iii. Helicopters should conform to the published helicopter circuit on departure.
iv. Subject to traffic, helicopters may be requested to depart direct or via a specified runway.
v. Helicopters must not overfly the Southwest corner of the aerodrome below 200 FT due to Control Line Model Flying which takes place.
vi. South East Departures via M60/Junc 9: Pilots should request clearance to enter the Manchester CTR from ATS prior to departure. Pilots should remain on 120.255 MHz until 1 mile South East of the aerodrome (not above 500 FT AGL).

c) **Helicopter Hover Training**

i. Two Helicopter Training Areas (HTA North and HTA West) are established for the purposes of helicopter hover training. Refer to EGCB-2-1.
ii. Helicopters must not leave the confines of any HTA without approval from ATS.

d) **Helicopter Aiming Points**

i. Two helicopter aiming points are established named ‘Heli West’ and Heli East’. These points are marked by a white triangle and are intended for use by helicopters conducting hover training and/or transition manoeuvres to aid separation between multiple helicopters conducting similar exercises.
ii. A hover square is established for specific hover training. This point is not to be used as an aiming point.
iii. Helicopters shall announce their intention to ATS to operate at one of the helicopter aiming points and must only leave the aiming point when in receipt of a positive taxi instruction.
iv. Helicopters engaged in auto-rotations should conduct the manoeuvre into a vacant aiming point, advising ATS on each occasion prior to climbing and prior to commencement.
v. Approaches to Runway 31 threshold are not permitted whilst the threshold of Runway 31 is used for aircraft parking.

e) **Arrivals and Departures**

i. All arrivals and departures should be made using procedures outlined in paragraphs a and b above.
ii. Helicopters positioning to/from the Heliport Apron should route via D1 Hold, following the Air-Taxiway to the Heliport. The Air-Taxiway is marked by green/yellow linlaners and is not suitable for ground taxi.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

INTENTIONALLY BLANK

EGNF AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Aerodrome is not available for public transport passenger flights required to use a licensed aerodrome.
b) PPR is strictly by telephone and may be refused to certain aircraft types. Inexperienced pilots are to phone for advice before arriving at Netherthorpe and are to contact a member of staff for a short briefing before departure.

2 GROUND MOVEMENT

a) Aircraft should not be left on the refuelling stand.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Aircraft based at Netherthorpe operate outside published operating hours.
b) At the weekend, when Runway 06/24 is in use, aircraft may be parked at the southern end of Runway 18/36.
c) In calm wind conditions arrivals may be on Runway 24 and departures from Runway 06.
d) Runways 06, 24 and 36 have displaced thresholds due to the proximity of public roads. Any pilot whose approach would result in being below 20 FT crossing the road must initiate an immediate missed approach.
e) Overrun on Runways 18 and 36. Only 29 M of overrun strip are available on Runways 18 and 36 beyond the end of ASDA and LDA.
f) Runways 18 and 36 Obstruction free Approach Surface Slopes are based on threshold and not strip end.
g) Runways 06 and 24 Obstruction free Approach Surface Slopes are based on threshold and not strip end.
h) Telegraph poles 27 FT AGL on the northern boundary.
i) Farm and trees 39 FT AGL on the northeast boundary.
j) Hangar 20 FT AGL on the eastern boundary.
k) Farm 30 FT AGL on the southern boundary.
l) Road traffic immediately adjacent to the eastern and southern boundaries.
m) Trees 45 FT AGL on the northwest boundary.
n) Overhead power line up to 35 FT AAL runs northeast/southwest 0.24 NM and north-north-west.
o) Three wind turbines on the northwest boundary up to 734 FT AMSL (322 FT AGL).

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

a) 3 Counties Flying School (01909-600231) operates a Designated Training Organisation for ab-initio training.

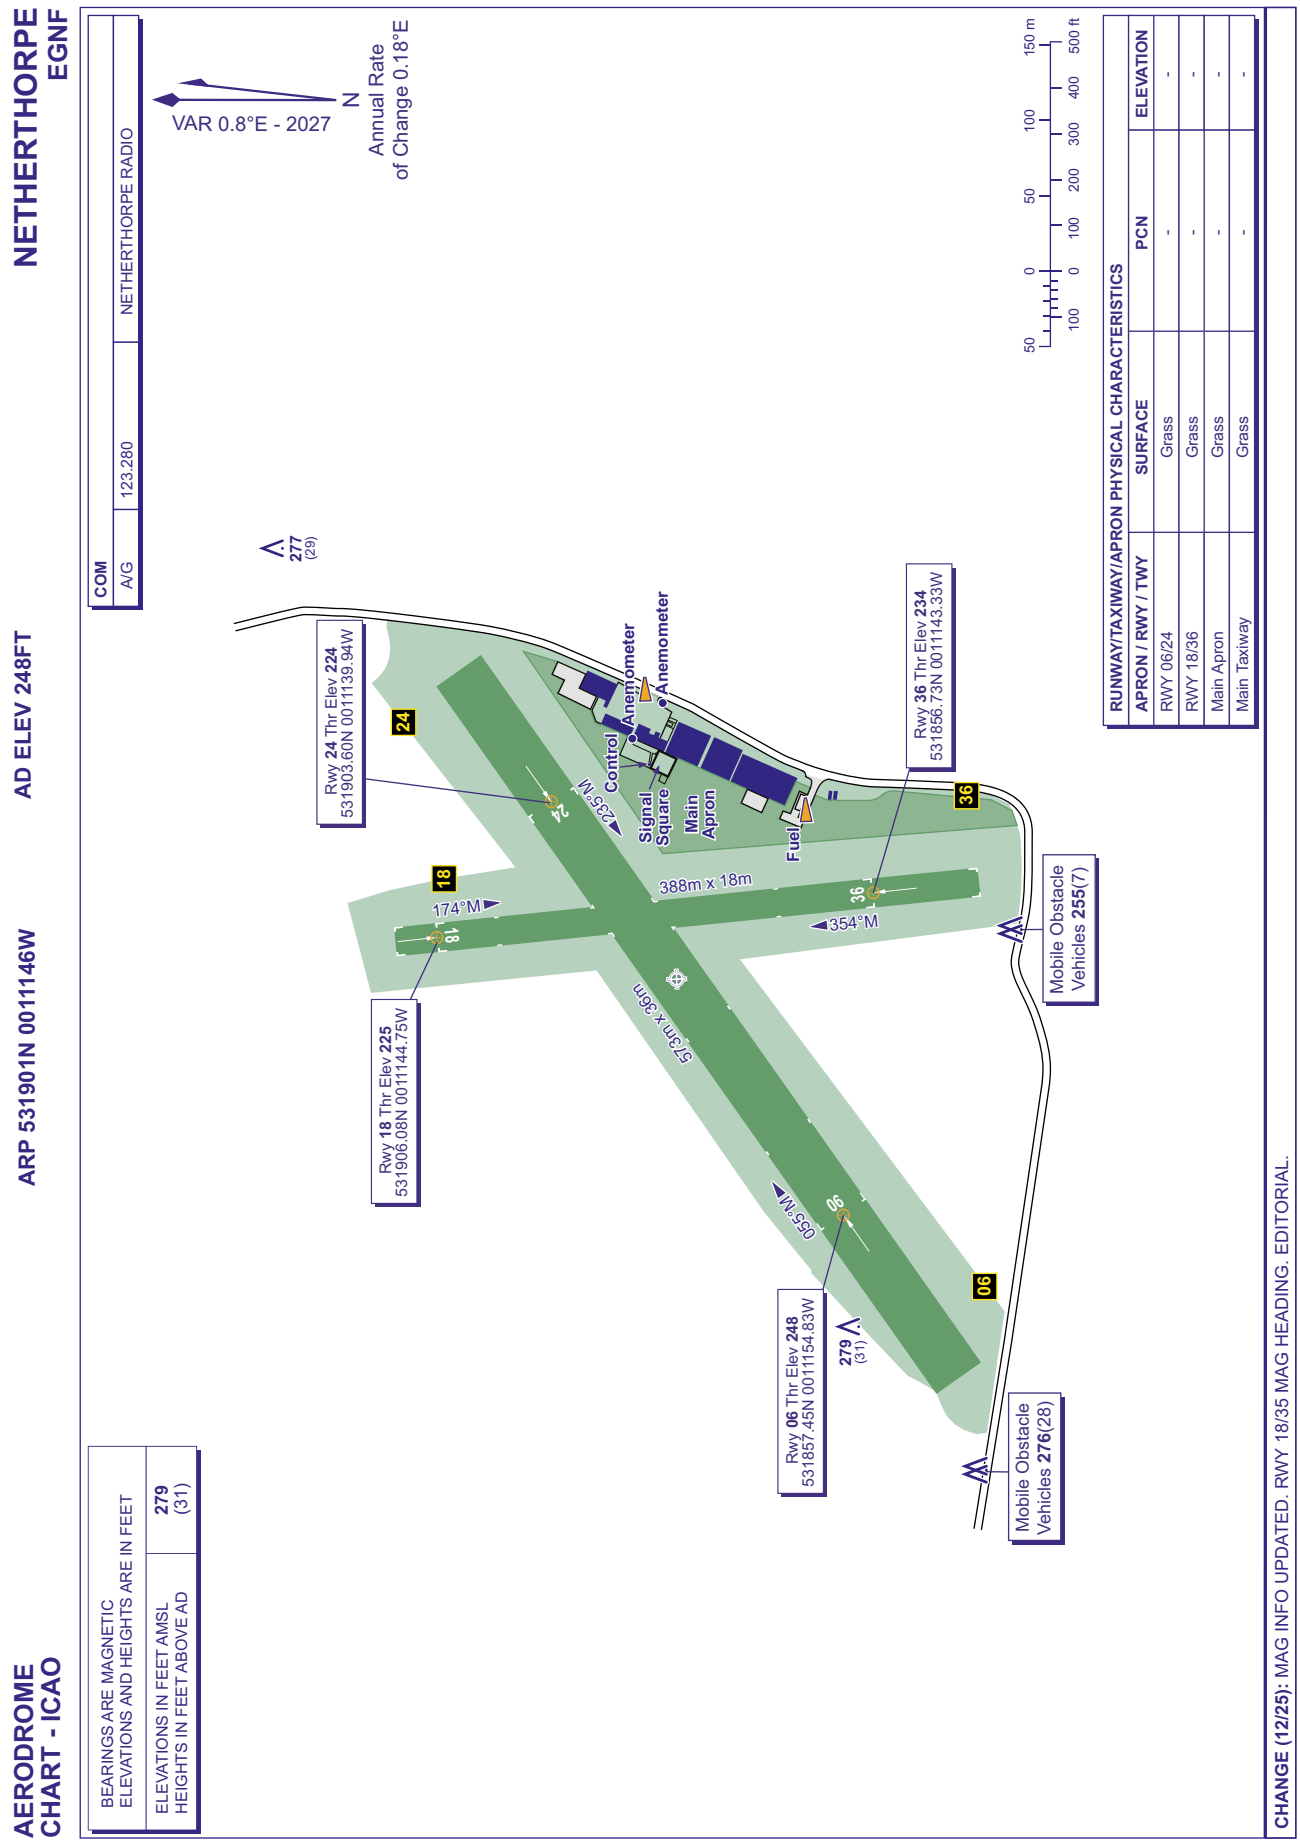
EGNF AD 2.21 NOISE ABATEMENT PROCEDURES

a) Avoid over-flying local villages.

EGNF AD 2.22 FLIGHT PROCEDURES

a) PPR is required by phone 01909-475233.
b) Join circuits from the overhead at 1800 FT QFE where possible.
c) Circuit height is 800 FT QFE for fixed wing powered aircraft.
d) Circuit directions: Runways 06 and 36 - RH; Runways 18 and 24 - LH.

EGNF AD 2.23 ADDITIONAL INFORMATION



a) Flights arranged through cost sharing platforms are not permitted at Netherthorpe.

EGNT AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Stands 1-25, 30 and 60-62 are designed for nose-in/push-back operations. Stands 50-54 are self-manoeuvring, although aircraft must be marshalled on to stand. Stands 13-25, 50-54 and 60-62 aircraft must be marshalled on to stand. Stands 1-12 and 30 are equipped with stand entry guidance systems. Aircrew should note that stand entry guidance systems are activated by their ground handling agent. Pilots must not enter an aircraft stand unless the stand entry guidance has been activated and the correct aircraft type is displayed, or alternatively an ATC instruction has been passed for marshalled on to stand. Airbridge available stands 3, 9/30 and 10. Stand 25 has an additional centre-line designated Left and Right. Stands 8, 13, 17 and 19 have additional markings for supplementary parking, as directed by ATC aircraft must be marshalled. Supplementary parking position Stand 30: Stand 30 is a parking position diagonally across Stand 9 for B747, A330-300 and B777-300 aircraft.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 07/25: Designation, runway edge, displaced threshold, centre-line and touchdown zone. Runway light(s): Lights are LED. Taxiway marking aid(s): Yellow centre-line paint marking, intermediate taxi-holding positions and runway taxi-holding positions. Taxiway light(s): Combination of blue edge lights and switchable green centre-line (spacing 7.5 M for CAT III routes (A and D), 15 M for other routes). Illuminated holding point signs, illuminated taxi signs.
3	Stop bars and runway guard lights (if any)	Stop bars and runway guard lights at runway entrance points are in operation H24.
4	Other runway protection measures	-
5	Remarks	Some obstacle marking. Illuminated wind direction indicators. Pilot attention is drawn to the use of additional paint markings at specified runway entrance and exit points. These markings are provided as an additional measure to raise situational awareness and to reduce the runway incursion risk. All Ground Movement is under ATC Control. WDI: 550234.35N 0014033.83W (LGTD) and 550207.44N 0014219.87W (LGTD).

EGNT AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGNT AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All flights are at all times subject to PPR. The filing of a flight plan does not constitute permission to use Newcastle International Airport Ltd. Applications for prior permission and runway slots should be addressed as follows:

i. All requests for slots during office hours 0900-1700 (0800-1600) are to be directed to Airport Coordination Ltd (ACL) Tel: 0161-493 1850, E-mail: manchester@acl-uk.org, SITA: LONACXH;
ii. Operators of Military, General and Business Aviation aircraft may only operate when permission has been obtained from Samson Aviation (0191-286 4156) in advance of each movement;
iii. Flight Training Requests should be made to ATC (0191-214 8130).

b) Booking out details should be passed by telephone to ATC (0191-214 8130). Booking out by radio will not be accepted.

c) Aircraft towing banners may not land at or depart from the aerodrome.
d) All aircraft using Newcastle Aerodrome or its facilities are required to have third party liability insurance cover in the sum of at least 1 million pounds. Proof of this insurance should be available for inspection at any time whilst the aircraft is at the aerodrome.
e) Newcastle Aerodrome aprons are a 24 hour mandatory High Visibility Clothing Area. All flight crews are to wear High Visibility clothing for all ramp activities, except when direct bussing to/from aircraft steps and terminal or when walking via delineated passenger walkways.
f) All General Aviation are required to nominate a handling agent, especially prior to filing a flight plan to arrive from outside the UK. Failure to do so will result in the provision of a security escort for which a charge will be levied. The exceptions to the above are as follows:

   i. Newcastle based operators. In this instance it will be the captain's responsibility to present to the Control Authorities any non-EC national as well as any other person required to be presented in accordance with current UK regulations.
   ii. All visiting General Aviation aircraft are strictly subject to PPR and compulsory handling. Pilots must obtain a PPR reference prior to arrival from Samson Aviation (0191-286 4156) indicating the purpose of the visit and parking requirements.

g) Parking outside delineated areas is contrary to the byelaws.
h) Fixed Electrical Ground Power must be used wherever available and serviceable.

2 GROUND MOVEMENT

a) General

   i. All requests for clearance, push-back, start-up and taxi should be made directly with ATC (The ATIS shall state the appropriate frequency). Directions issued by ATC should be followed precisely. RTF transmissions must be brief, concise and kept to a minimum.
   ii. Outbound aircraft, on first contact with Newcastle ATC, should state aircraft type, stand number, ATIS code letter, QNH received, and then maintain a listening watch at all times.
   iii. Clearance is available for departing aircraft no earlier than 20 minutes before EOBT, on the appropriate frequency.
   iv. Data link Departure Clearance (DCL):

      1. Pre-departure clearance via datalink (ARINC or SITA) is available at Newcastle for suitably equipped aircraft flight planned via GIRLI P18, or BAVDO/ERKIT N110;
      2. Requests for DCL should be submitted no earlier than 20 minutes before EOBT.

   v. Pilots should only request push back (with tug attached) when they are actually ready to do so and should be in direct communication with the tug crew via a headset person, ATC must be informed if no direct communication with a headset person is available.
   vi. Flights subject to CTOT may request to push-back and tow to wait in a remote position/stand, such requests shall be made to ATC upon the appropriate frequency.

b) Ground Movement Restrictions

   i. Holding Point D2 is restricted to aircraft with a maximum wingspan of 36 M.
   ii. Taxiway E is restricted to aircraft with a maximum wingspan of 17 M, larger aircraft should be towed with caution.
   iii. Taxiway F is restricted to aircraft with a maximum wingspan of 30 M. Aircraft with a wingspan greater than 27.5 M may be subject to a Follow Me service. Aircraft with a wingspan greater than 16 M shall park on stands 53 or 54. South of Stand 53, the maximum wingspan is 16 M and reduces further to 12 M within the west section of the apron.
   iv. Aircraft classified as Code E and higher (with the exception of B787-8) should not use the angled turn offs at Taxiway B and Taxiway C (Hold CW) to vacate the runway after landing.

3 CAT II/III OPERATIONS

a) Runways 07 and 25, subject to serviceability of the required facilities, are suitable for Category ll/lll operations by operators whose minima have been accepted by the Civil Aviation Authority.
b) During Category ll/lll operations, special ATC procedures (ATC Low Visibility Procedures) will be applied. Pilots will be informed when these procedures are in operation by ATIS broadcast or by RTF.
c) In the event of IRVR equipment being unserviceable, reported MET visibility shall be passed.
d) Departing aircraft: ATC shall require departing aircraft to use the following CAT II/III holding points:

   Runway 07 A2
   Runway 25 D3 or D2 (D2 when instructed by ATC)
   Holding Point G although not designated CAT II/III, the holding point is the required 137 M from the runway centre-line.
   Occasionally, it may be necessary for other holding points to be used at the discretion of ATC.

e) Arriving aircraft: Appropriate runway exits shall be illuminated. Pilots should select the first convenient exit unless advised by ATC.
f) When Low Visibility Procedures are in force a much reduced landing rate can be expected due to the requirement for increased spacing between arriving aircraft. In addition to the prevailing weather conditions, such factors as equipment serviceability may also have an effect on actual landing rates.

4 WARNINGS

a) Gliding takes place at Currock Hill gliding site, 8 NM south-west of Newcastle Aerodrome. ATC will advise when active via RTF and/or ATIS.
b) CAT I Localiser fluctuations are likely should the preceding landing aircraft vacate at the end.

c) Vehicular Operations taxiway E / G, aircraft should exercise caution when taxiing and be mindful of the vehicle crossing point upon taxiway E and G.
d) The grass verges along the sides of the runway and taxiways are soft in many places. Pilots are to exercise caution when taxiing.
e) When Runway 25 is in use and the wind direction is from 160° through south to 190°, pilots should expect wind disturbance and possible negative gradient.
f) Possible bird activity from nature reserve north of the NT NDB(L), 1.2 NM from Runway 25 touchdown and woodland area North of the aerodrome perimeter abeam the Fire Station.
g) 2.2 M paved strip along the edges of the Runway (beyond the slot drain) have limited load bearing strength.
h) Erosion strip along the edges of the runway (beyond the slot drain) have limited load bearing strength.
i) When a high pressure system is giving way to a low the wind aloft can be from the south or southwest whilst the surface wind still favours Runway 07. There is an increased risk of a rushed approach onto Runway 07; contributory factors are being held high, tailwind during descent and engine anti-ice required during descent through cloud (icing). A sea breeze due to the sun's warming overland can also have the same effect.
j) When vacating the Runway at Bravo and parking on Stand 7, use painted surface markings as reference due to position of stand signs.

5 HELICOPTER OPERATIONS

a) Helicopters must use the runway for take-off and landing, unless specific instruction issued by ATC not to use the runway.
b) Three helicopter parking areas are provided. Two are located on the general aviation apron and are designated 'P-East' and 'P-West'. Stand 54 is a multi-use stand and helicopters may be marshalled. Skid equipped helicopters must utilise P-East or P-west as no hover taxi permitted beyond these stands – Ground taxi only. Helicopters operations from Taxiway E restricted to based operators.
c) Helicopters operating TO/FROM sites within the CTR:

i. Flight Details - Prior to lifting, the pilot shall book out with Newcastle ATC, preferably via telephone at least ten minutes prior to lift. Note: The act of booking out does NOT constitute a zone clearance. Clearance must be obtained via RTF from Newcastle ATC.
ii. Operation - Outbound

The pilot must: Lift into the hover to a height of not greater than 200 FT AGL and obtain zone clearance. Only when a clearance has been received, can the flight set course subject to Newcastle ATC Instruction.

iii. Operation - Inbound

Contact should be made, where possible, with Newcastle Radar at least 5 minutes flying time from the CTR or CTA boundary requesting clearance to enter CAS. The pilot shall report when descending into the landing site. It should be noted that after this report has been made, no further action will be initiated by ATC, for instance incident/accident, unless information to the contrary is received. If no acknowledgement is received from Newcastle ATC, then the pilot must telephone ATC as soon as practical after landing.

6 USE OF RUNWAYS

a) Variable circuit as advised by ATC.
b) Aircraft exiting via Bravo and Charlie should do so at speeds of 25 KT or less.

7 TRAINING

a) Operators intending to follow a programme of training flights should obtain prior approval from the Chief Executive.
b) Training flights.

i. Training flights may only take place by prior arrangement with ATC and only between Mon-Sat 0730-2300 (0630-2200), Sun 1000-2300 (0900-2200).
ii. ATC must be advised of any cancellations. Any sortie delayed by 30 minutes or more will be deemed to have been cancelled.
iii. No flying training, including training circuits, missed approaches and landings, is permitted between 1200-1500 during the period 1 May until 30 September. The single take-off or full stop landing of an aircraft on a training flight may be permitted. Local sorties will also be restricted during these times. Outside of these times training and local sorties will be permitted subject to ATC priorities.
iv. Asymmetric flight must not be carried out without the permission of ATC.
v. The filing of a flight plan for a training detail does not constitute acceptance.
vi. Flight training is not permitted during Low Visibility Operations (LVOs).

c) All training flights by aircraft above 12,000 KG MTWA and all turbo-jet or turbo-fan aircraft shall be subject to the following conditions:

i. Circuits shall be at a minimum of 2000 FT QNH except for aircraft having an MTWA of 95,000 KG or greater, when they shall be at a minimum of 2300 FT QNH;

1. Circuits will be variable in direction, left or right hand, in accordance with ATC instructions.
2. Aircraft are to be flown in such a manner as to avoid built-up areas in the vicinity of the aerodrome.
3. All training aircraft carrying out circuits or making a missed approach from a visual circuit to either runway are required to comply with the Noise Preferential Routeings.
4. Training flights will not be given priority over essential aerodrome maintenance work.

EGNT AD 2.21 NOISE ABATEMENT PROCEDURES

All aircraft inbound to, and outbound from or local flying at this aerodrome are required to conform to the following procedures, notwithstanding that these may at any time be departed from to the extent necessary for avoiding immediate danger:

a) Every operator of aircraft using the aerodrome shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in areas surrounding the aerodrome.
b) **Continuous Descent Approaches**
Subject to ATC instructions, inbound jet aircraft are to maintain as high an altitude as practicable and adopt a low power, low drag continuous descent profile, when appropriate. Turbo-jet and turbo-prop aircraft are expected to apply continuous descent, low power, low drag approach techniques at all times. ATC shall provide regular range checks. Pilots who require additional track mileage to facilitate a successful CDA should inform ATC as soon as the requirement is apparent.
c) Aircraft approaching without assistance from radar or ILS shall follow a descent path which will result in the aircraft not being at any time lower than the approach path which would be followed by aircraft using the ILS glide path.
d) Aircraft must not join the final approach track to either runway at a range of less than 7 NM and not below altitude 2000 FT except when instructed by ATC, unless they are propeller driven aircraft with an MTWA of between 5700 KG and 12,000 KG when restriction shall be to join the final approach to either runway at not less than 3.5 NM and not below altitude 1300 FT. Aircraft whose MTWA is less than 5700 KG must not join the circuit below altitude 1300 FT.
e) To minimise disturbance in areas adjacent to the aerodrome, Captains are required to avoid the use of reverse thrust above idle power on landing, consistent with the safe operation of aircraft between the hours of 2300-0700 (2200-0600).
f) Noise Preferential Routings – The Noise Preferential Routings specified in the following table are compatible with ATC requirements and the tracks are to be flown by all departing jet aircraft and by all other departing aircraft of more than 5700 KG MTWA unless authorised by ATC or unless deviations are required in the interest of safety. The NPRs are incorporated into the Standard Instrument Departure (SIDs) and Omnidirectional departures.

Take-off Runway	Direction of turn	Intended track (°M)	Procedure	Take-off Runway	Direction of turn	Intended track (°M)	Procedure
07	Left Turn	Between 069° and 250° and LH circuit	Climb straight ahead to FL 80. (Circuit level as directed by ATC.)	25	Straight ahead or Right Turn	Between 251° and 070° and RH circuit	Climb straight ahead to FL 80 (Circuit level as directed by ATC).
	Right Turn	GIRLI P18 ERKIT N110 RH circuit	Climb straight ahead to 3.5 DME NEW (3 DME I-NC) and turn right heading 190° climbing to FL 80 (Circuit level as directed by ATC).		Left Turn	GIRLI P18 ERKIT N110 LH circuit	Climb straight ahead to 1.5 DME NEW (1 DME I-NWC) and turn left heading 210° climbing to FL 80. (Circuit level as directed by ATC.)
					Left turn (CURROCK ACTIVE)	GIRLI P18 ERKIT N110 LH circuit	Climb straight ahead to 1.5 DME NEW (1 DME I-NWC) and turn left heading 180° climb to FL 80.

Note 1: *Gliding may take place at Currock Hill Gliding Site, 545602N 0015043W, 8 NM south-west of Newcastle aerodrome from dawn to dusk, ATC will advise when active via RTF and/or ATIS.*

g) Ground Running: Ground running by aircraft is prohibited between 2300-0600 (2200-0500), unless the aircraft operator can show that there exists overriding operational requirements. At other times ground running is to be kept to the minimum consistent with operational needs and shall be authorised by ATC.
h) General Aviation to avoid overflying built up areas.

EGNT AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT

a) The standard routes for aircraft inbound descending from upper airspace are as follows:

Approach from	Via	Route
South STAR RNAV1 equipped aircraft only. If no onward clearance received by ETSES remain in the ETSES hold.	P18	POL – P18 – NATEB POL – POL 1N – ETSES (RNAV1)
	Y250	Y250 – GASKO – P18 – NATEB RIMTO – RIMTO 1N – ETSES (RNAV1)
South-East	N110	Leave CAS on track NATEB
North-West	Y96	Leave CAS on track NATEB
East	UP16	Leave CAS on track NATEB

b) Descent upon the STAR shall be as directed by ATC.
c) Aircraft inbound on the STAR can expect vectoring for an ILS to the runway in use.
d) Runway 25: RNAV1 equipped aircraft may request to fly the ETSES 1K transition for the RNP approach.
e) Runway 07: RNAV 1 equipped aircraft may request to fly the ETSES 1J transition for the RNP approach.
f) **Descent Planning**

i. To assist in the calculation of Continuous Descent Approach profiles, the following levels are recommended:

1. Abeam UVAVU - FL140.
2. Abeam TILNI - FL110.
3. Abeam GIRLI - FL90.

g) **Missed Approaches.** The Newcastle Standard Missed Approach Procedures are detailed within the associated Instrument Flight Procedure Charts including the procedures that apply in the event of executing a missed approach with loss of radio communications.
h) **Radio Failure IFR**

i. Aircraft expecting an ILS approach are to route to the NT (L) at the last assigned level and continue with the radio fail procedure adopted in ENR 1.1.3.
ii. Aircraft expecting an RNP approach are to:

1. If failure occurs **before** ETSES, continue on the STAR and establish in the ETSES hold before adopting the Radio Failure Procedure adopted in ENR 1.1.3;
2. If the failure occurs **after** ETSES, continue on the transition for the RNP approach in accordance with the Radio Failure Procedure adopted in ENR 1.1.3.

2 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Aircraft should flight plan via the following routes:

Outbound to	Via	Route
South and South-West	P18 P18/P16	P18 – POL (below FL 190) P18 – GASKO – P16 (FL 190 and above) ***Note:*** *Aircraft not able to make FL 210 by GASKO and requiring continuous climb above FL 210 should inform ATC*
South-East	Y250 for L60 and L603	P18 – GASKO – Y250 – MAMUL
	N110 for Y70 and L603	ERKIT – N110 – ABTOS (for Y70) ERKIT – N110 – DOLAS (for L603) ***Note:*** *Aircraft routeing via Y70 or L603 may alternatively route via P18 – Y250 – L60/ L603*
North, East and West	FIR	Route via appropriate significant points, advice available from ATC.

3 VFR FLIGHTS

a) VFR flights in the Control Zone will be passed routeing instructions and/or altitude restrictions in order to integrate VFR flights with other traffic.Pilots are reminded of the requirements to remain in VMC at all times and to comply with the relevant parts of SERA and the Rules of the Air Regulations 2015, and must advise ATC if at any time they are unable to comply with the clearance instructions issued.

4 VFR ROUTES TO AND FROM NEWCASTLE

a) VFR routes have been established; clearances will be issued subject to the conditions specified in paragraph 3. These routes are determined by visual reference points and prominent ground features, and are detailed in the following tables. ‘Not above altitude’ level instructions will be passed with the appropriate ATC VFR clearance.
b) Requests for non-standard routes must be co-ordinated with ATC.

Outbound Visual Routes

Exit Point	RWY	Route	Maximum Altitude
Tyne Bridges	07	Turn right outbound to leave the CTR no more than 1 NM east of the Tyne Bridges VRP.	2500 FT
Blaydon	07	Turn right outbound to leave the CTR south of Blaydon VRP and no more than 1 NM east of the A1.	2500 FT
Stagshaw Mast	07	Turn left outbound, to cross Ponteland at 1300 FT or above or remain north of Ponteland, routing north of Ouston VRP to leave the CTR no more than 1 NM north of Stagshaw Masts VRP.	2500 FT
Bolam Lake	07	Turn left outbound to remain North of Ponteland. Leave the CTR no more than 1 NM east of the A696 on track towards Bolam Lake VRP.	2500 FT

Exit Point	RWY	Route	Maximum Altitude
Morpeth Railway Station or Blyth Windfarm	07	Turn left outbound, to remain east of A1 from Stannington. Leave the CTR no more than 1 NM east of Morpeth Railway Station VRP.	2500 FT
Tyne Bridges	25	Turn left outbound to leave the CTR no more than 1 NM west of the Tyne Bridges VRP.	2500 FT
Blaydon	25	Turn left outbound to leave the CTR south of Blaydon VRP, remaining no more than 1 NM west of the A1.	2500 FT
Stagshaw Mast	25	Climb straight ahead to 1000 FT QNH, turn right to cross Ponteland at 1300 FT or above, route via Ouston VRP then no more than 1 NM south of Stagshaw VRP. **Note:** Advise ATC if unable to cross Ponteland at 1300 FT or above. Continue straight ahead until 3 DME before turning towards Ouston VRP.	2500 FT
Bolam Lake	25	Climb straight ahead to 1000 FT QNH, turn right to cross Ponteland at 1300 FT QNH or above. Leave the CTR no more than 1 NM west of the A696 on track towards Bolam Lake VRP. **Note:** Advise ATC if unable to cross Ponteland at 1300 FT or above. Continue straight ahead until 3 DME before turning towards Bolam Lake VRP.	2500 FT
Morpeth Railway Station or Blyth Windfarm	25	Climb straight ahead to 800 FT QNH, turn right to pass east of Ponteland continuing climb. Route to leave the zone no more than 1 NM west of the A1.	2500 FT

Outbound and inbound visual routes via Bolam Lake, Derwent Reservoir and Ouston (Disused Aerodrome) VRPs are recommended for daylight use only.

Inbound Visual Routes

Entry Point	RWY	Route	Maximum Altitude
Tyne Bridges	07	Enter the CTR no more than 1 NM west of Tyne Bridges VRP, route to join right base for RWY 07.	2500 FT
Blaydon	07	Enter the CTR no more than 1 NM west of Blaydon VRP, route join to right base for RWY 07.	2500 FT
Stagshaw Mast	07	Enter the CTR not more than 1 NM south of Stagshaw Masts VRP, route via Ouston VRP to join left base RWY 07, remaining 1300 FT or above over Ponteland OR if not possible remain west of Ponteland and when cleared join final approach RWY 07 not less than 3.5 NM from touchdown	2500 FT
Bolam Lake	07	Enter the CTR not more than 1 nm west of the A696. Route to join left base RWY 07, remaining 1300 FT or above over Ponteland OR if not possible remain west of Ponteland. When cleared join final approach not less than 3.5 NM from touchdown	2500 FT
Morpeth Railway Station or Blyth Windfarm	07	Enter the CTR no more than 1 NM west of the A1, to join left base RWY 07 east of Ponteland remaining at or above 1000 FT QFE until south of Ponteland	2500 FT
Tyne Bridges	25	Enter the CTR no more than 1 NM east of Tyne Bridges VRP to join left base RWY 25.	2500 FT
Blaydon	25	Enter the CTR no more than 1 NM east of Blaydon VRP to join left base RWY 25	2500 FT
Stagshaw Mast	25	Enter the CTR no more than 1 NM north of Stagshaw Masts VRP. Route north of Ouston VRP to join downwind right hand RWY 25. Cross Ponteland at or above 1300 FT or route north of Ponteland	2500 FT
Bolam Lake	25	Enter the CTR no more than 1 NM east of the A696, route to join right base RWY 25 remaining clear of Ponteland.	2500 FT
Morpeth Railway Station or Blyth Windfarm	25	Enter the CTR no more than 1 NM east of Morpeth Railway Station VRP, route east of the A1 until east of Stannington to join right base RWY 25.	2500 FT

5 SPECIAL VFR FLIGHT

a) Special VFR clearance for flights within the Control Zone may be requested and may be given in accordance with the rules applicable to Class D airspace.
b) Pilots are reminded that it is their responsibility when operating on a Special VFR Clearance to remain at all times clear of cloud and in sight of the surface and in flight conditions which will enable them to determine their flight path and ensure that they comply with SERA.3105 Minimum Heights and the relevant parts of SERA.5001 VMC Visibility and Distance from Cloud Minima, SERA.5005 Visual Flight Rules and Rules of the Air Regulations 2015. Pilots must inform the radar controller if compliance with these requirements entails a change of heading or level.

c) Pilots are reminded that a Special VFR clearance applies only to flight within the CTR and does not extend to flight within the surrounding airspace.
d) Special VFR flight may be subject to delay.
e) In order to reduce conflict with IFR flights, Special VFR arriving/departing flights will normally be cleared not above a specified altitude and to route via a published VRP.

6 GLIDERS

a) Local gliding activity takes place at Currock Hill. See note at AD 2.20
b) Newcastle ATC provides a service to gliders requesting clearance to enter the Borders / Newcastle CTA North of UVAVU below FL120.

7 VISUAL REFERENCE POINTS (VRP)

a) Use of Bolam Lake, Derwent Reservoir and Ouston (Disused Aerodrome) VRPs is not recommended at night.
b) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

8 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside the Newcastle controlled airspace within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Newcastle Radar frequency, 124.380 MHz, are encouraged to select SSR code 3737.

550321N 0010315W - 544746N 0012813W -
544003N 0015830W - 543945N 0021543W -
550313N 0021717W - 552217N 0021300W -
553343N 0012806W.

b) Selection of 3737 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Newcastle controlled airspace at all times.
c) Whilst squawking 3737, pilots should be aware that Newcastle Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 3737 shall be deselected.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1542
HEIGHTS IN FEET AGL (765)

NEWCASTLE

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **1700** in the sector defined by the lateral limits; 551023N 0014359W - 551137N 0013926W thence clockwise by an arc of a circle radius 8NM centred on 550420N 0013337W to 545705N 0012748W - 545539N 0013310W - 551023N 0014359W.

b) **2200** in the sector defined by the lateral limits; 550724N 0015517W - 551023N 0014359W - 545539N 0013310W - 545329N 0014123W thence anti-clockwise by an arc of a circle radius 3NM centred on 545210N 0014605W to 545214N 0015117W thence clockwise by an arc of a circle radius 8NM centred on 550009N 0014923W to 550724N 0015517W.

For right hand circuits to RWY 07 further descent to **2200** may be given on base leg when north of CTA boundary.

c) **2500** in the sector defined by the lateral limits; 545214N 0015117W thence clockwise by an arc of a circle radius 3NM centred on 545210N 0014605W to 545329N 0014123W - 545254N 0014331W thence clockwise by an arc of a circle radius 8NM centred on 550009N 0014923W to 545214N 0015117W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2500**, or last assigned level if higher to **NDB(L) NT†**.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) NT†**.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights area shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of NDB(L) NT.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
7. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of instrument approaches other than SRA is cleared to intercept the final approach track.**

EGHQ AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 502627N Long: 0045943W Mid point of Runway 12/30.
2	Direction and distance from city	3.5 NM NE Newquay.
3	Elevation / Reference temperature / Mean Low Temperature	390 FT / 18 °C / -
4	Geoid undulation at AD ELEV PSN	173 FT
5	Magnetic Variation / Annual Change	0.20°W (2027) / 0.18°E
6	AD Administration Address Telephone Web address	CORNWALL AIRPORT LTD Newquay Cornwall Airport St Mawgan, Newquay Cornwall TR8 4RQ 01637-861301 (ATC) 01637-860551 (Executive and GA Full Handling PPR) 01637-861744 (General Aviation PPR) www.cornwallairportnewquay.com
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	All telephone calls to ATC will be recorded.

EGHQ AD 2.3 OPERATIONAL HOURS

1	AD Administration	Mon-Sun 0700-1930 (0545-2030). All other times by arrangement.
2	Customs and immigration	H24. 24 hours notice required for non-scheduled movements.
3	Health and sanitation	As AD.
4	AIS Briefing Office	As AD via Handling Agent or self briefing by Internet site.
5	ATS Reporting Office (ARO)	As AD.
6	MET Briefing Office	As AD via Handling Agent or self briefing by Internet site.
7	ATS	See AD 2.18. SAR and Air Ambulance operations may occur H24, including outside the operating hours of the aerodrome.
8	Fuelling	As AD.
9	Handling	As AD.
10	Security	As AD.
11	De-icing	As AD on request.
12	Remarks	PPR before departure for all non-scheduled movements. For non-scheduled movements between 1700-0900 (1600-0800) PPR to be obtained before 1500 (1400).

EGHQ AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Limited
2	Fuel and oil types	AVTUR Jet A-1/ F35, AVGAS 100LL
3	Fuelling facilities/capacity	AVTUR Jet A-1 / F35 100,000 LTS. AVGAS 100LL 20,000 LTS.
4	De-icing facilities	Available via Airport Operations.
5	Hangar space for visiting aircraft	Limited.
6	Repair facilities for visiting aircraft	Limited. STS Aviation (UK CAA/EASA Part 145 Approved). www.stsaviationgroup.com
7	Remarks	Handling Agents: Fly NQY (GA): Tel: 01637-861744. Weston Aviation (Executive and GA full handling, including military training requests): Tel: 01637-860551 Fax: 01637-860788. No aircraft air-start available.

EGHQ AD 2.5 PASSENGER FACILITIES

1	Hotels	In the vicinity.
2	Restaurants	Cafe (landside and airside), Executive lounge (airside).
3	Transportation	Buses, Taxis and Car Hire.
4	Medical facilities	Limited First Aid.
5	Bank and Post Office	Cash Machine in Terminal
6	Tourist Office	-
7	Remarks	-

EGHQ AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category 6 Mon-Sun 0700-1930 (0545-2030). All other times by arrangement. RFF Category 7 accepted under remission. RFF Category 8 and 9 by prior arrangement.
2	Rescue equipment	3 x Panther, 6 x 6 Euro 6. Cutting equipment available.
3	Capability for removal of disabled aircraft	Limited.
4	Remarks	-

EGHQ AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Limited Mechanical, Chemical De-Icing.
2	Clearance priorities	Standard.
3	Remarks	-

EGHQ AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Aircraft classed as higher than Code C parking on ECHO Apron are to shut down on the ECHO taxilane and be towed to parking position under ground crew guidance. Aircraft parking stands 18-19 are to follow marshaller guidance. Aircraft parking Alpha Apron stands 20-24 are to follow marshaller guidance. All engine starts and aircraft manoeuvring on Alpha Apron require ground crew guidance. Light aircraft are to be allocated parking by ATC. Marshaller guidance on the General Aviation Parking Area may not be available.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 12/30: Runway designation, runway centre-line, runway threshold, fixed distance and touchdown and zone markings. Runway side stripes. Threshold turn-pad centre-line and edge markings with blue edge lights. Taxiway light(s): Green centre-line lighting. Yellow/Green lead-on/lead-off lights at runway intersection with taxiways A, B, C, E, G and H, lead-on lights switched with stopbars. Taxiways D and H fitted with catseye markers and reflective signs in addition to centre-line lights.
3	Stop bars and runway guard lights (if any)	Stop bars at A2, A3, B1, C1, D4, E1, G1 and H1. Also vehicle crossing V(North) and V(South). Runway guard lights at A1, A3, B1, C1, D4, E1, G1 and H1.
4	Other runway protection measures	-
5	Remarks	WDI (LGTD) - 502623.94N 0045946.34W; 502611.95N 0045914.45W; 502641.48N 0050032.84W.

EGHQ AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGHQ AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All persons on the manoeuvring and apron areas at Newquay Airport must wear high visibility clothing at all times. Passengers not wearing high visibility clothing must be escorted by personnel wearing the required clothing.

2 GROUND MOVEMENT

a) General Aviation light aircraft 3500 KG MTOW or less, not requiring executive handling will self position on the General Aviation parking area southeast of the control tower. Daylight operations only unless by special instruction.
b) All aircraft parking on Stands 18-24 and Echo Apron are to follow ground crew guidance.
c) All engine starts and aircraft manoeuvring on Alpha Apron require ground crew guidance.
d) Due to slopes on Echo Apron aircraft Code D and above must shut down on the apron taxi track and be towed to a parking position. Other aircraft will be directed to a parking position by ground crew guidance.
e) All aircraft parked on Echo must be chocked before the crew leave the aircraft.
f) Unless otherwise instructed by ATC: Pilots entering the Golf Apron are to follow the left hand fork. Pilots leaving the Golf Apron are to route via G1.

3 CAT II/III OPERATIONS

a) Runway 30 is suitable for Category II/IIIb operations by operators whose minima have been accepted by the Civil Aviation Authority.
b) During Category II/IIIb operations, special ATC procedures (Low Visibility Procedures (LVP)) will be applied. Pilots will be informed when these procedures are in operation by RTF and/or ATIS automatic broadcast.
c) Category II/III Holding Points are A2, B1, C1, A3 and E1 only. Red stopbars and amber/green coded centre-line lights are switched on for runway protection and guidance.
d) Special procedures will be applied to aircraft taxiing via D4, G1 and H1.

4 WARNINGS

a) Light aircraft should be aware of the elevated runway edge lights and PAPI for Runway 12/30.
b) Pilots are advised that bird concentrations may be present in agricultural areas on approaches to runways. Deterrent measures within the airport boundary are carried out by a Bird Control Unit and pilots may be requested by ATC to delay departure or arrival if bird concentrations within the BCU's area of control prove difficult to disperse.
c) Pilots are warned of the possibility of terrain induced turbulence and wind shear effects when landing on Runway 12 or 30.
d) From its junction with Taxiway Charlie to 650 M short of holding point Alpha 3, Taxiway Alpha exceeds the required transverse and longitudinal slopes. Advisory warning signs are positioned at the beginning and end of the up and down slope. Pilots are to exercise caution in this area especially in conditions of surface contamination or when following other aircraft.
e) Aircraft on instrument approach to Runway 30 or climb out from Runway 12 may experience a smell of burning due to a waste incinerator to the south of the FAT.
f) Overall runway longitudinal slope 1.17%. Maximum variation 1.3% located 1200 M from start of Rwy 30 TORA.
g) Runway 30 sight distance 841 M from runway end or 541 M from 30 threshold.
h) Taxiway Delta from Echo to Runway 30 threshold not suitable for use by aircraft.

i) Due to 24 hour SAR helicopter operations ILS I-NWQ and ILS I-NEW are not to be used without positive clearance from Newquay ATC.
j) Instrument approaches to Runway 12 require approximately 20 NM flight over water. Pilots of single engine aircraft are advised to carry appropriate safety equipment.

5 HELICOPTER OPERATIONS

a) Light helicopters may operate direct to their indicated landing position. The route to the landing position MUST avoid overflying the Terminal, terminal car parks, Carnanton House and RAF St Mawgan domestic site.
b) Helicopters are not to cross the runway or enter the runway strip (150 M either side of runway centre-line), without positive ATC clearance.
c) Heavy helicopters (SK61, Puma/Tiger etc) will be integrated into the fixed wing circuit and approach to the runway. After landing heavy helicopters may request ground or air taxi subject to landing gear fitted via the taxiways to their parking position.
d) Marked helicopter landing spots are for use by authorised operators only, unless specifically directed by ATC.

6 USE OF RUNWAYS

Not applicable

7 TRAINING

a) Training by jet aircraft or aircraft of more than 17,000 KG MTOW not accepted on UK Public Holidays.
b) Military training approach requests to be directed to Weston Aviation, Tel: 01637-860551. For other military operation requests contact Newquay Operations, Tel: 01637-861055.

EGHQ AD 2.21 NOISE ABATEMENT PROCEDURES

a) **Departures**

i. Runway 30: Aircraft less than 5700 kg MTOW: Climb straight ahead until above 1000 ft aal before turning on track. Avoid overflying Newquay Town or any built up area as much as possible. Instructions for an earlier turn may be given by ATC if traffic or weather conditions dictate.

Aircraft 5700 kg or more: Climb straight ahead until above 2000 ft agl or across the coast before turning on track.

ii. Runway 12: Aircraft less than 5700 kg MTOW: Climb straight ahead until above 1000 ft aal before turning on track. Avoid overflying Newquay Town or any built up area as much as possible. Instructions for an earlier turn may be given by ATC if traffic or weather conditions dictate.

Aircraft 5700 kg or more: Climb straight ahead until above 2000 ft aal.

b) **Arrivals**

i. Jet aircraft must not join the final approach track to either runway at a height of less than 1500 ft agl, except that jet aircraft carrying out visual circuit training may descend from 1500 ft agl on base leg and join the final approach track not less than 1000 ft aal.
ii. Propeller driven aircraft of more than 5700 kg MTWA must not join the final approach track to any runway at a height of less than 1000 ft aal.
iii. Unless otherwise instructed by ATC, aircraft using the ILS in IMC or VMC shall not descend below the height specified above before intercepting the glide path nor thereafter fly below it. Aircraft approaching without assistance from ILS or radar shall follow a descent path which will not result in it being at any time lower than the approach path which would be followed by an aircraft using the ILS glidepath.

EGHQ AD 2.22 FLIGHT PROCEDURES

1 INSTRUMENT APPROACH PROCEDURES

a) Instrument Approach Procedures (IAP) for this aerodrome are established outside controlled airspace. See ENR 1.5.

2 PROCEDURES FOR INBOUND AIRCRAFT

a) Recommended routes from the Airways System. Aircraft above FL 100 are recommended to contact Western Radar.

Approach from	Via	Route
Northeast	N92	EXMOR - NQY
East	L620	DAWLY - NQY
Southeast	N864	BHD - NQY
West		LND - NQY
Southwest		DCT - NQY

b) Inbound aircraft from other than Airways System

i. Aircraft inbound to Newquay from the London FIR may route direct towards the aerodrome. To avoid any commercial traffic it is recommended that an initial call be made 10 minutes before ETA, or at least 10 NM from the aerodrome
ii. Traffic inbound from Bodmin, Truro and Perranporth aerodromes are to call before setting heading towards Newquay.
iii. Inbound aircraft to contact Newquay Approach on 133.405 MHz unless otherwise instructed.

3 RADIO COMMUNICATIONS FAILURE

a) In the event of complete radio communications failure in an aircraft the pilot will adopt the appropriate procedure notified at ENR 1.1 paragraph 3.4.

NEWQUAY

APP	133.405	NEWQUAY APPROACH
TWR	134.380, 121.955	NEWQUAY TOWER/GROUND
RAD	127.930	NEWQUAY RADAR
ATIS	127.405	NEWQUAY INFORMATION
See AD 2.18 for details.		

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **2300** in the sector defined by the lateral limits; 503320N 0045321W - 503047N 0044636W thence clockwise by an arc of a circle radius 8NM centred on 502351N 0045300W to 501702N 0045920W - 501933N 0050604W - 503320N 0045321W.

b) **2000** in the sector defined by the lateral limits; 503552N 0050006W - 503320N 0045321W - 501933N 0050604W - 502205N 0051246W thence clockwise by an arc of a circle radius 8NM centred on 502859N 0050628W - 503552N 0050006W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2500**, or last assigned level if higher to **NDB(L) NQY**†.

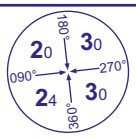
Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) NQY**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. The ATC Surveillance service is provided by Primary and/or Secondary Radar equipment.
7. **This chart should only be used for the cross-checking of assigned altitudes whilst in receipt of an ATC Surveillance service.**
8. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of Instrument approaches other than SRA is cleared to intercept the final approach track.**



CHANGE (13/25): MAG INFO REVISED.

EGAD AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGAD AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Aircraft (including microlight aircraft) using Newtownards Aerodrome are to carry third party liability insurance cover meeting or exceeding the appropriate European Directive requirements.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) There is high ground and a lighted obstruction (Scrabo Tower) that infringes the protected surface of the 26 climb-out. There are near-in lamp standards on the Comber Road that may present an obstruction in the event of a late decision to commence a missed approach. Turbulence may be experienced during a missed approach.

   Advice: Pilots of aircraft carrying out an approach to Runway 26 should satisfy themselves at or above 300 FT that they can safely land and stop on the runway. In the event of any doubt pilots are advised to commence a missed approach and make an early left turn to avoid the high ground. The pilot of an aircraft attempting to make a landing on Runway 26, who has not established wheels firmly on the ground before crossing the intersection with Runway 21, is advised to commence a missed approach. Once established in the climb an early left turn should be made away from the rising ground.

b) Pilots landing on Runway 33 should exercise caution on the approach to avoid possible pedestrian and vehicular traffic on the sea wall. Turbulence and windshear may be experienced on approach to Runway 33 in conditions of strong winds.
c) The aerodrome is frequently used outside the published hours of operation.
d) Pilots to exercise cautions as different heights and sizes of circuits may be in use simultaneously.

   i. Pilots of Microlight aircraft using the 700 FT circuit to exercise caution when turning base due to potential conflict with aircraft on final.
   ii. Pilots of aircraft flying the 1000 FT circuit to exercise caution due to potential conflict with aircraft operating in the 700 FT circuit.

e) Public road runs at right angles to the approach and under Runway 15 approach path beyond the aerodrome boundary.
f) Lamp standards (Lgtd with red warning lights and painted with red and white bands) approximately 5 M from aerodrome boundary, 26 FT AMSL, 140 M from Runway 15 threshold.
g) Vehicles on public road 150 M from Runway 15 threshold.
h) Model aircraft activity on the aerodrome located at the western hangars. All model flyers will have radio contact on 128.305 MHz and will not operate on active runways.

5 HELICOPTER OPERATIONS

In order to minimise the impact of noise on local residents ALL helicopters operating into or from Newtownards shall obey the following restrictions.

a) **Approaches**

   i. Helicopters shall not approach the aerodrome through the sector of the aerodrome traffic zone between the extended centre-line of Runway 21 and the extended centre-line of Runway 26, and helicopters shall not make any approaches to Runway 08. If approaching the aerodrome from the west they shall either route to the north of Scrabo Hill or join the extended centre-line of Runway 03 before the ATZ boundary and thereafter remain to the right of the runway centre-line.

b) **Departures**

   i. Helicopters departing from Runway 21 shall ensure that they do not fly west of the extended 21 centre-line until outside the ATZ.
   ii. Helicopters shall not depart from Runway 26.

c) **Hovering on the Aerodrome**

i. Visiting helicopters shall not carry out hovering practice at Newtownards without specific prior permission. Arriving helicopters shall route as expeditiously as possible to their planned set down area and shall shut down as soon as possible.
ii. Local helicopters shall take all possible actions to minimise noise impact from hover practice by avoiding hover training up-wind of residential areas.

6 USE OF RUNWAYS

a) Runway 26 is available for landing only.
b) Runway 08/26 is not available to solo students.
c) Grass Runway 15/33 is unlicensed, for details including dimensions/declared distances contact the aerodrome.

7 TRAINING

Not applicable

EGAD AD 2.21 NOISE ABATEMENT PROCEDURES

a) Avoid overflying bird sanctuary at Castle Espie.

EGAD AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuit directions; Runway 03 - RH; Runways 21, 15 and 33 - LH.
b) Runway 26 is not available for circuits.
c) Circuit height: 1000 FT AAL. Microlight circuit height for aircraft flying at IAS less than 70 KT 700 FT AAL. Microlight pilots using the 700 FT circuit to prefix Downwind radio call with ‘Microlight’.

EGEN AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All GA aircraft must park only on the clearly designated grass GA APRON. GA aircraft must not park on the main tarmac apron.
b) All pilots must be aware of a restriction in place for Runway 03/21. Any aircraft or obstacles on the main apron encroach the cleared and graded area of the runway strip of Runway 03/21. While aircraft or obstacles are present anywhere on the main apron, Runway 03/21 is unusable. This constitutes a variation to the licence for this aerodrome.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Visiting pilots should note that during periods of prolonged rainfall the grass runway can become very soft especially during the winter months.
b) **Runway 10/28 and 03/21:** Graded hardcore runway is generally unsuitable for light aircraft with low ground/propeller clearance due to unstabilised surface and as a result it would be advisable to carry out any power checks on the tarmac apron before departure.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	Use of this airport by aircraft not able to communicate with ATC by radio subject to prior permission. Aircraft towing banners, or non-powered gliders, may not land at or depart from the airport.

EGSH AD 2.3 OPERATIONAL HOURS

1	AD Administration	0600-2130 (0500-2030). Outside of these hours see remarks.
2	Customs and immigration	As AD Hours
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	-
7	ATS	As AD hours.
8	Fuelling	As AD hours and by arrangement.
9	Handling	As AD hours and on request.
10	Security	As AD hours.
11	De-icing	October to April during AD hours on request to Operations.
12	Remarks	01 May - 31 Oct: Mon to Thu, Sat 0600-2230 (0500-2130); Fri and Sun 0600-2300 (0500-2200). 01 Nov - 30 Apr: Sun to Fri 0600-2130; Sat 0600-2000. This aerodrome is strictly PPR. All movements outside published operating hours incur an extra charge. All requests to be made via Operations. Any changes to operating hours will be notified by NOTAM action.

EGSH AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Nearest railway siding: Norwich.
2	Fuel and oil types	AVTUR JET A-1, AVGAS 100LL.
3	Fuelling facilities/capacity	Above ground storage: JET A-1 225,000 L; AVGAS 30,000 L.
4	De-icing facilities	On request to Operations during AD hours.
5	Hangar space for visiting aircraft	None.

6	Repair facilities for visiting aircraft	None.
7	Remarks	All aircraft operating for hire or reward from/to Norwich will be required to be handled by Norwich Airport Ltd. Handling should be requested by telephoning Operations on 01603-420658; Fax: 01603-414927 or e-mail: ops@norwichairport.co.uk or telephone the Terminal Services Manager on 01603-420645; Fax: 01603-420646. Norwich Handling Frequency 131.855 MHz. For fuel contact Fuel Services, Tel: 01603-402042. E-mail: fuel@norwichairport.co.uk or via Norwich Airport Phone: 01603-420658 (Operations). SaxonAir are the preferred handling agents for GA and Business aviation. Handling by and use of the SaxonAir Apron is subject to Prior Permission from SaxonAir Operations. Tel: 01603-518111; Fax: 01603-488879; e-mail: handling@saxonair.com; website: www.saxonair.com

EGSH AD 2.5 PASSENGER FACILITIES

1	Hotels	Airport Hotel. Hotels in vicinity.
2	Restaurants	Restaurant and Licensed bar.
3	Transportation	Taxis and car hire, Limited bus service. Motor coaches by arrangement. Nearest railway station: Norwich.
4	Medical facilities	First Aid available during AD hours. Doctors and ambulance on call.
5	Bank and Post Office	Cash dispenser.
6	Tourist Office	Limited tourist information available from the airport information desk.
7	Remarks	-

EGSH AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A6 RFF Category 7 and 8 by arrangement. RFF Category 7 operations at remission level manning.
2	Rescue equipment	-
3	Capability for removal of disabled aircraft	Norwich Airport Ltd has an agreement with a local recovery company which holds resources capable of recovering aircraft up to 160,000 kg. Contact Air Ops: 07872-376275
4	Remarks	-

EGSH AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, Chemical de-icing. Runways and Taxiways anti-iced and de-iced with KAC fluid, supplemented with NAAC de-icing granules as required.
2	Clearance priorities	Standard. See AD 1.2.2.
3	Remarks	Norwich airport policy on clearing a contaminated runway will always be to clear back to blacktop. Therefore braking action readings derived from the use of a Grip tester friction meter, or any other source will not be available. Estimated braking action in accordance with CAP 1168, may be available. If the runway is open, standard operating procedures will be to pass flight crews the amount, depth and type of contamination only. Latest information from ATC, Tel: 01603-420641.

EGSH AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	EASTERN APRON Surface: Concrete PCR 555/R/D/X/U SAXONAIR APRON Surface: Concrete PCR 265/R/D/W/U TERMINAL APRON Surface: Concrete PCR 555/R/D/X/U WESTERN APRON Surface: Concrete PCR 100/R/D/X/U
2	Taxiway width, surface and strength	Taxiway A: 15 M Surface: Concrete and asphalt PCR 139/F/D/W/U Taxiway B: 15 M Surface: Asphalt PCR 139/F/D/Y/U Taxiway C: 18 M Surface: Asphalt PCR 539/F/D/X/U Taxiway D: 17.5 M Surface: Asphalt PCR 295/F/D/Y/U Taxiway E: 15 M Surface: Asphalt PCR 164/F/D/Y/U Taxiway N: 15 M Surface: Concrete and asphalt - Taxiway TAXILANE LINK E: 8.5 M Surface: Concrete PCR 100/R/D/W/U
3	Altimeter checkpoint location and elevation	Apron 101 FT
4	VOR checkpoints	-
5	INS checkpoints	See Aircraft Parking/Docking Chart
6	Remarks	Transverse surface gradients on Stands 4, 5 and 6 fall marginally outside the CAA/ICAO recommended criteria. Operators should be aware that localised gradients of 1 in 65 (1.54%) maximum have been confirmed within the above stand centre-line areas Western Apron is from E1 to E3.

EGSH AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Apron Stands numbered 1 to 6 are located in front of the Terminal. These stands have stand number, yellow centre-line and ground stop marking and are designed for nose-in parking. Stand 7 is located on an area north of the terminal. Visiting aircraft may be required to park on Stand 9, located on the Eastern Apron in front of Hangar 8. There are no Stand Entry Guidance or Visual Docking Guidance Systems. All aircraft are required to be marshalled onto all stands. Transport will be provided for access to and from Stands 7 and 9.

2	Runway and taxiway markings and lighting	Runway marking aid(s): 09/27: Runway 27 - Runway designation, runway centre-line, fixed distance, touchdown and threshold markings. Side strip. Stop and guard lights at runway/ taxiway intersections. Green turning circle. Runway 27 turning circle is marked by yellow line and alternate amber/green lighting with blue taxiway edge lights. Runway 09 - Runway designation, runway centre-line and threshold markings. Side strip. Stop and guard lights at runway/taxiway intersections. Runway 09 turning circle has yellow line and blue taxiway edge lighting only. Taxiway marking aid(s): Yellow lines.
3	Stop bars and runway guard lights (if any)	All runway holding points.
4	Other runway protection measures	-
5	Remarks	WDIs: 524041.84N 0011650.67E, 524024.19N 0011713.85E. Two WDIs 200 M from Runway 09 and Runway 27 thresholds: 524029.00N 0011623.29E (LGTD) and 524029.34N 0011733.90E (LGTD).

EGSH AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Booking out details should be passed by telephone: 01603-420641. Calls on RTF may result in delays.
b) All aircraft using Norwich aerodrome or its facilities, are required to have third party liability insurance cover in the sum of at least £1,000,000. Proof of this insurance should be available for inspection at any time whilst the aircraft is at Norwich aerodrome.
c) Extension charges apply after published AD HR.
d) All persons on the manoeuvring and apron areas at Norwich Airport must wear high visibility clothing as it is designed to be worn, at all times.
e) Pilots/Crew wearing high visibility clothing are permitted to escort passengers not wearing the required clothing. Apart from when carrying out aircraft walk round inspections, pilots/crew must keep to designated walkways and pedestrian crossings when on the terminal apron for their own safety. This also applies to passengers under pilot/crew escort. No pedestrian movement is permitted between the terminal and stand 7 parking area. Transport will be provided upon request.
f) Norwich Airport is PPR for all visiting aircraft movements. PPR can be obtained directly from Norwich Airport ATC on 01603-420641 or your Norwich based handling agent. PPR is required a minimum of 60 minutes prior to ETA. Scheduled flights are not affected by this requirement.

2 GROUND MOVEMENT

a) Push-backs: Jet powered aircraft over 45,000 KG AUW on Stands 4, 5 or 6 will be pushed-back and pulled forward as part of the pre-taxi manoeuvre. Due to jet blast safety distances, engine start is not to commence until instructed by the ground crew. This will normally be during the pull forward phase of the procedure.
b) Code D aircraft shall expect to use Taxiway Charlie only.
c) Large aircraft are to use the turning circles at either end as appropriate.
d) The Western Apron is only to be used by resident operators and their authorised visitors. Visiting aircraft shall park under marshaller's instruction. There are 5 helicopter parking stands on the Western Apron. Stands 20 and 21 on the western half at the northern end of the Western Apron for use by the Air Ambulance only, D value maximum of 13.63 M. Stand 22 on the western half in the middle of the Western Apron is a taxi-through helicopter stand. Stands 23 and 24 on the eastern half at the southern end of the Western Apron, D value maximum of 16.66 M.
e) All visiting aircraft to Hangars 2 and 3 via the Eastern Apron should be aware there is a gate with limiting dimensions on exiting the Eastern Apron towards Hangars 2 and 3. Operators should contact the host tenant company for further details and dimensions. The gate is removable provided sufficient notice of an aircraft movement is received by the host Tenant company.
f) Eastern Apron Gate - Aircraft access to non-airside tenant companies. With access gate in situ and fully open the measured clearance distances are:

- 19.75 M with no obstacle between the gates;
- from centre-line to EAST, 9.8 M; first obstacle is gate height 1.2 M;
- from centre-line to WEST, 9.95 M; first obstacle is gate height 1.0 M.

g) Commanders of visiting Code B aircraft to the SaxonAir apron will be marshalled if entry is via E1 and the Code A Echo taxilane.
h) Aircraft when operating on and off aprons and taxiing to/from hold point Papa, shall use MINIMUM thrust/idle power to avoid jet blast risk in the vicinity.
i) All Visiting Aircraft: Engine Start shall only be conducted when a qualified start crew are in attendance. All engine starts must be in compliance with current Norwich Airport Procedures. Note: Aircraft starting on Stand 7 require a Norwich Airport start crew.
j) Low Visibility Operations in force when MET visibility is 1500 M or less. If the IRVR is 400 M or less, entry to the runway will be via A2 and C2 only. For all other departures, a 'Follow-Me' vehicle will be provided.
k) Blue Taxiway edge lights between Holding Point B1 and Runway 09/27 edge unserviceable. Holding Point B1 closed during night and low visibility operations.

3 WARNINGS

a) Flying takes place by light aircraft and microlights from Felthorpe aerodrome (4 NM NW of ARP at *524200N 0011200E) occasionally throughout the year with increased activity during the summer months.
b) At both ends of Runway 09/27 its width is twice that of the associated edge lights due to extra pavement at one side. Aircraft backtracking the runway and conducting a 180 degree turn, shall ensure on completion of the turn, correct alignment with the runway centre-line.
c) During Low Visibility Procedures, one fire engine is positioned west of Hold Bravo 1 and another fire engine is positioned west of Hold Delta 1.
d) The following bird hazards have been identified within 4 KM of the airfield:

i. Around the aerodrome at dawn and dusk birds are observed transiting the airspace to various feeding/roosting locations.
ii. 2.5 KM N at St. Faiths, 2.5 KM NE at Spixworth and 4 KM E at Rackheath; these locations are pig farms which attract a variety of birds up to an estimated 1500 FT AGL.
iii. Perimeter of aerodrome up to 2 KM S, nesting gulls on building roofs presents bird activity during the day, predominantly April – September, and are known to overfly the aerodrome on a north/south track below 500 FT AGL.
iv. 1.5 KM N at St. Faiths, rooks are known to transit between this rookery and the aerodrome to feed/roost.
v. 1 KM SW at Hellesdon, racing pigeons flying low level during the day are on occasions observed crossing the runway/flight path.

e) Numerous flocks of birds have been observed crossing the approaches to Runway 09/27 at dawn and dusk within 1.5 NM of touchdown.
f) Helicopter winch training is conducted on the north side of the AD.
g) If a ground taxiing aircraft requires a brake test, this shall take place only on that portion of concrete Taxiway A parallel to Runway 27/09 between Holding Point B1 and A2.
h) Wind Shear and turbulence can occur on final approach to Runway 27 during periods of strong southerly or south westerly winds.
i) Unlit crane 150 M south of the terminal, up to 215 FT AGL.
j) Eastern Apron: 10 floodlight stanchions up to 115 FT AGL.
k) Caution - Helicopter activity takes place outside of AD published hours.
l) Surface wind observations for Runway 09 operations derived from the mid point anemometer.
m) Caution - Bright flood lighting at sports ground 1.5 NM final Runway 27.
n) Care should be exercised when arriving at EGSH from the south, to ensure alignment with the specified runway; Taxiway C is no longer a runway but is now an active taxiway.
o) All taxiway edge lights north of Runway 09/27 unserviceable.

4 HELICOPTER OPERATIONS

a) Light helicopters are not required to use the runways but arrivals and departures should be operated in such a way as to avoid overflying of, and to minimise the disturbance to, local residential areas.
b) Air taxiing on the main apron is not permitted except with the approval of ATC and under the guidance of a Marshaller.
c) Departures direct from the SaxonAir Apron and associated stands are prohibited.
d) Daily Helimed Operations take place outside of AD operating hours.

5 USE OF RUNWAYS

a) Variable circuits in operation.
b) Normally no overhead joins are permitted.

6 TRAINING

a) Circuit and Instrument training is only available by prior arrangement with ATC and subject to local traffic and the runway in use. Normal circuit heights are 1000 FT QFE for aircraft up to 5700 KG and 1500 FT QFE for aircraft over 5700 KG.
b) Due to the number of aircraft using the airport for instrument training a booking system is in operation. Training periods can be booked by application to ATC Tel: 01603-420641. The filing of a flight plan does not constitute a booking to carry out instrument training at the airport. Failure to make a booking may result in the aircraft being refused use of the facilities. Pilots unable to make the booked time must inform ATC either to cancel the slot or to re-book.
c) Aircraft wishing to make training approaches (non-landing) are to contact the preferred handling agents, SaxonAir on 01603-510111 to book in. There is no requirement to call ATC.

EGSH AD 2.21 NOISE ABATEMENT PROCEDURES

1 GENERAL

a) Operators of all aircraft using Norwich Aerodrome are to ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in the areas surrounding the aerodrome.
b) Where operationally possible, pilots should endeavour to avoid overflight of the town of Taverham situated 2 miles west of the airport.
c) When taking off, aircraft shall climb as steeply as minimum engine noise settings allow and when approaching to land, without the assistance of ILS, shall follow a descent path which will not result in their being at any time lower than the normal 3° GP.

2 ARRIVALS

a) Pilots of arriving jet aircraft and turbo-prop aircraft and aircraft in excess of 5700 KG should arrange their flights to be established on final approach to a runway not below 1500 FT AAL.

3 DEPARTURES

All aircraft other than IFR helicopters to the Southern North Sea (see below):

a) On departure from any runway, all aircraft are to climb straight ahead to 1000 FT AAL before turning, unless instructed otherwise by ATC.
b) Departure aircraft less than 5700 KG AUW - may be permitted to make a turn to the north of the aerodrome at 500 FT AAL.

EGSH AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Departures overflying the EHAA FIR via the UK North Sea are to flight plan via BODSO - L17 - MOLIX and then appropriate routes for destination.

2 AIR TESTS

a) Any aircraft requiring an air test which will be climbing to FL 190 or higher must have each individual flight approved by London Military. Pre-notification to London Military is required 24 hours prior to the flight taking place and it is the responsibility of the aircraft operator to ensure compliance with this requirement. London Military can be contacted on Tel: 01489-612408. If pre-notification is not completed start clearance may be delayed or withheld. All air tests must have a correctly filed flight plan which clearly and unambiguously states the nature and requirements of the flight and must include London Military as one of the addressees. A GAT Flight Plan into and routing along airways for the sole purpose of a flight test IS NOT acceptable. Norwich ATC can provide further information if required.

3 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

4 SPECIAL VFR FLIGHT

a) Clearance may be requested for Special VFR flight within the Norwich Control Zone and will be given whenever the traffic situation permits.
b) Special VFR clearance may include routing and maximum altitude instructions.
c) Pilots are reminded that they must at all times when operating on Special VFR clearance, remain clear of cloud and in sight of the surface and in flight conditions which will enable them to determine their flight path and keep clear of obstacles. Radar vectoring will not normally be applied to aircraft operating on Special VFR clearance.

5 VFR FLIGHTS

a) VFR flights in the CTR/CTAs may be given routing instructions and/or altitude restrictions in order to integrate VFR flights with other traffic.
b) Pilots should anticipate routing instructions in relation to the Visual Reference Points (VRPs) detailed in paragraph 3.
c) Pilots of VFR flights are reminded of the requirement to remain in VMC at all times and to advise ATC if at any time they are unable to comply with the clearances as issued.

6 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside the Norwich controlled airspace within a 20 NM radius of the airport and maintaining a listening watch only on Norwich Radar frequency, 119.355 MHz, are encouraged to select SSR code 7350.
b) Selection of 7350 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Norwich controlled airspace at all times.
c) Whilst squawking 7350, pilots should be aware that Norwich Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 7350 shall be deselected.

EGSH AD 2.23 ADDITIONAL INFORMATION

a) IFR departures will receive departure clearance on taxi. Pilots are requested not to ask for departure instructions prior to taxiing.

NORWICH

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is **1600** in the sector defined by the lateral limits; 524835N 0010905E - 524842N 0012534E thence clockwise by an arc of a circle radius 8NM centred on 524043N 0012542E - 523528N 0013537E - 522436N 0011835E - thence by an arc of a circle radius 16NM centred on 524033N 0011658E - 523015N 0005655E - 524005N 0005609E thence clockwise by an arc of a circle radius 8NM centred on 524035N 0010916E - 524835N 0010905E except, **1900** in the sector defined by the lateral limits; 523309N 0010446E - 523315N 0010457E thence clockwise by an arc of a circle radius 3NM centred on 523106N 0010822E to 522857N 0011147E - 522851N 0011136E thence clockwise by an arc of a circle radius 3NM centred on 523100N 0010811E - 523309N 0010446E.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2000**, or last assigned level if higher, to **NDB(L) NWI**†.

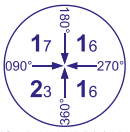
Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) NWI**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. The ATC Surveillance service is provided by Primary and/or Secondary Radar equipment.
7. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
8. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
9. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.



CHANGE (5/26): AD ELEVATION.

EGBN AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Fixed-wing operations are permanently withdrawn. Nottingham City Airport (EGBN) is restricted to helicopter operations only. Runways are not available for fixed-wing use and declared distances do not apply. All helicopter operations shall be conducted in accordance with local procedures.
b) Public Transport or Instructional flights exceeding 2730 KG are not accepted at this aerodrome.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Power cables outside the southern and eastern boundary of ATZ, max elevation 445 FT AMSL. Power cables running northeast/ southwest inside northeast sector of ATZ, max elevation 328 FT AMSL.
b) Model flying club situated approximately 1.9 NM northwest of AD at Nottingham Racecourse. Operating not above 400 FT AGL between 0930-2100 (0830-2000) all week.
c) Permanently based cranes are situated in Nottingham City, with heights up to 400 FT.

5 HELICOPTER OPERATIONS

a) Helicopters shall park on the south apron, adjacent to the Arcus Helicopters hangar.

6 USE OF RUNWAYS

a) Runways are not in use for fixed-wing aircraft. Runway lighting is retained for visual reference only for emergency service helicopters.

7 TRAINING

a) Helicopter Training permitted in grass centre triangle.

EGBN AD 2.21 NOISE ABATEMENT PROCEDURES

a) For noise abatement, join overhead or dead-side only.
b) For noise abatement, a 10 degree right turn after departure from Runway 21 is required to avoid Tollerton Hall and its surrounding properties. The rest of the 21 circuit remains the same.

EGBN AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuit height: 800 FT QFE. (Fixed-wing do not descend below 800 FT. Maintain 200 FT separation from airport based rotary traffic).
b) Helicopter circuit height: 600 FT QFE.

1	AD Administration	Mon-Tue 0900-1600 (0800-1515); Wed 0830-1600 (0715-1615); Thu 0815-1615 (0715-1615); Fri 1015-1600 (0720-1645); Sat 0845-1445 (0745-1615); Sun 1015-1615 (0900-1645); and by arrangement.
2	Customs and immigration	By arrangement. 24 hours notice required.
3	Health and sanitation	-
4	AIS Briefing Office	Internet access during operational hours.
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	Internet access during operational hours.
7	ATS	See AD 2.18.
8	Fuelling	Self-fuel and by arrangement with Oban Airport.
9	Handling	-
10	Security	-
11	De-icing	-
12	Remarks	This aerodrome is PPR.

EGEO AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	-
2	Fuel and oil types	AVGAS 100LL. By arrangement with Oban Airport.
3	Fuelling facilities/capacity	-
4	De-icing facilities	-
5	Hangar space for visiting aircraft	-
6	Repair facilities for visiting aircraft	-
7	Remarks	-

EGEO AD 2.5 PASSENGER FACILITIES

1	Hotels	In the vicinity.
2	Restaurants	Cafes and restaurants in vicinity.
3	Transportation	Taxis, buses with car hire by prior arrangement.
4	Medical facilities	First aid facilities.

5	Bank and Post Office	Most major banks and Po st Office in Oban. Most major banks and Post Office in Oban.
6	Tourist Office	Area Tourist Office in Oban. Tel: 01631-563122
7	Remarks	-

EGEO AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A2 RFF Category A3 available under remission.
2	Rescue equipment	-
3	Capability for removal of disabled aircraft	Limited.
4	Remarks	-

EGEO AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical.
2	Clearance priorities	No Formal Snow Clearing Plan exists at the aerodrome however attempts will be made to make all surfaces available for the movement of Aircraft with the limited resources available.
3	Remarks	Latest information on 01631-572910.

EGEO AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Non radio aircraft must obtain PPR via telephone with ATS prior to flight.
b) Pilots are to contact Oban Information to request start-up clearance.
c) Except whilst in a vehicle or aircraft, high visibility clothing must be worn airside at all times.
d) All Crew/Passengers walking from H1 and H2 are required to use the designated walkway to/from the terminal.
e) Aircraft that do not require the use of a licensed aerodrome and that wish to operate outside the notified hours of operation, must comply with the Argyll and Bute Council Out of Hours Indemnity Scheme. PPR applies to ALL out of hours flights and must be obtained within operating hours, from the aerodrome operator (Argyll and Bute Council, c/o Oban Airport) prior to flight. Details of the scheme and an

application form can be found at: http://www.obanandtheislesairports.com. Pilot information can be obtained from Oban aerodrome, Tel: 01631-572910.

2 GROUND MOVEMENT

a) Marshalling service available on request.
b) Aircrew are advised to use minimum suitable power whilst manoeuvring on the Main Apron, as the front of the terminal building and personnel can be subject to jet blast and prop wash.
c) Fuelling only in designated areas.
d) Follow directional arrows into fuel station parking (yellow hatched area) and only one aircraft at a time.

3 CAT II/III OPERATIONS

Not applicable.

4 WARNINGS

a) No ground signals except light signals.
b) Out of hours helicopter activity by Air Ambulance, Police and Coastguard.
c) Grassed areas are only suitable for use by 'tail wheel' aircraft.
d) During easterly winds, aircraft may encounter wind shear and turbulence on departure and finals.

5 HELICOPTER OPERATIONS

a) All helicopters are expected to make approaches from, and depart to, the west to minimise environmental impact on airport neighbours, unless weather conditions dictate otherwise.
b) Rotors running refuel is only available by prior agreement.

6 USE OF RUNWAYS

Not applicable.

7 TRAINING

a) The use of the airport for training purposes is subject to prior arrangement with Airport Administration, Tel. 01631-572910.

EGEO AD 2.21 NOISE ABATEMENT PROCEDURES

a) Helicopters must avoid overflying the caravan site to the North of the airport.

EGEO AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Runway 01 - left hand circuit only. Runway 19 - right hand circuit only.

EGEO AD 2.23 ADDITIONAL INFORMATION

a) Any proposed new schedule service using Oban Airport shall be subject to prior visit by the pilot in command in order to gain familiarisation with the terrain in the immediate vicinity.

EGSV AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGSV AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Prior Permission (PPR) is required, available online at http://www.oldbuck.com.
b) No weight shift microlights permitted at the aerodrome.
c) No Autogyros permitted at the aerodrome.
d) No helicopters permitted at the aerodrome unless for maintenance.
e) Aerodrome is not licensed for night flying.
f) Aerodrome is not available to non-radio equipped aircraft.

2 GROUND MOVEMENT

a) Pilots and passengers using aircraft parking Area C must use the pick-up point designated on the AIP Chart. No person is permitted to proceed south of the designated area at any time.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Gliding takes place at Tibenham Aerodrome 5 NM to the southeast.
b) Occasional straw stack up to 30 FT AGL, 250 M from Runway 25 threshold.
c) Vehicles may cross the runway at the intersection of runway and perimeter road.
d) Caution Class D airspace at Norwich Airport has been established approximately 5 NM north of Old Buckenham Aerodrome up to FL 50.
e) Aerodrome Obstacle: 25/Approach 07/Take-off, 523108N 0010819E, Radio mast, 884 FT AMSL, lit, 3 NM bearing 068° T from AD.

5 HELICOPTER OPERATIONS

a) Helicopters are only permitted for the purposes of maintenance.

6 USE OF RUNWAYS

a) Grass Runway 07/25 operations must not be simultaneous with Hard Runway 07/25 operations.

7 TRAINING

a) Training Aircraft operate daily and sorties often comprise student solos.

EGSV AD 2.21 NOISE ABATEMENT PROCEDURES

a) Avoid overflying the village of Old Buckenham (1 NM SSW of the AD) and the town of Attleborough (2 NM NW of the aerodrome).
b) Overhead Joins are prohibited except for training approved by the aerodrome management.
c) Ensure familiarity with local circuit diagram at aerodrome website. Detail is also given with Prior Permission (PPR) requests.

EGSV AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuit directions: Runway 07 - LH; Runway 25 - RH. Circuit height: 1000 FT AAL.
b) **Arrivals:**

i. When joining Runway 07 from the west, report at Snetterton Heath;
ii. When joining Runway 25 from the east, report at Tacolneston Mast.

c) **Departures:**

i. When departing from Runway 25, turn onto track 270° until reaching the railway line south of Attleborough;
ii. When departing from Runway 07, maintain runway heading until reaching 1500 FT AAL prior to setting course.

EGSV AD 2.23 ADDITIONAL INFORMATION

Electric Aircraft Charging is available 7 days.

a) Charging requests can be made when applying for Prior Permission (PPR) online at http://www.oldbuck.com.
b) Aircraft types currently serviced:

   i. NUNCATS Zenith CH705;
   ii. Pipistrel Velis Electro.

c) Charging is **not** self service and requires the assistance of trained staff.

EGTH AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGTH AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) PPR via the weblink - https://oldwardenaerodrome.co.uk/ppr-booking-form. Pilots use the aerodrome at their own risk and are required to read and accept the Terms and Conditions. For all other facilities see - https://www.shuttleworth.org.
b) Based operators may fly outside of notified hours.
c) A standard overhead join must be made at 1800 FT AAL.
d) Aircraft operators must transmit their intentions, including standard position reports, when Old Warden Information Service is not operational.

2 GROUND MOVEMENT

a) Do not backtrack runways, vacate the runway to the North West.

b) Aircraft must be parked well clear of the end and sides of Runway 12/30 at the NW end where manoeuvring space is limited.
c) Old Warden Information Service can be visually identified as being operational when a flag is hoisted at the tower.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Avoid overflying Home Farm immediately to the East of the aerodrome.
b) Birds of prey, including kites, in the vicinity.
c) Model aircraft may operate at times.
d) Non-radio aircraft may conduct flight trials or display practise. Visiting pilots must keep a good look out and remain clear until safe to join.
e) **Caution:** Runway 02X/20X extension, unmarked runways, and other unmarked surfaces are not available to aircraft except with approval from the Aerodrome Authority (conditions apply).
f) With moderate and higher wind speeds, pilots should expect to encounter sink/turbulence on the approach to, and climb out from, all runways. Furthermore, pilots are also reminded that in moderate and higher wind speeds the wind gradient close to the surface can result in loss of airspeed and lift during the landing flare. In the past these effects have caught out highly experienced pilots be they flying heavy warbirds, or microlight type aircraft.
g) Trees intersect the 20 approach and 02 climb out.

5 HELICOPTER OPERATIONS

a) Helicopters must land airside of spectator fence and join as per fixed wing operations.

6 USE OF RUNWAYS

a) Only Runway 02/20 is available to visiting aircraft. Other runways may be in use by based aircraft conducting test flights or practise display.
b) 02X/20X only available with approval of Aerodrome Authority (conditions apply).

7 TRAINING

a) No training permitted except with the written permission of the Aerodrome Authority.

EGTH AD 2.21 NOISE ABATEMENT PROCEDURES

a) Pilots should avoid overflight of all local villages where possible.

EGTH AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuit Height: 800 FT.
b) Circuit Direction: Runway 20 LH, Runway 02 RH.
c) All aircraft to make a full overhead join at 1800 FT AAL to allow any model flying to cease.

4	VOR checkpoints	-
5	INS checkpoints	See Aircraft Parking/Docking Chart.
6	Remarks	Movements beyond hold Juliet maybe subject to Marshaller's instructions. Taxiway Foxtrot is one way and only available for use to vacate the runway. Main Apron South (Stands 1-20) and Taxiway Foxtrot max wingspan 12 M due taxilane reduced wing tip clearance.

EGTK AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Stands 1-20 are self park. Parking on other areas of the apron will be marshalled including Stand 25.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 01/19: Threshold, centre-line, aiming point, touchdown zone. Runway light(s): All lighting LED. Taxiway marking aid(s): Yellow centre-line. Blue edge reflector markers. Taxiway light(s): Blue edge lighting on taxiway Alpha, Bravo, Charlie and Delta.
3	Stop bars and runway guard lights (if any)	All holding points for Runway 01/19, except Holding Point G. Stop bars illuminated during AD hours.
4	Other runway protection measures	-
5	Remarks	3 WDIs for Runway 01/19: 515002.44N 0011921.95W (LGTD); 515021.78N 0011915.28W (LGTD); and 515013.40N 0011933.64W (LGTD).

EGTK AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Aircraft operators must obtain, accept and operate in accordance with the London Oxford Airport 'Terms and Conditions of Use', available at www.oxfordairport.co.uk.
b) Non-radio aircraft must contact ATC to obtain prior permission and joining/departure briefing. Tel: 01865-290650.
c) A Grass Compass base. Located to the North East of Heli Hold Point N.
d) Passenger embarkation or disembarkation with engines running is prohibited.
e) High visibility clothing must be worn on all aprons, except for escorted passengers.
f) When the RVR is below 400 M departures are not permitted unless AOC holders have less restrictive State authorised take-off minima. Take-off will not be permitted if the RVR is less than 350 M.

2 GROUND MOVEMENT

a) Maintenance areas have restricted access (specified in terms and conditions of use). Operators must liaise with Oxford Operations to arrange parking, hangarage, if taxiing is permitted or towing required. Maintenance areas are not visible to ATC. Pilots of aircraft taxiing in these areas are solely responsible for the avoidance of collisions with aircraft, vehicles and other obstructions.
b) Compass swing bay, Class 1, Located at the end of Delta taxiway.
c) Data Link service available via ARINC.
d) Due to their tactical nature, departure instructions are not normally available until after the aircraft has taxied.
e) Jet Aircraft operating under their own power, larger than code B, are not permitted to use the taxiway link at Juliet to MA 1 or MA 2. Aircraft are to be parked on the main apron and towed as required.
f) Only single and twin piston aircraft are permitted to taxi under their own power beyond holding point Kilo at their discretion provided their wingspan does not exceed 15 M. All other aircraft will be towed to/from the main apron.

g) Piston aircraft are to perform pre-departure engine runs on Taxiway Alpha (Runway 01 in use) or in the designated run-up area on Taxiway Charlie east of holding point C3 (Runway 19 in use). Aircraft using the Taxiway Charlie run-up area are to pass other running aircraft on the south side of the taxiway then perform their checks on the north side of the taxiway, leaving sufficient space for another aircraft to pass.
h) All Jet and Turbo-prop maintenance ground runs are to be conducted on the Delta Compass Base. Other locations may be utilised for piston aircraft at ATC discretion. All maintenance ground runs must be booked with Airport Operations.
i) All aircraft operating on the Main Apron are reminded to use minimum power when manoeuvring.

3 CAT II/III OPERATIONS

a) Oxford is not equipped for Cat II/III operations, however LVPs are used to protect Cat I operations.
b) LVPs commence when the reported meteorological visibility is less than 550 M. A follow me vehicle may be provided as instructed by ATC.

4 WARNINGS

a) EGD129 is notified as active SR-SS Mon-Fri plus other HR as notified by NOTAM. It is located 4.5 NM northeast of the aerodrome. Tactical activity details are available from Oxford ATC upon request. A SUA Crossing Service is available from Oxford Approach/Radar on Channel 125.090.
b) Brize Norton CAS:

   i. Due to the possibility that departures from Runway 19 may penetrate the Brize Norton CTR, deviation from the departure clearance is not permitted unless safety is likely to be compromised.
   ii. Departures must remain outside the Brize Norton CTR unless cleared to transit. Seek confirmation from Oxford ATC if required.

c) Power cables 316 FT AMSL at 860 M north of Runway 19 threshold.
d) Caution: Abingdon aerodrome situated 8 NM south of Oxford has a similar runway configuration.
e) Caution: Oxford Airport is situated within the Oxford Area of Intense Aerial Activity.

5 HELICOPTER OPERATIONS

a) Standard Arrival: Enter via the fixed wing circuit unless otherwise instructed by ATC, route to the runway or Heli Area 1 as directed.
b) Standard Departure: Helicopters may depart parallel to the runway or as directed by ATC.
c) Except when using the runway, take-off and landing clearances will be appended “at your discretion”. Caution fixed obstacles on all grass manoeuvring areas and free-ranging vehicles which are operating on their own lookout.
d) Heli Area 1 is the grass manoeuvring area west of Runway 01/19 and south of Taxiway Delta.

   i. Heli Area 1 may be used by multiple helicopters simultaneously for: departure, arrival, low-level handling and circuits.
   ii. Arrivals and departures via Heli Area 1 must not overfly the buildings immediately north-west and south-west of the aerodrome.
   iii. Helicopter circuits may be flown from Heli Area 1. Circuits are left hand (Runway 01 in use) or right hand (Runway 19 in use) at 1000 FT QNH. Upon departure from Heli Area 1 all circuit aircraft are to climb parallel with the runway heading until passing 500 FT AGL.
   iv. Circuits in Heli Area 1 are not available at night and are instead to be flown to the runway.

e) Helipad 1, 2 & 3 are restricted to helicopters maximum 17D.
f) Helipad 4, 5, 6 & 7 are restricted to helicopters maximum 14D.
g) Helipads 21-28 are operated by Airbus Helicopters UK.
h) Helipad 21, 24, 25, 26 & 27 are restricted to helicopters maximum 18D.
i) Helipad 22 & 23 are restricted to helicopters maximum 16D.
j) Helipad 28 is restricted to helicopters maximum 20D.
k) Pilots operating to/from Airbus Helicopters UK must contact Airbus on 01865-852400 to book in, be allocated a helipad and receive a pilot briefing. This is due to specific operating procedures being in place.
l) Some helipads have low ambient light levels and no edge lighting. Pilots are to proceed with caution and land at their discretion at night.

6 USE OF RUNWAYS

a) Runway Occupancy

   i. Departures: Pilots must be ready for immediate departure before lining up. If unable, pilots must inform ATC prior to line up.
   ii. Landing: Due to limited runway exits all pilots must spend ’minimum time on the runway’ and vacate without delay to expedite traffic flow.

b) Runway 19 will be selected as the runway in use with up to a 5 KT tailwind. Requests for runway 01 must be made to ATC as early as possible.
c) Controllers may issue a ’land after’ instruction. Pilots unable to accept, must inform ATC and await a full landing clearance, or initiate a go around.

7 TRAINING

a) Instrument approaches and circuit training slots can be requested on the day (not less than 15 MIN notice) via ATC (01865-290650).
b) All training flights must be booked prior to departure. Non-adherence to slot times may result in refusal of flight.

EGTK AD 2.21 NOISE ABATEMENT PROCEDURES

a) Pilots are to avoid overflying the surrounding residential areas, including Blenheim Palace, except where there is an overriding training or flight safety requirement.
b) After departing from Runway 01, climb ahead to 1000 FT QNH or 1.0 DME I OXF, whichever is the earliest, before turning on course. Pilots carrying out visual departures should endeavour to complete this turn before reaching the Mercury Satellite Station (at 1.5 NM). When turning right, pilots are to avoid overflying the village of Shipton-on-Cherwell.
c) After departing from Runway 19, climb straight ahead to 1000 FT QNH or 1 DME I OXF, whichever is the earliest, before turning right. Aircraft intending to turn left, climb ahead to 1.5 DME I OXF (IFR) or until south of Yarnton Village (VFR), remaining clear, in all cases, of the Brize Norton CTR.
d) Whenever possible aircraft joining the circuit should, subject to ATC approval, plan to join on a base leg, giving way to traffic already established in the circuit. Straight in approaches are to be co-ordinated with ATC by no later than 10 NM so as not to conflict with published instrument final approach tracks.
e) Helicopter traffic is subject to standard arrival and departure procedures and routes.
f) Oxford Airport operates a noise amelioration scheme. A copy is available from Airport Operations.
g) Additional guidance and circuit diagrams are available on the Oxford Airport Website: https://www.oxfordairport.co.uk/noise-abatement/.

EGTK AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) The fixed wing circuit level is 1500 FT (QNH), 1200 FT (QFE).
b) The helicopter circuit level is 1000 FT (QNH), 700 FT (QFE) by day and 1300 FT (QNH), 1000 FT (QFE) by night.
c) Standard fixed wing circuit direction: Runway 01 - right hand, Runway 19 - left hand.
d) Rotary circuits are opposite direction to fixed wing.
e) Low-level circuits subject to ATC approval, not below 900 FT (QNH), 600 FT (QFE).
f) Additional guidance and circuit diagrams are available on the Oxford Airport Website: https://www.oxfordairport.co.uk/noise-abatement/.

2 DEPARTURES/ARRIVALS

a) STANDARD VFR DEPARTURE: VFR traffic shall squawk 4520, and must not fly above 2000 FT (QNH) until passing 5 NM from the aerodrome, unless otherwise instructed.
b) STANDARD VFR ARRIVAL: Inbound traffic is to make contact with Oxford Approach/Radar no later than 10 NM from Oxford and are to fly not above altitude 1500 FT (QNH) whilst within 5 NM of the aerodrome.
c) IFR departures and arrivals will be issued with specific routing instructions by ATC.
d) IFR DEPARTURES joining the airway structure are required to flight plan the following initial routes:

Direction	Route
North	IXURA - DTY - SAPCO
East	IXURA - DTY
South (RFL FL 195+)	IXURA - NANUM - BUGUP - EVSEM - CPT
South (RFL FL 195-)	BUGUP - KENET
West (RFL FL 105+)	CONKO
West (RFL FL 105-)	BADIM
London TMA	SILVA
EGLL / EGWU	WEZKO

e) IFR arrivals from outside CAS are to plan via the NDB OX.
f) IFR ARRIVALS via the airway structure are to flight plan via:

Direction	Route
North	HON / PEPUL - BUGUP - OX
East	CPT / KENET - BUGUP - OX
South	CPT / KENET - BUGUP - OX
West	CONKO - OX

g) RUNWAY 01 ARRIVALS: The final approach track to Runway 01 transits Brize Norton CAS and is subject to approval from Brize ATC. Pilots must not plan or expect a no delay straight in approach to Runway 01 due to the requirement to co-ordinate with and deconflict from Brize Norton traffic. All approaches to Runway 01 will be as directed by ATC.

3 ATS SERVICE PROVISION

a) IFR/VFR arrivals operating outside CAS must establish two-way contact with Oxford Approach/Radar no later than 10 MIN flying time or 10 NM range from Oxford.

b) Departing aircraft should inform ATC prior to being airborne which ATC service they will be requesting on departure (deconfliction, traffic, procedural or basic, as appropriate for their requirements).
c) Arriving aircraft should state on first contact what type of service they require (deconfliction, traffic, procedural or basic, as appropriate). Aircraft requiring a deconfliction service may incur delays during the promulgated radar hours due to intense GA and glider flying within the vicinity of the aerodrome.
d) **During Hours of Radar Operation**

i. VFR departures and arrivals will normally be provided with Basic Service unless another type of service is requested. Departures requesting radar services are to make this request on the ground before departure.
ii. IFR departures and arrivals will normally be provided with surveillance services in so far as practical. Departures and arrivals are to state requested service on first contact with Oxford Radar.

e) **Hours of Radar Closure**

i. VFR departures and arrivals will be provided with Basic Service.
ii. IFR departures and arrivals will be provided with Procedural Service. Pilots are reminded that delays may be expected in order to separate from other IFR flights.

f) **Air Tests**

i. Operators wishing to perform an air test inside CAS receiving a service from Swanwick (Mil) (off the main ATS structure) should follow the notification procedure in ENR 1.1, Section 4.8. Oxford ATC must be notified on booking out that this process has been completed.
ii. Operators wishing to perform an air test inside CAS (using the main ATS structure) should follow the notification procedure in ENR 1.1, Section 4.9. Oxford ATC must be notified on booking out that this process has been completed.
iii. Operators wishing to perform an air test outside CAS should notify Oxford ATS on booking out of an ATS provider and any prior arrangements made. ATS provision must be requested at least 2 hours before EOBT and is subject to controller workload and capacity.

4 INSTRUMENT APPROACH PROCEDURES

a) CAUTION: Instrument Approach Procedures (IAP) for Oxford are established outside controlled airspace. See ENR 1.5.
b) Auto-coupled approaches are not permitted.
c) Pilots may experience glidepath fluctuations within 1.0 DME IOXF.

5 FREQUENCY MONITORING CODE (FMC)

a) During the hours of Oxford Radar operation, pilots operating in the vicinity of Oxford Airport within the area defined by the following points and maintaining a listening watch only on Oxford Radar frequency, 125.090 MHz, are encouraged to select SSR code 4517.

514352N 0010616W - 514149N 0005911W
thence anti-clockwise by the arc of a circle radius 15 NM centred on 515013N 0011912W to
513530N 0012344W
thence clockwise by the arc of a circle radius 30 NM centred on 511631N 0004639W to
514352N 0010616W.

b) Selection of 4517 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of controlled airspace at all times.
c) Whilst squawking 4517 pilots should be aware that Oxford Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 4517 shall be deselected.
e) Pilots operating in this area but within 5 NM of the edge of the Brize Norton CTR may choose to maintain a listening watch on Brize Radar (LARS) on channel, 124.280 and select SSR code 3727.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1358
HEIGHTS IN FEET AGL (800)

OXFORD

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **1800** in the sector defined by the lateral limits; 520053N 0012642W thence clockwise by an arc of a circle radius 8NM centred on 515508N 0011742W to 515338N 0010500W - 514850N 0010630W thence anticlockwise by an arc of a circle radius 3NM centred on 514726N 0011045W to 514509N 0010738W - 514349N 0010803W thence clockwise by an arc of a circle radius 8NM centred on 514519N 0012041W to 513922N 0011205W thence anticlockwise by an arc of a circle radius 3NM centred on 513720N 0011537W to 513720N 0012025W thence clockwise by an arc of a circle radius 8NM centred on 514519N 0012041W to 514647N 0013321W - 515622N 0013029W thence anticlockwise by an arc of a circle radius 3NM centred on 515723N 0012555W to 520004N 0012344W - 520053N 0012642W.

b) **2000** in the sector defined by the lateral limits; 514850N 0010630W - 514509N 0010738W thence clockwise by an arc of a circle radius 3NM centred on 514726N 0011045W to 514850N 0010630W.

c) **1900** in the sector defined by the lateral limits; 513720N 0012025W thence clockwise by an arc of a circle radius 3NM centred on 513720N 0011537W to 513922N 0011205W thence clockwise by an arc of a circle radius 8NM centred on 514519N 0012041W to 513720N 0012025W .

d) **1900** in the sector defined by the lateral limits; 520053N 0012642W - 520004N 0012344W thence clockwise by an arc of a circle radius 3NM centred on 515723N 0012555W to 515622N 0013029W - 515636N 0013024W thence clockwise by an arc of a circle radius 8NM centred on 515508N 0011742W to 520053N 0012642W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and
b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

LOSS OF COMMUNICATION PROCEDURES

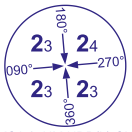
Initial Approach Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2200**, or last assigned level if higher, to **NDB(L)DME OX**†.

Intermediate and Final Approach Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L)DME OX**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of OX NDB.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart should only be used for the cross-checking of assigned altitudes whilst in receipt of an ATC Surveillance service.**



CHANGE (3/26): EGD218A VERTICAL LIMITS REVISED.

EGEP AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All GA aircraft must park only on the clearly designated grass GA APRON. GA aircraft must not park on the main tarmac apron.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Visiting pilots should note that during periods of prolonged rainfall the grass runway can become very soft especially during the winter months.
b) **Runway 03/21:** Graded hardcore runway is generally unsuitable for light aircraft with low ground/propeller clearance due to unstabilised surface and as a result it would be advisable to carry out any power checks on the tarmac apron before departure.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

a) While arriving or departing from Runway 03 for approximately 90 M, the 21 threshold is not visible and when arriving or departing Runway 21 for approximately 350 M the 03 threshold is not visible.

7 TRAINING

Not applicable

EGEP AD 2.21 NOISE ABATEMENT PROCEDURES

Not applicable

EGEP AD 2.22 FLIGHT PROCEDURES

a) RTF contact with Kirkwall (EGPA) recommended.

4	VOR checkpoints	-
5	INS checkpoints	See Aircraft Parking/Docking Chart.
6	Remarks	-

EGPK AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	All parking on aprons A and B is under marshaller's guidance. Aircrews are to note that the Stand Entry Guidance (SEG) is activated by Airline and Handling Agent staff. Aircrew should not enter the stand unless the AGNIS is illuminated or if advised that it is unserviceable, under marshaller's guidance only. An emergency stop sign has also been installed on all SEG equipped stands. When activated an electronic flashing 'STOP' warning sign is illuminated. Aircraft must not enter the stand under any circumstances until the sign has been switched off.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 02/20: Runway 02: Runway designation, runway threshold, runway centre-line and strip markings. Runway 20: Runway designation, runway threshold, runway centre-line and strip markings. Revised ICAO aiming point and touchdown zone markings. 12/30: Runway designation, runway threshold, runway centre-line and strip markings. Revised ICAO aiming point and touchdown zone markings. Runway light(s): 02: Runway guard lights, runway edge, threshold and wing bars, runway end. 20: Runway guard lights, runway edge, threshold and wing bars, runway end, stopway. 12/30: Runway guard lights (LED), colour coded runway centre-line, runway edge, threshold and wing bars, runway end (LED). Taxiway marking aid(s): Yellow taxiway centre-line, taxiway holding position, runway ahead markings. Enhanced taxiway centre-line markings approaching Romeo 1. Taxiway light(s): Green centre-line LED lights, blue edge lights on turns, blue retro/reflective edge markings/studs.
3	Stop bars and runway guard lights (if any)	At Holds; J, K, Q (LED), R1 (LED), S, W and Y.
4	Other runway protection measures	-
5	Remarks	WDI (LGTD): 553038.45N 0043505.08W; 553056.94N 0043632.72W; 552919.19N 0043507.01W; 553006.29N 0043445.98W. Standard apron markings.

EGPK AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Pilots are to 'book-out' by telephoning ATC.
b) Traffic flow management of inbound, outbound and local aircraft may be applied without notice.
c) Aircraft with tail skids will not be permitted to use the aerodrome without first having been fitted with some form of wheel to prevent surface damage.
d) The wearing of high visibility clothing is mandatory by all personnel working on airside areas.
e) Fixed Electrical Ground Power must be used wherever available and serviceable. Use of GPU and APU should be limited to minimise environmental impact.
f) Pilots of international arriving or departing GA aircraft are responsible for presenting their passengers to UK Border Force. Transport to and from the UK Border should be arranged with the Handling Agent.
g) Aprons A & B are subject to security restrictions and searches.

2 GROUND MOVEMENT

a) Holding positions are indicated at night by a row of red lights across the taxiway. Aircraft are not permitted to proceed on to the runway unless these lights have been extinguished or permission has been given by ATC.
b) To prevent soil erosion by jet blast, an area contiguous with the beginning of Runway 30 has been concreted. This area is not load bearing and aircraft should not be taxied across it during line up for take-off. A hatched area separates this area from the runway.
c) ATC taxiing instructions should be strictly observed.
d) Link November has a reduced width of 16 M and is only available for aircraft up to and including Code B size.
e) Only marked taxiways to be used.
f) The arrangement of the Terminal apron, piers, stand numbers, nose wheel guide lines and alignment bars are shown at AD 2-EGPK-2-2.
g) The taxiway Route to/from Spirit Aero systems and HMS Gannet is via Link Tango.
h) Holding Point M is available to aircraft up to code F. During hours of darkness and low visibility all aircraft must use a follow me vehicle.
i) The first 100 M of paved surface from Runway 30 threshold has been marked to provide 50 M width for large aircraft turning. All turns must be executed in a clockwise direction. Concrete outside the runway edge markings is unfit for the movement of aircraft. Any pilot who may require marshaller assistance is to advise ATC before taxi.
j) Commanders of wide-bodied aircraft are reminded that minimum power only should be applied on Taxiway Juliet, particularly when entering the runway via holding point Juliet.
k) Aircraft that require starting by manual swinging of propellers are only permitted to undertake engine starting as a two person operation. An assistant familiar with manual swinging of propellers must be present in addition to the pilot in command and both persons must carry out the operation in a safe manner.
l) Link R1 is a dual holding point. Aircraft will be held parallel to Runway 30, when instructed by ATC access is via Runway 20.
m) Due to limited line of sight of certain parts of the manoeuvring area, such as Aprons A, B, G & H and the Southwestern section of Taxiway S south of holding point W, ATC may request additional position reports. Pilots should maintain a good lookout in these areas.
n) Taxiway R east of holding point R1 to holding point R2 has reduced separation of 167 M from Runway 12/30 centreline. ATC will hold aircraft at holding point R2 as required in accordance with local procedures.

3 CAT II/III OPERATIONS

Not Applicable

4 WARNINGS

a) Except for light signals, ground signals are not displayed.
b) Aircraft carrying out circuits on Runway 02/20 are warned of rising ground to the Northeast.
c) Pilots are advised that bird numbers have been assessed as ‘severe’ during migratory periods (Oct/Nov and Mar/Apr). During Spring and Autumn, bird concentrations may be present on surrounding agricultural land. Active dispersal methods are employed within the Airport's boundaries. This will be the subject of a NOTAM.
d) Because of the extreme width of the concrete/asphalt surface forming Runway 12/30 (92 M) paved shoulders extend 23 M beyond each side of the runway. In certain conditions (poor visibility and at night) the edge lights may be mistaken for the centre-line (albeit the edge lights are raised and the centre-line lights are flush mounted). Pilots of departing aircraft should exercise extreme caution when lining up on the centre-line of the runway in such circumstances.
e) When visibility is less than 800 M, Low Visibility Procedures will be applied. Pilots will be informed by RTF or ATIS. Pilots are advised that these procedures can cause delays for inbound and outbound traffic.
f) When RVR is less than 600 M, only one aircraft movement is permitted at a time on the manoeuvring area.
g) The maximum reportable RVR value for Runway 30 is 1400 M.
h) Caution Runway Incursion Prevention. Dual runway hold at Runway 02/20. Pilots are to adhere to ATC instructions / information and relevant ground markings at all times. See Aerodrome charts for hotspot location.
i) Grass Cutting - Consequent upon the implementation of the long grass programme relating to the control of birds, the following will be introduced:

   Grass cutting may take place on a daily basis between April and October inclusive within the strip enclosing Runways 12/30 and 02/20.

j) Deer hazard, aircrews to report any sightings to ATC.
k) Low level mechanical turbulence due to terrain and the presence of buildings on short final for all runways can affect the wind, resulting in the reported wind speed sometimes being lower than that experienced by pilots.

5 HELICOPTER OPERATIONS

a) Civil helicopters operating to Prestwick will normally be allocated to Apron G or H. Such helicopters are to operate to/from Aprons G and H by approaching to/from the aiming point marked on Runway 12/30 between Links M and N.
b) Military helicopters may operate directly to and from Apron C, subject to ATC permission.
c) At ATC discretion, the thresholds of Runways 12/30 and 02/20 may also be used as aiming points.
d) Helicopters may ‘air’ or ‘ground’ taxi between the aiming point and the designated parking area, including the military parking circles. Due to the surface condition of Apron C, only marked designated taxiway routes should be used.

6 USE OF RUNWAYS

a) Runway surface conditions are reported in accordance with the Global Reporting Format.

7 TRAINING

a) Aircraft training slots are to be requested from ATC: 01292-511107.

b) The use of the airport for circuit and instrument training purposes is subject to the prior arrangement with ATC operations, Tel: 01292-511107.
c) ATC must be advised of any cancellations. Any training slot delayed by 30 minutes or more will be deemed to have been cancelled and the slot re-negotiated.
d) Failure to cancel a booked slot may result in cancellation charges.
e) The filing of a flight plan for a training slot does not imply acceptance.
f) Asymmetric flight must not be carried out without ATC permission.
g) From 1900-0800 (1800-0700) jet circuit training is not available due to noise abatement. Non jet aircraft may be accepted subject to PPR.
h) No training will be accepted on Tuesdays between 0800-1200 (0700-1100) due to essential airfield maintenance.

EGPK AD 2.21 NOISE ABATEMENT PROCEDURES

1 NOISE PREFERENTIAL PROCEDURES

a) Operators of all aircraft using the airport should ensure that at all times their aircraft conform to the noise abatement techniques laid down for that type of aircraft and that operations are conducted in a manner calculated to cause the least disturbance practicable in areas surrounding the aerodrome.
b) These requirements may at any time be departed from, to the extent necessary, for avoiding immediate danger and for complying with the instructions of ATC.
c) All aircraft using the aerodrome shall maintain as high an altitude as practicable.
d) Aircraft using the ILS in IMC or VMC shall not descend below 2000 FT before intercepting the glidepath unless directed by radar, nor thereafter fly below it. An Aircraft approaching without assistance from ILS or radar shall follow a descent path which will not result in its being lower than the approach path which would be followed by an aircraft using the ILS glidepath.
e) All airline crew training circuits shall be flown at a height of at least 1500 FT AAL. In other respects training aircraft shall comply with the procedures and routeings detailed in this notice together with procedures laid down by GPA Ltd with regard to training circuits.
f) Noise from ground running of aircraft engines is controlled in accordance with instructions issued by GPA Ltd.

2 NOISE PREFERENTIAL ROUTES

a) The Noise Preferential Routes (NPR) specified below are compatible with ATC requirements and shall apply in both IMC and VMC.
b) The tracks are to be flown by all departing jet aircraft and by all other aircraft of more than 12,500 KG MTWA unless otherwise instructed by ATC or unless deviations are required in the interests of safety.

Departure Runway	NPR
12	Climb straight ahead until passing DME I-PP or I-KK 4, or until passing 3000 FT ALT.
30	Climb straight ahead and after passing DME I-PP or I-KK 1.0 turn left onto track not North of 288°M until passing 3000 FT ALT.

c) The following NPR's will apply to circuit training as follows:

Departure Runway	NPR
12	Climb straight ahead until 1500 FT HGT / 1600 FT ALT before turning left or right into the circuit.
30	Climb straight ahead and after passing DME I-PP or I-KK 1.0 turn left onto track 288°M until 1500 FT HGT or 1600 FT ALT before turning left or right into the circuit.

3 VISUAL CIRCUITS

a) Aircraft carrying out right hand visual circuits on Runway 30 should avoid overflying Troon.

EGPK AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT

a) The Standard Arrival Routes for arrivals from the ATS route system are as follows, and are detailed at AD 2-EGPK-7-1

Approach from	Via	Route
Southeast and South	N601/UN601, UN590	ASLIB - ENIPI - direct TRN For Runway 30 arrivals, tactical routing to SUMIN may be given.
Southwest	P600	BLACA - P600 - TRN

b) Arrival routes from all other directions are as follows:

Approach from	Via	Route
North and Northeast	P600	Direct to TRN or SUMIN REP by Scottish ACC, or transferred to Glasgow Approach for transit of the Glasgow CTR/CTA and/or Scottish TMA.
East	Y96	Tactical routing to TRN or SUMIN by Scottish ACC.
West and Northwest	N562	Routed direct to TRN by Scottish ACC.

c) Inbound aircraft other than from the Airways Route Structure:

i. Aircraft wishing to enter the CTR or CTA under IFR direct from the FIR must observe the normal procedure for joining Controlled Airspace.
ii. Pilots inbound to Prestwick under VFR must contact Prestwick Approach Control and request clearance to enter the Prestwick CTR/CTA at least 10 minutes before reaching the CTR/CTA boundary. VFR and Special VFR aircraft will usually be instructed to route either via one of the designated VFR routes or via Visual Reference Points (see paragraphs 5 to 8).

d) Aircraft routing inbound from other Scottish TMA airfields will be cleared the PIK NDB not below the MSA.
e) Approach Procedures with Radar Control

i. When Prestwick inbound traffic is being sequenced by radar, the Approach Procedures will be flown under directions from the Approach Radar Controller and will consist of that part of the approach between the Terminal Holding Fix and the Final Approach Path. When holding procedures are not in use, radar sequencing may commence before the Terminal Holding Fix.
ii. Pilots should plan their flight profile in such a manner as to be able to achieve the Minimum Holding Level at the appropriate holding point if so required.
iii. When an aircraft is under Approach Radar Control, changes of heading or Flight Level/Altitude will be made only on instructions from the Radar Controller except in the case of radio communication failure in the aircraft or at the Radar Unit.
iv. Headings and Flight Levels/Altitudes at which to leave the holding areas will be passed by ATC. Radar vectors will be given and descent clearance will include an estimate of track distance to touchdown. Further distance information will be given between the initial descent clearance and intercept heading to the ILS.
v. Speed Control may be applied on a tactical basis to aircraft whilst radar sequencing is in progress. Aircraft unable to comply with requested speeds should inform the radar controller immediately and state what speeds will be used. In the interests of accurate spacing, pilots are requested to comply with speed adjustments as promptly as is feasible within their own operational constraints, and should advise ATC if circumstances necessitate a change of speed for aircraft performance reasons.
vi. In the event of a radar failure, new instructions will be issued to aircraft under Radar Control and the procedures as defined for approach without Radar Control will be put in effect.

f) Approach Procedures without Radar Control

When inbound traffic is not being sequenced by radar, aircraft will normally be cleared to either TRN VOR, SUMIN REP or PIK NDB in order to carry out an Instrument Approach Procedure appropriate to the landing direction.

2 RADIO COMMUNICATIONS FAILURE PROCEDURES

a) In the event of complete radio communication failure, pilots are to adopt the appropriate national basic procedures notified at ENR 1.1.3.
b) When leaving the CTR in accordance with national basic procedures, aircraft are to track 180° TRUE from the PIK NDB at 4000 FT ALT until clear of the Prestwick CTR Boundary.

3 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Standard Instrument Departures from Prestwick are as follows (see AD 2-EGPK-6-1/2):

- P600 via TRN
- N560 via TRN to GOW
- L602 via TRN to GOW
- UL612 North via TRN to GOW
- T256/UT256 departing Runway 30, LUCCO Z248 OSMEG T256 DCS
- T256/UT256 departing Runway 12, SUDBY Z249 OSMEG T256 DCS
- Y96 departing Runway 30, LUCCO Z250 HAVEN
- Y96 departing Runway 12, SUMIN Z250 HAVEN
- N562 departing Runway 30, DAUNT Z246 HERON
- N562 departing Runway 12, AKODA Z247 HERON

b) North Atlantic Departures.

i. Due to the proximity of the Shanwick Oceanic boundary to Prestwick, pilots of jet aircraft planned to enter Shanwick airspace at GOMUP and ETILO should contact Shanwick CDO prior to departure. On all other oceanic routes an 'RCL' can be submitted after the aircraft is airborne. ENR 2.2, paragraph 3.8.2 refers.
ii. When TRA 008 (ENR 5.2 and ENR 6-13) is active, aircraft entering Shanwick/Reykjavik airspace at ETILO, ERAKA, ADODO, BALIX, ORTAV, ATSIX, LUSEN or RATSU should file via TRN GOW.

4 SPEED LIMIT

a) A speed limitation of 250 KT applies to all departures whilst flying below FL 100 except when a request has been approved and exceptional circumstances require its removal.

5 VFR FLIGHTS

a) VFR flights in the Control Zone will be given routing instructions and/or altitude restrictions in order to integrate VFR flights with other traffic.
b) Pilots should anticipate routing instructions via the routes detailed in paragraph 7 or the Visual Reference Points detailed in paragraph 9.
c) Pilots of VFR flights are required to remain in VMC at all times and to comply with the relevant Rules of the Air Regulations 2015, and must advise ATC if at any times they are unable to comply with the instructions given.

6 SPECIAL VFR FLIGHTS

a) Clearance may be requested for Special VFR flight in IMC or at night within the Prestwick Control Zone and will be given whenever the traffic situation permits. These flights are subject to the general provisions laid down for Special VFR flights.
b) Special VFR clearances will include routing and maximum altitude instructions and may not necessarily be confined to the entry/exit lanes detailed at paragraph 7. Pilots holding a Private Pilots Licence (Aeroplanes) are reminded of the visibility requirements of Special VFR flights laid down in Schedule 7 of the Air Navigation Order 2009 and the related notification at ENR 1-4-6 note 4, which may require them to request routing via the notified Entry/Exit Lanes.
c) Pilots are reminded that they must at all times, when operating on a Special VFR clearance, remain clear of cloud and in sight of the surface and in flight conditions which will enable them to determine their flight path and keep clear of obstacles. Due to the nature of the terrain in the vicinity of Prestwick Airport, radar vectoring will not normally be applied to aircraft operating in accordance with a Special VFR clearance.
d) Pilots are reminded that a Special VFR clearance applies only to flight within the Prestwick Control Zone and does not extend to flight within the surrounding airspace of the Prestwick Control Area or Scottish Terminal Control Area.
e) Special VFR clearances will not normally be granted for flights operating in VMC or for flights by aircraft exceeding 5700 KG MTWA.

7 ENTRY/EXIT LANES

a) The following entry/exit lanes are notified for the purposes of Schedule 7 of the Air Navigation Order 2009, Part A, Private Pilots Licence (Aeroplanes), sub-para 2 (c) (ii) to permit aircraft to operate to and from Prestwick Airport in IMC under the conditions stated, as follows:

i.
1. A lane 3 NM wide, with centre-line from Irvine Harbour VRP (a point on the northern Prestwick CTR boundary), thence southeast along the coast to Barassie, then along the railway line to the point at which it joins the Prestwick Aerodrome Traffic Zone;
2. A lane 3 NM wide, with centre-line from Doonfoot (Millennium Bridge) VRP (a point on the southern Prestwick CTR boundary), thence northeast along the coast to the point at which it joins the Prestwick Aerodrome Traffic Zone.

ii. Use of the lanes is subject to clearance by Prestwick ATC and the carriage of the Prestwick Approach Control frequency.
iii. Aircraft using the lanes must remain clear of cloud and in sight of the surface, not above 3000 FT (Prestwick QNH), and in flight visibility of not less than 3 KM.
iv. An aircraft using a lane shall keep the centre-line on its left, unless otherwise instructed by ATC for separation purposes. In these circumstances ATC will pass traffic information to the aircraft concerned.
v. Pilots of aircraft are responsible for maintaining adequate clearance from the surface or other obstacles.

b) Additionally, to permit the effective integration of traffic, flights operating under VFR may be required by ATC to follow these routes as detailed in paragraph 5.

8 MICROLIGHT AND MODEL AIRCRAFT OPERATIONS IN THE PRESTWICK CONTROL ZONE

a) Model aircraft operations take place at Auchens, 553453N 0043653W, up to 1000 FT AGL during daylight hours. Operations at Auchens above 400 FT AGL will be advised by ATC. For further information on operations at Auchens, contact 07828-160896.
b) Weight shift/flex wing microlights are not allowed to use the aerodrome unless in emergency. Limited numbers of three-axis microlights may be permitted with prior permission from the aerodrome operator.

9 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

10 OMNI-DIRECTIONAL DEPARTURES

Omni-directional Departures		
Runway	**Description**	**Restrictions**
12	Climb straight ahead MAG track 124° to 740 FT then turn on track climbing to enroute safety altitude/MSA. PDG 3.8% to 740 FT then 3.3% after turn.	Close-in obstacles exist. See Aerodrome Obstacle Chart and EGPK AD 2.10 Aerodrome Obstacles. This procedure does not take account of noise abatement procedures which may require additional manoeuvres once above the initial altitude and climbing. See EGPK AD 2.21 for Noise Abatement Procedures.

Omni-directional Departures		
Runway	**Description**	**Restrictions**
20	Climb straight ahead MAG track 206° to 1350 FT then turn on track climbing to enroute safety altitude/MSA. PDG 3.7% to 1350 FT then 3.3% after turn.	Close-in obstacles exist. See Aerodrome Obstacle Chart and EGPK AD 2.10 Aerodrome Obstacles.
30	Climb straight ahead MAG track 304° to 570 FT then turn on track climbing to enroute safety altitude/MSA. PDG 3.3%.	Close-in obstacles exist. See Aerodrome Obstacle Chart and EGPK AD 2.10 Aerodrome Obstacles. This procedure does not take account of noise abatement procedures which may require additional manoeuvres once above the initial altitude and climbing. See EGPK AD 2.21 for Noise Abatement Procedures.

EGPK AD 2.23 ADDITIONAL INFORMATION

a) All permissions for Remotely Piloted Aircraft Systems (RPAS) flights within the Glasgow Prestwick Airport (GPA) Flight Restricted Zone (FRZ) should be made via the airport's website, at www.glasgowprestwick.com/corporate/drone-and-crane-use.

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **2000** in the sector defined by the lateral limits; 554107N 0045426W-554059N 0045410W thence anticlockwise by an arc of a circle radius 3.1NM centred on 554105N 0044842W to 553800N 0044839W-553022N 0043438W-552303N 0045827W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 552411N 0045930W-553836N 0045758W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 554107N 0045426W.

b) **2500** in the sector defined by the lateral limits; 554107N 0045426W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 554231N 0045137W thence anticlockwise by an arc of a circle radius 3NM centred on 554404N 0044705W to 554325N 0044154W-554513N 0044112W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 554241N 0042008W thence anticlockwise by an arc of a circle radius 3NM centred on 554117N 0041526W to 553818N 0041539W-553815N 0041332W-553022N 0043438W-554107N 0045426W.

c) **2600** in the sector defined by the lateral limits; 554513N 0044112W-554325N 0044154W thence clockwise by an arc of a circle radius 3NM centred on 554404N 0044705W to 554231N 0045137W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 554513N 0044112W.

d) **2600** in the sector defined by the lateral limits; 554241N 0042008W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 553814N 0041258W-553818N 0041539W thence clockwise by an arc of a circle radius 3NM centred on 554117N 0041526W to 554241N 0042008W.

e) **3000** in the sector defined by the lateral limits; 552303N 0045827W-553022N 0043438W-553815N 0041332W-553814N 0041258W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 552459N 0041113W-552336N 0041255W thence anticlockwise by an arc of a circle radius 6NM centred on 551741N 0041428W to 551726N 0042457W-551618N 0042742W thence clockwise by an arc of a circle radius 15NM centred on 553034N 0043540W to 552303N 0045827W.

f) **3200** in the sector defined by the lateral limits; 552336N 0041255W to 552112N 0041552W-551726N 0042457W thence clockwise by an arc of a circle radius 6NM centred on 551741N 0041428W to 552336N 0041255W.

g) **2100** in the sector defined by the lateral limits; 553800N 0044839W thence clockwise by an arc of a circle radius 3.1NM centred on 554105N 0044842W to 554059N 0045410W-553800N 0044839W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and
b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach: Continue visually or by means of ILS final approach procedure. If not possible proceed at **4000**, or last assigned level if higher to **PIK NDB**†.
Intermediate and Final Approach: Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **PIK NDB**†.
† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
7. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be Issued If the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of instrument approaches other than SRA is cleared to intercept the final approach track.**

CHANGE (8/26): PAGE RENUMBERED. SPECIFICATION CHANGE.
AERO INFO DATE 13 MAY 26

INTENTIONALLY BLANK

EGKR — REDHILL

EGKR AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGKR — REDHILL

EGKR AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 511249N Long: 0000819W Mid point of Runway 07R/25L.
2	Direction and distance from city	1.5 NM SE of Redhill.
3	Elevation / Reference temperature / Mean Low Temperature	222 FT / 20 °C / -
4	Geoid undulation at AD ELEV PSN	149 FT
5	Magnetic Variation / Annual Change	1.35°E (2027) / 0.17°E
6	AD Administration Address Telephone E-mail address	REDHILL AERODROME LTD Terminal Building, Redhill Aerodrome, Surrey, RH1 5YP. 01737-823377 (Administration) Mon-Fri 0900-1700 (0800-1600) 01737-821802 (ATC) 01737-821805 (Fuel) 01737-822947 (ATIS available H24) reception@redhillaerodrome.com (Administration) atc@redhillaerodrome.com (ATC) arffs@redhillaerodrome.com (ARFFS/Fuel)
7	Type of Traffic permitted (IFR/VFR)	VFR
8	Remarks	ATC telephone calls are recorded.

EGKR AD 2.3 OPERATIONAL HOURS

1	AD Administration	0900-1700 (0800-1800).
2	Customs and immigration	Available by arrangement. Submit GAR form via www.submit-general-aviation-report.service.gov.uk 4 hours notice required for inbound flights. Flights within the UK Common Travel Area require 24hrs notice to Surrey Police.
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	-
7	ATS	0845-1715 (0745-1815).
8	Fuelling	0900-1630 (0800-1730); and by arrangement.
9	Handling	-
10	Security	-
11	De-icing	-
12	Remarks	This aerodrome is PPR.

EGKR AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	-
2	Fuel and oil types	AVTUR JET A-1 (with AL48), AVGAS 100LL W80, W100
3	Fuelling facilities/capacity	AVTUR JET A-1 fixed installation 60,000 lt. Bowser 12,000 lt. AVGAS 100LL fixed installation 25,000 lt.
4	De-icing facilities	-
5	Hangar space for visiting aircraft	-
6	Repair facilities for visiting aircraft	-
7	Remarks	-

EGKR AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGKR AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) The Aerodrome is not available to flex-wing microlight aircraft.
b) Aerodrome not available to aircraft unable to communicate by radio.
c) All pilots and persons operating on the manoeuvring area are required to wear high visibility clothing at all times. Pilots or operations staff wearing high visibility clothing must escort passengers (not wearing high visibility clothing) to and from their aircraft.
d) Use of the Aerodrome outside ATC hours is restricted to operators who have obtained prior approval from the Aerodrome Manager or SATCO. Specific procedures apply, details will be provided when approval is given.
e) Use of Aerodrome by aircraft not equipped with a serviceable transponder is subject to prior approval from the Aerodrome Licensee.
f) Details of arrival, departure and circuit patterns are available via www.redhillaerodrome.com.

2 GROUND MOVEMENT

a) Fixed-wing aircraft operations are confined to the marked runways and taxiways and to the grass areas north of Runway 07R/25L. Unmarked taxiways should not be used without ATC permission.
b) Pilots of fixed-wing aircraft must exercise caution when taxiing on the grass, especially west of Runway 18/36 where the surface is uneven in places.
c) Hangar Apron - a dashed yellow advisory centre-line is marked to assist pilots in avoiding obstacles located adjacent to the apron. This centre-line is based on aircraft with a wing span of up to but not including 11 M. A red safety line is marked on the eastern edge of the paced apron, aircraft must be parked behind this line. Pilots unsure about their wing tip clearance should either obtain the services of a competent "wing-walker" or request assistance from the ARFFS via ATC.
d) Traffic lights control non-radio vehicles between holds H2 and E1. Radio equipped vehicles may be instructed by ATC to proceed past a red signal. These traffic lights do not apply to taxiing aircraft.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) The aerodrome is subject to waterlogging.
b) The surface slopes up 10 FT from the centre to the West boundary.
c) Intensive helicopter operations (Caution wake turbulence): Care must be taken by fixed-wing pilots on approach and departure from all runways not to drift into the helicopter circuit area. Do not vacate any runway until instructed to by ATC.
d) Air Taxiing helicopters direct a forceful blast of air downwards which rolls out in all directions. Also, when a helicopter's weight is transferred from the landing gear to the rotor a strong downwash is created. Fixed-wing aircraft should not be parked close to helicopter aprons.
e) Helicopters may not comply with standard RTF procedures.
f) When Runway 18/36 is in use it is not possible to provide separation between the runway and air-taxiing helicopters. Consequently, delays may occur to both helicopters and fixed-wing aircraft.
g) Operations by Police, Air Ambulance and commercial helicopters take place H24.
h) Ridge running east - west 545 FT AMSL 1.3 NM north of the aerodrome.
i) Caution: Model aircraft flying (North Downs Flyers) approximately 1.3 NM from the threshold of Runway 18 310 M west of centre-line up to 400 FT AGL/790 FT AMSL.
j) Caution: Model aircraft flying (Esher & District Model Flying Club) approximately 2 NM from the threshold of Runway 07R 170 M south of centre-line up to 400 FT AGL/575 FT AMSL.

5 HELICOPTER OPERATIONS

a) Two grass heli-strips (H07/H25 and H18/H36) are marked on the Aerodrome with standard ICAO markings and are available for helicopters up to and including 13 M overall length. Larger helicopters will operate from the marked hover squares or the fixed-wing runways.
b) The helicopter operating areas (heli-strips, confined areas and sloping ground) are separated from the fixed-wing runways and procedures are in place that permit independent and simultaneous helicopter/fixed-wing operations. Special procedures apply to A139 helicopters or larger. Helicopters will only be parked on marked grass or concrete pads. Non based helicopters will be directed by ATC to an appropriate pad.
c) Night Operations

    i. Helicopters are not permitted to arrive and depart via unlit areas of the Aerodrome unless operators have procedures, agreed with the Aerodrome Licensee, published in their Operations Manual.
    ii. At night helicopters will operate to/from H07/H25 (equipped with flush green edge lights) or Runway 07R/25L.
    iii. Additionally a lighted concrete helipad, equipped with green FATO LED edge lights, blue LED taxi area lights and red LED stop line lights, is available adjacent to the Air Ambulance Kent Surrey Sussex (AAKSS) hangar. Use of this pad is PPR through AAKSS Ops.

d) Helicopters operating in the visual circuit must remain east of the Redhill-Brighton Railway Line.

6 USE OF RUNWAYS

a) Runway 07R/25L is the preferential runway.
b) Runway 07L/25R is primarily used as a taxiway, it is only available as a runway when Runway 07R/25L is NOTAM out of service.
c) The aerodrome is equipped with Pilot Activated Lighting, pre-set to 10% intensity. Details from Aerodrome Licensee.
d) An unlicensed paved runway 06/24 is available for use by fixed-wing aircraft when the licensed grass runways are unserviceable. Helicopters equipped with wheeled undercarriage may be directed to use this facility when the grass areas are soft. Details on this runway are available on the aerodrome website www.redhillaerodrome.com
e) Runway 18/36 is not available to aircraft that are not equipped with a serviceable transponder.

7 TRAINING

a) Training is restricted to based operators and approved helicopter operations.

EGKR AD 2.21 NOISE ABATEMENT PROCEDURES

a) Pilots are to operate their aircraft in a manner that will minimise the disturbance caused to local residents.
b) Aerobatic manoeuvres are prohibited within the Redhill ATZ.
c) Runway 07R/25L is the preferential runway.
d) Fixed-wing aircraft departing Runway 07L/R must climb straight ahead, tracking the extended centre-line, until passed Henhaw Farm before turning on track.
e) Fixed-wing aircraft departing Runway 25L/R must climb straight ahead, tracking the extended centre-line, until reaching the centre of Benting Wood before turning on track.
f) Multi-engine fixed-wing aircraft may only use Runway 18/36 when the surface wind precludes the safe use of Runway 07R/25L.
g) Circuit training by multi-engine fixed-wing aircraft is not permitted on Runway 18/36.
h) Circuit training by multi-engine fixed-wing aircraft is not permitted on a Sunday.
i) Helicopter night flying training within the ATZ is not permitted Mon-Fri after 2359 (2300).
j) Helicopter night flying training within the ATZ is prohibited on Saturday and Sunday.
k) During ATC hours all ground running of helicopters for maintenance purposes is subject to ATC approval. Except for Police and Air Ambulance helicopters ground runs may not take place prior to 0800 (0700) hours or after 2100 (2000) hours.
l) Except for Police, Air Ambulance and based news gathering helicopters flights are not normally permitted during 0001-0700 (2301-0600) Mon-Sat or during the periods of 0001-0800 (2301-0700) and 2200-2359 (2100-2300) on a Sunday.
m) Helicopters departing from the Runway 18 displaced threshold markings to the north are to use their best angle of climb speed.
n) Except for Category A or B flights (MATS Part 1 Section 1 Chapter 4) helicopter departures or arrivals below the circuit altitude are not permitted.
o) Helicopter departures or arrivals via the Runway 18 displaced threshold markings are not permitted if the tail wind component exceeds 10 KTS.

EGKR AD 2.22 FLIGHT PROCEDURES

1 GENERAL

a) All procedures are based on Redhill QNH. ATC will provide QFE when requested by pilots.
b) Variable circuits, no dead-side, helicopters will fly a circuit pattern opposite to that used by fixed-wing aircraft. Circuit height: Fixed-wing and Helicopters 1200 FT QNH.
c) All inbound aircraft must establish contact with Redhill ATC at least 5 minutes prior to their ETA.
d) Runway 18 departing fixed-wing aircraft must commence their left turn within 0.5 NM of crossing Taxiway C/D and track 070°(M) on the crosswind leg.
e) Runway 36 fixed-wing aircraft must turn right base at Burstow Park Farm and track 250°(M) to turn onto final approach at a range not greater than 0.5 NM of the threshold. Report FINAL on crossing the M23 motorway.

2 VFR ARRIVAL AND DEPARTURE PROCEDURES

a) ATC will require all VFR/SVFR aircraft to enter and leave the ATZ by routeing via one of the VRPs (listed in paragraph 4) as follows:

i. Fixed-wing aircraft:

1. Join at 1400 FT QNH. If required to join overhead - enter the ATZ on the runway QDM remaining within the fixed-wing circuit area. When instructed, descend to circuit height and join the visual circuit pattern. Note: overhead join is not available when Runway 36 is in use or on other runways when operating SVFR.
2. Departures are to fly not above 1400 FT QNH until passed the appropriate VRP.

ii. Helicopters:

1. Join at 1200 FT QNH and enter the circuit pattern via the appropriate VRP or outside the Gatwick CTA.

Note: *When Runway 18/36 is in operation helicopters joining from the east may be instructed to route from Godstone Railway Station to the eastern aerodrome boundary at 700 FT QNH.*

2. Departures are fly between 700 FT and 1200 FT QNH until passed the appropriate VRP or until outside the Gatwick CTA.

3 REDHILL LOCAL FLYING AREA (LFA) AND PROCEDURES

a) The southern half of Redhill aerodrome lies within the Gatwick CTR and the northern half lies beneath the Gatwick CTA. During the hours of watch of Redhill ATC, subject to the restrictions listed in paragraph (b), VFR and SVFR flights without reference to Gatwick ATC may be made within a LFA which is bounded by the following positions:

511405N 0001047W - 511437N 0000656W thence south by the arc of a circle radius 2 NM centred on 511249N 0000819W to 511230N 0000511W - 511134N 0001048W - 511248N 0001240W - 511258N 0001129W thence north by the arc of a circle radius 2 NM centred on 511249N 0000819W to 511405N 0001047W.

b) The following restrictions apply within that part of the Redhill LFA that lies within the Gatwick CTR (Area A) (i.e. south of a line joining positions 511258N 0001129W - 511234N 0000510W):

i. Aircraft are to remain clear of cloud and with the surface in sight;
ii. Maximum altitude — 1400 FT QNH;
iii. VFR weather minima: Fixed-wing minimum meteorological visibility 5000 M, helicopter minimum meteorological visibility 1500 M.
iv. SVFR weather minima: Fixed-wing minimum meteorological visibility 3000 M and/or cloud ceiling (BKN) 700 FT. Helicopter minimum meteorological visibility 1500 M and/or cloud ceiling (BKN) 700 FT.
v. Limits of circuit:

- Middle of Benting Wood to the west;
- Redhill — Bletchingley Road (A25) to the north;
- Outwood — Bletchingley road to the east;
- Picketts and Brownslade farms to the south.

c) Within that part of the Redhill Local Flying Area that lies outside the Gatwick CTR (Area B) the maximum altitude is 1400 FT QNH.
d) Aircraft joining or leaving Redhill Local Flying Area must do so at a point north of the Gatwick CTR. Joining procedures and Visual Reference Points are as detailed.
e) The LFA is depicted at AD 2-EGKR-4-1.
f) Refer to Section ENR 1.4 for Notifications.

Note 1: *Aircraft that are in communication with Gatwick ATC and intend either to land or overfly adjacent to Redhill aerodrome must not assume that clearance has been issued to penetrate the Redhill LFA. Pilots must obtain prior permission from Redhill by RTF. Gatwick ATC will, whenever possible, permit an aircraft to leave the frequency temporarily to obtain such clearance.*

Note 2: *Aircraft following the Redhill - Tonbridge railway line, London - Brighton railway line and the M23 Motorway are reminded that these routes traverse the Redhill LFA.*

4 SPECIAL VFR (SVFR) OPERATIONS

a) When the weather conditions reported at Redhill do not allow VFR operations, SVFR flights will be permitted (subject to a clearance from Redhill ATC) within the ATZ/LFA. The minimum weather limits for SVFR flights at Redhill are:

i. Helicopters - meteorological visibility 1500 M and/or cloud ceiling 700 FT;
ii. Fixed-wing - meteorological visibility 3000 M and/or cloud ceiling 700 FT.

b) Radar separation will not be provided by London Terminal Control between aircraft operating within or outside the Redhill ATZ/LFA however, traffic information may be passed to those aircraft operating outside the Redhill ATZ/LFA on those observed to be operating within the Redhill ATZ/LFA.

5 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

8	Remarks	-

EGNE AD 2.3 OPERATIONAL HOURS

1	AD Administration	A) Mon-Fri 0800-1800 (0700-1700); Sat, Sun and PH 0900-1800 (0800-1700). B) Extension of hours on request: Mon-Fri 0600-0759 (0500-0659), 1801-2300 (1701-2200); Sat, Sun and PH 0800-0859 (0700-0759), 1801-2100 (1701-2000). Outside of these extended hours, the aerodrome is unavailable for use in line with local noise abatement restrictions except for Emergency Flights. Unless subject to an approved extension of hours, the aerodrome is only available for flights not requiring the facilities of a licensed aerodrome, conducted solely by based operators and users, holding the appropriate 'out of hours permit' and with prior permission. C) Emergency Flights H24 by prior arrangement. D) Gamston Aerodrome is a dual operations facility, operating both general aviation and assistive driving technology vehicle testing. Please contact Gamston Aviation for more information regarding dual-use operations.

EGNE AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) AD not available to aircraft unable to communicate by radio with A/G station unless specifically arranged.
b) Pilots, other aircrew, engineers and those working in airside areas are required to wear a high visibility vest or jacket at all times whilst accessing the ramp, apron and hangars. Passengers and visitors accessing these areas are required to be escorted at all times by a competent individual wearing a high visibility vest or jacket.
c) Engine testing or high power engine runs by turbine or jet aircraft must only be carried out in the space provided near holding point C. Aircraft conducting engine testing or high power engine runs must maintain radio communication with Gamston Radio on 130.480 MHz for the duration of testing.
d) Large turboprop and jet aircraft may join downwind left-hand for Runway 20 and downwind right-hand for Runway 02, when there is traffic to affect in the established circuit, for separation purposes. Gamston Radio can advise on reported traffic.
e) The airport is strictly PPR for all non-based aircraft. PPR can be obtained via telephone or via the website. Aircraft must obtain confirmation that PPR has been accepted before departing for the AD. Airborne PPRs aren't accepted.

2 GROUND MOVEMENT

a) Access to and from Runway 02/20 is via points A, B, C and D only.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Runway 02 APAPI is positioned to the right-hand side of the runway.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGNE AD 2.21 NOISE ABATEMENT PROCEDURES

1 GENERAL

a) All aircraft inbound and outbound from this airport are required to conform to the following procedures, notwithstanding that these may at any time be departed from to the extent necessary for avoiding immediate danger:

   i. Every operator of aircraft using the airport shall always ensure that aircraft are operated in a manner calculated to cause the least disturbance practicable in areas surrounding the airport.
   ii. Aircraft operators should conform to the aerodrome circuit and avoid noise sensitive areas as published on the airport website https://retfordairport.co.uk/fly-in.html.
   iii. Aircraft must utilise the full declared distances when departing in order to minimise noise in the areas surrounding the airport.

EGNE AD 2.22 FLIGHT PROCEDURES

1 GENERAL

a) Pilots are to contact the A/G station prior to entering the ATZ.

2 PROCEDURES FOR INBOUND AIRCRAFT VIA THE AIRWAYS SYSTEM

a) Aircraft inbound from the South† via the airways system must follow the East Midlands Standard Arrival Routes (STAR) as shown at AD-2- EGNX-7. A STAR will be issued by the relevant area control unit.
b) Aircraft may be vectored off the routes for separation purposes. When separation has been achieved, ATC will give an instruction to resume the STAR via the appropriate fix.
c) East Midlands Radar will position aircraft inbound to Gamston on a heading or own navigation. Aircraft are required to free-call Gamston when clear of CAS.

3 PROCEDURES FOR OUTBOUND AIRCRAFT TO THE SOUTH VIA THE AIRWAYS SYSTEM

a) Departures to the south should route via DCT SAPCO or TNT. Aircraft should include all necessary and relevant waypoints in the flight plan.
b) Gamston will pre-note East Midlands Radar with the aircraft's routing and requested level prior to departure.

4 PROCEDURES FOR OUTBOUND AIRCRAFT TO THE NORTH VIA THE AIRWAYS SYSTEM

a) Departures to the North should route via DCT UPTON or GOLES. Aircraft should include all necessary and relevant waypoints in the flight plan.
b) IFR flights should inform Gamston Radio when they are ready for departure, including which waypoint they intend to join at.
c) Gamston will pre-note Scottish control with the aircraft's routing and requested level prior to an aircraft's departure.

Note: *Pilots are recommended to hold prior to departure and wait for further details from Gamston Radio to avoid delays on joining CAS.*

5 RADIO COMMUNICATION FAILURE PROCEDURE

a) In the event of complete radio communication failure, the pilot will adopt the appropriate procedure notified at ENR 1.1.3.3. Aircraft are then to leave Controlled Airspace routeing UPDUK - GAM DME.

6 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGNE AD 2.23 ADDITIONAL INFORMATION

1 PROXIMITY OF MICROLIGHT FLYING SITE

a) Headon microlight flying site is located 3 NM to the east of the airport and may be active at any time.
b) Darlton gliding site is located 4 NM to the east of the airport and may be active at any time. Confirmation of active launches may be obtained from Waddington LARS.

EGTO AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Not available at night to aircraft requiring to use a licensed runway when relief Runway 02R/20L is in operation.
b) Aircraft using this aerodrome are required to have third party liability insurance in the sum of at least £1,000,000. Proof of this insurance should be available for inspection at any time whilst the aircraft is at Rochester aerodrome.
c) Use of the aerodrome is restricted to published hours unless prior permission has been obtained from the aerodrome authority.
d) Practice Engine Failure at take-off should not be attempted from Runway 02 due to the flight paths over built up areas.
e) Air training flights, intending to request circuit training, solo students and microlight aircraft are required to obtain prior permission by telephone.
f) Aerobatic manoeuvres are not permitted unless authorised by the duty manager.
g) Home based aircraft may be active outside the published hours. Non-home based aircraft should remain clear of the ATZ. Over flights may listen out on frequency and prefix position reports with ‘Rochester Traffic’.
h) No circuits are permitted outside of published hours.

2 GROUND MOVEMENT

a) Fixed wing aircraft are to taxi with caution on prepared and marked areas only.
b) Pilots must avoid the use of excessive power on the main apron due to poor surface conditions and pedestrian traffic in the vicinity.
c) No centre-line on main apron. Pilots are responsible for wing tip clearance.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Runway 20R APAPI signals are visible to the east of the extended runway centre-line where normal obstacle clearance is not guaranteed. They should not be used until the aircraft is aligned with the runway extended centre-line.
b) Runway 02L APAPI signals are visible to the west of the extended runway centre-line where normal obstacle clearance is not guaranteed. They should not be used until the aircraft is aligned with the runway extended centre-line.
c) APAPI are used at night, inclement weather and when requested.
d) The proximity of large buildings and topography may cause turbulence and windsheer in some wind conditions.
e) Pilots are advised that the aerodrome is situated beneath the LTMR of 2500 FT QNH.

5 HELICOPTER OPERATIONS

a) Helicopters air taxiing should avoid low flight over the runway maker boards and parked aircraft due to high energy downwash from rotors.
b) Helicopters landing and taxiing in the northern manoeuvring areas are advised of the close proximity of the main car park and pedestrians.
c) Rescue and Police helicopter flights may take place outside of published hours day and night without notice.

6 USE OF RUNWAYS

Not applicable

7 TRAINING

a) Circuit training is not available to visitors at weekends, public holidays, and at other times that the aerodrome authority consider appropriate.

EGTO AD 2.21 NOISE ABATEMENT PROCEDURES

a) All aircraft inbound to or outbound from Rochester are required to conform to the following procedures, notwithstanding that these may at any time be departed from to the extent necessary for avoiding immediate danger.
b) Aircraft should not join the circuit or final approach path below 1000 FT QFE.
c) Circuit patterns should be flown to the west avoiding the large built up area to the east.
d) Aircraft taking off should use the full length of the runway, applying take-off power prior to releasing the brakes whenever surface conditions permit.
e) Aircraft fitted with VP propellers must endeavour to reduce RPM consistent with manufacturers noise abatement advice.
f) Aircraft departing from Runway 02 to the east are expected to depart via the overhead unless requesting a right hand turn after passing 1500 FT QNH.
g) Unless making an approach on the PAPIs installed on Runway 02/20 aircraft should adjust their visual approach to maintain a 5° approach angle to the runway threshold.
h) Circuit direction is variable to avoid flying over built up areas: Runway 20R/L - RH; Runway 02L/R - LH.

EGTO AD 2.22 FLIGHT PROCEDURES

1 STANDARD DEPARTURE ROUTES - VIA ATS ROUTE NETWORK

a) Pilots who wish to join the ATS Route Network should flight plan as per the UK SRD.
b) Rochester ATSU will notify the pending departure to London Terminal Control (LTCC) and will co-ordinate the departure with LTCC or Southend.
c) Rochester ATSU will issue pilots with after departure instructions and pilots must remain outside of controlled airspace until a clearance to enter controlled airspace has been issued by LTCC or Southend Radar.
d) Pilots are to ensure they have received and acknowledged a joining clearance before entering controlled airspace.

2 INBOUND AIRCRAFT VIA ATS ROUTE NETWORK

In order to provide improved ATC handling of flights inbound to Rochester via the ATS Route network a system of standard routes has been established.

Approach from	Via	Route
North	N859	N859 – HON – LAM
West	Q63	Q63 – CPT – GWC – SFD – LYD – DET
Southwest	L620	L620 – GIBSO – SAM – GWC – SFD – LYD – DET
South	L980	L980 – KATHY – GWC – SFD – LYD – DET
	M189	M189 – NEVIL – LYD – DET
	L613	L613 – SOVAT – SANDY – DET
Southeast	L9	L9 – KONAN – DVR – DET
East	L980	L980 – LOGAN – JACKO – TANET – DET
	L179	L179 – LOGAN – JACKO – TANET – DET

3 VFR FLIGHT PROCEDURES

a) A standard overhead join is preferred but other joins may be requested.
b) Departing Runways 02 to the east via the overhead is preferred but a right turn after passing 1500 FT QFE can be requested.
c) Departing Runway 20 to the east, aircraft should depart overhead or climb ahead on runway heading until clear of the built up area to the east.
d) Circuit height is 1000 FT QFE, always flown to the west.

e) A standard circuit pattern should be flown within the ATZ which is geographically marked to the north and west by the River Medway, turning on to finals at 2 NM.

4 RADIO COMMUNICATION FAILURE PROCEDURES

a) In the event of complete radio communication failure in an aircraft, the pilot is to adopt the appropriate procedure described at ENR 1.1 paragraph 3.4 until:

i. Inbound Aircraft: Follow the routes detailed in paragraph 2 for inbound aircraft to leave CAS at LAM (4000 FT or below) or DET (3000 FT or below) as appropriate and proceed to Rochester.
ii. Outbound Aircraft: For the purposes of radio failure, the climb to flight planned level should be commenced after the last position shown in the Standard Departure Routes where an altitude or flight level is specified.

EGES AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All GA aircraft must park only on the clearly designated grass GA APRON. GA aircraft must not park on the main tarmac apron.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Visiting pilots should note that during periods of prolonged rainfall the grass runway can become very soft especially during the winter months.
b) **Runway 02/20:** Graded hardcore runway is generally unsuitable for light aircraft with low ground/propeller clearance due to unstabilised surface and as a result it would be advisable to carry out any power checks on the tarmac apron before departure.

EGHE AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Flight Plans should be filed for all flights to and from Scilly Isles/St Mary's aerodrome.
b) Non-radio aircraft not accepted.
c) General Aviation parking on grass only NE of Runway 14.
d) Access from/to GA parking shall be via Exit/Entry gates along boundary fence. Telephone for transport available on front of Fire Station building, or walk via perimeter track around aerodrome to Terminal Building.
e) High Visibility Clothing mandatory with exception of passengers under escort.
f) Pilots are to contact ATC prior to engine start.
g) Pilots must not cross the runways on foot under any circumstance.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Pilots should exercise extreme caution when landing or taking-off at this aerodrome, which is markedly hump-backed. The gradients increase to as much as 1 in 13 at runway ends.
b) A perimeter road runs around the northern part of the aerodrome and the vehicular traffic is liable to cross the approach to Runway 14.
c) Locally based aircraft activity may take place outside of published hours, also SAR aircraft, air ambulance and Trinity House Helicopters.
d) Runway 14 PAPI signals are visible to the east of the runway extended centre-line where normal obstacle clearance is not guaranteed. They should only be used when the aircraft is aligned with the runway.
e) Pilots of aircraft are cautioned to exercise great care when using the Runway 32 end turning circle due to the reduced clearance to the south-south-east where a granite outcrop inhibits the provision of normal taxiway clearances; consequently the reverse turn to line-up on Runway 32 should be commenced as soon as is practicable.
f) Turbulence and/or windshear may affect the final half mile of approaches to all runways and may be increased by valley effect and/or structures when using Runways 09, 14 or 27.
g) Buildings 28 FT AAL adjacent to the northeast boundary.
Building (Lgtd) 37 FT AAL adjacent to the northwest boundary.
h) Footpath crosses the Runway 32 turning circle controlled by traffic lights, pedestrians liable to cross the undershoot.
i) Outside operational hours ATZ may be activated without notice to accommodate SAR and Air Ambulance Flights with an Air Ground Service provided.
j) Runway 09-27 transverse slopes alternate between North and South, up to 2.3% in places.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGHE AD 2.21 NOISE ABATEMENT PROCEDURES

Not applicable

EGHE AD 2.22 FLIGHT PROCEDURES

1 LAND'S END RMZ

a) Passenger carrying flights operating between Land's End Airport, Penzance Heliport, Tresco Heliport and Scilly Isles / St Mary's Aerodrome operate within airspace designated as an RMZ centred on a direct track from Land's End to Scilly Isles from the SFC to 4000 FT ALT. Pilots intending to transit the Land's End RMZ must comply with section 2 below.
b) Pilots intending to transit the Land's End RMZ must contact either Culdrose ATC on 134.055, Land's End ATC on 120.255 MHz (if approaching from the east) or St Mary's ATC on 124.880 MHz (if approaching from the west), prior to entering. Pilots of aircraft transiting the Culdrose AIAA should contact Culdrose ATC on 134.055 (Refer to AD 2-EGHC-3-1).
c) Aircraft operating under VFR may be asked to follow the Northern (R251 LND) route according to traffic and/or weather conditions in the Land's End RMZ.

2 LAND'S END RMZ REQUIREMENTS

For flight within the Land's End RMZ aircraft commanders must comply with one of the following:

a) Establish satisfactory two-way RTF communication with and pass pertinent flight details to ATC prior to entering the Land's End RMZ and maintain two-way communication with ATC whilst operating within the Land's End RMZ.
b) Conduct flight in accordance with valid Letter of Agreement.
c) Conduct flight in accordance with agreed tactical arrangements with either Land's End ATC or St Mary's ATC.

3 INSTRUMENT APPROACH PROCEDURES

a) Instrument Approach Procedures (IAP) for this aerodrome are established outside controlled airspace. See ENR 1.5.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGCJ AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Aerodrome is not available for use by public transport passenger flights required to use a licensed aerodrome.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Power Lines and Pylons, 58 ft amsl, 258 m south of RWY 01 THR and following southern AD perimeter east to west.
b) Woods, 275 m south of RWY 01 following southern AD perimeter east to west.
c) Mast, 134 ft amsl (111 ft agl), 830 m to the east and south of RWY 28 THR and left of the extended RWY approach centre-line.

5 HELICOPTER OPERATIONS

a) Helicopters should use grass Runways 10/28, 06/24, 01/19 and touch down at midpoint to minimise rotor vortex at runway thresholds.
b) When Runway 10/28 (Grass) or 10/28 (Tarmac) are in use, helicopters are requested to fly the circuit so as to touch down/lift across grass Runway 01/19 at the runway midpoint.
c) A designated hover practice area is located to the east of Runway 19 threshold and forms part of the Main Grass Parking Area.
d) Helicopters must avoid overflight of fixed-wing parking areas.
e) Helicopters must use the dedicated helicopter pads for refuelling.

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGCJ AD 2.21 NOISE ABATEMENT PROCEDURES

a) Aircraft must not overfly the villages of Sherburn-in-Elmet, South Milford, Lumby, Monk Fryston or Hambleton.

EGCJ AD 2.22 FLIGHT PROCEDURES

1 GENERAL

a) Within the circuit, pilots should plan to avoid flight over villages and remain well clear of them at all times when flying within the ATZ.
b) On arrival/departure, avoid Leeds East ATZ to the North.
c) Non-radio aircraft are not accepted.
d) Runway in use and QFE will be passed by A/G (QNH and wind check available on request). Aerodrome elevation 26 FT.
e) Flexwing Microlights welcome (must be radio equipped).
f) Backtracking on active runways is not permitted.

2 ARRIVALS

a) Fixed wing aircraft to join overhead at 2000 FT QFE and descend in accordance with the 'Standard Overhead Join' procedure.
b) Initial contact with A/G 122.610 MHz within range 5 NM of the ATZ.
c) Helicopters route inbound at 700 FT QFE. Should it be necessary to join crossing the active runway, do so at 90° across the runway at midpoint not below 200 FT AAL.

3 CIRCUITS

a) Fixed wing: circuits are to be flown at 1000 FT QFE.
b) Helicopters: circuits are to be flown at 700 FT QFE.

4 CIRCUIT PATTERNS

a) Runway 24 - left hand: Fixed wing and Helicopters.
b) Runway 06 - right hand: Fixed wing and Helicopters.
c) Runway 28 (Tarmac and Grass) - left hand: Fixed wing (right hand Helicopters).
d) Runway 10 (Tarmac and Grass) - right hand: Fixed wing (left hand Helicopters).
e) Runway 19 - left hand: Fixed wing (right hand Helicopters).
f) Runway 01 - right hand: Fixed wing (left hand Helicopters).

5 DEPARTURE

a) Fixed wing to depart at 1000 FT QFE whilst within the ATZ remaining clear of the 'dead side' at all times:

   i. on runway heading;
   ii. extended crosswind left or right as required;
   iii. completion of the ‘downwind’ leg left or right as required.

b) Helicopters to depart not above 700 FT QFE; should it be necessary to cross the active runway, fly across at 90° the midpoint.
c) Traffic departing to the west or northwest may cross the path of instrument approach procedures to Leeds East Airport. Details of IFR arrivals at Leeds East available from Sherburn Radio on 122.610 MHz.

Note: *Aircraft may at times depart from the overhead at 2000 FT for training purposes.*

6 INSTRUMENT APPROACH PROCEDURES

a) IAP at Sherburn-in-Elmet are established in Class G airspace and no approach control service is provided.
b) Runways at Sherburn do not conform to ‘Instrument Runway’ standards.
c) Use of the IAP is by prior permission from Sherburn Operations on 01977-682674. Approach time slot to be agreed with Sherburn Operations to avoid conflict with other IFR arrivals.
d) Sherburn Operations will provide a briefing document relating to IAP. Pilots are to abide by the procedures in the briefing document when executing the IAP.
e) Initial airborne requests for an IAP slot not accepted, unless in an emergency.

EGBS AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGBS AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Non-radio aircraft only accepted by prior arrangement.
b) Runway 08 is not licensed for night use.
c) Each aircraft commander is responsible for the safety of their passengers and other crew members. To ensure the safety of passengers and crew members, the aircraft commander or other competent crew member is to supervise and escort passengers whilst airside.
d) All pilots and personnel, except for passengers and other persons that are being escorted, shall wear high visibility clothing whilst airside.

2 GROUND MOVEMENT

a) Pilots should exercise caution taxiing to and from the Fuel Bay. Aircraft taxiing to the Fuel Bay cross a Bridleway which is used by vehicular traffic, not under the control of the aerodrome operator.
b) On days when parachuting onto the airfield is notified by NOTAM, pilots must call for engine start.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Visiting pilots are warned of intensive gliding on the north side of the aerodrome. Aircraft joining overhead should not descend below 1500 FT QFE dead side due gliding. Descend to circuit height when south of runway centre-line.
b) Pilots should use the access taxiway to Runway 08 with caution. Distance between taxiway centre-line and fence is 10 M.
c) Departure from the marked movement area can be hazardous.
d) During periods of heavy rain runway is liable to have patches of standing water.
e) Pilots landing at night should land as near as possible to the centre of the runway as the surface on the two outer sections (width 36 M) is rough in places. Runway edge lights are not located along the declared width of the runway.
f) A boundary fence on the western edge of the paved taxiway leading to Taxi-Holding Point Bravo, infringes the taxiway strip by 5 M. The fence is marked with high-visibility/reflective markings
g) Windshear may occur when the following conditions apply: Mountain wave accompanied by wind with a northern component.
h) Parachuting takes place onto the airfield on days notified by NOTAM. The NOTAM will specify the dimensions and heights of the drop-zone. Pilots should contact Shobdon Information or Radio on 118.155 for information about scheduled parachuting. Information also available by calling 01568-708369.
i) Periods, usually of up to 15 minutes duration, when parachuting is in progress will be broadcast by Shobdon Information or Radio. During such periods the airfield is closed to all other traffic.
j) Pilots should exercise caution when entering or vacating the asphalt runway via holding points A, B1 or C, as this requires crossing the unlicensed grass runway or its approach/climb-out.

5 HELICOPTER OPERATIONS

a) Holding point 'X' established north of Taxiway A dedicated for the use of helicopters outbound from Tiger Helicopters Limited.
b) Helicopter circuits operate parallel to and inside fixed wing circuits up to a maximum of 700 FT QFE.
c) Arrivals will normally approach to join downwind or base leg on the live side at 700 FT to remain below the fixed wing circuit at 1000 FT.
d) Arrivals from the north will normally approach to join base leg on the dead side or overhead in accordance with the noise abatement join procedure detailed in Warnings, paragraph 4(a). CAUTION – if Gliding Ops taking place, the circuit for which is on the north/dead side, helicopters joining base leg should give the glider circuit a wide berth.
e) Helicopters are required to comply with noise abatement procedures as detailed in AD 2.21.
f) Helicopters requiring AVGAS are required to alight on the grass as directed by ATS, with rotors clear of the roadway.
g) After departure or line up clearance issued, helicopters will cross the grass taxiway onto the grass runway or main runway to depart or report ready.
h) Helicopters taxiing are asked to operate their aircraft so as to minimise the effect of their downdraft on nearby aircraft parked on the grass.
i) Rotors running refuelling (Jet A1 only) available for approved helicopter types subject to staff availability.

6 USE OF RUNWAYS

a) Shobdon has three parallel runways. They are not available for simultaneous landings or departures.
b) The Glider Strip (North Grass runway) and Microlight Strip (South Grass runway) are unlicensed.

7 TRAINING

Not applicable

EGBS AD 2.21 NOISE ABATEMENT PROCEDURES

a) Following take-off on Runway 26, the heading is maintained until Rowe Ditch (a line of hedges running north/south approximately 0.5 nm west of Runway 08 threshold); when a left turn through 90° is made and the southbound crosswind leg flown just to the west of Rowe Ditch. After climbing to 1000 ft QFE crosswind, the heading should be maintained until passing Pembridge on the left, after which a downwind turn can be commenced.
b) Operations for Runway 08 are the exact reciprocal of Runway 26 with the base leg flown with the Rowe Ditch line feature kept to the right of track.

EGBS AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuit directions:

   i. Powered aircraft circuit: Runway 26 - LH; Runway 08 – RH (south of airfield);
   ii. Gliding circuit (including glider tug): opposite direction to powered aircraft (north of airfield).

b) Circuit heights:

   i. Powered fixed-wing circuits at 1000 FT QFE to the south of the villages of Pembridge and Eardisland;
   ii. Microlight circuits at 500 FT QFE;
   iii. Helicopter circuits at 700 FT QFE inside the normal circuit pattern;
   iv. Gliding circuit (including glider tug) at variable heights as necessitated.

c) Radio failure procedure for a powered aircraft in VMC is for the circuit to be joined overhead not below 2000 FT QFE and to let down on the dead side, joining over the upwind end of the active runway, observing any light signals displayed.
d) Radio failure procedure for a glider in VMC is to join the normal glider circuit, keeping a good look-out for other traffic and land when safe on an available runway.

7	Remarks	Oxygen and related servicing: Through maintenance organisation. To arrange refuelling at specific times, contact 01273-467395. Handling: Contact handling@flybrighton.com

EGKA AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels in vicinity.
2	Restaurants	Restaurant and bar.
3	Transportation	Taxis. Nearest railway station: Shoreham-by-Sea 2 NM.
4	Medical facilities	Limited first aid.
5	Bank and Post Office	-
6	Tourist Office	-
7	Remarks	-

EGKA AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A2 RFF Category 3 accepted under remission.
2	Rescue equipment	-
3	Capability for removal of disabled aircraft	MTWA 5080 KG. Contact 01273-467395.
4	Remarks	-

EGKA AD 2.7 SEASONAL AVAILABILITY - CLEARING

INTENTIONALLY BLANK

EGKA AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	APRON Surface: Concrete and asphalt NIL
2	Taxiway width, surface and strength	Taxiway A: 11 M Surface: Asphalt NIL Taxiway B: 7.5 M Surface: Asphalt NIL Taxiway F: 10 M Surface: Grass NIL Taxiway J: 10 M Surface: Grass NIL Taxiway K: 7.5 M Surface: Asphalt NIL Taxiway L: 10 M Surface: Grass NIL
3	Altimeter checkpoint location and elevation	Apron 6 FT
4	VOR checkpoints	-
5	INS checkpoints	-
6	Remarks	-

EGKA AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	-

2	Runway and taxiway markings and lighting	Runway marking aid(s): 02/20: Displaced threshold markings and designators on Runway 02/20. Centre marking Runway 02/20. 02G/20G: Threshold markings, designators, and white edge markings. 06/24: Displaced threshold markings and designators on Runways 06 and 24. 13/31: Displaced threshold markings and designators on Runway 31. Threshold markings and designators on Runway 13. Taxiway marking aid(s): Taxiway holding point markers. Grass taxiways Foxtrot, Juliet and Lima have white edge markings. Hard Taxiways have centre-line marking. Taxiway light(s): Blue edge lights and reflective markers except grass taxiways Foxtrot, Juliet and Lima.
3	Stop bars and runway guard lights (if any)	Runway Guard Lights at A1, B1 and K1.
4	Other runway protection measures	-
5	Remarks	3 WDI: 505017.26N 0001750.56W, 505012.81N 0001722.43W, 504956.16N 0001751.70W (LGTD). Runway 02/20 and associated taxiway widths meet minimum requirements. Pilots should exercise caution when manoeuvring on hard surfaces.

NDB (L) 1.32°E (2027)	SHM	332.000 kHz	0800-2000 (0700-1900).	505007.84N 0001743.39W	-	On AD. Range 10 NM. Normally radiates H24

EGKA AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of this airport by non-radio aircraft is subject to prior permission.
b) Standard light signals should be followed.
c) High visibility clothing is mandatory airside. Groups of two or more people can be escorted by one wearer of high-visibility clothing (tabard/ jacket) if kept together.
d) Local council by-laws prohibit dogs airside. Dogs are expected to be in a suitable dog carrier or on a lead, under full control of the handler/ owner.
e) While airside, each aircraft commander is responsible for the safety of their passengers and other crew members.
f) The parking rows numbered 70-72 and helipads H4-H6 must only be accessed by persons attending the aircraft for flight purposes. No visitors or sightseers are permitted.
g) When taxiing on the grass, keep to cut grass taxiways. The longer (uncut) grass areas are not inspected and are unfit for manoeuvring of any type.
h) Maintenance is prohibited in all parking areas and main concrete apron without the express permission of aerodrome management.
i) Out of hours movements (fixed wing and rotary) are strictly prohibited without an agreed extension to services.
j) Unless in receipt of authorised handling, all visiting aircraft should report to the Airport RFFS office C.
k) The carriage of dangerous goods into or out of EGKA, as specified by the Air Navigation (Dangerous Goods) Regulations 2002, is strictly prohibited.
l) Use of this aerodrome is subject to the published schedule of fees, charges, terms and conditions. Copies are available from Airport Administration and on the Airport Website www.flybrighton.com.
m) Aircraft engines shall not be run outside of notified operating hours without prior management approval via ATS or Fire Crew. An outside operational hours charge may be applied.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Aircraft approaching Runway 02 are reminded of displaced threshold and should NOT attempt to touch down on the numbers or the threshold line. Pilots to follow PAPIs (MEHT 16 FT) in order to safely overfly trains and railway line embankment on very short final.
b) Caution soft ground either side of Taxiway Kilo. Enter and exit on marked points only.
c) Caution should be used when taxiing on Taxiway A to ensure adequate wing-tip separation from aircraft holding at Hold C1.
d) Caution, model aircraft fly adjacent to Runway 20 approach on the hills at approximately 1 NM from the threshold up to 450 FT AMSL.
e) Caution, kite flying along the coast and on other areas within the ATZ up to 100 FT AGL.
f) Caution, turbulence may be encountered on final approach Runway 24 over the river, especially when the tide is out.
g) Runway 06/24 is not even and level along its length.
h) HT Cables to the North East of aerodrome, running north east-south west 585 FT AMSL at 2 NM. Terrain to the North of the Aerodrome rising to 783 FT AMSL at 4 NM.
i) Caution, reduced wing tip clearance between taxiing and parked aircraft on main concrete apron.
j) Caution, flocks of birds can descend on the aerodrome quickly. Occasionally, pilots may face delays, if birds are difficult to disperse.
k) Grass cutting will take place on the aerodrome daily between March and October.
l) Restrictions to operations will be applied during LVPs. Only the hard runway and Taxiway Alpha will be in use.
m) Wind information passed by ATS is given as Degrees True. Pilots are to allow for current magnetic variation.
n) Pilots are to be aware that the Runway 06 climb-out/Runway 24 approach is over a built-up area. Pilots departing Runway 06 and wishing to make an early turn are to request this from ATC, as helicopters may be operating north side of Runway 06 or inbound from the southeast.
o) Caution, potential for building-induced turbulence on the final approach to Runway 20 and Runway 13 when surface winds are from a south-easterly direction.

5 HELICOPTER OPERATIONS

a) Helicopter circuits from HTA 'W' are frequently active below the fixed-wing 'dead-side' and 'live-side' circuit patterns subject to the runway(s) in use. The profile of the helicopter circuit is described below. The pilot in command of helicopters operating in the helicopter circuit may adopt passive RTF but must maintain a listening watch on the appropriate frequency:

   i. HTA 'W' - Runway 02 in use - Left hand circuit, remain west of 02/20 runway strip. Climb to the north-east to 600 FT QNH. On turning south on the downwind leg climb to 800 FT QNH to be level before crossing the A27. When passing over the football ground descend to 600 FT QNH and continue to the coast before turning left toward the aerodrome and make the approach to HTA ‘W’.
   ii. HTA 'W' - Runway 20 in use - Right hand circuit, remain west of 02/20 runway strip. Climb on a track parallel to the departure lane from the main runway, when crossing the railway line turn right 10 degrees. Continue to the coast and turn north-east for the downwind leg and continue climb to 800 FT QNH to be level by the football training ground. After crossing the A27, descend to 600 FT QNH to be level before turning east and upon reaching the River Adur turn south towards the aerodrome and make the approach to HTA ‘W’.

b) A sloping ground training area is situated adjacent to the northern windsock on the northwestern side of the aerodrome.
c) All helicopter arrivals and departures shall enter/depart the ATZ not above 600 FT QNH unless otherwise authorised and request specific clearance to cross any runway strip.
d) Helicopters should avoid overflying built up areas that are adjacent to the arrival/departure routes and should not fly along the river from the harbour entrance, but shall remain on the coast to the southeastern corner entry route of the aerodrome.
e) Confined helicopter training area (HTA 'Q') is situated NNW of HTA 'W'. Not to be used by solo/student pilots.

6 USE OF RUNWAYS

a) More than one runway may be in use at any one time.
b) Runway 02/20 will always be preferred subject to operational limitations. Aircraft departing Runway 20 should avoid overflying as much of the built up areas to the south and follow the published noise abatement procedures.
c) Circuit heights are 1100 FT AAL for all runways.
d) Variable circuit direction at discretion of ATC.
e) Unless otherwise instructed aircraft joining the circuit will overfly the aerodrome maintaining 2000 FT AAL, until instructed to descend to circuit height on the inactive (dead) side of the runway in use and join the circuit by crossing the upwind end. Pilots should note that there would frequently be helicopters operating both ‘liveside’ and ‘deadside’ in the ATZ up to 800 FT.
f) Aircraft joining direct to the crosswind leg should arrange their flight to track over the upwind end of the runway-in-use, ie in the same position as if approaching it from the ‘deadside’. Unless otherwise instructed, this should be at circuit height.
g) Departing aircraft shall not turn on course below 600 FT QNH unless approved by ATC.
h) All fixed wing aircraft should be aware of helicopters operating live side and dead side beneath the fixed wing circuit patterns.
i) Departing aircraft, and aircraft going around, should be aware of the possibility of aircraft on the crosswind leg at 1100 FT QFE.
j) PAPIs are to be used for Runway 02/20 asphalt only, not for grass 02/20.
k) The Runways 02/20 asphalt and 02/20 grass are operated as a single runway strip. No simultaneous parallel approaches or departures are permitted.
l) Grass runways are unavailable before 1000 (0900) Monday-Friday to facilitate grass cutting, between 01 March-31 October each year.

7 TRAINING

a) Circuit training (fixed-wing & rotary) is not permitted Sundays. It is permitted Mondays 1000-2000 (0900-1900) and Tuesday-Saturday 1000-1800 (0900-1700).
b) Runway 02/20 Grass and 13/31 are not available for touch and go's.
c) Only Runways 02 and 31 may be used for practice engine failure after take-off.
d) Instrument training is strictly PPR.
e) Qualifying cross country flights are strictly PPR.

EGKA AD 2.21 NOISE ABATEMENT PROCEDURES

a) Noise abatement techniques should be practiced at all times, the area to the east and west being particularly sensitive.
b) Aircraft departing Runway 20 should make a 10 degree turn to the right on reaching the railway line. This track should be maintained until reaching the coast before turning left or right on course.
c) Runway 02/20 is the preferred runway for noise abatement purposes.
d) Ground engine runs should not be performed adjacent to buildings, re-fuelling areas or on the concrete apron. These will normally be performed on the B taxiway or C loop. All ground runs are logged by ATS for noise abatement purposes.
e) Prolonged helicopter hovering details should not be completed adjacent to buildings.
f) Prolonged helicopter operations on Runway 24 are to be avoided unless a strong easterly wind prevails.

EGKA AD 2.22 FLIGHT PROCEDURES

1 RADIO COMMUNICATION FAILURE PROCEDURES

a) In the event of an aircraft experiencing a radio failure during daytime, an aircraft should join overhead the aerodrome, fit into the traffic pattern and overfly the runway in use at 500 FT before positioning for landing.

2 INSTRUMENT APPROACH PROCEDURES

a) Instrument Approach Procedures (IAP) for this aerodrome are established outside controlled airspace. See ENR 1.5.
b) The RNP IAP's should not be used if an approach service is not available.
c) Rules of the Air regulations, Section 6 apply when using RNP IAP's.
d) Use of the RNP IAP without an approach service may result in investigative action being taken by the ANSP.

3 ATS SERVICES

a) Approach service may not be available every day.
b) Each day is notified on the Airport website at www.flybrighton.com/atc-availability.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGCV AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGCV AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) RAF Shawbury is 4.5 NM south-east with identical runway headings and can be mistaken for Sleap. During RAF Shawbury's published MATZ operating hours Mon-Fri 0845-1700 (0745-1600); pilots should initially contact Shawbury Zone (133.155). Shawbury's ATZ is operational Mon-Sun H24 and must be avoided. RAF Shawbury provides an excellent Flight Information Service.
b) An east-west entry and exit lane for helicopters from RAF Shawbury sits on the southern edge of Sleap's ATZ boundary at 1000 FT to 1500 FT. This should be avoided when possible.

2 GROUND MOVEMENT

a) **KEEP CLEAR AREA**: Aircraft should not be left on the fuel bay.

3 CAT II/III OPERATIONS

Not applicable.

4 WARNINGS

a) **Gliders**

i. At Sleap, aero-tow gliding may be operational at any time.
ii. At RAF Shawbury, during weekends and bank holidays, aero-tow gliding is operational.

b) **Aeromodels**

i. Remote controlled model aircraft may be operating at Sleap up to 400 FT QFE on the western end of disused Runway 28.

c) **Military Helicopters**

i. Aircraft should avoid RAF Shawbury's military helicopter entry and exit lane that runs east-west close to the south boundary of the Sleap ATZ at 1000 FT to 1500 FT QFE. Military helicopters using the lane do not monitor Sleap's A/G radio frequency.
ii. Military helicopter training may occur at Sleap. Military helicopters will always operate to the WEST of the active runway. Sufficient clearance of 75 M is to be given to landing and departing civil aircraft.

d) **CAA Low Flying Display Practice Authorisation**

i. The airfield operator holds an aerobatic and low flying exemption from the CAA permitting practice display flying below 500 FT QFE. Pilots of arriving and departing traffic will be informed by Sleap Air/Ground radio when practices are taking place. These flights will normally last only for a short duration and will be conducted only when prevailing traffic conditions suit.

e) **Wake Turbulence**

i. Sleap is often used by large and heavy Military Helicopters and produce Wake Turbulence. The wake turbulence requirements for light aircraft is an absolute minimum of a 4 mile separation. The A/G team will advise if there is large Military traffic in the circuit. If operating a large helicopter, please be mindful of wake in the vicinity of light aircraft.

f) **Out Of Hours Airfield Use**

i. Aircraft based at Sleap operate outside of published airfield operating hours, or by visitors on request.

5 HELICOPTER OPERATIONS

a) **Helicopter Arrival**

i. Helicopters inbound to Sleap can join on direct track at 600 FT QFE, without crossing the active runway. Give way to fixed wing traffic on finals and military helicopter traffic.
ii. Alternatively, helicopters may join the fixed-wing circuit.
iii. Helicopters requiring fuel should liaise with the ops staff regarding best parking and shut down location. Fuel hoses are 20 M (60 FT) long, so there is no need to park too close to the pump.
iv. Helicopters parking should consider downwash and tail rotor safety, clear of fixed-wing aircraft and access to taxiways and grass aprons.

v. Rotors running refuels on request via 01939-232882, Ext 6.
vi. For all helicopter procedures visit www.shropshireaeroclub.com/heli.

b) **Helicopter Departure**

i. Departure should be at 600 FT QFE on track until 2 NM radius away from Sleap, or departing in accordance with the active runway and fixed-wing circuit.

6 USE OF RUNWAYS

Not applicable.

7 TRAINING

a) Shropshire Aero Club operates a designated training organisation for ab-initio flying training, night ratings and aerobatics. There is an approved training organisation for commercial pilot's licences, multi engine piston and instrument rating training.

EGCV AD 2.21 NOISE ABATEMENT PROCEDURES

a) Adjust circuit to avoid over flying local villages and towns, particularly Wem, Clive, Loppington, Noneley, Burlton and Ruewood.
b) On departure from Runway 36 turn right 10 degrees to avoid houses in Noneley village.

EGCV AD 2.22 FLIGHT PROCEDURES

1 ARRIVAL PROCEDURES

a) PPR is required by phone or online (shropshireaeroclub.com/fly-in).
b) When RAF Shawbury is operating, contact Shawbury Zone (133.155) before contacting Sleap. Once within visual with the airfield, or Shawbury Zone advises, contact Sleap Radio for airfield data and traffic information. Aircraft inbound to Sleap will normally be requested by Shawbury Zone to fly not below 2500 FT QNH to keep above busy helicopter traffic.
c) It is advised to join from the south via the Montford Bridge (Disused AD) VRP, or from the north via the Ellesmere Lake VRP.
d) Join the circuits from the overhead where possible, remaining inside the ATZ.
e) When display flying practice or aerobatics is operational, arriving traffic must not fly overhead the airfield within a 2 NM radius. Instead, arriving aircraft should join the circuit downwind at 1000 FT QFE.
f) Gyroplane pilots are required to read the specific gyro procedures before their arrival. For more details, please visit www.shropshireaeroclub.com/fly-in or call 01939-232882, extension 1.

2 DEPARTURE PROCEDURES

a) When RAF Shawbury is operating, aircraft should contact Shawbury Zone on 133.155 after leaving Sleap's ATZ.
b) Aircraft **must** always avoid RAF Shawbury's ATZ unless they are in two-way communication and have been given clearance by Shawbury Zone (133.155).

3 CIRCUITS

a) Circuit height is 1000 FT QFE for fixed-wing powered aircraft.
b) Circuit height is 800 FT QFE for gyrocopters and flown inside of fixed-wing circuit.
c) Civil helicopters should fly at 600 FT QFE within Sleap's ATZ, or join the fixed-wing circuit.
d) Monday to Friday, all circuits flown by fixed-wing powered aircraft shall be EAST of the airfield meaning left hand on Runways 18 and 23 and right hand on Runways 36 and 05.
e) On Saturdays, Sundays and Bank Holidays, the direction flown by fixed-wing powered and gyrocopter aircraft shall be left hand circuit.
f) On Saturdays, Sundays and Bank Holidays, gliders shall fly right hand circuit.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGHI — SOUTHAMPTON

EGHI AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGHI — SOUTHAMPTON

EGHI AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 505701N Long: 0012124W Mid point of Runway 02/20.
2	Direction and distance from city	3.5 NM NNE of Southampton. 1 NM SE of Eastleigh.
3	Elevation / Reference temperature / Mean Low Temperature	44 FT / 19 °C / -
4	Geoid undulation at AD ELEV PSN	152 FT
5	Magnetic Variation / Annual Change	0.97°E (2027) / 0.17°E
6	AD Administration Address Telephone AFS	SOUTHAMPTON INTERNATIONAL AIRPORT LTD. Southampton Airport, Southampton SO18 2NL. 023-80627102 (Airport Control Centre) EGHIZPZX.
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	Aerodrome not normally available to aircraft unable to communicate with ATC by radio.

EGHI AD 2.3 OPERATIONAL HOURS

1	AD Administration	Mon-Sat 0630-2200 (0530-2100); Sun 0730-2200 (0630-2100). PPR until 2300 (2200).
2	Customs and immigration	As AD hours.
3	Health and sanitation	-
4	AIS Briefing Office	As AD hours. Self briefing.
5	ATS Reporting Office (ARO)	As AD hours.
6	MET Briefing Office	As AIS Briefing hours.
7	ATS	As AD hours. See also AD 2.18.
8	Fuelling	As AD hours.
9	Handling	Mandatory by arrangement with handling agents.
10	Security	H24
11	De-icing	By arrangement with Swissport Handling.
12	Remarks	Operational Hours: Hours subject to change, consult latest NOTAM. Aerodrome/ATC hours may be extended by arrangement. Requests for extension of aerodrome hours must be made to the Airside Duty Manager, Tel: 023-80627113. Air Ambulance operations are based adjacent to the airport Alpha Taxiway and will operate outside of published aerodrome hours. These out of hours operations will use a dedicated FATO and TLOF facility not associated with the normal airport operations. Refer to AD 2.20 item 1.

EGHI AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Facilities available for handling weights up to 4 tonnes by prior arrangement with handling agent. Nearest railway siding, Eastleigh, Hants, 1 NM
2	Fuel and oil types	AVTUR JET A-1 Shell 750 turbine grades.
3	Fuelling facilities/capacity	Bowser. maximum delivery rate (JET A-1) 6.5 lts per second.
4	De-icing facilities	By arrangement with Swissport Handling.
5	Hangar space for visiting aircraft	Prior arrangement with Signature Flight Support, Tel: 0330-0271276, and JetWorks, Tel: 023-81290777.
6	Repair facilities for visiting aircraft	-

7	Remarks	Handling Agencies are: Signature Aviation, Tel: 023-80616600, SITA: SOUGFCR. Swissport, Tel: 023-80627272 or 023-80627147 or 07815-147809. SITA: SOUOOXH.

EGHI AD 2.5 PASSENGER FACILITIES

1	Hotels	Unlimited within 4 NM of the aerodrome. Limited adjacent to the aerodrome.
2	Restaurants	Restaurant and bar. In terminal building.
3	Transportation	Buses, taxis, car hire, trains. Nearest railway station, Southampton Airport (Parkway), 100 M from terminal building.
4	Medical facilities	Limited first aid treatment provided by aerodrome operator, requests for assistance to Airport Fire Service, Tel: 023-80627222.
5	Bank and Post Office	-
6	Tourist Office	-
7	Remarks	-

EGHI AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A6 RFF Category 6 available Mon-Sat 0610-0630 (0510-0530); Sun 0655-0730 (0555-0630). Aircraft to call on Tower frequency for emergency response only. RFF Category 7 available by arrangement with the Airport Duty Manager. (2 hours notice normally required).
2	Rescue equipment	As required for RFF Category 7.
3	Capability for removal of disabled aircraft	Aircraft lifting capability available with 3 hours notice. Contact Airport Duty Manager, Tel: 023-80627113.
4	Remarks	-

EGHI AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Snow ploughs, brushes and movement area de-icing equipment.
2	Clearance priorities	Runway 02/20, Taxiway A, Taxiway B, Apron and airside roads.
3	Remarks	Braking action assessment by Grip Tester. Latest information from Airside Operations Tel: 023-80627102.

EGHI AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	STAND 5 Surface: Concrete NIL STANDS 2 TO 4 Surface: Brick, Block paving NIL STANDS 6 TO 14 Surface: Brick, Block paving NIL
2	Taxiway width, surface and strength	Taxiway A: 18 M Surface: Concrete and asphalt NIL Taxiway B: 18 M Surface: Concrete and asphalt NIL
3	Altimeter checkpoint location and elevation	Apron Stands 2-12, 38 FT AMSL.
4	VOR checkpoints	-

5	INS checkpoints	Holding Point A1: 505645.14N 0012139.09W. Holding Point B1: 505701.55N 0012129.96W. See Aircraft Parking/Docking Chart.
6	Remarks	Use of Taxiway Alpha, south of the apron between Alpha 1 and Alpha 2 is restricted to aircraft with a wingspan of 40 M or less.

EGHI AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	All CAT shall be marshalled on to stand by Airside Operations. Stands 2-14, surface stand markings. Illuminated stand designator signs. Stands 2-4 and 6-14. Nose-in parking Stands 2-14. Powerback operations are not permitted from Stands 5, 6, 7, 12, 13 and 14. Aircraft departing from Stands 13 and 14 are to push-back and then tow to holding point A6. APU equipped aircraft are to start engines at A6. Non APU equipped aircraft may start on stand but are to maintain ground idle power setting until at A6.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 02/20: Runway centre-line, designator, aiming points and touchdown zone markings, displaced threshold, side stripes. Taxiway light(s): Blue elevated taxiway edge lights. Runway guard lights and holding points.
3	Stop bars and runway guard lights (if any)	Holds A1 and B1.
4	Other runway protection measures	-
5	Remarks	Wind direction indicators located on the eastern side of the runway, 300 M from each threshold. 505644.53N 0012125.52W (LGTD); 505715.10N 0012108.49W (LGTD).

EGHI AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGHI AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of the aerodrome is subject to compliance with the provisions of a document entitled 'Conditions of Use'. Copies of this document are available on request to the aerodrome operator.

b) Use of aerodrome by General Aviation, Military and non-scheduled flights subject to prior permission via Handling Agent (refer AD 2.4) or Airside Operations 023-80627102.

c) Non Chapter 3 aircraft are not permitted to use the aerodrome.

d) Use of the aerodrome by certain jet aircraft in the 'medium/heavy' wake turbulence categories is prohibited. Advice may be obtained from the Airport Duty Manager, Tel: 023-80627113.

e) The operator of an aircraft carrying dangerous or hazardous cargo must notify the Airport Duty Manager, Tel: 023-80627113 prior to the arrival of the aircraft or before loading of cargo prior to departure from the aerodrome.

f) For safety and security reasons occupants of General Aviation aircraft are required to use airport ground transportation. After arrival crew and passengers are to remain at the aircraft until arrival of transportation. Departing crew and passengers are provided transportation from the Terminal Building to the aircraft.

g) The aircraft commander is to ensure that passengers and crew remain with the aircraft unless they are escorted.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

a) Southampton Airport is not equipped for CAT II/III operations, however Low Visibility Procedures are used to protect CAT 1 operations.

b) Low Visibility Procedures will commence when RVR/Met visibility falls to 1000 M or less.

4 WARNINGS

a) A Soft Ground Arrestor Bed is provided to stop aircraft in the event of an overrun on Runway 20. The bed, which is 73 M, is disposed symmetrically about the extended runway centre-line and is twice the runway width. The bed starts 19.5 M beyond the end of the paved surface.

b) Terrain induced turbulence is possible on approach to Runway 02, within 2 NM from touchdown, particularly when strong easterly winds occur.

c) Buildings induced turbulence is possible on approach to Runway 20, within 2 NM from touchdown, when strong surface winds occur.

d) Significant differences may occur between surface wind velocity reported by ATC and actual wind at approximately 200 FT AAL and above.

5 HELICOPTER OPERATIONS

a) All helicopters must land and take-off on the runway.

b) Air Ambulance operations are based adjacent to the airport Alpha Taxiway. During aerodrome operating hours they will use the runway in use. Outside of published aerodrome hours helimed operations will use a dedicated FATO and TLOF facility not associated with the normal airport operations. Pilot controlled aeronautical ground lighting will be in operation using a dedicated radio frequency.

6 USE OF RUNWAYS

Not applicable

7 TRAINING

a) Use of the aerodrome by training flights is subject to approval from Airside Operations, Tel: 023-80627102.

b) Training flights by helicopters may be permitted. All enquiries to Airport Duty Manager on 023-80627113.

EGHI AD 2.21 NOISE ABATEMENT PROCEDURES

a) Operators of all aircraft arriving or departing from the aerodrome are required to conform to the following procedures, as applicable, notwithstanding that at any time they may be departed from to the extent necessary for avoiding immediate danger or for compliance with instructions from ATC.

b) In order that the least possible noise disturbance is caused in areas surrounding the aerodrome, aircraft operators should ensure that at all times their aircraft conform to the noise abatement techniques laid down for that type of aircraft.

c) Arrivals
Following procedures apply to:

i. All turbo jet aircraft;
ii. all aircraft with a MTOW of 5700 KG or greater;

1. Aircraft flying an ILS approach should at no time descend below 1744 FT AMSL, 1700 FT AGL before intercepting the glide path.

2. Aircraft flying an instrument approach other than ILS, or those aircraft flying a visual approach, should not intercept the appropriate final approach track at a range less than 5 DME I-SN for RWY 20 and 4.7 DME I-SN for RWY 02, except that aircraft flying a visual approach via the downwind leg should not intercept final approach at less than 2 DME I-SN for RWY 20 or 3.7 DME I-SN for RWY 02.

3. Aircraft flying a visual approach should intercept the final approach track at a level not less than that equivalent to a 3° glide path at the intercept range. Final approach should be flown at not less than a nominal 3° glide path.

4. With the exception of the minimum ILS intercept level, nothing herein shall apply to an aircraft authorised by ATC to fly a circling instrument approach procedure.

d) Except as required during normal aircraft operations when flight is immediately intended, or as part of an after landing engine shutdown routine, engine ground running by aircraft is subject to strict control and is prohibited at certain times. Requests for approval must be made to the Airport Duty Manager, Tel: 023-80627113.

e) The operation of aircraft auxiliary power units or ground power units should be kept to a minimum consistent with safety.

f) Noise Abatement Procedures (NAP) specified herein are applicable to:

i. All turbo jet aircraft;
ii. all aircraft with a MTOW of 5700 KG or greater;

Take-off Runway	NAP
02	Climb straight ahead until 2.5 DME I-SN.
20	As soon as possible after passing 500 FT ALT, turn right to maintain a track 215 MAG until 2000 FT ALT.

g) The NAP specified in (f) may be varied by ATC except for aircraft that do not conform to the provisions of ICAO Annex 16, Vol 1, Chapter 3. If an ATC clearance requires a departure heading other than that specified in (f), the ATC specified heading supersedes that required by the appropriate NAP.

EGHI AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Unless flying a circling approach procedure, circuits shall normally be flown during daylight hours by propeller driven aircraft and helicopters at 1000 FT ALT and turbojet aircraft at 1500 FT ALT. All circuits flown at night shall be flown at 1500 FT ALT.

2 PROCEDURES FOR INBOUND AIRCRAFT

a) Standard Inbound Routes

Full routeings are published in the UK Standard Route Document (SRD). Aircraft inbound to Southampton from the ATS Route network will be routed on the designated Standard Arrival Routes. The Standard Arrival Routes are published in AD 2-EGHI-7-1/4.

b) Holding Procedures

Holding patterns are as follows:

Main Stacks	Holding
Southampton NDB(L) EAS (Lowest level 2000 FT ALT)	Holding axis 017° MAG turning right at the facility.

Main Stacks	Holding
SAM RNAV Hold (Lowest level 2000 FT ALT)	Please refer to RNAV Hold Coding Tables AD 2. EGHI 7-7 for details.
NEDUL RNAV Hold (Lowest level 4000 FT ALT)	Please refer to RNAV Hold Coding Tables AD 2. EGHI 7-7 for details.

3 PROCEDURES FOR OUTBOUND AIRCRAFT

a) The initial departures routes are shown below – full routeings are published in the UK Standard Route Document (SRD). These routes may be varied at the discretion of ATC (e.g. to offer more direct routeing when the traffic situation permits). **Pilots must adhere to the Noise Abatement Procedures (NAP) detailed in EGHI AD 2.21 before turning onto the specified route.**

*: see also UK Standard Route Document

Departing to	Runway	Via	Route*
North	02, 20	Q41	Q41 - NORRY **(Note 1)**
Northwest	02, 20	Y321/N14/Q63	Y321 - NUBRI - N14 - HEKXA/Y321 - NUBRI - DCT - KENET **(Note 1)**
East	02, 20	GWC	GWC
South	02, 20	Q41/Z171	NEDUL - Q41/Z171 **(Note 2)**
West **(Note 3)**	02, 20	FIR	As directed by ATC

Note 1: *Right turn from end of NAP Runway 20.*

Note 2: *Left turn from end of NAP Runway 02.*

Note 3: *There is no contiguous Controlled Airspace to the west of the Solent CTA. Departing aircraft intending to join the ATS Route network will leave controlled airspace at the Solent CTA boundary. Unless prior arrangements have been made by the aircraft operator with another ATS provider, the aircraft commander is responsible for obtaining a service outside controlled airspace.*

4 RADIO COMMUNICATIONS FAILURE PROCEDURES

a) In the event of complete radio communication failure in an aircraft, the pilot will adopt the appropriate procedure notified at ENR 1.1 paragraph 3.4.

b) The routes to be used when leaving the CTR in accordance with the procedures at ENR 1.1 paragraph 3.4 are shown in the table below; the route to be followed is dependent on the position of the aircraft at the time the decision to leave the Airspace is made.

Position at time of decision	Route
Southampton VOR/DME SAM	Track 295°(T)
Southampton NDB(L) EAS	Track 295°(T)

5 Flights Engaged in Instrument Route training - Flow Management Requirements

a) See EGHH AD 2.22, paragraph 4.

6 Visual Reference Points (VRP)

a) VFR traffic requesting transit of the Southampton CTR routeing west-east or east-west can expect clearance subject to traffic as follows:

West Route: Bishops Waltham VRP - Romsey VRP;
East Route: Romsey VRP - Bishops Waltham VRP.

b) Transit will be subject to ATC clearance.
c) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

7 Frequency Monitoring Code (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside Southampton CTR/Solent CTA, within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Solent Radar channel 120.230, are encouraged to select SSR code 7011.

511031N 0012021W - 510648N 0010232W -
505836N 0005856W - 504656N 0005626W -
503435N 0011753W - 503945N 0013529W -
504229N 0013301W - 505442N 0013925W -
510128N 0013420W - 511031N 0012021W.

b) Selection of 7011 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Southampton CTR/Solent CTA at all times.

c) Whilst squawking 7011 pilots should be aware that Solent Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.

d) When a pilot ceases to maintain a listening watch, code 7011 shall be deselected.

8 BISHOPS WALTHAM FLYING AREA

a) As detailed in EGHI AD 2.17, the Bishops Waltham Flying Area (BWFA) exists solely for the use of approved operators flying to and from Roughay Farm or Lower Upham aerodromes. The BWFA is active sunrise to sunset and approved aircraft operate within the confines of the BWFA up to 1500 FT, without communication with ATC at Southampton.

EGHI AD 2.23 ADDITIONAL INFORMATION

a) Solent/Southampton Radar and Southampton Tower may be provided as a combined function. Periods when active will be notified by ATIS. SRA not available.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 947
HEIGHTS IN FEET AGL (498)

SOUTHAMPTON

MINIMUM INITIAL ALTITUDE
Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is **2000** in the sector defined by the lateral limits; 504900N 0013734W - 510940N 0012608W thence clockwise by an arc of a circle radius 13NM centred on 505701N 0012124W to 510500N 0010510W - 504422N 0011645W thence clockwise by an arc of a circle radius 13NM centred on 505701N 0012124W to 504900N 0013734W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA
The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:
a) within 5NM of the aircraft, and
b) within the sector 15NM ahead of and within 20° either side of the aircraft's track.

LOSS OF COMMUNICATION PROCEDURES
Initial Approach
Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2000**, or last assigned level if higher to **NDB(L) EAS**†.
Intermediate and Final Approach
Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) EAS**†.
† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION
1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA. 5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. The ATC Surveillance service is provided by Primary and Secondary Radar equipment, or exceptionally by only Primary or Secondary Radar equipment.
7. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
8. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of instrument approaches other than SRA is cleared to intercept the final approach track.**

EGMC AD 2.3 OPERATIONAL HOURS

1	AD Administration	H24.
2	Customs and immigration	H24
3	Health and sanitation	-
4	AIS Briefing Office	Briefing services available for aircraft receiving handling from London Southend Jet Centre.
5	ATS Reporting Office (ARO)	Briefing services available for aircraft receiving handling from London Southend Jet Centre. Self-briefing/Pilot brief and limited telephone consultation available from Meteorological Observers in ATC.
6	MET Briefing Office	Briefing services available for aircraft receiving handling from London Southend Jet Centre.
7	ATS	H24. See also AD 2.18.
8	Fuelling	H24
9	Handling	Airline handling 0400-2359 (0300-2300), FBO handling H24.
10	Security	H24
11	De-icing	By arrangement. Contact: 07443-258705. LSA.de-icing@londonsouthendairport.com.
12	Remarks	Use of the airport between 2200-0630 (2100-0530), is subject to prior permission from ATC. This aerodrome is strictly PPR.

EGMC AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	Yes. Details through Southend Handling.
2	Fuel and oil types	AVTUR JET A1 91/91, AVGAS 100LL 91/90

3	Fuelling facilities/capacity	Jet A1 bowser 80,000 LT + 300,000 LT storage capacity. Avgas bowser 10,000 LT + 14,500 LT storage capacity.
4	De-icing facilities	Available by arrangement through Southend Operations.
5	Hangar space for visiting aircraft	Contact London Southend Jet Centre for hangar space/parking.
6	Repair facilities for visiting aircraft	Repair stations for a variety of fixed wing aircraft, contact Southend operations.
7	Remarks	Maintenance / Oxygen & Nitrogen servicing / Pre/Post flight inspection support. Email: MX@DunhillAviation.com Office: 01702-844902 Mobile: 07456-837458 and by arrangement with resident operators. Handling mandatory for all non-based civil aircraft with a MTWA of over 2.5 tonnes. London Southend Jet Centre H24 operating hours. Night time slot restrictions are in place for operations between 2300-0630 (2200-0530). London Southend Jet Centre: Tel: 01702-538600; E-mail: ops@londonsjc.com.

EGMC AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotel on Airport, 2 Hotels adjacent to Airport.
2	Restaurants	In hotel and fast food outlet adjacent to airport entrance.
3	Transportation	Trains, buses, taxis and car hire. Railway station (Southend Airport) adjacent to terminal.
4	Medical facilities	Limited first aid treatment.
5	Bank and Post Office	Post Office 1 mile.
6	Tourist Office	Limited information available.
7	Remarks	Business lounge and conference facilities available. Contact lsaenquiries@londonsouthendairport.com.

EGMC AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A7
2	Rescue equipment	Standard equipment for up to Category 7.
3	Capability for removal of disabled aircraft	Arranged through IATA pool for those with agreements in place, or through based firm that may support recovery: JRB engineering (Tel: 01702-545430).
4	Remarks	-

EGMC AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, Chemical de-icing.
2	Clearance priorities	Standard. See AD 1.2.2.
3	Remarks	Latest runway contamination information from ATC Tel: 01702-538420. Estimated braking action assessments and pilot reports may be passed.

EGMC AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	NORTH APRON AND STANDS 16-18 Surface: Concrete PCR 586/R/D/X/U STANDS 1-10 Surface: Concrete PCR 586/R/D/X/U STANDS 101 / 102 Surface: Concrete PCR 570/R/C/X/U STANDS 11-15 Surface: Concrete PCR 586/R/D/X/U
2	Taxiway width, surface and strength	Taxiway A: 15 M Surface: Asphalt PCR 537/F/D/X/U Taxiway B: 15 M Surface: Concrete and asphalt PCR 586/R/D/X/U Taxiway C: 15 M Surface: Concrete and asphalt PCR 537/F/D/X/U Taxiway D: 15 M Surface: Asphalt PCR 434/F/B/X/U Taxiway E: 5.5 M Surface: Asphalt - Taxiway F: 27 M Surface: Asphalt PCR 434/F/B/X/U Taxiway Z: 15 M Surface: Asphalt PCR 537/F/D/X/U
3	Altimeter checkpoint location and elevation	Stands 11-15 and North Apron 37 FT.
4	VOR checkpoints	-
5	INS checkpoints	See Aircraft Parking/Docking Chart.
6	Remarks	Taxiway Echo only available for code A aircraft with an outer main gear wheel span of less than 4.5 M. Aircraft under their own power, do so at owners risk. Code A aircraft with outer main gear wheel span of 4.5 M or greater will be towed along Taxiway Echo with prior approval.

EGMC AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Stands 1-10 are nose-in pushback stands and have painted centre-lines/stop arrows. Stands also have nose-out markings for aircraft up to E190 and under marshaller guidance. Stands 1-10 are fitted with AGNIS. The activation of the AGNIS is an indication to the Captain that the stand has been inspected and is clear of FOD and any obstacles. If the AGNIS is not switched on, the aircraft should hold its position on the adjacent taxiway until the AGNIS has been activated, or a marshaller is present. Stands 11-15, 16-18 and all other North Apron parking requires marshaller instruction. Stands 101 and 102 can accommodate aircraft up to B737-400. Aircraft are to be towed onto and off stand. Stands 1-6 maximum aircraft nose-in by span B737-700. Stands 7 and 8 maximum aircraft nose-in by span B737-800. Stands 9 and 10 maximum aircraft nose-in by span B737-900. On departure minimum power is to be used when taxiing off stand.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 05/23: Runway Designators; Runway 23: permanently displaced threshold, Runway 05: Starter extension markings and lighting (turning circle at start of Runway 05 has green centre-line lights and blue edge lights); runway edge stripes; runway centre-line; TDZ markings. Taxiway marking aid(s): Painted yellow centre-line with lead-on/lead-off lines at junctions with Taxiways A, B, C, D and F; holding points. Taxiway light(s): Internally illuminated holding point signs at Holds A1, A2, A3, A4, B1, B2, B3, C1, C2, D, Z1 and Z2. Amber runway guard lights at Holds A1, B1, C1, D, E and F. Taxiways E and F are unlit, night time use is entirely at the operator's discretion.
3	Stop bars and runway guard lights (if any)	Stop bars located at Runway Holding Points A1, B1, C1 & D are unidirectional; aircraft and vehicles are not to cross illuminated red stop bars except when an explicit ATC clearance has been received. Stop bars located at Intermediate Holding Points A2, A3, A4, B3, C2 and C3 are bidirectional, B2 is unidirectional. Intermediate Holding Point stop bars may not always be illuminated.
4	Other runway protection measures	-
5	Remarks	Two WDI Runway 05 (LGTD) 513400.38N 0004056.40E, Runway 23 (LGTD) 513425.74N 0004212.38E. Taxiway D may only be used with ATC approval.

EGMC AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGMC AD 2.11 METEOROLOGICAL INFORMATION PROVIDED

1	Associated MET Office	MET OFFICE HEATHROW
2	Hours of service MET Office outside hour	H24 -
3	Office responsible for TAF preparation Periods of validity	MET OFFICE HEATHROW 9 hours.
4	Trend forecast Interval of issuance	-
5	Briefing/consultation provided	Self-briefing/Pilot brief and limited telephone consultation available from Meteorological Observers in ATC.

6	Flight documentation Language(s) used	Charts abbreviated plain language text. TAFs/METARs. English.
7	Charts and other information available for briefing or consultation	Charts and other information available for briefing or consultation – Internet WIFI for ASXX, 215 Low Level SIG WX, 214 Spot Winds and Weather warnings.
8	Supplementary equipment available for providing information	ATIS 136.055 MHz.
9	ATS units provided with information	SOUTHEND
10	Additional information (limitation of service, etc.)	Hourly METAR at night. Only Touchdown and Stop end IRVRs available.

EGMC AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Pilots and aircraft operators operating into London Southend Airport are deemed to have read and accepted the London Southend Airport 'Terms and Conditions of Use', and to be operating in accordance with them. These are downloadable from: https://southendairport.com/corporate-and-community/doing-business-with-us.
b) Use by aircraft not able to communicate with ATC by radio subject to prior permission by telephone, 01702-538420.
c) Southend airport will not permit any fixed wing aircraft to embark or disembark passengers with any engine running, except in emergency.
d) High visibility clothing must be worn on the apron and manoeuvring area at all times, except for passengers under escort.
e) Operators are advised that a night surcharge applies to movements between 2300-0600 (2200-0500).
f) Any ad-hoc movements between 2200-0630 (2100-0530) must obtain prior permission from ATC by telephone +44 (0)1702-538420 prior to commencement of the flight. Filing a flight plan is not sufficient in this regard.
g) Crew and passengers walking to and from north and south aprons will do so following the green marked walkways.
h) This aerodrome is strictly PPR.

2 GROUND MOVEMENT

a) Not all taxiways are available for use by all aircraft types. A321 sized aircraft and larger shall not vacate the runway via Taxiway Bravo. All code D sized aircraft must have a follow me vehicle or be towed. ATC will advise. Taxiway Echo only available for code A aircraft with an outer main gear wheel span of less than 4.5 M. Aircraft under their own power, do so at owners risk. All flights operating from the north side of the airport will, to aid ATC situational awareness, request taxi clearance. Code A aircraft with outer main gear wheel span of 4.5 M or greater will be towed along Taxiway Echo with prior approval.
b) Taxiway Delta: Pilots are advised that there is no taxiway lighting guidance and that vehicles operate north of Holding Point Delta without clearance or knowledge. Wingtip clearance is not assured and pilots are to take extra care when taxiing. All flights operating from the north side of the airport will, to aid ATC situational awareness, request start, push back and taxi clearance. TP-D on Taxiway Delta signage reads Delta Tug Point (DTP).
c) Runway 05 – Aircraft able to accept a departure from intersection of Taxiways C or D should inform ATC on start–up or taxi. See AD 2.13 for intersection departure declared distances.
d) Jet aircraft are to apply minimum thrust when starting and taxiing off Stands 11-15, due to proximity of buildings and other aircraft.
e) GA Parking will be directed by ATC and the marshaller.
f) Crew are requested to use minimum engine power when manoeuvring on the aprons and taxiways.
g) Taxiway Delta has a longitudinal slope of 2%. Operators are to taxi with caution between Delta holding point and runway edge.
h) The Centralised De-icing Facility (CDF) located towards the southern end of Taxiway Bravo is the only location enabled for the remote de-icing of aircraft.
    i. Remote de-icing is available.
    ii. Remote de-icing operations may occur when snow is falling and accumulating and will be promulgated by Southend Operations.
    iii. When the CDF is "open" this will be broadcast on ATIS and full details are available via the Aerodrome Manual.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) It is a condition of operating at the airport that the operator accepts that St. Laurence Church and graveyard are permanent obstacles within the runway instrument strip and that they take account of them to the extent necessary to ensure a safe operation. Operators must refer to the airport conditions of use, and the pilots briefing pack on the LSACL website. Church roof is at 78 FT AMSL at 94 M from runway centre-line, spire at 114 FT AMSL, 105 M from runway centre-line at approximately 200 M north-east of Runway 05 threshold, lit with a single red obstacle light. Frangible fence around Church graveyard up to 9 FT AGL (56 FT AMSL), at closest 49 M from Runway centre-line. Operators should refer to obstacle data at AD 2.10 and charts at AD 2.24.

b) Low Visibility Operations will commence whenever the meteorological visibility is less than 2000 M and/or the cloud ceiling is less than 300 FT. The ATIS will advise when Low visibility procedures are in force.

A follow me vehicle may be provided as instructed by ATC.

Aircraft that require the use of Taxiway Delta should advise ATC at the earliest opportunity in order to facilitate timely removal of safety barriers.

c) Bird hazard: increased bird activity may be encountered on Runway 05 and 23 approaches during Spring and Autumn due to agricultural activity.

5 HELICOPTER OPERATIONS

a) Helicopter circuits as directed by ATC.
b) Helicopters must obtain specific clearance to cross the runway.
c) During Low Visibility Procedures any helicopter movements will be to/from the runway.
d) Helicopters not permitted between 2300-0630 (2200-0530). Exceptions are due to weather diversion; emergencies; when operated by or on behalf of HEMS/Hospital flights; the Military, the Police, or on Search and Rescue duties.

6 USE OF RUNWAYS

a) Variable circuits as instructed by ATC.
b) Circuit height 1000 FT AAL and 1500 FT AAL for aircraft 5700 KG or greater by day. All circuits 1500 FT AAL by night.
c) Operators attention is drawn to the possibility of localiser signal fluctuations due to the proximity of the Runway 05 localiser array to the runway. Landing aircraft vacating Runway 05 via Taxiway Alpha should endeavour to keep the aircraft in continuous motion until passing A1 Holding Point.

7 TRAINING

a) The following require prior permission from ATC by Tel: 01702-538420:

i. IFR Examination flights
ii. Circuit details
iii. Qualifying cross country flights - Inbound
iv. Instrument approach training.

b) A slot booking system operates for Instrument Approach training and circuit training details. Because of airspace limitations, pilots of instrument training flights must adhere to pre-booked times otherwise their flights may be delayed or curtailed. ATC are to be advised (prior to the time of the original slot) of any cancellations, or delays of 10 minutes or more.
c) In order to maximise capacity, it is preferred that instrument training flights accept radar vectors. Such flights requesting to enter the hold or to fly ‘non-radar’ instrument approaches may be refused or delayed to accommodate non-training traffic.

EGMC AD 2.21 NOISE ABATEMENT PROCEDURES

Operators of all aircraft using the aerodrome shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in the areas surrounding the aerodrome. The following procedures and routeings apply to all aircraft whether landing or taking off or making a missed approach in either VMC or IMC.

a) Aircraft of more than 5.7 tonnes Maximum Certified Weight:

i. When departing Runway 05 shall climb straight ahead until a range of 1 DME (I-SO or I-ND) **and** an altitude of 1500 FT is reached before turning;
ii. When departing Runway 23 shall climb straight ahead until a range of 2.5 DME (I-SO or I-ND) **and** an altitude of 1500 FT is reached before turning;
iii. Aircraft of more than 5.7 tonnes weight intending to operate at below 1500 FT altitude shall conform to the DME distances above before commencing any turn on track.

b) Between 2300-0630 (2200-0530), noise limits, noise quotas and limitations on the number and types of aircraft accepted apply. Operators wishing to operate within this period must seek prior approval from 'London Southend Jet Centre’ +44(0)1702-538600; ops@londonsjc.com. Civil Helicopters not normally permitted.
c) The airport operates a Preferred Runway Usage Scheme as follows: Subject to over-riding Pilot and ATC safety/performance and separation requirements, whenever the tailwind component is 5 KT or less, the preferred runway for departures is Runway 05, and for arrivals is Runway 23. Between 2330-0630 (2230-0530) ATC will avoid using Taxiway C as much as is practically possible. Pilots should expect to enter and vacate the runway via alternative routes.
d) When making a visual approach to either runway, all aircraft of 5.7 tonnes or more AUW are to be established on the extended runway centre-line no later than reaching a range of 3 NM (3 DME) from the threshold of the runway in use and at a height not below the PAPI indicated approach slope. Thereafter aircraft shall follow a descent path not below a normal approach path as indicated by the PAPIs of 3.5° (RWY 05), 3° (RWY 23).
e) The routings and procedures specified above are compatible with normal Air Traffic Control requirements. In individual cases they may be varied by Air Traffic Control when necessary. The use of the procedures is supplementary to standard noise abatement take-off techniques as used by piston, turbo-prop and turbo-jet aircraft. Any of the above requirements may be departed from to the extent necessary for the avoidance of immediate danger.
f) Ground Running of Engines: Due to the close proximity of residential areas ground running of aircraft engines for maintenance purposes will not be permitted as follows:

i. Mon-Sat 2000-0800 (1900-0700)
Sat 1800 (1700) - Sun 0900 (0800)
Sun 1800 (1700) - Mon 0800 (0700)
Between 1055-1105 on the 11 November.
ii. No individual engine runs shall last more than 90 minutes. High power runs must be kept to the minimum necessary and in all cases less than 60 minutes duration.
iii. Ground running of aircraft engines for maintenance purposes is only permitted on Taxiways B and F, and requires authorisation by ATC on 01702-538420. Radio contact must then be established and maintained with ATC during the engine run. ATC is to be informed on each occasion when high power running ceases.
iv. APUs on passenger aircraft shall not be used for more than 30 minutes before departure or after arrival, this limit may be extended to 40 minutes when air temperature is less than minus 5° C, or more than 20° C. During stand re-positioning, the APU is not to be started prior to 10 minutes before the aircraft is moved.

EGMC AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR IFR FLIGHTS

a) **IFR Arrivals - Airways**

i. The standard routes for inbound aircraft via the ATS Route Network are detailed in the Standard Arrival Routes (STAR) shown at AD 2-EGMC-7-STAR Charts (and associated database coding tables).
ii. Pilots should ensure they have received the Southend ATIS prior to transfer to Southend by the airways sector.
iii. Pilots should expect radar vectoring to the runway in use; outside of the hours of radar operation, pilots should expect to route to the SND for a procedural approach to the runway in use.
iv. Arrivals from the north may be issued tactical routing via either of the points SABER, SND or GEGMU. Holding may be required at either SND or GEGMU.
v. Pilots should note that when flying the full procedural ILS/DME/NDB(L) RWY 05 or LOC/DME/NDB(L) RWY 05 that they should not exceed 10.3 DME I-SO in order to remain within CAS. On either runway, the ICAO primary protection areas of the base turn areas of the procedural ILS approaches are not wholly contained within CAS.

b) **IFR Departures – Airways Preferred Departure Routes**

i. The Standard Routes for outbound aircraft are shown in the table below. Revised clearances may be issued prior to departure for integration into the LTMA.
ii. The PDRs are not wholly contained within controlled airspace; ATC will seek to provide CAS containment by issuing tactical instructions.
iii. Pilots must adhere to the Noise Abatement Procedures detailed at EGMC AD 2.21 a (i) and (ii), which must be followed by aircraft of more than 5.7 tonnes Maximum Certified Weight before turning towards the first routing point listed in the PDR route (or before turning onto a radar heading, unless ATC have authorised otherwise).
iv. These routes do not constitute Standard Instrument Departure procedures and are not assessed for obstacle clearance.

Departing to	PDR Designator	Via	Routeing
Northeast	Clacton (CLN)	L608/L620	CLN (**Note 1**)
Southeast	Dover (DVR)	L9/L10/Q70	DET - DVR (**Note 1** and **Note 3**)
South & Southwest	Lydd (LYD)	M189	DET - LYD (**Note 1** and **Note 3**)
West	Compton (CPT)	Q63	EVNAS - LAM - BPK - HEN - CPT (**Note 2**)
North	Brookmans Park (BPK)	L10/N601	EVNAS - LAM - BPK (**Note 2**)

Note 1: *Cross first point in 'Route' level at altitude 3000 FT.*

Note 2: *Cross EVNAS at altitude 3000 FT. When established inbound to LAM climb to altitude 4000 FT.*

Note 3: *Information regarding the status of the Danger Area complex to the east of Southend (see chart AD 2-EGMC-4-1) are provided by ATC. When operating RWY 05, pilots are responsible for maintaining safe separation from the Danger Area complex and shall advise ATC prior to taking off if an alternative clearance is required.*

Flights to London TMA airfields, route in accordance with the UK and Ireland Standard Route Document.

c) **IFR Flights Routing Outside CAS**

i. Arrivals and Overflights are to establish communications with ATC at least 5 minutes prior to the boundary of Southend CTA/CTR whenever possible, stating what type of ATC service they request whilst outside CAS. Pilots should be aware that IFR clearances to enter Southend CAS may be lower than the published upper levels due to the interface with LTMA traffic.
ii. IFR Departures planning to leave Southend CAS that have not filed a flight plan are required to book out either with the FBO in person or via telephone, or with ATC via telephone. Pilots will be expected to supply their initial track or routing and the service they may require outside CAS.

2 RADIO COMMUNICATIONS FAILURE PROCEDURES

a) **IFR Flights**

In the event of complete radio communication failure in an aircraft, the pilot is to adopt the appropriate procedure described at ENR 1.1 sub-section 3.4, then:

i. Inbound aircraft - follow the Southend STARs and proceed as below:

1. SPEAR arrivals from the north and northwest: Leave MAYLA direct SND descending to 3000 FT level by the SND and carry out an ILS approach to Southend.
2. GEGMU arrivals from the east and south - Runway 23: Leave GEGMU and carry out an ILS approach to Runway 23.
3. GEGMU arrivals from the east and south - Runway 05: Leave GEGMU direct SND descending to 3000 FT level by the SND and carry out an ILS approach to Runway 05.
4. Unless advised by ATC, pilots shall regard Danger Areas D136/D138/D138A/D138B as active and shall avoid them accordingly.

ii. Outbound aircraft

1. For the purposes of radio failure, the climb to flight planned level should be commenced after the last position shown in the Preferred Departure Routes where an altitude is specified.

b) **VFR Flights**

The procedures to be adopted by pilots experiencing two-way radio communication failure, inside Southend CAS, are:

i. If suitably equipped, operate the Transponder on Mode A, Code 7600 with Mode C.
ii. If it is believed that the radio communication transmitter is functioning, transmit blind giving position reports, stating intentions and proceed as follows:

1. Aircraft inbound to an aerodrome in the CTR - proceed in accordance with VFR clearance to the aerodrome and land as soon as possible. When in aerodrome traffic circuit watch for visual signals;
2. Aircraft transiting the CTR - continue flight not above the cleared altitude to leave the CTR by the most direct route, taking into account weather limitations, obstacle clearance.

Note: *In (1) and (2), if flying on a heading advised by radar, when radio communication failure occurs, resume own navigation and carry out the appropriate procedure described.*

If entry into Southend CAS has been received but two-way radio communication failure occurs outside controlled airspace, pilot is to remain outside controlled airspace. In all cases notify ATC as soon as possible after landing.

3 IFR HOLDING

a) The holding pattern 'SND' is located overhead the airport NDB. Below 3000 FT it is only available for Category A to C aircraft. The lowest available hold for Category D aircraft at the SND is 3000 FT.
b) Holding pattern 'GEGMU' at 4000 FT and 5000 FT. D138A and B are in close proximity to the hold.
c) London Control may instruct use of alternative holding facilities for traffic inbound to Southend – this will usually be at reporting points SANDY (from the south), LOGAN (from the east or north) or LOREL (from the northwest).

4 PROCEDURES FOR VFR FLIGHTS

a) VFR flight in the CTR/CTAs will be given a routing, and where necessary, altitude instructions in order to integrate with other flights.
b) Pilots should anticipate routing instructions in relation to the Visual Reference Points (VRPs) detailed in paragraph 6.
c) Pilots of VFR flights are reminded of the requirement to remain in VMC at all times and to advise ATC if at any time they are unable to comply with the level or routing clearance as issued.
d) **VFR Arrivals and Overflights**

i. Arrivals and overflights are advised to establish communications with Southend Approach at least 5 minutes prior to ETA for the Southend CTA/CTR boundary.
ii. Pilots wishing to make a Standard Overhead Join are to request this on initial contact.
iii. Pilots are advised that instrument approaches and departures may on occasion be flown that do not conform to the runway in use.

e) **VFR Departures**

i. If a flight plan has not been filed pilots are required to book out with the FBO or ATC via telephone and not on the RTF. Pilots will be expected to supply their initial track or routing.

5 SPECIAL VFR FLIGHT

a) Clearance may be requested for Special VFR flight in IMC or at night within the Southend Control Zone and will be given whenever the traffic situation permits. These flights are subject to the general conditions laid down for Special VFR flights (ENR 1.2 refers).
b) Special VFR clearance will include routing and maximum altitude instructions. Pilots holding a Private Pilots Licence (Aeroplanes) are reminded of the visibility requirements of Special VFR flights.
c) Pilots are reminded that when operating on Special VFR clearance, they must at all times remain clear of cloud and with the surface in sight and in flight conditions which will enable them to determine their flight path and keep clear of obstacles.
d) Radar vectoring will not normally be applied to aircraft operating on a Special VFR clearance. Pilots are reminded that a Special VFR clearance applies only to flights within the CTR and does not extend to flight within the surrounding airspace.
e) Pilots operating under SVFR should be aware that aircraft may be flying VFR within the Stoke LFZ (see 7(a)). Pilots will be provided with generic traffic information.

6 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

7 FIXED WING, HANG-GLIDING, PARAGLIDING AND MICROLIGHT ACTIVITY - SOUTHEND CTR/ CTA

a) **Stoke LFZ** Microlight and fixed wing activity takes place under VFR during daylight hours at an unlicensed aerodrome at Middle Stoke. Use of the Stoke LFZ is strictly controlled by a Letter of Agreement (LOA) between Southend and the Aerodrome Operator. The Stoke Local Flying Zone (LFZ) is defined as the airspace from the surface up to 1500 FT AMSL (based on Southend QNH or Stoke QFE) including that portion of the Southend CTR defined by straight lines between the following co-ordinates: 512853.8068N 0003829.4708E - 512840.8108N 0004044.2613E - 512820.4312N 0004212.9641E - 512718.6516N 0003955.1293E - 512700.6588N 0003629.8230E thence clockwise by the arc of a circle radius 7.5 NM centred on 513357.327N 0004059.963E to 512730.17N 0003454.14E - 512852.75N 0003756.66E - 512853.8068N 0003829.4708E. The Stoke LFZ is Class D airspace.

Pilots operating to or from Stoke must be fully briefed by Medway Microlights and must comply with the Stoke LFZ LOA.

Generic traffic information will be provided to aircraft in communication with Southend as appropriate.

b) Para-motors and powered para-gliders sometimes operate during daylight hours under VFR in an area to the west of Canewdon from the surface to 800 FT AMSL. This area is within the Southend CTR and is defined by straight lines between the co-ordinates: 514053N 0004239E (CTR boundary) - 513659N 0004218.50E - 513658N 0004207E - 513852.50N 0003811E (CTR boundary). Traffic information will be provided when necessary. Contact Southend Airport ATC for further information.

c) Sports and Recreational Aviation activity sometimes operate during daylight hours under VFR at the following unlicensed private sites located within the Southend CTR:

Barling - 513407N 0004742E
St. Lawrence - 514124N 0004914E
Tillingham - 514133N 0005222E

Entry clearance to the Southend CTR must be obtained from Southend Approach/Radar via RTF.

8 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside the Southend controlled airspace within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Southend Radar frequency, 130.780 MHz, are encouraged to select SSR code 5050.

515805N 0005802E - 515547N 0010701E -
515903N 0012302E - 515222N 0012635E -
513905N 0012500E - 512010N 0011421E -
511217N 0002018E - 513630N 0001545E -
515805N 0005802E

b) Selection of 5050 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the Southend controlled airspace at all times.

c) Whilst squawking 5050, pilots should be aware that Southend Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.

d) When a pilot ceases to maintain a listening watch, code 5050 shall be deselected.

EGMC AD 2.23 ADDITIONAL INFORMATION

1 MODE S BAROMETRIC PRESSURE SETTING DATA

a) London Terminal Control has the ability to downlink Mode S Barometric Pressure Setting (BPS) data. Therefore, if the downlinked pressure data is at variance with the BPS expected by Air Traffic Control, pilots can expect additional challenge. When Air Traffic Control pass a reminder of the appropriate BPS, it is anticipated that the aircrew will cross check the altimeter settings and confirm set.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1305
HEIGHTS IN FEET AGL (591)

SOUTHEND

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **1700** in the sector defined by the lateral limits; 513252N 0001957E - 514659N 0003625E - 515056N 0010848E - 514222N 0011113E - 512442N 0005738E - 513249N 0004421E - 512933N 0003123E - 513218N 0002817E - 513252N 0001957E.

b) **1900** in the sector defined by the lateral limits; 512907N 0001535E - 513252N 0001957E - 513218N 0002817E - 512933N 0003123E - 513249N 0004421E - 512442N 0005738E - 511909N 0005324E - 511801N 0003025E - 512907N 0001535E.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2000**, or last assigned level if higher to **NDB(L) SND**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) SND**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of NDB SND.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
7. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of instrument approaches other than SRA is cleared to intercept the final approach track.**

DESCENT PLANNING
Pilots should plan for possible clearance as detailed in the table above.
ACTUAL DESCENT CLEARANCE WILL BE AS DIRECTED BY ATC.
WARNING
For Minimum Descent Rate requirements See ENR 1.1.3.2.
WARNING
Do not proceed beyond SPEAR without ATC clearance.
GENERAL INFORMATION
1 Standard Routes may be varied at the discretion of ATC.
2 Adhere to maximum speed limits where specified by waypoint constraints.
3 Maximum 250KIAS below FL100 unless authorised by ATC.
4 Aircraft may be instructed "Direct to" (waypoint) following radar vectoring.
5 En route holding may be required at HON, BOMBO or LOGAN as directed by ATC. Aircraft holding at LOGAN shall expect to be re-cleared on SUMUM 1S from LOGAN (see AD 2 EGMC 7-1).

CHANGE (11/26): SPECIFICATION UPDATE.

AERO INFO DATE 03 AUG 26 AD 2-EGMC-8-8

EGSY — ST ATHAN

EGSY AD 2.1 AERODROME LOCATION INDICATOR AND NAME

EGSY — ST ATHAN

EGSY AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 512417N Long: 0032609W RWY 07/25 intersection with Taxiways E and F.
2	Direction and distance from city	10 NM WSW of Cardiff city.
3	Elevation / Reference temperature / Mean Low Temperature	164 FT / 20 °C / -
4	Geoid undulation at AD ELEV PSN	169 FT
5	Magnetic Variation / Annual Change	0.24°E (2027) / 0.18°E
6	AD Administration	CARDIFF INTERNATIONAL AIRPORT ON BEHALF OF THE WELSH GOV.
	Address	Aerodrome Manager, Dragon Way, Bro Tathan West, St Athan, Barry, CF62 4AF.
	Telephone	01446-243901 Aerodrome Manager 01446-243940 ATC 01446-243943 ATIS
	E-mail address	stathan.ops@cwl.aero
	Web address	www.cardiff-airport.com
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	IFR Arrivals and Departures, VFR and SVFR see AD 2.22 item 6.

EGSY AD 2.3 OPERATIONAL HOURS

1	AD Administration	0900-1700 (0800-1600) PPR H24. Extension of hours by prior arrangement.
2	Customs and immigration	By arrangement.
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	-
7	ATS	As AD hours. Extension of ATC hours by prior arrangement.
8	Fuelling	AVGAS 100LL available 0830-1700 (0730-1600). Jet A1 available 0830-1700 (0730-1600).
9	Handling	By prior arrangement with on-site based operators.
10	Security	On request by prior arrangement.
11	De-icing	-
12	Remarks	This aerodrome is strictly by PPR via Airfield Operations by telephone Monday-Friday on 01446-243903 or via email stathan.ops@cwl.aero. For weekends and Bank Holidays, by telephone to our Fire Team on 01446-243912.

EGSY AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	-
2	Fuel and oil types	JET A-1, AVGAS 100LL
3	Fuelling facilities/capacity	Bowsers: 2 x 5000 LT AVGAS. 1 x 17,400 LT JET A-1, 1 x 17,000 LT JET A-1.
4	De-icing facilities	-
5	Hangar space for visiting aircraft	Limited, by arrangement.
6	Repair facilities for visiting aircraft	Caerdav. Horizon Aircraft Services and eCube.
7	Remarks	All visiting aircraft require to be sponsored by one of the resident AD organisations.

EGSY AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels in the vicinity.
2	Restaurants	-
3	Transportation	Limited.
4	Medical facilities	Limited.
5	Bank and Post Office	-
6	Tourist Office	-
7	Remarks	-

EGSY AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A4 Category 5, 6 or 7 by 48 hours prior arrangement.
2	Rescue equipment	-
3	Capability for removal of disabled aircraft	Will be supported by onsite handler/host co-ordinated with Cardiff Airport.
4	Remarks	-

EGSY AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	-
2	Clearance priorities	Taxiway Bravo, Runway 07/25 from intersection with Taxiway Foxtrot to the Runway 07 threshold, Taxiway Alpha from the Runway 07 threshold/HP A1 to intersection with Taxiway Foxtrot.
3	Remarks	Anti-iced with KC Potassium acetate fluid.

EGSY AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	ALPHA Surface: Concrete and asphalt PCR 197/F/A/X/U CHARLIE Surface: Concrete PCR 311/R/C/W/U ECHO Surface: Concrete PCR 168/R/C/W/U ENGINE RUNNING PLATFORM Surface: Concrete PCR 379/R/C/W/U KILO 1 Surface: Concrete PCR 350/R/B/W/U MAINTENANCE AREA C Surface: Concrete PCR 290/R/B/W/U MAINTENANCE AREA E Surface: Concrete PCR 379/R/C/W/U MAINTENANCE AREA G Surface: Concrete and asphalt PCR 213/F/B/Y/U

		Taxiway BRAVO: 10.5 M Surface: Asphalt PCR 119/F/B/X/U Taxiway CHARLIE: 15 M Surface: Concrete and asphalt PCR 290/R/B/W/U Taxiway DELTA: 15 M Surface: Asphalt PCR 143/F/C/Y/U Taxiway ECHO: 23 M Surface: Asphalt PCR 343/F/C/X/U Taxiway FOXTROT: 23 M Surface: Asphalt PCR 253/F/A/X/U Taxiway GOLF: 15 M Surface: Concrete and asphalt PCR 213/F/B/Y/U Taxiway HOTEL: 15 M Surface: Asphalt PCR 143/F/C/Y/U
3	Altimeter checkpoint location and elevation	-
4	VOR checkpoints	-
5	INS checkpoints	-
6	Remarks	No lighting provided for night operations on Apron Alpha, Apron Echo and Maintenance Area Echo.

EGSY AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Yellow taxiway markings and parking slot guidance on Apron Echo. There are no aircraft stands or stand markings. Aircraft marshalling is mandatory on Apron Alpha, Apron Charlie, Maintenance Area Echo, and the ecube and Caerdav demised areas.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 07/25: Runway designation, runway threshold, runway centre-line, touchdown zone markings. Taxiway marking aid(s): Blue edge lights on Taxiway Alpha, Bravo, Charlie and Echo to holding point E. Blue edge lights on Apron Kilo 1 and Apron Charlie.
3	Stop bars and runway guard lights (if any)	Runway guard lights are positioned at Holding Points A1, A6, C, D, E, F, G and H.
4	Other runway protection measures	-
5	Remarks	There are 2 illuminated WDIs to the south of Runway 07/25, adjacent to the runway threshold markings.

EGSY AD 2.10 AERODROME OBSTACLES

Obstacle data is provided as Digital Datasets in XML (AIXM) and CSV formats via the NATS AIS Website at http://www.nats.aero/ais/datasets.

Further information on UK Digital Datasets can be found in GEN 3.1.6.

EGSY AD 2.11 METEOROLOGICAL INFORMATION PROVIDED

1	Associated MET Office	MET OFFICE EXETER
2	Hours of service MET Office outside hour	H24 -

3	Office responsible for TAF preparation Periods of validity	MET OFFICE EXETER 9 Hours
4	Trend forecast Interval of issuance	-
5	Briefing/consultation provided	Self-briefing / Telephone.
6	Flight documentation Language(s) used	TAFs/METARs. English.
7	Charts and other information available for briefing or consultation	Available on the met office website www.metoffice.gov.uk/aviation.
8	Supplementary equipment available for providing information	St Athan ATIS available by telephone on 01446-243943.
9	ATS units provided with information	ST ATHAN
10	Additional information (limitation of service, etc.)	Unverified automatic met observations on ATIS (130.560 MHz) or by telephone (01446-243943) outside of aerodrome/ATC hours.

EGSY AD 2.19 RADIO NAVIGATION AND LANDING AIDS

Type of Aid CAT of ILS/MLS MAG Var/VOR Declination	Ident	Frequency	Hours of Operation	Position of transmitting antenna coordinates	Elevation of DME transmitting antenna	Remarks
1	2	3	4	5	6	7
ILS/LOC I 0.24°E (2027)	ISAT	111.150 MHz	HO	512407.66N 0032658.28W	-	(RWY 25) There is no hold associated with a Missed Approach (MAP) from the ILS at St Athan. In the event of a normal MAP the aircraft will climb ahead to 4000 FT or as directed by Radar and contact Cardiff approach on 119.155 MHz and either be vectored for a further ILS approach at St Athan or diverted to the aircraft captain's nominated diversion aerodrome. An aircraft may not fly an ILS at St Athan if the runway at Cardiff is closed or the Cardiff NDB has failed or unavailable. Runway Closure or NDB failure will be NOTAM'ed, notified on the Cardiff ATIS or passed to the aircraft by the controller.
ILS/GP	ISAT	331.550 MHz	HO	512421.80N 0032530.07W	-	(RWY 25) Pilots may not receive full fly up indications when left of centreline below glidepath.
DME	ISAT	48Y 111.150 MHz	HO	512421.85N 0032530.27W	146 FT	Frequency paired with ILS ISAT.

EGSY AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use governed by regulations applicable to Cardiff CTR and Cardiff Airport.
b) Terms and Conditions of use of aerodrome available from Airport Operations.
c) PPR. Visiting civil aircraft must book in with the aerodrome based operator who is acting as their sponsor.
d) Ground running of aircraft engines for test or maintenance purposes is permitted between the hours of 0800-2000 (0700-1900) only. ATC require prior notification and additionally ATC prior approval required if conducted outside an operator's demised area. Operators should advise whether, during airfield operating hours, attendance of the Aerodrome Fire Service is required for the duration of the engine run. Outside airfield opening hours, no later than 2000 daily, unless it is an urgent operational requirement, prior permission of the Airfield Manager/Deputy Airfield Manager must be sought by calling 07436-803400 or 07776-649158. In either case, if a full engine ground run is to be conducted on maintenance area northside, or Point Charlie utilising the Jet Blast Efflux Deflector Barrier an email must be sent to the Aerodrome operator (including AML) by the maintenance organisation at least 2 hours prior to EGR taking place to inform them of the anticipated times. Engine Ground Runs (EGR) must be conducted in accordance with company risk assessments and a safety assessment by the Airfield Authority. Risk assessments must be made available to the airfield operator.
e) Non-radio aircraft not permitted.
f) High-visibility clothing MUST be worn airside.
g) Aerodrome not available when MET visibility is less than 1500 M, other than for emergency service helicopters.

2 GROUND MOVEMENT

a) Departing aircraft, on first contact with St Athan ATC, must state aircraft location, type and the code letter of the latest ATIS received. Pilots of departing aircraft are reminded to contact St Athan Tower for clearance 10 minutes before start up.
b) Aircraft larger than B757-200 series and A321 series will be pushed back onto the departure runway threshold prior to departure and towed off the runway after landing.
c) Commanders of aircraft that cannot backtrack on the runway and if unable to vacate at the taxiway Echo turn off on landing, should advise ATC and their sponsor organisation prior to arrival.
d) Wheel to taxiway edge clearances not assured on entrances to southside hangars from Taxiway 'A'.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) St Athan is located 3 NM West of Cardiff Airport within the Cardiff CTR. By arrangement with Cardiff ATC during St Athan ATC hours of operation, and subject to conditions detailed in EGSY AD 2.22 Flight Procedures, flights by St Athan based aircraft may take place in VMC without reference to Cardiff ATC within a Local Flying Zone (LFZ).
b) Helicopter activity (SAR and Police) conducted H24.
c) Uncontrolled vehicular traffic may be encountered on the airfield outside ATC operational hours.
d) Runway 25 in strong north westerly winds, turbulence may be encountered on short finals.

5 HELICOPTER OPERATIONS

a) SAR and Police helicopters operate H24. Aircrew are to make Callsign 'Blind RT calls' on 122.865 MHz when taxiing, departing and arriving out of airfield operating hours.
b) Helicopter traffic arriving and departing outside ATC operational hours are to contact Cardiff Tower on 133.105 MHz to obtain clearance into Controlled Airspace and make 'blind calls' in accordance with paragraph 5(a).
c) Two Helicopter Training Areas (HTAs) delineated by white markers at the corners of the HTAs are established for the use of SAR and Police helicopters.
d) Visiting helicopters are to arrive and depart to/from the runway.

6 USE OF RUNWAYS

a) Aircraft taxiing from the north of the runway can expect to back track on the runway when so cleared by ATC.
b) Aircraft larger than B757-200 require push back off the runway after landing if the landing roll is beyond intersection with Taxiways E and F. This may result in delays until the runway is vacated.

7 TRAINING

a) Visiting aircraft wishing to conduct circuit training at St Athan require an airspace brief by Air Traffic Control before commencing any circuit training details.
b) All aircraft wishing to carry out instrument training within the Cardiff Zone, must have a functioning transponder with Mode C.
c) All IFR training in Cardiff CTR/CTA subject to PPR from Cardiff Approach. Operators wishing to conduct radar vectored ILS approaches to St Athan should do so utilising the web booking form ensuring they specify St Athan https://instrumenttraining.as.me/.
d) Operators must also apply for PPR as well as completing the booking form. For PPR email stathan.ops@cwl.aero or ring 01446-243901/02.

EGSY AD 2.21 NOISE ABATEMENT PROCEDURES

a) Avoid overflight of St Athan village south east of the aerodrome below 1500 FT or 1700 FT QNH.

EGSY AD 2.22 FLIGHT PROCEDURES

1 GENERAL INFORMATION

a) Attention is drawn to the close proximity of Cardiff Airport (3 miles east of St Athan).
b) Approach Radar services are provided by Cardiff Airport ATC.
c) Military operators wishing to conduct unusual air activity on the aerodrome (e.g. TALO, fast roping) should request prior permission from the Aerodrome Manager Contact Tel: 01446-243901.

2 CIRCUIT DIRECTION

a) Runway 07 Right hand circuits.
b) Runway 25 Left hand circuits.

3 CIRCUIT HEIGHTS

a) Light piston aircraft: 800 FT QFE.
b) All other types (Fast Jets, large multi-engine turbine and piston): 1300 FT QFE.
c) Glide Circuit height: 1500 FT QFE.
d) Low level circuit height: 500 FT QFE.
e) No RT/Total electrical failure: 600 FT QFE.
f) When circuit flying is taking place involving mixed military and civil aircraft, civil circuits are to be flown.

4 ST ATHAN LOCAL FLYING ZONE

a) A portion of Cardiff CTR is delegated to St Athan ATC during certain VMC weather criteria to enable St Athan to operate autonomously within the St Athan Local Flying Zone (LFZ), (see EGSY AD 2.17 ATS Airspace) provided:

i. Aircraft are to be in communication with and comply with instructions from St Athan ATC.
ii. All aircraft are to conduct their flights within the weather criteria specified for VFR flights within Class D Airspace.
iii. Maximum Altitude 1,700 FT St Athan QNH (1,500 FT St Athan QFE).

b) Pilots operating in the LFZ are responsible for maintaining their own visual separation from other aircraft, including aircraft on final approach to Cardiff Runway 12 and departing from Cardiff Runway 30, which are in close proximity to the LFZ. (Traffic information will be passed where possible by ATC). Arriving VFR aircraft can expect to be held south and west of the runway 07/25 mid-point when IFR traffic is departing from Cardiff runway 30 or Cardiff IFR approaching traffic is within 15 miles from touchdown to Cardiff runway 12.
c) Flights to and from St Athan which are unable to comply with the requirements to remain within the St Athan Local Flying Zone will be subject to individual clearance from Cardiff ATC and will be integrated with Cardiff arriving and departing traffic.
d) All Airfield users should adopt the VFR Nash departure/arrival to operate to/from the West via a transit along the coast as depicted in the local area map. Aircraft departing St Athan to the West climb straight away to 1500 FT St Athan QNH to exit the LFZ, remaining over land throughout. Aircraft returning from the West enter the LFZ at Nash Point at 1500 FT St Athan QNH, then descend to the appropriate circuit height at Nash Point, remaining over water until the last appropriate moment to join the St Athan circuit.

5 VISUAL REFERENCE POINTS (VRP)

a) Pilots are advised to use caution when routeing via the St Hilary TV Mast and Wenvoe TV Mast VRPs as they are Air Navigation Obstacles with high elevation – See ENR 5.4 dataset for up to date details of ICAO AREA 1 Obstacles.
b) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

6 VFR ROUTES TO/FROM ST ATHAN

a) All arriving aircraft must obtain an ATC clearance from Cardiff ATC to enter Controlled Airspace.
b) In order to reduce RTF congestion, the published outbound and inbound VFR routes are allocated designators. Pilots are to ensure they are familiar with the route alignment. Level instructions will be passed with the appropriate ATC VFR clearance.
c) Pilots filing VFR flight plans should additionally address the flight plan to EGFFZTZX.

Published VFR Departure Routes

Route Designator	RWY	Route	Maximum Altitude QNH	Remarks
East	07/25	Aircraft remain west of the quarry and route to remain West of Aberthaw Power Station over water, clearance limit Aberthaw power station then as directed by Cardiff Tower.	1500 FT	Do not proceed east of Aberthaw Power Station until cleared by Cardiff ATC.
South	07/25	Aircraft remain west of the quarry and leave CAS towards Minehead VRP.	1500 FT	
Nash Point	07/25	After departure remain within the confines of the LFZ and leave CAS to the west via Nash Point VRP remaining overland and south of the Cardiff Runway 12 final track.	1500 FT	Runway 07 departures should remain west of the quarry.
North	07/25	Leave CAS between the St Hilary and Wenvoe TV Masts.	1500 FT	

Note 1: *Pilots who wish to operate above the 'maximum altitude' shall request this once airborne.*

Note 2: *All routes are available Special VFR subject to ATC clearance.*

Note 3: *Pilots can expect to receive a clearance at the holding point in the format "<Callsign>, cleared to leave controlled airspace on a published <designator> departure, not above <altitude restriction> <QNH> VFR." A complete read back is required.*

Published VFR Arrival Routes

Route Designator	RWY	Route	Maximum Altitude QNH	Remarks
East	07/25	From the North East route as directed by Cardiff Tower to hold East of Aberthaw Power Station and as directed by St Athan ATC.	1500 FT	Do not proceed west of Aberthaw Power Station until cleared by St Athan ATC.
South	07/25	Enter CAS from the South, remain west of the quarry and as directed by St Athan ATC.	1500 FT	
Nash Point	07/25	Enter CAS via Nash Point route east bound along the coast over water then as directed by St Athan ATC.	1500 FT	
North Arrival	07/25	Enter CAS towards the St Hilary VRP to orbit and remain north of the mast then as directed by Cardiff Tower.	1500 FT	
Straight In	07/25	Enter CAS to position Straight in for the Runway in use.	1500 FT	

Note 1: *Pilots who wish to operate above the 'maximum altitude' shall request this.*

Note 2: *All routes are available Special VFR subject to ATC clearance.*

Note 3: *Pilots can expect to receive a clearance in the format: "<Callsign>, cleared to enter controlled airspace on a published <designator> arrival, not above <altitude restriction> <QNH> VFR." A complete read back is required.*

7 IFR ARRIVALS FROM THE ATS ROUTE NETWORK

a) Aircraft inbound via the ATS Route Network must follow the Cardiff Standard Arrival Routes (STAR) as shown at AD 2-EGFF-7.

8 IFR DEPARTURES

a) An Abbreviated IFR Departure (AID) shall be passed to all IFR aircraft outbound from St Athan regardless of their intended routing.
b) The AID clearance is defined as: AID 07 or AID 25 - Climb straight ahead to altitude 4000 FT St Athan QNH, squawk <xxxx>.
c) In the absence of an ORCAM SSR code one from the Cardiff IFR allocation shall be allocated.
d) The Cardiff ATC shall issue an AID departure clearance to St Athan ATC.
e) AID is subject to release from Cardiff ATC.

9 RADIO COMMUNICATIONS FAILURE

a) In the event of an RT Failure, except for an ILS approach, the appropriate Procedures detailed in UK AIP ENR 1.1 Para 3.4 should be followed.
b) If at some point during the ILS an RCF is experienced the aircraft is to squawk 7600 and either land at St Athan or carry out an RCF Missed Approach (RCFMAP).

RCFMAP

The aircraft will:

- Squawk 7600.
- Climb to 5000 FT, initially straight ahead to 4000 FT or I-SAT D4, whichever is later, then turn left to NDB CDF to hold at 5000 FT. Max 230 KIAS. Be aware that in the event of a slow climb you may exit controlled airspace for a short time.
- Select Cardiff approach 119.155 MHz or for University of Wales Air Squadron (UWAS) aircraft if directed to by ATC 241.125 MHz.
- Complete two holds.
- Carry out an instrument approach to Cardiff and land at Cardiff or divert to their nominated alternate as per the flight plan.

On planning to make an ILS approach to St Athan the crew of the inbound aircraft must ensure that:

- They are fully briefed for the approach, including the requirements of a RCFMAP at St Athan.
- They have both the Cardiff and St Athan ATIS prior to commencing the approach.

Note: *If an aircraft carries out an RCFMAP it must subsequently land at Cardiff or nominated alternative and not attempt a cloudbreak and landing at St Athan.*

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL **1975**
HEIGHTS IN FEET AGL (410)

ST ATHAN

APP	119.155 125.855	CARDIFF APPROACH
TWR	122.865	ST ATHAN TOWER
RAD	125.855	CARDIFF RADAR
ATIS	130.560	ST ATHAN INFORMATION
See AD 2.18 for details.		

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **2500** in the sector defined by the lateral limits; 513039N 0035438W - 513302N 0032847W - 513655N 0030733W - 512913N 0030413W - 512416N 0031053W thence clockwise by an arc of a circle radius 5NM centred on 512734N 0031654W to 512241N 0031835W - 512715N 0035305W - 513039N 0035438W.

b) **1900** in the sector defined by the lateral limits; 512715N 0035305W - 512241N 0031835W thence anticlockwise by an arc of a circle radius 5NM centred on 512734N 0031654W to 512416N 0031053W - 512913N 0030413W - 512435N 0030213W thence clockwise by an arc of a circle radius 9NM centred on 512224N 0031610W to 511348N 0032026W - 512111N 0035021W - 512715N 0035305W.

NOTE: Radar headings will be allocated so as to avoid Danger Area D119 when active.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible, continue on last assigned heading until reaching **5000** then turn to enter the hold at **NDB(L) CDF**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible follow the RCF Procedure to **NDB(L) CDF**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Radar vectoring for initial approach to St Athan is provided by CARDIFF APPROACH.
2. Levels shown are based on QNH.
3. Only significant obstacles and dominant spot heights are shown.
4. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
5. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
6. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
7. **Thls chart should only be used for the cross-checklng of asslgned altltudes whllst ln recelpt of an ATC Surveillance servlce.**
8. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
9. Detailed description of ATS airspace organized at Cardiff Airport see EGFF AD 2.17.

7	ATS	See AD 2.18.
8	Fuelling	By arrangement with North Air.
9	Handling	By arrangement with HIAL, Tel: 01851-702256; e-mail: Stornatc@hial.co.uk; or Loganair, Tel: 01851-703673.
10	Security	As AD hours.
11	De-icing	Operational hours.
12	Remarks	This aerodrome is PPR. Filing of a Flight Plan does NOT constitute PPR. To cover the possibility of an aircraft which departs within 15 minutes of normal closing time having to return, the Aerodrome will normally retain sufficient services and equipment for 15 minutes after the time of actual departure. For PPR visit www.hial.co.uk.

EGPO AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	By arrangement with Loganair, Tel: 01851-703673
2	Fuel and oil types	AVGAS JET A-1, AVGAS 100LL.
3	Fuelling facilities/capacity	Bowser delivery. Limited stocks of AVGAS 100LL.
4	De-icing facilities	By arrangement with Loganair, Tel: 01851-703673, e-mail: syycs@loganair.co.uk.
5	Hangar space for visiting aircraft	Yes by arrangement with AD operator (HIAL).
6	Repair facilities for visiting aircraft	-
7	Remarks	By arrangement with Loganair, Tel: 01851-703673, e-mail: syycs@loganair.co.uk. Basic handling available from HIAL, Tel: 01851-707415, e-mail: stornatc@hial.co.uk. Electronic motorised tug is available on request to HIAL.

EGPO AD 2.5 PASSENGER FACILITIES

1	Hotels	Hotels and B & B in vicinity.
2	Restaurants	Café available during terminal opening times.
3	Transportation	Taxis, Car hire and Buses.
4	Medical facilities	Limited first aid. Medical services contactable.
5	Bank and Post Office	-
6	Tourist Office	-
7	Remarks	Ambulift and wheelchair facilities are available upon request.

EGPO AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A5 RFF Category 6 accepted on request by prior arrangement.
2	Rescue equipment	Limited water rescue facilities are available for Runways 18/36 and 06/24 during published opening hours and special/on call openings, subject to serviceability of equipment and times when the weather conditions and sea state are conducive to such rescue operations.
3	Capability for removal of disabled aircraft	Limited.
4	Remarks	-

EGPO AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical and chemical de-icing. Surfaces de-iced/anti-iced with KAC/EG and/or NAAC.
2	Clearance priorities	Runway in use. Designated Taxi Routes. Main Apron and SAR Apron.
3	Remarks	For latest information telephone ATC.

EGPO AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	LOWER APRON Surface: Concrete PCR 26/R/B/X/U MAIN APRON Surface: Brick PCR 115/F/B/X/U
2	Taxiway width, surface and strength	Taxiway ALPHA: 15 M Surface: Asphalt PCR 95/F/A/X/U Taxiway APRON: 15 M Surface: Concrete PCR 135/F/C/W/U Taxiway BRAVO: 15 M Surface: Asphalt PCR 115/F/B/Y/U Taxiway CHARLIE: 15 M Surface: Concrete NIL
3	Altimeter checkpoint location and elevation	Main Apron 22 FT
4	VOR checkpoints	-
5	INS checkpoints	-
6	Remarks	-

EGPO AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Marshalling provided for all stands.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 06/24: Runway designators and centre-line markings. Yellow lead on/off lines to all runways. 18/36: Runway designators and centre-line markings. Edge lines, TDZ markings on Runway 18/36. Yellow lead on/off lines to all runways. Taxiway marking aid(s): Yellow centre-line markings. Taxi holding point markings.
3	Stop bars and runway guard lights (if any)	A1, B1, C1, F1
4	Other runway protection measures	-
5	Remarks	3 WDI's: 581229.70N 0061954.02W (LGTD) - 581320.23N 0061949.69W (LGTD) - 581257.70N 0061939.77W.

EGPO AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of this airport by aircraft not able to communicate with ATC by radio is strictly PPR.
b) Aircraft that do not require the use of a licensed aerodrome and that wish to operate outwith the notified aerodrome hours of operation must comply with Highlands and Islands Airports Limited Out of Hours Indemnity Scheme. Details of the scheme and an application form can be obtained from the HIAL website or HIAL Tel: 01667-462445.
c) Use of Stornoway aerodrome is subject to standard Terms and Conditions of Use, which can be requested from the aerodrome.
d) High visibility clothing is to be worn when airside.

2 GROUND MOVEMENT

a) Pilots are advised that the width of the Alpha and Charlie taxiways on the East side of the aerodrome is 15 M.
b) Pilots are reminded that aircraft using the Main Apron will normally be marshalled. Caution should be exercised when manoeuvring due to the proximity of lighting pylons at the southern edge of the Main apron.
c) Pilots should exercise caution when operating in the area north and south of the hangar because of vehicular activity which is not subject to ground movement control.
d) All parking is normally under the direction of the marshaller.
e) The taxiway to the north of Echo 2 is unusable.
f) To permit crossing of the southern taxiway by pedestrians and non-radio equipped vehicles, a crossing is established between Taxiway Charlie and the Control Tower Building. During the notified hours of ATC/AFIS this crossing is controlled by traffic lights. The traffic light signal is located above the front door of the Control Tower. Pedestrians and vehicles must not cross the taxiway, in either direction, when this light is red. Outwith the notified hours of ATC/AFIS the traffic light is OFF, however, pedestrians/vehicles must exercise extreme caution as aircraft operating out of hours may be using the taxiway. This crossing is not available during LVP operations, ATC will advise.
g) Marshalling will be provided at the Marshaller's discretion when the wind speed is in excess of 40 KT.
h) When manoeuvring on Runway 18/36 aircraft must not proceed beyond the runway stopend lights. The area beyond is unfit for normal movement of aircraft and is marked as such by yellow chevrons.
i) Access from the Lower Apron is restricted to the adjacent exit gate and to the ATC building. A walkway (painted green) with painted footprints and signage will guide all Lower Apron users to either the ATC Control Tower building or the exit gate. Crossing the active taxiway to the ATC Control Tower building is controlled by traffic lights situated above the entry door of the Control Tower building. Airside access to the Terminal building from either the Lower Apron or ATC is strictly prohibited and the exit gate adjacent to the Lower Apron must always be used.To open the pedestrian gate, first press the electrical release switch on the grey cabinet to the left of the gate, then twist the opening handle. Ensure that the gate is securely closed after you pass through. Be advised the access gate is electronically controlled, so when you require access airside you will have to visit the Security Office in the main Terminal who will issue you with a Temporary Airside Pass (don’t forget to have your photo ID and hi-visibility jacket with you), they will then escort you airside.Once airside, hangar access is by request to the marshaller or telephone 01851-707415 (ATC).

j) High ground to north and west rising to 1000 FT within 7 NM.
k) Pilots are reminded that Taxiway Alpha, between main apron Gate 10 and the Gaydon hangar, is used regularly by vehicular traffic under the control of ATS. Vehicles using this taxiway may be seen by taxiing aircraft using the Apron Taxiway, Taxiway Bravo and Taxiway Charlie.
l) Landing fees shall be issued via invoice. Billing address details will be obtained from PPR forms.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) No ground signals except light signals.
b) Flocks of geese present in fields adjacent to the aerodrome, all year round.
c) Birds can be expected on all approaches. Dedicated bird patrols during operational hours under control of ATS. Increased risk from birds at low tide on approach to Runway 18.
d) Minimum approach angles of 3° (indicated by the PAPI) must be strictly adhered to when using Runway 36 due to vehicles on road within undershoot.
e) Grass areas are soft and unsafe. Poor load bearing characteristics may be found on runway/taxiway strips and the area adjacent to the apron. Only marked taxiways are to be used. Pilots are warned to exercise caution whilst taxiing between the Main Apron and Alpha 3 as this portion of taxiway includes a compound curve and taxiway centre-line markings must be followed to ensure clearance distances from pavement edge are maintained.
f) A Coastguard helicopter operates from Stornoway and will be given appropriate priority over other traffic when operating on search and rescue duties. These activities may take place throughout the 24 hour period and pilots using out of hours permission at Stornoway should therefore exercise appropriate caution.
g) Pilots are reminded that they should not cross the Runway 18 threshold when lining up for departure. The area beyond the Runway 18 threshold and marked with chevrons is for the protection of the Runway 36 Localiser monitor antenna (Lit).

5 HELICOPTER OPERATIONS

a) Light helicopters are not required to use the runways and may arrive depart from the appropriate apron.
b) Rotors running refuel is not permitted.
c) Pilots of helicopters engaged in Public Transport Operations are required to provide ATS an ETA/ETD giving at least 10 minutes notice. This may be done via telephone or RTF.
d) Pilots are reminded that routine helicopter winching training takes place on the Gaydon South Apron and the Gaydon North Apron. S92 helicopters may hover, up to a max of 300 FT AGL with the winch cable attached to a ground weight. These operations are separated for wake turbulence purposes from Runways 18/36 and 06/24. Traffic Information on these operations will be passed by ATS.

6 USE OF RUNWAYS

a) Runway 06/24 is not available for night landings but is available for use by Air Ambulance and SAR ops on request.
b) Runway departure restriction for aircraft requiring the use of a licensed aerodrome:

i. **Runway 18/36** . Except where an AOC holder has a less restrictive State authorised take-off minima, departures in RVR conditions of less than 400 M are not permitted;
ii. **Runway 06/24** . Except where an AOC holder has a less restrictive State authorised take-off minima, departures when the reported MET visibility is 800 M or less are not permitted.

c) Runway 06/24 is not available for landing or take-off outside of aerodrome opening hours. Aircraft operating outside aerodrome opening hours in accordance with HIAL's Out of Hours Indemnity Scheme must exercise caution when taxiing on the Charlie, Bravo and Alpha Taxiways as vehicles may be operating on those routes.

7 TRAINING

Not applicable

EGPO AD 2.21 NOISE ABATEMENT PROCEDURES

Not applicable

EGPO AD 2.22 FLIGHT PROCEDURES

1 INSTRUMENT APPROACH PROCEDURES

a) Instrument Approach Procedures (IAP) for this aerodrome are established outside controlled airspace. See ENR 1.5.

2 NORTH ATLANTIC DEPARTURES

a) Due to the proximity of the Shanwick Oceanic boundary to Stornoway, pilots must consider timescales for submitting an 'RCL'. Refer to ENR 2.2, paragraph 3.8.2 for details.

3 CIRCUITS

a) Circuit directions: Runways 18 and 24 - LH; Runways 06 and 36 - RH. Unless otherwise instructed by ATC.

4 AIR TRAFFIC SERVICES OUTSIDE CONTROLLED AIRSPACE

a) During notified ATC hours of Service, a procedural service will routinely be applied to IFR flights. Pilots will be expected to accept Level, Radial, Track and Time allocations that may require flight in IMC. A basic service will be routinely applied to VFR flights. A pilot may request another service if considered more appropriate.
b) Outside notified ATC hours of service, a basic service will always be applied to SAR and ambulance flights by an AFISO.

5 RADIO COMMUNICATION FAILURE PROCEDURES

a) The pilot of a VFR flight experiencing communications failure should join overhead at 2000 FT and descend into the circuit pattern for the runway in use watching for light signals from the Tower all the while. Should a light signal not be forthcoming on turning onto final approach, the pilot should level off at not below 450 FT and fly parallel to the runway, and adjacent to the Tower, to attract attention.

6 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGPO AD 2.23 ADDITIONAL INFORMATION

a) Aircraft operators are responsible for the searching of any aircraft parked either overnight or within the demarcated area prior to departure.

TRANSITION ALTITUDE **3000**

INITIAL APPROACH FROM VOR/DME STN (Subject to ATC approval)
Arrival **not below MSA**. Overhead VOR/DME STN (IAF) at **3000** or as directed (lowest altitude to start procedure from hold is **2000**). Fly outbound in the hold. After passing VOR STN R083, turn right onto SOY D10 arc clockwise descending along the arc to **1800**(1785). From NDB(L) SAY QDM 342° (VOR STN R197) turn right onto LOC/extended FAT. When established continue with appropriate procedure.

DIRECT ARRIVAL FROM SOUTHEAST (Subject to ATC approval)
Arrival on VOR STN R160 (QDM 340°) **not below MSA**. After passing SOY D17 (IAF) descend **not below 1800**. From SOY D12 turn left onto SOY D10 arc clockwise. From NDB(L) SAY QDM 342° (VOR STN R197) turn right onto LOC/extended FAT. When established continue with appropriate procedure.

DIRECT ARRIVAL FROM SOUTHEAST (Subject to ATC approval)
Arrival on VOR STN R123 (QDM 303°) **not below MSA**. After passing SOY D17 (IAF) descend **not below 1800**. From SOY D12 turn left onto SOY D10 arc clockwise. From NDB(L) SAY QDM 342° (VOR STN R197) turn right onto LOC/extended FAT. When established continue with appropriate procedure.

DIRECT ARRIVAL FROM SOUTHWEST (Subject to ATC approval)
Arrival on VOR STN R224 (QDM 044°) **not below MSA**. After passing SOY D16 (IAF) descend **not below 2400**. From SOY D12 turn right onto SOY D10 arc anticlockwise and descend to **1800**. From NDB(L) SAY QDM 010° (VOR STN R220) turn left onto LOC/extended FAT. When established continue with appropriate procedure.

CHANGE (7/26): MAG VAR REVISED. MAG HEADINGS.

	East of RWY 18/36	500(474)	630(604)	860(834)	1060(1034)

VOR STN to MAPT	G/S KT	160	140	120	100	80	60
	MIN:SEC	1:30	1:43	2:00	2:24	3:00	4:00

ENTRY TO BASETURN PROCEDURE AFTER HOLDING
If required, the baseturn procedure may be entered after holding by flying a teardrop manoeuvre from overhead the holding facility after flying inbound in the hold as follows: Fly outbound on track 279° (CAT A,B,C,D) for 1 MIN then turn right to return to the overhead to enter the baseturn procedure. Lowest altitude to commence the procedure from the hold is **2000**.

AIRCRAFT UNABLE TO RECEIVE DME STN
Direct arrivals are unavailable to aircraft unable to receive DME STN, pilots are to join the hold and continue as for the main procedure. The missed approach point is calculated using the designated timings from overhead FAF VOR STN.

NOTE Direct arrivals only available with ATC clearance.

CHANGE (7/26): MAG VAR REVISED.

EGER AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All GA aircraft must park only on the clearly designated grass GA APRON. GA aircraft must not park on the main tarmac apron.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Visiting pilots should note that during periods of prolonged rainfall the grass runway can become very soft especially during the winter months.
b) Runway 02/20: Graded hardcore runway is generally unsuitable for light aircraft with low ground/propeller clearance due to unstabilised surface and as a result it would be advisable to carry out any power checks on the tarmac apron before departure.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGER AD 2.21 NOISE ABATEMENT PROCEDURES

Not applicable

EGER AD 2.22 FLIGHT PROCEDURES

a) RTF contact with Kirkwall (EGPA) recommended.

EGPB AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Pilots of fixed wing aircraft can anticipate to be marshalled onto stand on arrival. Helicopters self-park on numbered spots/stands; marshalling available on request. Spots 5 and 6 not normally available for shutdown. Pilots are to exercise caution when operating on spots 4 or 5. Helicopter and fixed wing operations in close proximity.
2	Runway and taxiway markings and lighting	Runway light(s): Blue edge lights on Runway 15/33 from Hold Kilo to the edge of Runway 09/27. Taxiway light(s): Holding points designated by retro-reflective illuminated signs and red stop lights (except Holds F, W and Z which is unlit). Yellow centre-line paint marking. Green centre-line lighting to stop bars. Blue edge lighting between stop bars and runway edge, and on Runway 15/33 from holding points Kilo and Charlie to the edge of Runway 09/27.
3	Stop bars and runway guard lights (if any)	Holding points are designated by retro-reflective signs, illuminated in hours of darkness. Red stop bars at holding points A, C, E, G, J, K, V. Caution: H06/24 holding points F, W, and Z do not have lit stop bars.
4	Other runway protection measures	-
5	Remarks	WDI RWY 09 (LGTD): 595254.95N 0011812.33W; WDI RWY 27 (LGTD): 595251.18N 0011706.70W; WDI RWY 15: 595257.17N 0011757.64W; WDI RWY 33: 595218.86N 0011658.44W; WDI RWY 06/24: 595234.64N 0011704.55W.

EGPB AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) All aircraft are required to request start up from ATC.
b) Pilots are reminded that all flights wishing to depart Sumburgh must, in accordance with the requirements of Class D airspace, notify ATC. This may be in the form of a filed flight plan or contact with Sumburgh ATS via landline prior to departure.

2 GROUND MOVEMENT

a) The centre-line of the northern taxiway is diverted to the south side of the 46 M wide pavement. The edge of the usable taxiway (width 18 M) is marked by blue edge lights and blue reflective markers. Green reflective studs mark the centre-line. Pilots are reminded to adhere to the marked centre-line. A separate vehicle route is marked on the north side of part of the northern taxiway.
b) No ground signals except light signals.
c) Aircraft Parking

   i. Sumburgh operates a parking policy which considers: customs requirements, duration of stay and type of flight. Fixed wing aircraft will be marshalled and may be required to reposition due to operational requirements.
   ii. Helicopters will be allocated spots by ATC. Helicopters that require to shutdown should inform Sumburgh Tower at the earliest opportunity, they may be required to reposition to a remote part of the apron.

d) Use of Sumburgh aerodrome is subject to standard Terms and Conditions of Use, which can be requested from the aerodrome.
e) Full ATC clearance is available from EOBT - 15 minutes. Departing aircraft are required to state stand/spot number on initial contact with Sumburgh Tower.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) During strong wind conditions turbulence may be expected on approach to, or climb out from, any runway.
b) Bird colonies are active throughout the year, particularly during the nesting season. Concentrations of birds may be encountered in the vicinity of cliffs and beaches and over the sea.
c) A coastguard and support helicopter operates from Sumburgh and will be given appropriate priority over other traffic when operating on search and rescue duties. These operations may take place throughout the 24 hour period using the call sign 'Rescue'.
d) Unlit mast erected on Scousburgh Hill, 5 NM north of the aerodrome approximate height 220 FT AGL, 1085 FT AMSL.
e) Pilots will observe that a main road crosses the Runway 09 undershoot immediately before the painted threshold. A barrier system closes the public road. These barriers must be closed before any fixed wing aircraft can land or depart.

5 HELICOPTER OPERATIONS

a) Helicopters are treated as fixed-wing traffic and should normally ground taxi, unless skid equipped between the runways and parking areas. In adverse weather conditions and during snow clearing operations, air taxiing may be permitted by ATC. Only one helicopter at any one time may air taxi on any one apron. Pilots may request an air taxi if required.
b) Rotors running refuelling of helicopters with passengers on board is only permitted during exceptionally severe wind conditions, and with the permission of ATC. Rotors-running refuelling is only permitted on helicopter spots 4, 5, 6, 7, 8. Spot 4 may only be used by S92s for rotors-running refuelling in exceptional circumstances.

6 USE OF RUNWAYS

a) With the exception of helicopters, night landings are not permitted on Runways 15 and 33 except in an emergency. Night take-offs from Runways 15 and 33 are restricted to operators with procedures accepted by the Civil Aviation Authority.
b) The helicopter Runway 06/24 is not to be used by fixed-wing aircraft.
c) More than one runway may be lit, and in use, at any one time.
d) Except for locally based SAR helicopters, out of hours indemnity is not permitted.
e) The thresholds of Runways 09 and 27 are positioned 135 M and 120 M respectively from concrete sea-defenses and the open sea.
f) RVR Conditions

   i. Runway 09/27. Except where an AOC holder has a less restrictive State authorised take-off minima, departures in RVR conditions of less than 400 M are not permitted.
   ii. Runway 15/33. Except where an AOC holder has a less restrictive State authorised take-off minima, departures when the reported MET visibility is 400 M or less are not permitted.
   iii. Helicopter Runway 06/24. Except where an AOC holder has a less restrictive State authorised take-off minima, departures when the reported MET visibility is 800 M or less are not permitted.

g) Pilots will observe that a main road crosses the Runway 09 undershoot immediately before the painted threshold. The road is closed by staffed barriers prior to any movement requiring the closure of the road.

7 TRAINING

Not applicable

EGPB AD 2.21 NOISE ABATEMENT PROCEDURES

a) Helicopters requiring to hover for long periods for test purposes should be directed to a location where they will cause least disturbance to residential areas.
b) Military Practice Diversions

i. Practice diversion approaches by high energy jet aircraft should, whenever possible, be made to Runway 09/27.
ii. Exceptionally, when traffic conditions prevent an approach to Runway 09/27, an approach to Runway 33 may be authorised. When aircraft are carrying out a missed approach from Runway 33 or overflying the aerodrome they are given specific instructions to prevent them from overflying the village of Toab.
iii. The village of Toab is particularly vulnerable to noise from aircraft and approaches to Runway 15 by high energy jet aircraft are not normally permitted.

EGPB AD 2.22 FLIGHT PROCEDURES

1 RADIO COMMUNICATIONS FAILURE PROCEDURE

a) In the event of complete radio communication failure in an aircraft, the pilot will adopt the appropriate procedure notified at ENR 1.1 General Rules, section 3.4 Radiotelephony, Radio Failure and Loss of Communication Procedures. The route to be used when leaving the airspace in accordance with these procedures is as follows:
b) In the event of a communications failure ATS will issue instructions to aircraft and vehicles using visual signals by the use of an ALDIS lamp. These signals will be displayed in accordance with guidelines issued in the CAP 637 Visual Aids Hand Book.

Position at time of decision	Route
VOR SUM or NDB(L) SBH	Track 310°(T) at 2400 FT ALT until clear of the CTR/CTA.

2 HELICOPTER OPERATIONS IN THE SUMBURGH CTR/CTA

a) Procedures for helicopter operations in the Sumburgh CTR/CTA are detailed at ENR 1.6.

3 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

4 NORTH ATLANTIC DEPARTURES

a) Due to the proximity of the Shanwick Oceanic boundary to Sumburgh, pilots must consider timescales for submitting an ’RCL’. Refer to ENR 2.2, paragraph 3.8.2 for details.

5 APPROACH AND APPROACH RADAR SERVICES

a) Approach and Approach Radar Services for Sumburgh Airport are provided from Aberdeen ATSU. If this service is not available during published hours, the CTR/CTA airspace will revert to Class G status. In the event, this will be promulgated by NOTAM.

EGPB AD 2.23 ADDITIONAL INFORMATION

a) Aircraft operators are responsible for the searching of any aircraft parked either overnight or within the demarcated area prior to departure.

ATC SURVEILLANCE MINIMUM ALTITUDE CHART - ICAO

BEARINGS, TRACKS AND RADIALS ARE MAGNETIC
ELEVATIONS IN FEET AMSL 1077
HEIGHTS IN FEET AGL (229)

SUMBURGH

MINIMUM INITIAL ALTITUDE
Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

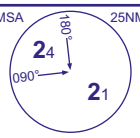
a) **2000** in the sector defined by the lateral limits; 600013N 0013000W - 600124N 0010859W thence clockwise by an arc of a circle radius 8NM centred on 595328N 0010714W to 594532N 0010530W - 594421N 0012621W thence clockwise by an arc of a circle radius 8NM centred on 595217N 0012810W to 600013N 0013000W, except;
b) **2100** in the sector defined by the lateral limits; 600026N 0012609W - 600112N 0011234W thence clockwise by an arc of a circle radius 5NM centred on 595713N 0011832W to 600026N 0012609W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA
The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft, and
b) within the sector 15NM ahead of and within 20° either side of the aircraft's track.

LOSS OF COMMUNICATION PROCEDURES
Initial Approach
Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at 2100, or last assigned level if higher to **VOR SUM**†.
Intermedlate and FInal Approach
Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **VOR SUM**†.
† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.

GENERAL INFORMATION
1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
7. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
8. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.
9. During notified hours of operation of the Sumburgh CTA/CTR the lower limit of MORAY CTA 16 changes to FL100.



CHANGE (5/26): AD ELEVATION. MAG INFO REVISED.

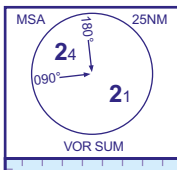
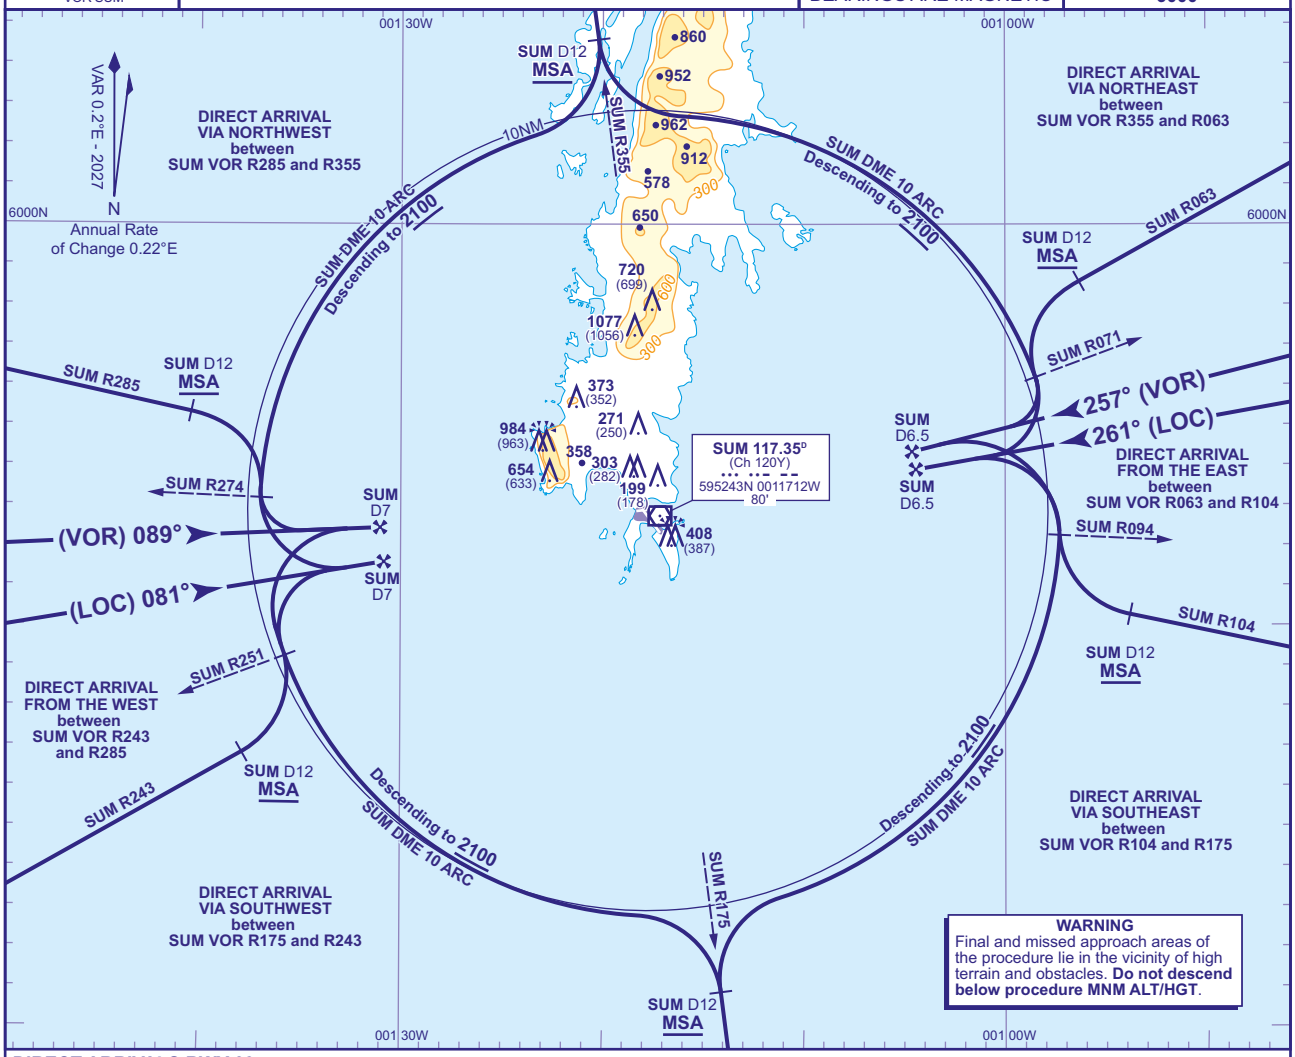
VM(C)OCA (OCH AAL)	**Total Area**	**860**(836)	**1200**(1176)

Rate of descent	**G/S KT**	160	140	120	100	80
	FT/MIN	850	740	630	530	420



AIRCRAFT UNABLE TO RECEIVE DME
Fly outbound on base turn procedure for 3MIN then turn left to establish on the FAT.

CHANGE (5/26): AD ELEVATION. MAG VAR. VM(C)OCA (OCH AAL). NOTES.



AERO INFO DATE 17 FEB 26 AD 2-EGPB-8-10

INSTRUMENT APPROACH CHART - ICAO

SUMBURGH Direct Arrivals RWY 09/27
(ACFT CAT A,B,C)

TWR	118.255	SUMBURGH TOWER	AD ELEVATION 24	
RAD	131.300, 123.155	SUMBURGH RADAR		
ATIS	125.855	SUMBURGH INFORMATION	OBSTACLE ELEVATION 1077 AMSL (1056) (ABOVE THR)	
AFIS	118.255	SUMBURGH INFORMATION	BEARINGS ARE MAGNETIC	TRANSITION ALTITUDE 6000

DIRECT ARRIVALS RWY 09

From the Northwest (SUM VOR R285 to R355)
Track towards VOR SUM on any radial between SUM VOR R285 and R355 **not below MSA**. At SUM DME 12 turn right to establish on the SUM DME 10 arc anti-clockwise. Once established on the arc descend to **not below 2100**. At SUM R274 turn left to establish on the LOC or FAT. Once established continue as for main procedure.

From the Southwest (SUM VOR R175 to R243)
Track towards VOR SUM on any radial between SUM VOR R175 and R243 **not below MSA**. At SUM DME 12 turn left to establish on the SUM DME 10 arc clockwise. Once established on the arc descend to **not below 2100**. At SUM R251 turn right to establish on the LOC or FAT. Once established continue as for main procedure.

From the West (SUM VOR R243 to R285)
Establish on the extended LOC or FAT **not below MSA**. Once established descend to **2100** and continue as for main procedure.

DIRECT ARRIVALS RWY 27

From the Northeast (SUM VOR R355 to R063)
Track towards VOR SUM on any radial between SUM VOR R355 and R063 **not below MSA**. At SUM DME 12 turn left to establish on the SUM DME 10 arc clockwise. Once established on the arc descend to **not below 2100**. At SUM R071 turn right to establish on the LOC or FAT. Once established continue as for main procedure.

From the Southeast (SUM VOR R104 to R175)
Track towards VOR SUM on any radial between SUM VOR R104 and R175 **not below MSA**. At SUM DME 12 turn right to establish on the SUM DME 10 arc anti-clockwise. Once established on the arc descend to **not below 2100**. At SUM R094 turn left to establish on the LOC or FAT. Once established continue as for main procedure.

From the East (SUM VOR R063 to R104)
Establish on the extended LOC or FAT **not below MSA**. Once established descend to **2100** and continue as for main procedure.

CHANGE (5/26): AD ELEVATION. MAG VAR. MAG TRACKS.

INTENTIONALLY BLANK

EGFH AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of the aerodrome is subject to the provisions of a document entitled Swansea Airport Stakeholders Alliance, Conditions of Use. A copy of this document may be obtained on request to the Airport Manager, at the address specified at AD 2.2.
b) Aerodrome available to aircraft unable to communicate via radio with the A/G station by PPR.
c) Information and/or instructions from the Airport Manager may be relayed via A/G. Such messages will be prefixed 'Message from the aerodrome authority...'. Compliance with any relayed instruction is mandatory.
d) Permission to use the aerodrome either to land or depart, may be withdrawn without notice. Withdrawal of permission may occur due to prevailing weather conditions, if it is considered that the requirements of the airport's Safety Management System cannot be met.

2 GROUND MOVEMENT

a) Helicopters are to call for start when parachute operations are in progress.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) The carriage of Dangerous Goods, as specified by the Air Navigation (Dangerous Goods) Regulations 2002, is prohibited unless written approval has been issued by the Airport Manager or nominated deputy.
b) Each aircraft commander is responsible for the safety of his/her passengers and other crew members. To ensure the safety of passengers and crew members, the aircraft commander or other competent crew member is to supervise and escort passengers whilst airside.
c) Smoking and use of mobile phones whilst airside is strictly prohibited.

d) Windshear can occur on the final approach to Runway 10 in strong easterly winds.

5 HELICOPTER OPERATIONS

a) Helicopter landing spots situated on Apron 1 and adjacent to Holding Point B1.

6 USE OF RUNWAYS

a) Runways 04/22 and 10/28 are restricted to aircraft with MTOW 5700 KG or less.

7 TRAINING

a) Use of the aerodrome by training flights is subject to approval, which may be withdrawn without prior notice. Issue of approval is conditional upon training flights not causing delays to other aircraft and not causing movement area or airspace congestion.

EGFH AD 2.21 NOISE ABATEMENT PROCEDURES

a) Aircraft are to be operated in a manner to cause least disturbance in areas surrounding the aerodrome.

EGFH AD 2.22 FLIGHT PROCEDURES

1 RADIO COMMUNICATION FAILURE PROCEDURES

a) If radio communications failure is experienced after establishment of RTF contact do not fly in the overhead or 'dead' side to avoid conflict with parachuting operations. If RTF contact has not been established, unless an emergency is experienced which requires immediate landing, the ATZ is not to be entered, and diversion made to a suitable alternate aerodrome.

2 CIRCUITS

a) Unless notified by A/G that parachute descents are not in progress aircraft must not fly in the overhead and deadside. However, a straight-in approach to the notified runway in use may be flown if 'Swansea Radio' notify that there is no reported traffic to affect this course of action.
b) Unless otherwise notified by 'Swansea Radio' standard circuit directions are as follows: Runway 10 and 22 - Right Hand; Runway 28 and 04 - Left Hand.

3 FREE-FALL PARACHUTING PROCEDURES

a) Free-fall parachuting takes place overhead the aerodrome. ENR 5.5 refers. A/G will notify when parachute descents are taking place.
b) Subject to the notified runway in use, one of two parachute landing areas will be used. When Runway 04/22 is in use, the Southern Parachute Landing Area (PLA), located in the south eastern corner of the aerodrome, south of Runway 28 threshold, will be used. When Runway 10/28 is in use, the Northern PLA, located in the northeast corner of the aerodrome, north of Taxiway A, will be used.
c) Arriving aircraft that have not entered the ATZ are advised to remain outside until notified by A/G that all parachutes have landed. Any aircraft within the ATZ on final approach, requiring to go around, should climb straight ahead and then conform to the notified circuit direction.

EGNV AD 2.20 LOCAL AERODROME REGULATIONS

1 AERODROME REGULATIONS

a) All aircraft using Teesside International Airport and its facilities are required to have third party liability insurance cover in the sum of at least £500,000 sterling. Proof of this insurance must be available for inspection at any time whilst the aircraft is at Teesside International Airport.
b) Aerobatics and other unusual flight manoeuvres or aerial activities are prohibited within the ATZ unless prior written permission has been obtained from the Managing Director of Teesside International Airport Ltd.
c) Aircrew are to wear high visibility jackets whilst on the aprons and movement areas.
d) Booking out details will not be accepted via RTF.
e) Aerodrome not available to aircraft unable to communicate with ATC by radio.
f) Extensions available outside published aerodrome hours with prior permission required. As per landing fees and charges via the Airport Duty Manager, Tel: 01325-331008.

2 GROUND MOVEMENT

a) All taxiways are 15 M wide, apart from Bravo (central taxiway - 23 M). Aircraft requiring greater width must enter or vacate Runway 05/23 via the Bravo Taxiway.

3 CAT II/III OPERATIONS

a) Teesside is not equipped for CAT II/III operations, however, Low Visibility Procedures are used to protect CAT 1 operations.
b) Safeguarding commences when the visibility reduces to 1500 M and is expected to decrease, or the cloud ceiling reduces to 300 FT and is expected to decrease.
c) LVPs will commence when the visibility or RVR is 800 M or less, or the cloud ceiling reduces below 200 FT.

4 WARNINGS

a) Deer hazard, aircrews to report any sightings to ATC.
b) Bird concentrations may be present on surrounding agricultural land. Active dispersal methods are employed, however, pilots may occasionally be requested to slightly delay a departure or arrival if any potential hazard persists.
c) Model aircraft flying takes place at Redmarshall, 3.7 NM NE of Teesside Aerodrome from 0930 (0830) to SS. Aircraft will remain within 500 M of the site not above 400 FT AGL. ATC will advise when aircraft between 7 KG and 25 KG are operating.
d) A HEMS base is located within Teesside CTR/ATZ. The site lies 1.2 NM North East of Runway 23 threshold and 600 M from 23 FAT. Co-ordinates 543130N 0012258W. The helicopter will not lift without permission from ATC.
e) L159 Fast Jets may operate inside Class D Airspace in excess of 250 KT IAS with ATC permission.
f) Caution - on approach to Runway 23, road lights on adjacent road may cause distraction.

5 HELICOPTER OPERATIONS

a) All helicopters to integrate into traffic pattern/circuit. Training is PPR from ATC, Tel: 01325-331020. There is no dedicated training area.

6 USE OF RUNWAYS

a) Runway 05/23 shall be accessed by Taxiways Alpha, Bravo, Charlie and Delta.
b) Hold C is situated north side approximately 550 M from 05 threshold. Pilots vacating the runway at Hold C must establish the aircraft on and follow the lead off taxi guidance markings and when applicable the centreline lighting and not attempt to cut the corner. ATC will advise when Hold C is available for use.

c) At both ends of Runway 05/23, its width is twice that of the associated edge lights due to extra pavement at the northwest side. Pilots should ensure that they are correctly lined up, especially if take-off is at night, when the runway is contaminated, or in low visibility. The yellow taxiway centre-line marking supplemented with green reflective studs must be followed until alignment with runway centre-line lights is achieved.
d) Aircraft unable to accept the non-standard 15 M wide taxiways should back-track and vacate at taxiway Bravo. See also paragraph 2b above.
e) Aircraft requiring more than runway width (45 M) to turn should turn at the end of the runway where extra width is available. All aircraft turning on the runway should execute gentle turns.

7 TRAINING

a) Operators intending to follow a programme of training flights should obtain prior approval from the Airport Duty Manager: Tel: 01325-331008; Email: dutymanagers@teesideinternational.com.
b) All Airline or aircraft above 5700 KG training flights shall be carried out subject to the following conditions:

i. Circuits shall be at a height specified by ATC, but at a minimum of 1500 FT AAL;
ii. circuits will be variable in direction, left or right hand, in accordance with ATC instructions;
iii. aircraft are to be flown in such a manner as to avoid flight over built up areas in the vicinity of the airport whenever practicable.

c) The published circuit height for aircraft up to 5700 KG MTWA is not to be flown above 1500 FT QNH.

EGNV AD 2.21 NOISE ABATEMENT PROCEDURES

These procedures may at any time be departed from to the extent necessary for avoiding immediate danger.

a) Operators of all aircraft using the airport shall ensure at all times that aircraft are operated in a manner calculated to cause the least disturbance practicable in areas surrounding the airport.
b) Turbojet and turboprop aircraft approaching Teesside International Airport will be expected to conform to the continuous descent and low power, low drag approach procedures. To facilitate this technique, aircraft should fly within the speed band of 210 KT to 240 KT during the approach phase reducing to the band 160 KT to 180 KT at a range of 12 NM from touchdown and maintain 160 KT from 8 NM to 4 NM DME from touchdown.
c) ATC, in the interests of accurate spacing, as required may request specific speeds and pilots are thus requested to comply with the speed adjustments as promptly as possible within the constraints of their operating procedures. Pilots will advise ATC if circumstances necessitate a speed change for aircraft performance reasons.
d) ATC will advise pilots of an estimate of the track distance to run to touchdown when clearance to descend below the Transition Altitude is given. Further information on the distance to run will be given between this descent clearance and the instruction to turn onto the intercept heading for the ILS localiser.
e) Military aircraft will be vectored for an ILS approach, except during a mass visual recovery in the case of emergency diversions.
f) Ground running of aircraft engines is subject to regulations and control. All ground running must be pre-arranged with the Airport Duty Manager and the appropriate documentation completed. Ground running of aircraft engines is not permitted between 2200-0700 (2100-0600).
g) Aircraft are to avoid overflying nearby villages of Middleton St George, Middleton-One-Row, Yarm and Eaglescliffe wherever practicable.

EGNV AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT

a) The standard routes for aircraft inbound from the Airways System are as follows:

Approach from	Via	Route
South and Southwest	Y250 P18	Leave airways via GASKO to TD NDB
North and Northwest	P18	Leave airways via TILNI to TD NDB

b) Aircraft inbound to EGNV leaving the airways system from the southeast via ERKIT are subject to the availability of derogated services in Class G airspace. Clearance to enter EGNV CTR/CTA should be requested at least 10 minutes before reaching the CTR/CTA boundary.
c) That portion of the transit through Class G airspace, pilots may encounter conflicting VFR traffic.
d) Aircraft may be vectored outside the notified airspace for approaches to Runway 05/23 due to controlled airspace constraints. See ENR 1.6 section 1.4.

2 PROCEDURES FOR OUTBOUND AIRCRAFT

a) Aircraft intending to join the airways system should flight plan via the following routes:

Outbound to	Via	Route
South and Southwest	P18 P16	GASKO – POL (below FL 190) GASKO – RIBEL (FL 190 and above)
Southeast	Y250 for L60 and L603	GASKO – Y250 – MAMUL
	N110 for Y70 and L603	ERKIT N110 ABTOS (for Y70) ERKIT N110 DOLAS (for L603)
North and Northwest	P18	TILNI – P18

b) A portion of the transit is through an area of Class G airspace where pilots may encounter conflicting VFR traffic.
c) IFR aircraft to expect departure instructions on taxi.

3 TRANSIT AIRCRAFT

a) Aircraft wishing to transit controlled airspace should request a crossing clearance at least 10 minutes flying time or 20 NM, whichever is earlier, before reaching the CTR/CTA boundary.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

5 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of, but intending to remain outside Teesside controlled airspace within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Teesside Radar channel, 118.855, are encouraged to select SSR code 7047.

544003N 0015830W - 541152N 0014544W -
541145N 0010539W - 542950N 0003714W -
544655N 0010255W - 544746N 0012813W -
544003N 0015830W.

b) Selection of code 7047 does not imply receipt of an ATC service. Pilots of aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of controlled airspace.
c) Whilst squawking 7047 pilots should be aware that Teesside Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 7047 shall be deselected.
e) Pilot’s who intend to transit Teesside CTR/CTA should still contact Teesside Radar on 118.855 for a service and clearance if required.
f) Pilots operating at adjacent aerodromes such as RAF Leeming, RAF Topcliffe and Sutton Bank BGA are to select the most appropriate frequency to their location and The Rules of the Air Regulations 2015 and be aware that within the MATZ and the area proximate to it, in the notified FMC, may contain high performance military aircraft.

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **1900** in the sector defined by the lateral limits; 543239N 0014208W - 544012N 0012800W thence clockwise by an arc of a circle radius 8NM centred on 543419N 0011841W to 543610N 0010519W thence anticlockwise by an arc of a circle radius 3NM centred on 543324N 0010718W to 543153N 0011145W - 542632N 0012148W - 542029N 0012424W thence clockwise by an arc of a circle radius 8NM centred on 542647N 0013249W to 542221N 0014413W thence anti-clockwise by an arc of a circle radius 5NM centred on 542635N 0014843W to 543056N 0014432W thence clockwise by an arc of a circle radius 8NM centred on 542647N 0013249W to 543239N 0014208W.

b) **2000** in the sector defined by the lateral limits; 543153N 0011145W thence clockwise by an arc of a circle radius 3NM centred on 543324N 0010718W to 543610N 0010519W thence clockwise by an arc of a circle radius 8NM centred on 543419N 0011841W to 543526N 0010504W - 543153N 0011145W.

c) **2400** in the sector defined by the lateral limits; 543056N 0014432W thence clockwise by an arc of a circle radius 5NM centred on 542635N 0014843W to 542221N 0014413W thence clockwise by an arc of a circle radius 8NM centred on 542647N 0013249W to 543056N 0014432W.

d) **2500** in the sector defined by the lateral limits; 542632N 0012148W - 543526N 0010504W thence clockwise by an arc of a circle radius 8NM centred on 543419N 0011841W to 542825N 0010926W - 542054N 0012333W thence clockwise by an arc of a circle radius 8NM centred on 542647N 0013249W to 542029N 0012424W - 542632N 0012148W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **2500**, or last assigned level if higher to **NDB(L) TD**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **NDB(L) TD**†.

† In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of the Aerodrome Reference Point.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. The ATC Surveillance service is provided by Primary and/or Secondary Radar equipment.
7. **This chart may only be used for cross-checking of altitudes assigned when in receipt of an ATC Surveillance service.**
8. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an intercept of 40° or less, and in the case of Instrument approaches other than SRA is cleared to intercept the final approach track.**
9. Detailed description of FIR, UIR, CTA and TMA see ENR 2.1.
10. Detailed description of ATS airspace organized at the aerodrome see AD 2.17.

INTENTIONALLY BLANK

EGHO AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) While airside each aircraft commander is responsible for the safety of their passengers and other crew members. Passengers are at all times to be escorted by the aircraft commander or a crew member who is known to be competent to ensure both his/her and the passengers safety. The wearing of high visibility clothing is mandatory.
b) Aircraft commanders or crew members, as applicable, are responsible for ensuring that a total ban on smoking whilst airside is observed.
c) Permission to use the aerodrome, either to land or depart, may be withdrawn without prior notice. Withdrawal of permission may occur due to prevailing weather conditions if it is considered that the requirements of the aerodrome's Safety Management System cannot be met.
d) The carriage of Dangerous Goods, as defined by The Air Navigation (Dangerous Goods) Regulations 2002, is prohibited unless written approval has been issued by the Aerodrome Manager.
e) Permission to use the aerodrome by flights that are subject to the GAR process is conditional upon submission of a copy of the GAR to the aerodrome operator, at the email address listed at AD 2.2, item 6.
f) Thruxton is a regulated aerodrome pursuant to the provisions of the UK Customs and Excise Management Act 1979. Thruxton is not designated as a Customs & Excise airport but operates under an approval managed by UK Border Force.

   Subject to compliance with the provisions of the UK General Aviation Report (GAR) process, flights by general aviation aircraft may enter and depart the UK via Thruxton, except for those aircraft that are being imported, either temporarily or permanently, from a state that is outside the Common Travel Area, in which case they must first enter and, if temporarily imported, leave the UK via a designated customs airport.

g) Use of the aerodrome not permitted for aircraft that are unable to communicate with the A/G station via RTF on 118.280 MHZ.
h) Subject to compliance with operating conditions and limitations specified by the Aerodrome Operator, permission may be granted for aircraft that do not require use of a licensed aerodrome to use the aerodrome outside the notified hours of availability of A/G and RFFS. This is referred to as “Outside Hours”. Permission may, at the discretion of the Aerodrome Operator, be temporarily suspended when notified by NOTAM or withdrawn at short notice.
i) Non-aviation public events take place adjacent to the aerodrome and on parts of it. These events result in assemblies of more than 1000 persons requiring compliance with Rules of The Air Regulations 2015 (as amended), Rule 5, (2) (a), whereby any aircraft landings and take-offs within 1000 M of the assemblies must be in accordance with procedures notified by the CAA.

   During assemblies of more than 1000 persons the aerodrome is notified via NOTAM as closed. However, the Aerodrome Operator may, subject to compliance with specific risk mitigating procedures, issue permission to a limited number of aircraft operators to land and take-off when assemblies of more than 1000 persons are present. In these cases the provisions of Rule 5 (2) (a) are deemed to have been met.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Danger Areas EGD126, EGD127 Boscombe Down and Middle Wallop ATZ are located adjacent to the Thruxton ATZ. All are active as notified in the UK AIP.
b) Part of Danger Area EGD126 overlaps with the NW extremity of the ATZ. Within this part of the ATZ, activities including helicopter flying, may take place below 500 FT AGL and also UAS flying at or below 400 FT AGL.

Operation of aircraft within the Thruxton ATZ is subject to a Letter of Agreement with the SUA Authority. Aircraft within the ATZ may accordingly cross the overlapping part of EGD126 at a recommended height of 800 FT AAL (1119 FT ALT) or above. At times that Runway 25 is in use, aircraft on the crosswind leg may enter EGD126 at or above 700 FT AAL whilst climbing to 800 FT AAL or above.

The notified Upper Limit of EGD126 (1400 FT ALT/1081 FT AAL) may from time to time be temporarily raised, as notified via NOTAM. During these times it is recommended that aircraft within the ATZ avoid EGD126.

c) Part of the final approach track to Runway 23 at Boscombe Down passes through the lateral limits of the Thruxton ATZ. During Boscombe Down Combined Military Air Traffic Zone (CMATZ) hours of operation, aircraft being provided ATS by ATC Boscombe Down will transit the Thruxton ATZ above 1450 FT AAL. Recommended arrival and departure procedures are notified at AD 2.22 with the intent of avoiding traffic above 1450 FT AAL.
d) Military helicopter, transport and tactical jet aircraft operations can be anticipated at any time in the vicinity of Thruxton ATZ. These are normally being provided ATS by Boscombe Down or Middle Wallop.
e) Subject to approval by the aerodrome operator, aircraft movements may take place outside notified aerodrome/ATZ operating hours involving aircraft that do not require the use of a licensed aerodrome.

5 HELICOPTER OPERATIONS

a) Helicopters may operate from/to an aiming point designated “Heli Alpha” and “Heli Bravo”. The aiming point is marked by two white concentric circles.

Training flights may take place at Heli Alpha. Circuits flown by helicopters will be as follows, in relation to the specified runway in use, and at the specified height:

- Runway 07 - RH, 1000 FT AAL
- Runway 25 - LH, 1000 FT AAL
- Runway 12 - RH, 800 † FT AAL
- Runway 30 - LH, 800 † FT AAL

† 1000 FT if Boscombe CMATZ is not active.

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGHO AD 2.21 NOISE ABATEMENT PROCEDURES

a) All aircraft are to be operated in a manner to cause least disturbance to residential and other areas surrounding the aerodrome. Overflight of the following should be avoided:

- School (adjacent to the eastern aerodrome boundary);
- Kimpton Village (adjacent to northern aerodrome boundary);
- Fyfield Village (1 NM northeast of the aerodrome);
- Quarley Village (1.25 NM southwest of the aerodrome);
- Thruxton Village (adjacent to eastern aerodrome boundary);
- The Hawk Conservancy (bird sanctuary 1.5 NM southeast of the aerodrome).

EGHO AD 2.22 FLIGHT PROCEDURES

1 BOSCOMBE DOWN/MIDDLE WALLOP CMATZ

a) If ATC Boscombe Down is the CMATZ managing authority, recommended procedures are set out below. Information on the CMATZ activity status may be obtained from A/G.

i. **Arriving aircraft**

1. Contact Boscombe Zone on 126.705 for a MATZ penetration service (in accordance with ENR 2.2). Unless a direct routeing is offered by Boscombe Down ATC, arriving traffic should route via a point 1 NM north of Andover. Once an aircraft has reported at this point it will be advised to free-call Thruxton A/G. Remain outside the Thruxton ATZ and contact ‘Thruxton Radio’ on 118.280 MHz for ATZ entry information. ATZ entry should be level at 1200 FT AAL, or lower if necessary to maintain VMC; or,
2. Avoid the Boscombe Down CMATZ, contact 'Thruxton Radio' for ATZ entry information. ATZ entry should be level at 1200 FT AAL, or lower if necessary to maintain VMC.

ii. **Departing aircraft**

1. Leave the Thruxton ATZ not above 1200 FT ALT (Thruxton QNH) on an easterly track. Runway 25 departures should turn right, with the intent to complete the turn within the ATZ.
2. Before climbing above 1200 FT ALT (Thruxton QNH), either free-call 'Boscombe Zone' on 126.705 after leaving the Thruxton ATZ or delay further climb until clear of the CMATZ.
3. In the case of an intention to track westbound through the CMATZ, aircraft should continue on an easterly track until in contact with Boscombe and approval to set course is given.

2 COMMUNICATIONS

a) Aircraft should squawk conspicuity SSR code 2660, without altimeter information, when remaining within the traffic circuit.

3 CIRCUITS

a) Unless otherwise notified by A/G, circuit height is 800 FT AAL (Thruxton QFE) for all runways.
b) During times that the Boscombe Down CMATZ is not in operation, circuit joining height is 1500 FT AAL, or the maximum possible below this level to maintain VMC and circuit height 1000 FT AAL.
c) There is no dead-side for Runway 07/25. Helicopters operate south of Runway 07/25 up to 1000 FT AAL.
d) The following are recommended circuit joining procedures:

i. Runway 07 in use

1. Joining from the east, notify A/G of intent to join downwind, descend to circuit height at the ATZ boundary, enter the circuit via the downwind leg.
2. Joining from the west, fly along the runway centreline, turn crosswind at the RWY 25 threshold, descend to circuit height when crosswind.

ii. Runway 25 in use

1. Joining from the east, fly along the runway centreline, at the Runway 07 threshold turn crosswind, descend to circuit height when crosswind.
2. Joining from the west, notify A/G of intent to join downwind, descend to circuit height at the ATZ boundary, enter the circuit via the downwind leg.

iii. Runway 12/30 in use

1. If entering the ATZ from the north or east, fixed wing and helicopters should position to join the circuit from the north-east, continue on south-westerly heading and join on the downwind leg of the runway/helicopter aiming point in use, as applicable.

e) The following circuit directions apply for fixed wing aircraft when the specified runways are in use:

- Runway 07 - LH
- Runway 25 - RH
- Runway 12 - RH
- Runway 30 - LH

f) Due to the proximity of the Middle Wallop ATZ, aircraft using Runway 12/30 are advised to remain north of the Andover-Salisbury railway line.

EGPU AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Runway departure restriction for aircraft requiring the use of a licensed aerodrome:

i. **Runways 05/23 and 11/29**. Except where an AOC holder has a less restrictive State authorised take-off minima, departures when the reported MET visibility is 800 M or less are not permitted.

b) Use of Tiree aerodrome is subject to standard Terms and Conditions of Use, which can be requested from the aerodrome.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) No ground signals except light signals.
b) All taxiways are closed except between the threshold of Runway 11, the parking apron, south of Runway 11/29. Unserviceable sections of Runway are fenced off and marked with white crosses.
c) Grass areas are soft and unsafe. Poor load bearing characteristics may be found on the runway/taxiway strips and the area adjacent to the apron. Only marked taxiway to be used.
d) Large flocks of geese are prevalent in the vicinity of the aerodrome all year round, with increased activity between October and March.
e) Windsurfing and kite surfing may take place on beaches near the aerodrome.
f) Paramotor activity by non-radio aircraft takes place occasionally throughout the year on the Isle of Tiree.
g) Wind Turbine, 563208N 0064528W, 4.4 NM/59°T from ARP, 262 FT AGL.

EGNL AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) No aircraft is permitted to land at Walney, except in an emergency, when ATS is not available.
b) Use of ILS/NDB/RNP (including training) is strictly PPR.
c) Aircraft that use the ILS Glidepath element for descent must comply with a local ILS RDH requirement that the glidepath receiver antennas on the aircraft and the distance to the lowest part of a fully extended undercarriage must not exceed two metres.
d) Non-radio aircraft not accepted.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Pilots must avoid the EGR445 Barrow-in-Furness. A circle radius 0.5 NM centred on 540635N 0031410W SFC to 2000 FT ALT.
b) Poor R/T coverage at low level to the north - east north east of the AD due topography.
c) Runway 23 Night-time approaches: Aircraft are warned not to descend below the indicated PAPI "on-slope" indication due to an obstruction-chimney (219 FT - Lit) on approach. As described in EGNL AD 2.10, Obstructions - in circling area and at aerodrome.
d) Windshear warning - pilots are warned that windshear can occur on final approach over Walney Channel to the threshold Runway 23, especially when the tide is out and the surface wind is down Runway 23 at a speed of 15-20 KT.
e) Multiple cranes operating within an area bounded by co-ordinates: 540633.6N 0031340.6W - 540618.3N 0031257.6W - 540608.6N 0031313.7W - 540618.2N 0031350.0W - 540603.0N 0031402.2W - 540611.0N 0031417.3W - 540626.4N 0031427.6W - 540637.0N 0031425.2W - 540642.4N 0031420.2W - 540633.6N 0031340.6W. Maximum Elevation 335 FT. Height 308 FT AGL. All cranes will have obstruction lighting.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Runway 05/23 is an unlicensed runway.

7 TRAINING

Not applicable

EGNL AD 2.21 NOISE ABATEMENT PROCEDURES

Not applicable

EGNL AD 2.22 FLIGHT PROCEDURES

1 PROCEDURES FOR INBOUND AIRCRAFT

a) Aircraft arriving from the south for a straight-in approach to the instrument approach procedures to Runway 35 should route via:

Name	Co-ordinates	Terminal Area
TUNUP	535548N 0031103W	EGNL RWY 35 IAF ILS/DME/NDB(L), LOC/DME/NDB(L) and NDB(L)/DME

b) Warton Radar provides approach control service to Walney.
c) Outside of Warton Radar hours of operation refer to UK AIP EGNO AD 2.22, Section 3.

2 COMMUNICATIONS & SSR

a) Aircraft in communication with Walney ATS may be allocated a conspicuity squawk of 4576. Aircraft must not select this squawk unless instructed to do so by ATS.

b) Aircraft remaining in the circuit at Walney will be allocated a conspicuity squawk of 7010. Aircraft must not select this squawk unless instructed to do so by ATS.
c) Allocation of these conspicuity squawks does not constitute any radar service.

3 INSTRUMENT APPROACH PROCEDURES WITHOUT APPROACH CONTROL

a) When Warton Radar is not available, the RNP IAP may be flown into Walney subject to PPR from the Aerodrome Operator and limited to company flights by specified operators only.
b) Walney Operations will allocate a slot time for the IAF, which is to be adhered to in order to maintain separation. Only one aircraft is to use the RNP IAP at any time.
c) The hold shall not be used for separation or sequencing.
d) ILS or NDB IAP are not available without approach control.
e) In the event of RCF, if unable to land within 30 minutes of the ETA for the IAF, the pilot shall divert.

EGNO — WARTON

EGNO AD 2.2 AERODROME GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 534442N Long: 0025300W Mid point of Runway 07/25
2	Direction and distance from city	6 NM W of Preston.
3	Elevation / Reference temperature / Mean Low Temperature	55 FT / 18 °C / -
4	Geoid undulation at AD ELEV PSN	171 FT
5	Magnetic Variation / Annual Change	0.19°E (2027) / 0.19°E
6	AD Administration Address Telephone	BAE SYSTEMS. BAE Systems, Warton Aerodrome, Warton, Preston, PR4 1AX. 01772-852374 (ATC) 01772-856470 (Aerodrome Ops & PPR for visiting aircraft) 01772-856060 (ATIS)
7	Type of Traffic permitted (IFR/VFR)	IFR/VFR
8	Remarks	All calls to ATC will be recorded.

EGNO AD 2.3 OPERATIONAL HOURS

1	AD Administration	Mon-Thu 0730-1900 (0630-1800); Fri 0730-1700 (0630-1600). Aircraft may operate outside of these times with the prior approval of the Aerodrome Operator.
2	Customs and immigration	Mon-Fri 0600-2000 (0500-1900) Subject to 48 hours prior notice.
3	Health and sanitation	As AD hours.
4	AIS Briefing Office	As AD hours.
5	ATS Reporting Office (ARO)	As AD hours.
6	MET Briefing Office	As AD hours.
7	ATS	See AD 2.18.
8	Fuelling	Sun-Fri 0615-1930 (0515-1830).
9	Handling	As AD hours.
10	Security	As AD hours.
11	De-icing	Mon-Fri 0630-1850 (0530-1750). Out of hours de-icing carried out when required to meet business requirements.
12	Remarks	This aerodrome is PPR. The aerodrome may operate outside of the published hours to support business requirements.

EGNO AD 2.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	18 Tonne Mobile Crane, 10 Tonne Forklift, Atlas ‘K Loader’, 14 Cargo Dolly’s (including 1 Double Dolly), Avi-Ramp Regional Mobile Boarding Bridge, 7 Tonne FMC Commander (Wide) Cargo Loader, various Aircraft steps & Licenced Store. Tow bars available for the following aircraft: Boeing 737 (800 & Classic), 747, 757, Embraer, Typhoon, Tornado, Hawk, short aircraft towbar & hand operated towbar.
2	Fuel and oil types	AVTUR JET A-1 WITH FSII (F34 AVTUR)
3	Fuelling facilities/capacity	3 Bowsers (pressure and overwing). Approximately 500,000 lt.
4	De-icing facilities	2 aircraft de-icers.
5	Hangar space for visiting aircraft	Limited.
6	Repair facilities for visiting aircraft	Limited.
7	Remarks	Prior Permission Required (PPR) is mandatory for all visiting aircraft. PPR requests should be submitted to Warton Operations at WartonOps@baesystems.com.

EGNO AD 2.5 PASSENGER FACILITIES

1	Hotels	Lytham 3.5 miles.
2	Restaurants	Lytham 3.5 miles.
3	Transportation	Regular bus service, taxis on request. Nearest rail station Lytham 3.5 miles.
4	Medical facilities	Limited first aid on site. Nearest hospital Preston 6 miles.
5	Bank and Post Office	Warton. Lytham 3.5 miles.
6	Tourist Office	St Annes 5 miles.
7	Remarks	-

EGNO AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A6 For operations. RFF Category will be maintained to suit operational requirements for weekend operations.
2	Rescue equipment	3 Rosenbauer Panther 6x6, Major Foam Vehicle, Incident Command Vehicle, Argo Titan, Mud Rescue Support Vehicle, Medical Response Vehicle & Emergency Equipment Trailer.
3	Capability for removal of disabled aircraft	By arrangement with nominated recovery company. Light aircraft removal possible if required.
4	Remarks	-

EGNO AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical, chemical de-icing
2	Clearance priorities	Runway, taxiways, apron.
3	Remarks	For latest information on snow clearance programme and runway state Tel: ATC 01772-852374

EGNO AD 2.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron surface and strength	CARGO APRON Surface: Asphalt PCR 550/F/C/W/U MILITARY TRAINING APRON Surface: Concrete and asphalt PCR 550/F/C/W/U NORTHERN APRON Surface: Concrete and asphalt PCR 550/F/C/W/U SOUTHERN APRON Surface: Concrete and asphalt PCR 320/R/C/W/U
2	Taxiway width, surface and strength	Taxiway ALPHA: 18 M Surface: Asphalt PCR 655/R/C/W/U Taxiway BRAVO: 23 M Surface: Asphalt PCR 550/F/C/W/U Taxiway CHARLIE: 15 M Surface: Asphalt PCR 303/F/C/X/U

		Taxiway DELTA: 23 M Surface: Asphalt PCR 550/F/C/W/U Taxiway ECHO: 15 M Surface: Asphalt PCR 272/F/C/W/U
3	Altimeter checkpoint location and elevation	-
4	VOR checkpoints	-
5	INS checkpoints	-
6	Remarks	-

EGNO AD 2.9 SURFACE MOVEMENT GUIDANCE AND CONTROL SYSTEM AND MARKINGS

1	Use of aircraft stand ID signs, TWY guide lines and visual docking/parking guidance system of aircraft stands	Northern Apron: Apron is accessed via Taxiways Alpha or Bravo. Aircraft are to follow marshalling guidance, no self-parking. Stands 10 & 11 are nose-in/push-back configuration. Stand 12 has been decommissioned & must not be used. Blue reflective marker posts in use to demark Stand 12. Military Training Apron: Apron is accessed via Taxiway Bravo or Northern Apron. Pilots to self park, no marshalling available. Reserved for military aircraft only. Southern Apron: Apron is accessed via Taxiways Charlie and Echo. Aircraft may be asked to self-park when marshalling guidance not available. Cargo Apron: Apron is accessed via Taxiway Delta. Aircraft may be asked to self-park when marshalling guidance not available. Turning circle at the southern end of the apron is available for large aircraft use.
2	Runway and taxiway markings and lighting	Runway marking aid(s): 07/25: Runway designation markings. Runway threshold markings. Runway 07 threshold permanently displaced. Runway centre-line marking. Runway aiming point and touchdown zone markings for Runway 25 only. Runway turning circle markings. The runway side stripe is only 50 mm wide. Runway light(s): High intensity runway edge lights at 60 M spacing. 600 M yellow high intensity caution zone. Red high intensity runway end lights. Green high intensity threshold lights. Illuminated runway distance to go markers every 1000 FT. Taxiway marking aid(s): Centre-line markings. Hold point markings. Taxiway D edge lighting is not coincident with taxiway edge, see AD 2.20 paragraph 4. Narrow paved surface on the south side of Runway 25/07 (opposite Taxiway Alpha) has a yellow centre-line marking & has reflective studs. This route is not to be used as a taxi route. Markings are for towed aircraft only Vehicular access only. Non-standard runway markings to show 'Armament Safe Headings' in the form of yellow arrows are located adjacent to Runway 07 threshold and the end of Taxiway Delta adjacent to D1 hold. Taxiway light(s): Taxiways A, B, D & E blue edge lighting. Taxiway D edge lights are 8 M outside marked edge of taxiway. Taxiway C blue reflective edge markers. Taxiway A alternate green / yellow centreline solar studs (lead off only). Taxiway B green centreline solar studs between aprons and B1 hold. Taxiway C alternate green / yellow centreline solar studs (lead off only) and green centreline solar studs between aprons and C2 hold.
3	Stop bars and runway guard lights (if any)	At holding points A1, B1, C2 and D2. Red high intensity uni-directional stop bar lights. Yellow flashing runway guard lights.
4	Other runway protection measures	-
5	Remarks	WDIs (LGTD): 534430.97N 0025315.76W; 534436.78N 0025348.52W; 534447.76N 0025218.31W.

EGNO AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of the aerodrome is strictly PPR from Civil Ops for all visitors.
b) Use of the aerodrome is strictly PPR from ATC for all instrument and circuit training.
c) Civil private licence circuit training is not permitted when fast jet traffic is in the visual circuit.
d) High visibility clothing must be worn on the apron at all times.
e) During RVR/Low visibility procedures movements restricted to one aircraft at a time.
f) ATC permission required for all aircraft engine starts.
g) Aerodrome not available to aircraft unable to communicate by radio.

2 GROUND MOVEMENT

Due to surrounding topography, the use of Taxiway Echo is restricted to aircraft with a wingspan of 16.3 M or less.

3 WARNINGS

a) Large concentrations of birds are a year round hazard to aircraft due to the aerodrome location on a river estuary.
b) Geese activity is present in the vicinity of the aerodrome from September to April. Skeins range from 10 to 500 birds but can be in significantly larger numbers. Most activity takes place in daylight but the birds may be present at any time of day or night up to 2000 FT.
c) Rotary Hydraulic Arrestor Gear (RHAG) are used on Runway 07/25 to stop military aircraft overrunning the runway in the event of an emergency. The cables are recessed into the runway and are only raised for military aircraft operations.
d) Final approach tracks to RWY 25 Warton and RWY 28 Blackpool converge at approximately 2.5 NM from Warton touchdown zone. Pilots should exercise caution when visually identifying Warton.
e) Restricted Area EGR312 and Blackpool ATZ are in close proximity to the aerodrome.
f) An ATC Mobile Caravan is positioned close to the active threshold of Runway 07/25 when test flying is taking place.
g) Runway 07/25 is treated as an instrument runway for safeguarding purposes. However, owing to real estate limitations, the runway is restricted to visual status. The following runway strip infringements exist:

- Abeam the threshold of Runway 07 on the northerly side, the runway strip narrows to 106 M due to a fence and a line of trees.
- Over the first 880 M of Runway 25 on the northerly side, the runway strip narrows to 91 M due to fences, trees and third party property.
- Over the first 718 M of Runway 25 on the southerly side, the runway strip narrows to 92 M due to fences, trees, a road and third party property.

h) Hazard from EGR Detuners which emit high velocity vertical jet efflux. Overflight of these facilities below 500 FT is prohibited for helicopters and light aircraft at all times.
i) The simple approach lighting system for Runway 07 is non-standard in the following areas due to the approach lighting extending through private land and into the marsh area in the Ribble Estuary:

- There is an additional crossbar sited in the approach. The spacing, widths and number of lights are irregular.
- 1st crossbar at 568 M, 18 M width and 2 lights.

- 2nd crossbar at 839 M, 36 M width and 4 lights.
- Reduced centre-line lighting with 90 M spacing instead of 60 M.
- High intensity white lighting is provided to a distance of 1030 M from the threshold.

j) The precision approach category I lighting system for Runway 25 is non-standard in the following areas due to the approach lighting extending through private land:

- Crossbars have irregular spacing.
  - 1st at 135 M
  - 2nd at 135 M
  - 3rd at 135 M
  - 4th at 175 M
  - 5th at 150 M
- There is single centre-line light source out to the third crossbar, then two light sources for the remainder of the approach lighting.
- There are a reduced number of extended centre-line lights, with an average spacing of 45 M.
- The lighting consists of a red T bar commencing at the 3rd crossbar to provide circling guidance.

k) The edge lighting on Taxiway Delta is located at the extremity of the paved surface and not at the edge of the taxiway. The taxiway is 23 M wide and the paved surface is 46 M wide.
l) Floodlighting on all aprons is limited.
m) At weekends when the aerodrome is closed, a 4 M wide illuminated cross is located at the threshold to indicate the runway is closed. Siting on either 07/25 threshold is dependent on wind conditions. This is a mitigation to help prevent pilots misidentifying Warton for Blackpool.

4 HELICOPTER OPERATIONS

Helicopter Landing Areas are located adjacent to Stands 1, 10, 11, 32, 33 and 34.

5 USE OF RUNWAYS

a) Access to the runway thresholds will require a backtrack from all taxiways.
b) Limited turning circles are available at either end of Runway 07/25.
c) Unless an AOC holder has state approved less restrictive minima, take-offs in RVR less than 400 M will not be permitted as Runway 07/25 is not equipped with centre-line lighting.
d) All circuits are to the south of Runway 07/25.

6 TRAINING

a) Use of the aerodrome is strictly PPR from ATC for all instrument and circuit training.
b) Priority will be given to test and experimental flying.
c) Hazard from EGR Detuners which emit high velocity vertical jet efflux. Overflight of these facilities below 500 FT is prohibited for helicopters and light aircraft at all times.
d) All circuits are to the south of Runway 07/25.

EGNO AD 2.21 NOISE ABATEMENT PROCEDURES

a) All aircraft are to be operated in such a manner as to cause the least possible disturbance to surrounding residential areas.
b) Westerly departures should avoid overflying the town of Lytham.
c) Easterly departures should avoid remaining low or initiating full power climb overhead the town of Preston.

EGNO AD 2.22 FLIGHT PROCEDURES

1 GENERAL

a) Priority will be given to test and experimental flying.
b) Aircraft transiting the Warton MATZ flying at or below 3500 FT will be instructed to set the Warton QNH.
c) Pilots wishing permission to enter Warton ATZ should in the first instance attempt to obtain that permission from Warton ATC on 129.530 MHz. If no response is obtained from Warton ATC, pilots must obtain permission from Blackpool ATC on 119.955 MHz.
d) When flying within the Warton ATZ upon the basis of a permission obtained from Blackpool ATC, a continuous watch must be maintained on the Blackpool ATC frequency of 119.955 MHz. Pilots must communicate their position and altitude to Blackpool ATC. Blackpool ATC is itself not manned H24. Accordingly, it may be that pilots will be unable to obtain positive flight information from either Warton ATC or Blackpool ATC. In that event they are to assume the ATZ to be active and remain clear.

2 CIRCUITS

a) All circuits are to the south of Runway 07/25 at 1000 FT.

b) Low level circuits are not to be below 500 FT.
c) Large aircraft circuits will be at 1500 FT.

3 INSTRUMENT APPROACH PROCEDURES

Non-published Instrument Approach Procedures (IAP) are established outside controlled airspace. See ENR 1.5.

4 IFR ROUTINGS

- Inbound from N864 from the south: Via WAL ESTRY
- Inbound from DTY CTA: Via POL
- Inbound from Scottish TMA: Via DCS
- Outbound to N864 to the south: Via ESTRY WAL
- Outbound to DTY CTA: Via ESTRY WAL
- Outbound to the east: Via POL or RIBEL
- Outbound to Scottish TMA: Via RIBEL or SETEL

Local ATC instructions will be issued to avoid the Blackpool ATZ and overflight of EGR312.

5 VFR ROUTINGS

Local ATC instructions will be issued to avoid the Blackpool ATZ and overflight of EGR312.

6 FREQUENCY MONITORING CODE (FMC)

a) Pilots operating in the vicinity of Warton, but intending to remain outside controlled airspace, within the area defined by straight lines joining successively the following points and maintaining a listening watch only on Warton Radar frequency, 129.530 MHz, are encouraged to select SSR code 3660.

535800N 0022410W - 535240N 0021607W -
534459N 0020433W - 533223N 0025907W -
533213N 0031406W - 533021N 0031621W -
thence clockwise by the arc of a circle radius 20 NM centred on 534442N 0025300W to
540206N 0023628W - 535800N 0022410W.

b) Selection of 3660 does not imply the receipt of an ATC service. Aircraft displaying the code are not expected to contact ATC under normal circumstances, remain responsible for their own navigation, separation, terrain clearance and are expected to remain clear of the controlled airspace at all times.
c) Whilst squawking 3660, pilots should be aware that Warton Radar may make blind transmissions in order to ascertain a particular aircraft's intentions/route.
d) When a pilot ceases to maintain a listening watch, code 3660 shall be deselected.

7 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

MINIMUM INITIAL ALTITUDE

Within the ATC Surveillance Minimum Altitude area the minimum initial altitude to be allocated by the approach surveillance controller is:

a) **1700** in the sector defined by the lateral limits; 535115N 0030138W - 535325N 0025152W - 533753N 0025030W - 533625N 0030215W thence clockwise by an arc of a circle radius 8NM centred on 534346N 0025704W - 535115N 0030138W.

b) **2300** in the sector defined by the lateral limits; 535325N 0025152W - 535404N 0024858W - 535122N 0024436W - 534950N 0023847W - 535033N 0022848W thence clockwise by an arc of a circle radius 8NM centred on 534716N 0024107W to 534725N 0022738W - 534632N 0022954W - 533903N 0024059W - 533753N 0025030W - 535325N 0025152W.

c) **2700** in the sector defined by the lateral limits; 535404N 0024858W - 535440N 0024548W thence clockwise by an arc of a circle radius 8NM centred on 534716N 0024107W to 535033N 0022848W - 534950N 0023847W - 535122N 0024436W - 535404N 0024858W.

d) **2700** in the sector defined by the lateral limits; 534632N 0022954W - 534725N 0022738W thence clockwise by an arc of a circle radius 8NM centred on 534716N 0024107W to 534536N 0022756W - 533903N 0024059W - 534632N 0022954W.

OUTSIDE THE DESIGNATED ATC SURVEILLANCE MINIMUM ALTITUDE AREA

The minimum altitude to be allocated by the approach surveillance controller will be either the Minimum Sector Altitude, or **1000** above any fixed obstacles:

a) within 5NM of the aircraft*, and

b) within the sector 15NM ahead of and within 20° either side of the aircraft's track*.

*When the aircraft is within 15NM of the radar antennae, the 5NM in a) and the 15NM in b) may be reduced to 3NM and 10NM respectively.

LOSS OF COMMUNICATION PROCEDURES

Initial Approach

Continue visually or by means of an appropriate approved final approach aid. If not possible proceed at **3500**, or last assigned level if higher, to **WTN NDB**†.

Intermediate and Final Approach

Continue visually or by means of an appropriate final approach aid. If not possible follow the Missed Approach Procedure to **WTN NDB**†.

†In all cases where the aircraft returns to the holding facility the procedure to be adopted is the Radio Failure Procedure detailed at ENR 1.1.3.4.

GENERAL INFORMATION

1. Levels shown are based on QNH.
2. Only significant obstacles and dominant spot heights are shown.
3. The minimum levels shown within the ATC Surveillance Minimum Altitude Area are in conformance with the Standard European Rules of the Air - SERA.5015.
4. Minimum Sector Altitudes are based on obstacles and spot heights within 25NM of **WTN NDB**.
5. Controlled airspace with a base in excess of **5000** or FL55, as appropriate, is not shown.
6. **This chart may only be used for cross-checking of assigned altitudes whilst in receipt of an ATC Surveillance service.**
7. **When vectoring an aircraft within the Final Approach Vectoring Area descent clearance below the SMAA to the FAVA altitude may only be issued if the aircraft is either established on the final approach track or on an Intercept of 40° or less, and in the case of Instrument approaches other than SRA is cleared to Intercept the final approach track.**

EGBW AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGBW AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Aerodrome is not available to aircraft unable to communicate by radio.

2 GROUND MOVEMENT

a) Runway 05/23 is not available from Fri 1600 (1500) - Sun 0900 (0800), or Tue 0900 (0800) following a PH, due to market.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) The aerodrome is situated 3 nm from the southern boundary of the Birmingham CTA (base 1500 FT) and below the CTA (base 3500 FT). Aircraft within the vicinity of Birmingham CTA are advised to Squawk 0010 and listen out on Birmingham radar 123.980 MHz.
b) Pilots are warned that departure from the marked manoeuvring area can be hazardous.
c) Buildings to the east of the aerodrome can cause turbulance and windshear.
d) Runway edge lights are located at the outer shoulders of the runway and not at the edges of the area declared for use as the runway.
e) Aircraft should avoid overflying Stratford upon Avon Gliding Club situated 4 NM North West of Wellesbourne. Gliders winch launched to 2400 FT AMSL.

f) Grass areas, including grass Runway 18/36 are subject to restricted use or closure due to water logging and subsequent soak away, during and following periods of wet weather.
g) Reduced wingtip clearance in front of main buildings. Aircraft with a wingspan in excess of 15 M to exercise caution.

5 HELICOPTER OPERATIONS

a) Helicopter arrivals and departures to remain not above 600 FT QFE within the ATZ.

6 USE OF RUNWAYS

a) Runways 18/36 (grass) is unlicensed and can only be used if available and by prior arrangement. For details including dimensions/ declared distances contact the aerodrome.
b) Prior to any pilot using the grass strip they must receive a briefing from the FISO/Airport Manager and familiarise themselves with the runway condition including the location of the high intensity runway lighting positioned on the tarmac runway edge and the crops located on the western side of the grass.
c) Simultaneous operations on Runway 18/36 tarmac and 18/36 grass are not permitted.

7 TRAINING

a) Aerodrome does not meet criteria for training outside published hours of operation.
b) Only one non-based aircraft at a time is permitted to operate in the circuit for approaches, booking is essential.

EGBW AD 2.21 NOISE ABATEMENT PROCEDURES

a) Runway 36 departures: After departure turn right onto a track of 030° to 1000 FT QFE before turning crosswind.
b) Do not overfly Loxley (1.5 NM southwest) or Charlecote/Hampton Lucy (1 NM north) on departure.

EGBW AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuit directions variable. Circuit height 1000 FT QFE. Helicopters 600 FT QFE.
b) Helicopter aiming points Whiskey and Echo for circuits, arrivals and departures. (Echo not available Saturdays and Bank Holidays)
c) No touch-and-go's allowed outside of published hours.

2 ARRIVALS

a) Overhead joins preferred.

3 RADIO COMMUNICATION FAILURE PROCEDURES

a) Standard radio failure procedures apply at Wellesbourne ENR section 1.1, paragraph 3.4.2 refers.
b) Fixed wing aircraft will join from the overhead at 2000 FT QFE, letting down to circuit height on the dead side, then join downwind at 1000 FT QFE observing any light signals displayed.
c) Rotary aircraft should arrive from the west and join midpoint downwind at 600 FT AGL for either runway 18RH or runway 36LH and aim for Heli 'W', remaining clear of all runways and final approach paths observing any light signals displayed. From 'W' air taxi to suitable parking away from any fixed-wing aircraft.

1	2	3	4	5	6	7
DME	WPL	106Y 115.950 MHz	0900-1700 (0800-1800).	523747.85N 0030913.73W	252 FT	On AD. Any VOR indications should be ignored. Due to terrain effects, the DME may unlock in two sectors, 055 to 155 MAG and 245 to 355 MAG; range error in these sectors may be experienced up to 0.3 NM. DOC 15 NM/25,000 FT.
NDB 0.21°E (2027)	WPL	323.000 kHz	0900-1700 (0800-1800).	523747.74N 0030913.90W	-	On AD. Range 10 NM. Normally radiates H24. Poor ADF performance may be experienced due to terrain effects.

EGCW AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Aerodrome is not available to aircraft unable to communicate by radio.
b) No solo flying training for the purpose of the grant of a licence shall take place when the visibility at the aerodrome is less than 8 KM or the cloud base is less than 2500 FT above aerodrome level.

2 GROUND MOVEMENT

a) The Northern Taxiway is limited to aircraft with a wing span no greater than 12.8 M.
b) Aircraft parking is on grass apron in summer season.
c) Power checks:

i. Rwy 22 – Alpha Hold (Avoid pointing propwash onto North Apron).
ii. Rwy 04 – Delta Hold.

3 CAT II/III OPERATIONS

Not applicable.

4 WARNINGS

a) The aerodrome is located in the River Severn Valley with high ground on each side of the valley. Pilots are advised not to descend below safety height until on final approach after having positively identified the runway.
b) The fins of aircraft parked on the Southern Apron may infringe the aerodrome transitional area.
c) Trees infringe the transitional surface by 16 M, east-southeast of the aerodrome:

i. Single oak tree located 130 M south east of the centreline, 400 M from the north eastern end of the runway, 23 M tall;
ii. Row of poplars located 120 M south east of the centreline, 345 M from the south western end of the runway, 34 M tall.

d) Runway 04 Procedure – Aircraft holding on the far end turning pad are to hold at marker board Delta. Landing aircraft are to note that any aircraft holding at Delta will be abeam the undershoot, separated by 70 M from the displaced threshold.

5 HELICOPTER OPERATIONS

a) Light aircraft are warned of the possible effect of wake turbulence by preceding helicopters on approach or departure. Light aircraft should also be aware of the possible effect of rotor downwash generated by large helicopters operating on the aerodrome, including the home based Air Ambulance EC145 Helicopter which may lift at short notice. Both Civil and Military Helicopter training takes place at the airfield, fields to the east and west of the runway are often used for hover practice.

6 USE OF RUNWAYS

Not applicable.

7 TRAINING

a) Rotary, fixed wing & microlight training takes place at this aerodrome.

EGCW AD 2.21 NOISE ABATEMENT PROCEDURES

a) Avoid flying overhead Powis Castle.

EGCW AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Overhead Joins 2500 FT QFE.
b) Fixed Wing Circuit 22/04 LH 1500 FT AGL.
c) Rotary Circuit LH 22/04 1200 FT AGL inboard of fixed wing circuit.
d) State Position on first contact with Welshpool Radio.

INTENTIONALLY BLANK

EGFA AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) While airside each commander is responsible for the safety of his/her passengers and other crew members. Passengers are at all times to be escorted by the aircraft commander or a crew member who is known to be competent to ensure both his/her and the passengers' safety. The wearing of high visibility clothing when airside is strongly recommended.
b) Aircraft commanders or crew members, as applicable, are responsible for ensuring that a total ban on smoking while airside is observed.
c) The carriage of Dangerous Goods, as specified by The Air Navigation (Dangerous Goods) Regulations 2002, is prohibited unless written approval has been issued by the Airport Manager.
d) Use of the airport by aircraft unable to communicate via RTF, is not permitted.
e) Permission to use the airport, either to land or depart, may be withdrawn without prior notice. Withdrawal of permission may occur due to prevailing weather conditions, if it is considered that the requirements of the airports safety management system cannot be met.

2 GROUND MOVEMENT

a) Runway incursion Hot Spots HS1 and HS2 shown on Aerodrome Chart at AD 2-EGFA-2-1.

3 CAT II/III OPERATIONS

Not applicable.

4 Warnings

a) Parts of the ATZ are located within Danger Areas EGD201H and EGD202D. Operation of these areas is not continuous and is accordingly notified via NOTAM. Aircraft given permission to use the aerodrome during notified hours of operation of these Danger Areas should use the flight procedures set out at AD 2.22.
b) Unmanned aircraft flying takes place at the aerodrome, within the ATZ and surrounding Danger Areas. During times that unmanned aircraft are airborne temporary restrictions to manned aircraft flights may be applied. Permission to use the aerodrome during these times will specify conditions which are intended to minimise delays. Unmanned aircraft flying will normally result in Danger Area EGD202D being notified active.
c) During times that EGD202D is notified active arriving flights are required to contact the current Danger Area managing authority for entry approval. This will be either:

   Aberporth Radar 120.835; or

   West Wales Radar 127.090; or

   West Wales Information 122.155.

d) During times that unmanned aircraft flying is taking place, support equipment may be present on Runway 07/25 and/or within the runway strip. During times that such equipment is present Runway 07/25 may operate unlicensed.
e) Unmanned aircraft systems (including model aircraft) operates from the North East corner of the aerodrome, position 520707.1N 0043327.9W, up to 200 FT AGL (676 FT AMSL) and occasionally up to 400 FT AGL (876 FT AMSL), during daylight hours until 2000 (1900). Go-arounds on RWY 07/25 are to be carried out on the live side only.
f) FRZ (EGR2U001A) active with Unmanned Aircraft Systems (including model aircraft), SFC-400 FT AGL (867 FT AMSL) outside of AD published hours.

5 HELICOPTER OPERATIONS

a) All wheel equipped helicopters are required to land and take-off on the runway and ground taxi to/from the apron.

6 USE OF RUNWAYS

a) Runway 04/22 available by prior arrangement for fixed-wing aircraft not requiring use of a licensed runway.

7 TRAINING

Not applicable.

EGFA AD 2.21 NOISE ABATEMENT PROCEDURES

a) Aircraft are to be operated in a manner to cause least disturbance in areas surrounding the airport.
b) Use of Hangar 1 is subject to noise abatement requirements.

   i. No engine ground running is permitted on the paved maintenance area adjacent to the Hangar.
   ii. Subject to AFIS approval aircraft are to be towed to a designated location on Taxiway B before engine start up.
   iii. Aircraft vacating Runway 07/25 at Taxiway B are to shutdown engine(s) north of Hold B and then towed to Hangar 1.

EGFA AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuit height is 1000 FT AAL/1424 FT AMSL.
b) The following circuit directions apply when the specified runway is in use:

   Runways 07 and 04 RH; Runway 25 and 22 LH.

c) Unless otherwise notified by 'West Wales Information' a standard circuit joining procedure via overhead the aerodrome is not permitted. The southern lateral limit of Danger Area EGD201H is located approximately 1 NM north of Runway 07/25 centre-line. When notified active, entry into the circuit is to ensure that aircraft avoid entry into the Danger Area. The intended entry point into the circuit should be notified to 'West Wales Information'.

2 COMMUNICATIONS & SSR

a) Aircraft in communication with West Wales ATS may be allocated a conspicuity squawk of 4527. Aircraft must not select this squawk unless instructed to do so by ATS.
b) Aircraft remaining in the circuit at West Wales will be allocated a conspicuity squawk of 7010. Aircraft must not select this squawk unless instructed to do so by ATS.
c) Allocation of these conspicuity squawks does not constitute any radar service.

EGEW AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

All GA aircraft must park only on the clearly designated grass GA APRON. GA aircraft must not park on the main tarmac apron.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Visiting pilots should note that during periods of prolonged rainfall the grass runway can become very soft especially during the winter months.
b) **Runway 09/27:** Graded hardcore runway is generally unsuitable for light aircraft with low ground/propeller clearance due to unstabilised surface and as a result it would be advisable to carry out any power checks on the tarmac apron before departure.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGEW AD 2.21 NOISE ABATEMENT PROCEDURES

EGLM AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Users of the aerodrome should be familiar with the West London Aero Club Operations Manual which is available at the aerodrome or on the internet at **https://www.wlac.co.uk**

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) The aerodrome is located immediately to the west of the London CTR and part of the White Waltham ATZ to the east lies within the London CTR.
b) The aerodrome surface is rough and undulating.
c) Vehicular traffic, not under the control of the aerodrome operator, uses the perimeter track which bounds the manoeuvring area to the west and north of the aerodrome and pilots are cautioned to exercise extreme vigilance when operating aircraft and to use only established taxiways in order to ensure safe clearance.
d) Aerobatics display practice may take place in the airfield overhead.
e) Drone testing takes place on the aerodrome up to 400 FT AGL.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGLM AD 2.21 NOISE ABATEMENT PROCEDURES

a) Pilots of departing aircraft are requested to conform with Local Noise Abatement Procedures. Details are available in the briefing room, on the website and via a briefing from Operations. Pilots should take care that operating noise is kept to a minimum. No flying over built up areas, avoid overflying local villages.

EGLM AD 2.22 FLIGHT PROCEDURES

1 REPORTING POINTS AND ARRIVALS

a) Aircraft arriving at White Waltham aerodrome are to approach by one of the reporting points November, Sierra or Whiskey shown on the Traffic Zone Chart at AD 2-EGLM-4-1.
b) Aircraft are to arrive overhead the aerodrome at 1200 FT QFE and then carry out a standard overhead join from this height.

2 AIRCRAFT IN THE LONDON CTR OUTSIDE THE WHITE WALTHAM LOCAL FLYING AREA (LFA)

a) Pilots operating on a VFR or Special VFR clearance in the London CTR inbound to White Waltham (or otherwise) must not assume a clearance has been given to penetrate the ATZ.
b) Pilots requiring a VFR or Special VFR clearance to transit the London CTR must remain within the confines of the White Waltham LFA until a clearance has been obtained from Heathrow Radar.

3 LOCAL FLYING AREA (LFA)

a) White Waltham Aerodrome Local Flying Area (LFA) (see AD 2-EGLM-4-1) is defined as that portion of the White Waltham ATZ contained within the London Control Zone. VFR flights may take place within the LFA subject to the following conditions:

   i. In compliance with the Class D Airspace weather minima as defined in ENR 1.2;
   ii. Maximum altitude: 1500 ft QNH;

   Note 1: *Pilots of aircraft flying under VFR in the LFA are responsible for providing their own separation from other aircraft operating in the relevant airspace. SVFR flights are required to be separated by Heathrow Radar.*

   Note 2: *Aircraft unable to operate VFR may operate Special VFR within the LFA subject to:*

   (i) The conditions in paragraph (a)(i) and (ii);

   (ii) The requirements for Special VFR flights detailed in ENR 1.2 and;

   (iii) Subject to approval from Heathrow Radar.

b) Mode S Transponders

   i. The carriage of a Mode S Transponder within the LFA is encouraged, however there is currently no requirement for aircraft operating in the White Waltham LFA to comply with the requirements of the London CTR Mode S Transponder Mandatory Zone (TMZ).
   ii. Pilots of suitably equipped aircraft shall utilise the transponder to the maximum serviceable extent, selecting SSR code 7000 with altitude information selected where fitted.

4 CIRCUITS

a) All joins normally overhead at 1200 FT QFE; circuit height 800 FT QFE.

4	De-icing facilities	-
5	Hangar space for visiting aircraft	By arrangement with Far North Aviation.
6	Repair facilities for visiting aircraft	By arrangement with Far North Aviation.

7	Remarks	Fuelling/Handling via Far North Aviation by Tel: 01955-602201, Fax: 01955-602203 or RTF (131.560 MHz callsign 'Far Nor'). Helicopter rotors running refuelling available by arrangements with HIAL and Far North Aviation. Oxygen, nitrogen and related servicing available from Far North Aviation. Survival suits, lifejackets and dinghies available from Far North Aviation.

EGPC AD 2.5 PASSENGER FACILITIES

1	Hotels	Wick and surrounding area.
2	Restaurants	Vending machines in terminal.
3	Transportation	Car Hire and taxis available.
4	Medical facilities	First Aid.
5	Bank and Post Office	Wick.
6	Tourist Office	Wick.
7	Remarks	Aviramp, stair climber and wheelchairs available for passengers with reduced mobility.

EGPC AD 2.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category A4 RFF Category 4 Mon-Fri, Sun. RFF Category 5 accepted under remission. RFF Category 6 by prior arrangement.
2	Rescue equipment	Off road trailer unit for 1000 M response.
3	Capability for removal of disabled aircraft	Limited.
4	Remarks	-

EGPC AD 2.7 SEASONAL AVAILABILITY - CLEARING

1	Type of clearing equipment	Mechanical. Chemical de-icing/anti-icing. Surfaces de-iced/anti-iced with KAC/EG and/or NAAC.
2	Clearance priorities	Runway 13/31, Taxiways, Apron, Airport domestic area.
3	Remarks	Latest information from ATC, Tel: 01955-602215, Ext 583.

EGPC AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Use of this airport by aircraft not able to communicate with ATC by radio is strictly PPR.
b) Aircraft that do not require the use of a licensed aerodrome and that wish to operate outwith the notified aerodrome hours of operation must comply with Highlands and Islands Airport Ltd Out of Hours Indemnity Scheme. Mandatory handling for Out of Hours applies to all aircraft not based at Wick. During periods when the aerodrome is snow closed to facilitate snow clearing and/or de-icing operations out of hours indemnities are suspended and no flights may operate. Details of the scheme and an application form can be obtained at: https://www.hial.co.uk/hial-group/general-aviation-4/1 or from HIAL Business Support Team, Email: bstdoccontrol@hial.co.uk.
c) Use of Wick aerodrome is subject to standard Terms and Conditions of Use, which can be requested from the aerodrome.
d) High visibility clothing must be worn airside at all times.

2 GROUND MOVEMENT

a) During periods of aircraft congestion on the apron, marshalling will be provided by HIAL.
b) Start-up requests are mandatory on all aprons.
c) Pilots must request and follow ATC taxi instructions.

3 CAT II/III OPERATIONS

Not applicable.

4 WARNINGS

a) Except for light signals, ground signals are not displayed.
b) Pilots are advised to exercise caution as this aerodrome has a deer hazard, particularly during the periods of dawn and dusk, although patrols are mounted whenever the presence of deer is known or anticipated. Pilots are requested to report the location of any animals on the aerodrome to ATC.
c) In Winter months there is increased bird activity in the vicinity of the aerodrome due to over wintering geese.
d) Grass areas are soft and unsafe. Poor load bearing characteristics may be found on the runway/taxiway strips and the area adjacent to the apron. Only marked taxiway to be used.
e) Loop Taxiway from Runway 13/31 through hold C, B & A, and North Taxiway through hold D and D1, is restricted to aircraft with an outer main gear wheel span not exceeding 8 M. Loop Taxiway through hold E and E1 is restricted to aircraft with an outer main gear wheel span not exceeding 6 M.

5 HELICOPTER OPERATIONS

a) Rotors running refuelling is available if Far North Aviation are provided with a copy of the Helicopter Operators written instructions regarding the aircraft, the required safety measures and the emergency procedures to be followed. All passengers must disembark before refuelling commences, unless in exceptional circumstances at the discretion of the aircraft commander.

6 USE OF RUNWAYS

a) Runway departure restriction for aircraft requiring the use of a licensed aerodrome:

   i. **Runway 13/31.** Except where an AOC holder has a less restrictive State authorised take-off minima, departures when the reported MET visibility is 400 M or less are not permitted.

b) Arriving aircraft on Runway 31 are required to backtrack and exit via Hold C. Pilots should commence backtrack as soon as practicable and successive inbound aircraft will be informed by ATC if required.
c) Departing aircraft are required to backtrack Runways 13 and 31 via Hold C. Backtracking should be as expeditious as possible. Pilots must inform ATC prior to entering the runway if they are aware that they will not be ready for departure on line up. Clearances or departure instructions will be issued during taxi.

7 TRAINING

a) The use of the airport for training purposes is subject to prior arrangement with ATC, Tel: 01955-602215, Ext 583.

EGPC AD 2.21 NOISE ABATEMENT PROCEDURES

Not applicable.

EGPC AD 2.22 FLIGHT PROCEDURES

1 INSTRUMENT APPROACH PROCEDURES

a) Instrument Approach Procedures (IAP) for this aerodrome are established outside controlled airspace. See ENR 1.5.

2 NORTH ATLANTIC DEPARTURES

a) Due to the proximity of the Shanwick Oceanic boundary to Wick, pilots must consider timescales for submitting an 'RCL'. Refer to ENR 2.2, paragraph 3.8.2 for details.

3 RADIO COMMUNICATION FAILURE PROCEDURES

a) The pilot of a VFR flight experiencing communications failure should join overhead at 2000 FT and descend into the circuit pattern for the runway-in-use watching for light signals from the Tower all the while. Should a light signal not be forthcoming on turning onto final approach, the pilot should level off at not below 400 FT and fly parallel to the runway, and adjacent to the Tower, to attract attention.

4 CIRCUITS

a) Circuit Height: 1000 FT AAL unless directed by ATC.
b) Circuit Directions: Runway 13 - LH; Runway 31 - RH.
c) Joining instructions as directed by ATC.

5 VISUAL REFERENCE POINTS (VRP)

a) Castletown (Disused AD) and Loch Watten lack conspicuity at night and are unsuitable.
b) Castletown (Disused AD) is close to the let-down pattern for Runway 13, the direct arrival to Runway 13, the missed approach procedure for Runway 31, and helicopters on HMRIs X-RAY and YANKEE.
c) Loch Watten is close to the let-down pattern for Runway 13 and missed approach Runway 31.
d) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

6 UK FLIGHT INFORMATION SERVICES

a) During notified ATC hours of service:

   i. A procedural ATS will be routinely applied to IFR flights. Pilots will be expected to accept levels, radials, tracks and/or time allocations that may require flight in IMC, to achieve planned deconfliction minima from other aircraft being provided with a procedural ATS;

ii. Pilots must use conventional navigation aids when receiving a procedural ATS that includes deconfliction from other traffic, and not use FMS overlays for the purpose;
iii. A basic ATS will be applied to VFR flights. Agreements may be requested which restrict aircraft to a specific level, level band, heading, route, or operating area for the purposes of co-ordination and/or to facilitate the safe use of airspace;
iv. A pilot may request another ATS if considered more appropriate.

b) Outside notified ATC hours of service:

i. A basic ATS will be applied to SAR and ambulance flights by an AFISO.

7 TRANSITION LEVEL

a) Pilots of inbound IFR aircraft shall acknowledge receipt of the Transition Level on first contact with Wick ATSU. The Transition Level will be broadcast on ATIS.

8 TRANSPONDER MANDATORY ZONE ACCESS

a) Pilots are reminded of the proximity of the Moray Firth Transponder Mandatory Zone and of the pilot's responsibility to remain clear of airspace for which they are not suitably equipped to enter. Many of the approaches to Runway 31 and most arrivals from the south east will enter the Moray Firth TMZ; as such pilots must state if they are not equipped to enter a TMZ to the relevant controlling agency.

b) Suitably equipped aircraft may access the Moray Firth TMZ without ATS approval although such traffic is strongly recommended to afford itself of an ATS from either Wick, Lossiemouth or Scottish Control.

c) The pilot of an aircraft that wishes to operate in the Moray Firth TMZ without serviceable transponder equipment as defined in GEN 1.5 para 5.3 may be granted access to the TMZ subject to specific ATC approval. This approval may be obtained with prior notice from Wick ATC or from Lossiemouth Departures. Pilots of departing aircraft from Wick AD without a serviceable transponder must notify Wick ATC of their transponder status on start.

EGPC AD 2.23 ADDITIONAL INFORMATION

a) Aircraft operators are responsible for the searching of any aircraft parked either overnight or within the demarcated area prior to departure.

EGNW AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

Not applicable

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) The aerodrome is divided by a public road and only the runways to the North of the road can be used.
b) Hot Spot HS1 vehicles crossing the Runway 21 threshold.
c) The warehouses of Rase and Frontier distribution on the aerodrome are not to be flown over at anytime.
d) Aerobatics are conducted within the aerobatic box located in the South East part of the ATZ. When aerobatics are being conducted there will be no overhead joins and only live side joins will be permitted.
e) Departing aircraft passing 1500 FT AAL within the ATZ are requested to contact RAF Waddington ATC on 119.505.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

a) Aircraft landing on Runway 33 are to backtrack in turn to the intersection and vacate for fuel or parking.

7 TRAINING

Not applicable

EGNW AD 2.21 NOISE ABATEMENT PROCEDURES

a) All traffic are to avoid overflying the local villages of Wickenby, Lissington and Holton-cum-beckering.
b) All traffic are to avoid overflying Blackhills farm 1.1 NM on approach to Runway 15.

EGNW AD 2.22 FLIGHT PROCEDURES

1 INBOUND AIRCRAFT

a) Inbound aircraft are requested to contact RAF Waddington on 119.505.

2 LOCAL FLYING AREA

a) Flights within the ATZ above 1500 FT AAL are subject to clearance from RAF Waddington ATC.

3 CIRCUITS

a) Normal circuit directions: All Runways - LH. Circuit height 1000 FT QFE. Microlight circuit 700 FT QFE inside GA circuit.
b) Aerobatic circuit directions: Runway 33 & Runway 03 - LH, Runway 15 & Runway 21 - RH.

EGBO AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Pilots are responsible for their passengers whilst airside at this aerodrome.
b) High visibility clothing is recommended airside.
c) Non-radio aircraft are not permitted to operate outside of published hours. During published hours all non-radio flights are to be approved by ATS.
d) All movements outside of published hours are subject to the out of hours conditions published on the airport website.
e) During winter hours night flying can take place on Thursdays until 2100. Intended Night Flights are subject to PPR which must be notified no later than 1500 on the date of flight.

2 GROUND MOVEMENT

a) Fuel Bay operates a one-way system, entry at the west end (near Hangar 3 east), exit at east (near the mobile fuel bowser). Aircraft to draw up with pumps on starboard side.
b) Pilots must moderate taxiing speeds on Taxiway A and Taxiway F due to undulating surfaces and between A4 and the Fuel Bay due to the possible presence of pedestrians in this area. Special caution must be exercised in the area adjacent to the tower where there is a marked crossing area. Taxi speeds should not exceed a fast walking pace.
c) There are three stands marked 1, 2 and 3 and are adjacent to the Fuel Bay. These parking stands are available for fixed wing and rotary aircraft.

d) Jet aircraft should seek prior approval from ATS before booking in.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Runway 16/34 lights may be illuminated outside ATS hours for police helicopter operations.
b) Helicopters are not to hover within 50 M of DME/NDB masts, which are situated northeast of the eastern apron.
c) Runway 16/34 shallow depression on eastern edge of runway close to Runway 34 PAPIs will hold water after rain. Runway 16/34 shallow depression crosses the runway north of Runway 34 threshold.
d) View from A5 Hold restricted. Care to be taken when entering/crossing Runway 34.
e) Aircraft should not cut corners when turning on to taxiways and runways due to bad ground and fixed objects such as markers and lighting.
f) Pilots must taxi with caution near the Fuel Bay and in the area adjacent to the tower where there is a marked pedestrian crossing, due to pedestrians possibly manoeuvring on the taxiway. Taxi speeds should not exceed a fast walking pace.

5 HELICOPTER OPERATIONS

a) There are three designated helicopter pads marked 4, 5 & 6 adjacent to the mobile bowser.
b) Stands marked 1, 2 & 3 adjacent to the Fuel Bay can also be used to park helicopters.
c) Helicopters taxiing to the fuel pads are asked to operate their aircraft so as to minimise the effect of their downdraft on the nearby hangars.
d) Wheeled helicopters requiring fuel can expect to be instructed to land on Taxiway A to the south east of the fuel bay and then ground-taxi to fuelling pads 4, 5 or 6.
e) Hovering helicopters shall maintain a distance of 60 M from any active runway, taxiway, fencelines, buildings and public viewing area.
f) Helicopters are not to air taxi anywhere between the west of the Fuel Bay and A4 holding point, due to proximity to parked aircraft, buildings, and pedestrians. This includes the main parking apron.
g) See aerodrome chart for named helicopter landing areas.
h) Helicopters are not to land adjacent to the entrance of Hangar 3E. They should use the Helipads and be ground handled in an out of the hangar.
i) JET A-1 F34 Rotors running available Mon-Fri 0900-1645 (0800-1545); extensions available with advanced notice bookings. Available from Helipads 4,5 & 6 using the mobile bowser. Contact ATS to book in or for additional information.

6 USE OF RUNWAYS

a) Only Runway 16/34 is licensed for night use.
b) All runways and taxiway use restricted to aircraft weighing not more than twelve tonnes.

7 TRAINING

a) Training is permitted at the aerodrome. See website for deals on training packages.

EGBO AD 2.21 NOISE ABATEMENT PROCEDURES

a) Runway 16: All departures at the airfield boundary should make a track change of 10 degrees to the right. No left turns are to be made below 600 FT QFE. No direct overflights of Highgate Farm (523030.132N 0021457.5268W) are permitted.
b) Runway 34: No FANSTOP (practice engine failure after take-off) are permitted until passed Whittimere Farm (523149.1016N 0021551.696W), 1000 M beyond end of runway. Traffic turning left into the visual circuit are to avoid direct overflights of Claverley (523214.4204N 0021811.9592W) and Bobbington Village (523043.848N 0021658.116W).
c) Runway 28/10: Departures, approaches and visual circuits are to avoid direct overflights of Bobbington Village and Primary school (523043.848N 0021658.116W).
d) All visual circuits are to be completed within the ATZ.

EGBO AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Fixed wing circuits are LH at 1000 FT QFE.
b) Helicopter circuits are RH at 800 FT QFE.
c) Use of multiple runways is to cease when more than two aircraft are in or call to join the visual circuit. In this situation all aircraft should revert to the published runway. Any approaches to the non-published runway is then limited to one approach only with no mixed multiple circuits permitted. All aircraft are to revert to the published runway if any of the aircraft are student pilots or an emergency is declared. If Runway 16/34 is being used for a larger aircraft then it shall become the published runway until that aircraft has landed or departed the ATZ.
d) Autogyros are to fly the standard fixed wing circuit pattern and profiles. Pilots of autogyros are to prefix their callsign with 'Gyro' and be aware that they can be hard to see and that additional transmissions may be required to confirm their position and intentions to other aircraft.

2 JOINING

a) The standard fixed wing join is overhead. Aircraft should not descend below 1300 FT QFE on the deadside due to the helicopter circuit at 800 FT QFE.

3 DEPARTURES

a) **South:**

IFR Airways traffic departing to the south should file a flight plan direct to CPT VOR. Flight plans should not be filed for HON VOR due to commercial traffic volumes.

b) **North/East/West:**

File flight plan as normal using preferred reporting points.

When ready to taxi, request for an airways join from ATS and await further instructions.

EGTB AD 2.19 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGTB AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Aerodrome strictly PPR. Visiting aircraft and helicopters will not be accepted without prior permission being granted by the aerodrome authority. All pilots must receive briefing.
b) Air-ground communication service provided - 'Wycombe Radio'. No ATC. Pilots are responsible at all times for lookout and traffic separation.

2 GROUND MOVEMENT

a) Taxiway Bravo is a grass taxiway that has been reinforced with plastic matting to a width of 6.6 M, there is an inset yellow centre-line and the edges are marked with blue linlaners. Pilots should remain on the matting as the grass is subject to waterlogging.

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) The aerodrome is close to the London CTR and situated below the London TMA.

b) The aerodrome is liable to waterlogging.
c) Intense gliding takes place on and around the aerodrome. Pilots should maintain a sharp lookout at all times, but particularly when crossing between the main apron (Hold Alpha 3) and the grass Runway 06/24 (Hold Alpha 2). No overhead transits of aircraft due to gliding activity.
d) Helicopters operate inside fixed-wing circuits.
e) Non-standard markings on Main Apron do not guarantee wingtip clearance. Pilots should taxi with extreme caution.

5 HELICOPTER OPERATIONS

Not applicable

6 USE OF RUNWAYS

Not applicable

7 TRAINING

Not applicable

EGTB AD 2.21 NOISE ABATEMENT PROCEDURES

a) Pilots of departing aircraft are required to conform to strict Noise Abatement Procedures. These are available from the Aerodrome Operator.

EGTB AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuits variable.
b) Gliders will be flying a circuit opposite to that in use by powered aircraft.
c) Joining aircraft are to position to overfly the runway in use at 1200 FT QFE on the runway QDM. When overhead the midpoint of the runway turn left or right (depending on the circuit direction) to level at circuit height 1000 FT QFE on the crosswind leg prior to turning downwind.
d) Helicopter circuit height 750 FT QFE.

2 HELICOPTER OPERATIONS

a) Helicopters shall not operate above 50 FT QFE when within 150 M of the runways without permission. All arriving and departing helicopters must contact Wycombe Radio at the ATZ boundary for local aerodrome information. Maximum care is to be exercised when manoeuvring to/from the helipad, 100 M South of visual control room, to avoid the effect of downwash on fixed-wing aircraft and gliders, always maintain a minimum distance of 30 M from any structure. There will be no helicopter hover movements to the South or West of the Southwest corner of the helipad. Helicopters are at all times to avoid flying directly over or within 25 M of parked aircraft and gliders at low level. Helicopters must remain well clear of the housing area East of the Airfield.

3 LOCAL FLYING PROCEDURES

a) Although no part of the Wycombe Air Park ATZ lies within the London CTR the following procedures should be observed:

   i. Pilots operating on a VFR or SVFR clearance in the London CTR and inbound to Wycombe Air Park (or otherwise) must not assume clearance has been given to penetrate the Wycombe ATZ. Pilots must obtain prior permission from Wycombe by RTF;
   ii. Pilots requiring a VFR or SVFR clearance to transit the London CTR must remain outside the London CTR until a clearance has been obtained from Heathrow Radar;
   iii. Pilots of aircraft flying within the confines of the Wycombe ATZ are responsible for providing their own separation from other aircraft operating within the ATZ.

b) Gliders and glider tugs are to land beyond the locally agreed 'D' line to deconflict with taxiing aircraft.

4 VISUAL REFERENCE POINTS (VRP)

a) Details of VRPs are available in the consolidated 'Visual Reference Points List' published on the 'Digital Dataset' page of the NATS AIS website, www.nats.aero/ais.

EGHG AD 2.20 LOCAL AERODROME REGULATIONS

1 AIRPORT REGULATIONS

a) Licensed for night operations by helicopters only.

2 GROUND MOVEMENT

Not applicable

3 CAT II/III OPERATIONS

Not applicable

4 WARNINGS

a) Noticeable windshear on Runway 27 approach.
b) Strict PPR in force, visiting aircraft may be delayed due to helicopter test flying.
c) The aerodrome surface is convex with a pronounced down gradient to the South at Runway 09 threshold.
d) Beware of bird concentrations.
e) Caution light aircraft, model aircraft and helicopter flying outside operational hours.
f) Caution is required after heavy rain.
g) Houses adjacent to the north and east boundaries of the aerodrome.
h) Trees on high ground up to 400 FT AMSL, 1 NM to the east.
i) Hangars in the southeast corner of the aerodrome.
j) High ground rising to 442 FT AMSL 2.5 NM to the southwest with Radio mast (LGTD) 528 FT AMSL.
k) Runway 09/27 has degraded and undulating surface. Aerodrome closed to fixed-wing aircraft.
l) Transitional slope infringed by 4.88 M due to Radome at 505626.69N 0023931.68W.
m) Transitional slope infringed by 2.13 M due to Aerodrome Boundary fence at 505629.74N 0024007.44W.
n) Wildlife control measures and grass cutting may take place outside published aerodrome operating hours.

5 HELICOPTER OPERATIONS

a) Procedures as for fixed-wing aircraft.

6 USE OF RUNWAYS

a) Runway surface degraded. Runway use by fixed-wing aircraft is prohibited.

7 TRAINING

Not applicable

EGHG AD 2.21 NOISE ABATEMENT PROCEDURES

a) All pilots should take particular note of noise sensitive areas at the eastern boundary of the aerodrome on final approach to Runway 27 which prohibits close base leg approaches to Runway 27 and low departures from Runway 09. An additional noise sensitive area exists at Brympton D'Evercy House (505612.88N 0024105.48W). Normal visual approaches to either runway should be made to an approximate mid-field position (e.g. abeam the radome) unless over-riding safety considerations exist or otherwise instructed by ATC. Pilots should plan to backtrack as required when departing from Runway 09 to avoid low departures over Yeovil town centre.

EGHG AD 2.22 FLIGHT PROCEDURES

1 CIRCUITS

a) Circuits to the south of the runway due to the proximity to Yeovilton. Circuit height 1000 FT AAL.

2 INSTRUMENT APPROACH PROCEDURES

a) Instrument Approach Procedures (IAP) for this aerodrome are established outside controlled airspace. See ENR 1.5.

6	AD Administration Address Telephone E-mail address Web address	HELICOPTER AND AVIATION SERVICES LIMITED Hangar 11, Redhill Aerodrome, Redhill, Surrey, RH1 5JY. 01202-835385 (Administration) 01202-098013 (ATC) nick@helipad.co.uk (Ops) phil@helipad.co.uk (ATC) www.helipad.co.uk
7	Type of Traffic permitted (IFR/VFR)	VFR
8	Remarks	Helicopter and Aviation Services Ltd on behalf of The Jockey Club.

EGBC AD 3.3 OPERATIONAL HOURS

1	Heliport Operator	1030-1900 (0930-1800). 1900-2000 (1800-1900) by arrangement; surcharge will apply. All flights PPR. Heliport not available 10 minutes prior to race start or whenever horses are on the course.
2	Customs and Immigration	By arrangement. Contact Aerodrome Licensee for details.
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	-
7	Air Traffic Service	1030-1900 (0930-1800). 1900-2000 (1800-1900) by arrangement. ATC is provided for the annual Cheltenham Festival and Gold Cup Meeting. Other times Nil. Helicopter and Aviation Services Ltd will provide an ATC service when the heliport is licensed.
8	Fuelling	As heliport hours, when licensed. May be available for other events by arrangement.
9	Handling	Helicopter Aviation Services provide a passenger handling service for all flights. Helicopter operators undertaking shuttle flights must have a representative at the Heliport to co-ordinate their passengers.
10	Security	-
11	De-icing	-
12	Remarks	No flights permitted before 1030 hours or 10 minutes before the start of a race until 5 minutes after a race or at anytime when horses are on the course.

EGBC AD 3.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	-
2	Fuel and oil types	AVTUR JET-A1 rotors-running refuels when licensed. At other times, rotors stopped refueling may be available.
3	Fuelling facilities/capacity	-
4	De-icing facilities	-
5	Hangar space for visiting aircraft	-

6	Repair facilities for visiting aircraft	-
7	Remarks	-

EGBC AD 3.5 PASSENGER FACILITIES

INTENTIONALLY BLANK

EGBC AD 3.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category H2 Category may be reduced to H1, pleasure flying level or nil for events when heliport is not licensed.
2	Rescue equipment	-
3	Capability for removal of disabled aircraft	-
4	Remarks	-

EGBC AD 3.7 SEASONAL AVAILABILITY - CLEARING

INTENTIONALLY BLANK

EGBC AD 3.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron/ helicopter stands surface and strength	APRON Surface: Grass NIL
2	Ground taxiway width, surface and designation	Taxiway TWY: - Surface: Grass NIL
3	Air taxiway width and designation	-
4	Altimeter checkpoint location and elevation	-
5	VOR checkpoints	-
6	INS checkpoints	-
7	Remarks	The surface of the heliport is not suitable for ground taxiing. Helicopters are required to air-taxi via the FATO. During periods of intense traffic helicopters may be required to air-taxi on the eastern side of the FATO in order to allow helicopters to pass each other; this may involve crossing and re-crossing the FATO when taxiing to and from fuel. 5 stands (18 M diameter) are marked by white circle edge markings.

EGBC AD 3.9 MARKINGS AND MARKERS

1	Final approach and take-off markings	FATO 13/31: Painted white corner markings, white edge markings with standard H in centre of FATO. FATO designation markers provided when licensed operations are taking place.
2	Taxiway, air taxiway and air transit route markers	-
3	Remarks	Standard FATO markings. Stands marked by white circular edge markings.

EGBC AD 3.16 AIR TRAFFIC SERVICES AIRSPACE

INTENTIONALLY BLANK

EGBC AD 3.17 AIR TRAFFIC SERVICES COMMUNICATION FACILITIES

INTENTIONALLY BLANK

EGBC AD 3.18 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGBC AD 3.19 LOCAL HELIPORT REGULATIONS

1 HELIPORT REGULATIONS

a) All operators will be required to provide an insurance indemnity in advance of landing at this helicopter aerodrome. This indemnity is in standard form and is available from Helicopter and Aviation Services Ltd.
b) Heliport is not normally available to helicopters unable to communicate by radio. Non-radio helicopters must obtain PPR from ATC.
c) Prior to using the Heliport pilots must obtain a briefing from Helicopter and Aviation Services Limited.
d) ATC permission is required for engine start.
e) Helicopters are not permitted to shutdown on stand. Pilots unable to disembark passengers rotors-running must inform the Heliport operator when obtaining PPR.

2 GROUND MOVEMENT

a) All manoeuvres, including hover and air taxiing require ATC permission.
b) The heliport surface is not suitable for ground taxiing.
c) The distance between stands does not permit hovering on adjacent stands.

3 WARNINGS

a) Intense traffic can be expected during the Cheltenham Gold Cup event. To accommodate this specific procedures have been designed these include:

   i. Non standard RTF phraseology and
   ii. Non standard ATC procedures. Pilots must be briefed on these procedures by the Licensee.

b) Use of the Heliport is subject to pilots complying with these procedures.
c) High ground rises to 1083 FT AMSL to the East of the aerodrome.

4 TRAINING

a) Use of the Heliport by training flights is subject to prior approval from the Licensee.

EGBC AD 3.20 NOISE ABATEMENT PROCEDURES

a) No movements are permitted whenever horses are on the racecourse.
b) All helicopters shall avoid overflying the grandstands, racecourse, car parks and residential properties around the Heliport.
c) The visual circuit patterns together with the arrival and departure routes form part of the noise abatement procedures. The Heliport Licensee requires strict compliance with these routings.

EGBC AD 3.21 FLIGHT PROCEDURES

1 GENERAL

a) All procedures are based on the Cheltenham QNH. ATC will provide the QFE when requested by pilots.
b) Pilots operating to/from the Heliport must follow the published routes and altitudes.
c) ATZ radius 2 NM 2000 FT AAL and Restricted Airspace (Temporary), radius 3 NM SFC - 3000 FT AMSL, are established for the duration of the Cheltenham Festival and Gold Cup Meeting. Details are published in NOTAM and AIC.

6	Flight documentation Language(s) used	- English.
7	Charts and other information available for briefing or consultation	F214 UK Forecast Spot winds. F215 UK Low Level Forecast.
8	Supplementary equipment available for providing information	-
9	ATS units provided with information	-
10	Additional information (limitation of service, etc.)	Local Observations available during AD hours.

EGLW AD 3.12 HELIPORT DATA

1	Heliport type	Surface Level or Elevated depending on tidal state of River Thames (see AD 3.12.11 Remarks below).
2	TLOF dimensions	02: 37.97 M x 16 M 20: 37.97 M x 16 M
3	FATO, GEO bearing	02: 023.31° 20: 203.31°
4	FATO dimensions and surface type	02/20: 37.97 M x 16 M Surface: Concrete 11.4 M diameter.
5	TLOF surface and bearing strength	02 Surface: Concrete Platform. 16,330 KG. 20 Surface: Concrete Platform. 16,330 KG.
6	Co-ordinates of geometric centre TLOF or threshold of FATO	FATO 02: 512811.19N 0001046.73W FATO 20: 512812.32N 0001045.95W TLOF 02: 512811.19N 0001046.73W, 149 FT TLOF 20: 512812.32N 0001045.95W, 149 FT
7	TLOF and/ or FATO elevation and slope	FATO 02: 18 FT FATO 20: 18 FT TLOF 02: 18 FT TLOF 20: 18 FT
8	Safety area dimensions	TLOF 02: 38 M x 16 M TLOF 20: 38 M x 16 M
9	Helicopter clearway dimensions	02: Clearway River Thames
10	Obstacle-free sector	River Thames
11	Remarks	Tidal range of River Thames up to 7 M means heliport is 'elevated' for the majority of permitted operational hours (see Port of London Authority website (www.pla.co.uk) for Tide Tables and refer to entry for 'Chelsea' for local predicted tide states). Operators should ensure that they comply with the requirements for operating to an elevated heliport and, where appropriate, have been granted an approval by the competent aviation authority to do so.

EGLW AD 3.13 DECLARED DISTANCES

Declared distance	TODAH	RTODAH	LDAH	Remarks
1	2	3	4	5
02	38 M	38 M	38 M	-
20	38 M	38 M	38 M	-

EGLW AD 3.14 APPROACH AND FATO LIGHTING

1	Approach lighting system type, length, intensity	-
2	Type of visual approach slope indicator system	-
3	FATO area lighting characteristics and location	02: White variable intensity perimeter lights (3 stage intensity). 20: White variable intensity perimeter lights (3 stage intensity).
4	Aiming point lighting characteristics and location	02: Aiming point 512811.75N 0001046.34W. Soft sodium floodlighting. 20: Aiming point 512811.75N 0001046.34W. Soft sodium floodlighting.
5	TLOF lighting system characteristics and location	02: Aiming point Soft sodium floodlighting.
6	Remarks	-

EGLW AD 3.15 OTHER LIGHTING, SECONDARY POWER SUPPLY

1	Heliport BCN location, characteristics and hours of operation	-
2	WDI location and lighting	Anemometer: 512812.06N 0001044.76W (unlit). Anemometer/WDI: 512810.02N 0001046.15W (Illuminated WDI with red obstruction light to mast).
3	TWY edge and centre line lighting	EDGE: Blue variable intensity TWY edge lights (3 stage intensity).
4	Secondary power supply/switch-over time	-
5	Remarks	-

EGLW AD 3.16 AIR TRAFFIC SERVICES AIRSPACE

Designation and lateral limits	Vertical Limits	Airspace Class	ATS unit callsign/ language	Transition Altitude	Hours of applicability	Remarks

EGLW AD 3.18 RADIO NAVIGATION AND LANDING AIDS

INTENTIONALLY BLANK

EGLW AD 3.19 LOCAL HELIPORT REGULATIONS

1 HELIPORT REGULATIONS

a) The heliport is PPR only. Requests for landing must be made only by owners and operators to the operations department (not ATC).
b) All pilots must have conducted a familiarisation flight with an approved pilot and have signed acceptance of the heliport's arrangements and conditions of use, be familiar with marshalling signals at SERA Appendix 1, and comply with them. If unable to comply, stop, hold position and advise ATC. An alternative course of action will be offered.
c) The flight platform is to be used for all arrivals and departures. The take-off climb and approach surfaces are off-set by 15° away from the shoreline.
d) Aircraft must not overfly shipping that is within 100 M of the flight platform.
e) ATC permission required to start and shut down rotors.

2 GROUND MOVEMENT

a) ATC permission required for all manoeuvres including taxi and hover.
b) Taxi speeds should be kept at a minimum due to downwash.

3 WARNINGS

a) Aircrew should exercise caution within the circuit and on approaches and climb outs due to:

i. Turbulence - Associated with strong winds & tall buildings;
ii. Cranes - Continuing redevelopment of land in the vicinity of the heliport changing the built environment;
iii. Birds - Various species are attracted to the local river environment.

4 TRAINING

a) Flights for the purpose of flying training are not permitted at the heliport.

EGLW AD 3.20 NOISE ABATEMENT PROCEDURES

a) All approaches and departures over the river.
b) No manoeuvres other than actual approach and take-off may be carried out below 500 ft agl.
c) Maintain circuit height until descending to land, after departure, climb to circuit height as soon as possible.

EGLW AD 3.21 FLIGHT PROCEDURES

1 WEATHER MINIMA

a) For inbound and departing helicopters, the weather minima for the London Heliport are a reported Heliport meteorological visibility of 3000 M or greater and a cloud ceiling of 1000 FT AGL or greater.
b) Inbound and departure routings via the Local Flying Area require a minimum flight visibility of 3 KM. When the flight visibility is less than 3 KM, helicopters will be unable to access the Heliport as the Heliport ATZ falls within the area bounded by the lateral limits of EGR160 where the weather minima specified in ENR 5.1 (EGR160) shall apply.

2 PROCEDURES WITHIN THE LONDON CTR AND LONDON CITY CTR

a) See EGLL AD 2.22 for details of helicopter procedures within the London CTR and London City CTR.

3 CIRCUITS

a) Circuit height is 1000 FT AMSL.
b) The traffic circuit is a non-standard shape. The circuit is established over the River Thames, between Chelsea Bridge and Putney Railway Bridge. Crosswind and base legs are reduced to turns, which should be made, as far as practicable, over the river and above 500 FT AGL.
c) Circuit pattern follows the course of the river as shown on the diagram on page AD 3-EGLW-4-1. The circuit may be extended at the discrection of ATC only. Circuit must not extend west of Putney Railway Bridge or east of Chelsea Bridge.
d) Do not fly above 1000 FT AMSL unless instructed by ATC.

4 ARRIVALS/DEPARTURES

a) Inbound aircraft **MUST** establish radio contact with Battersea Tower before entering the Local Flying Area, advising total number of people on board and fuelling requirements on first contact with ATC.
b) Aircraft inbound or outbound on direct tracks must comply with altitude restrictions as shown on the diagram on page AD 3-EGLW-4-1.

5 LONDON HELIPORT LOCAL FLYING AREA

a) The airspace forming that part of the London CTR and London City CTR up to 1300 FT AMSL bounded by: 512054N 0001200W - 512657N 0001317W - thence clockwise by an arc of a circle radius 2 NM centred on 512812N 0001046W (Heliport) to 512706N 0000806W - thence clockwise by an arc of a circle radius 12 NM centred on 512812N 0002713W (Heathrow Airport) to 512054N 0001200W.

Note 1: *Pilots must remain outside Restricted Areas R157 and R158 unless in possession of an Enhanced Non-Standard Flight approval as detailed at ENR 1.1 para 4.1.6.*

Note 2: *Due to the restrictions on single engine helicopters over London, inbound and outbound routings via the LFA are only available to multi-engine helicopters.*

b) **Subject to ATC Clearance from Battersea Tower**, VFR or Special VFR flights may take place subject to the following conditions:

i. Aircraft to remain below cloud with the surface in sight;
ii. Maximum altitude: VFR 1300 FT QNH; SVFR 1000 FT QNH;
iii. Minimum flight visibility: 3 KM;
iv. All flights within the area bounded by the lateral limits of EGR160, including that part of the River Thames excluded from EGR160, shall comply with the weather minima specified in ENR 5.1 (EGR160).

Note 1: *In addition to paragraph (b), VFR flights must also comply with the VMC minima for Class D airspace detailed at ENR 1.2.*

Note 2: *Aircraft unable to operate VFR may operate Special VFR within the LFA subject to the conditions in paragraph (b) and the requirements for Special VFR flights detailed at ENR 1.2.*

c) RTF Communication

i. Pilots must obtain an ATC clearance from Battersea Tower prior to entering the LFA.
ii. Due to the frequency DOC restrictions, pilots should only call Battersea Tower for entry clearance when south of the London CTR and London City CTR and within 10 NM of the heliport.
iii. In the event that R/T contact with Battersea Tower cannot be established, pilots must contact Heathrow Radar on 125.625 MHz.
iv. Pilots must accurately observe the LFA boundaries, particularly in the vicinity of Banstead due to helicopters entering and leaving the London CTR via helicopter route H7 under the control of Heathrow Radar.
v. Pilots routing via the LFA will be instructed by Battersea Tower to squawk the heliport conspicuity SSR code **7077** and must also select **Altitude Mode**.
vi. Pilots are requested to report when they are visual with other traffic to Battersea Tower as soon as possible in order to expedite traffic flows.
vii. Battersea Tower may be unaware of traffic within controlled airspace or outside controlled airspace that is operating immediately adjacent to the LFA, and neither traffic information nor separation will be provided on/from such traffic. Pilots are reminded to be vigilant with respect to such traffic when leaving the LFA.

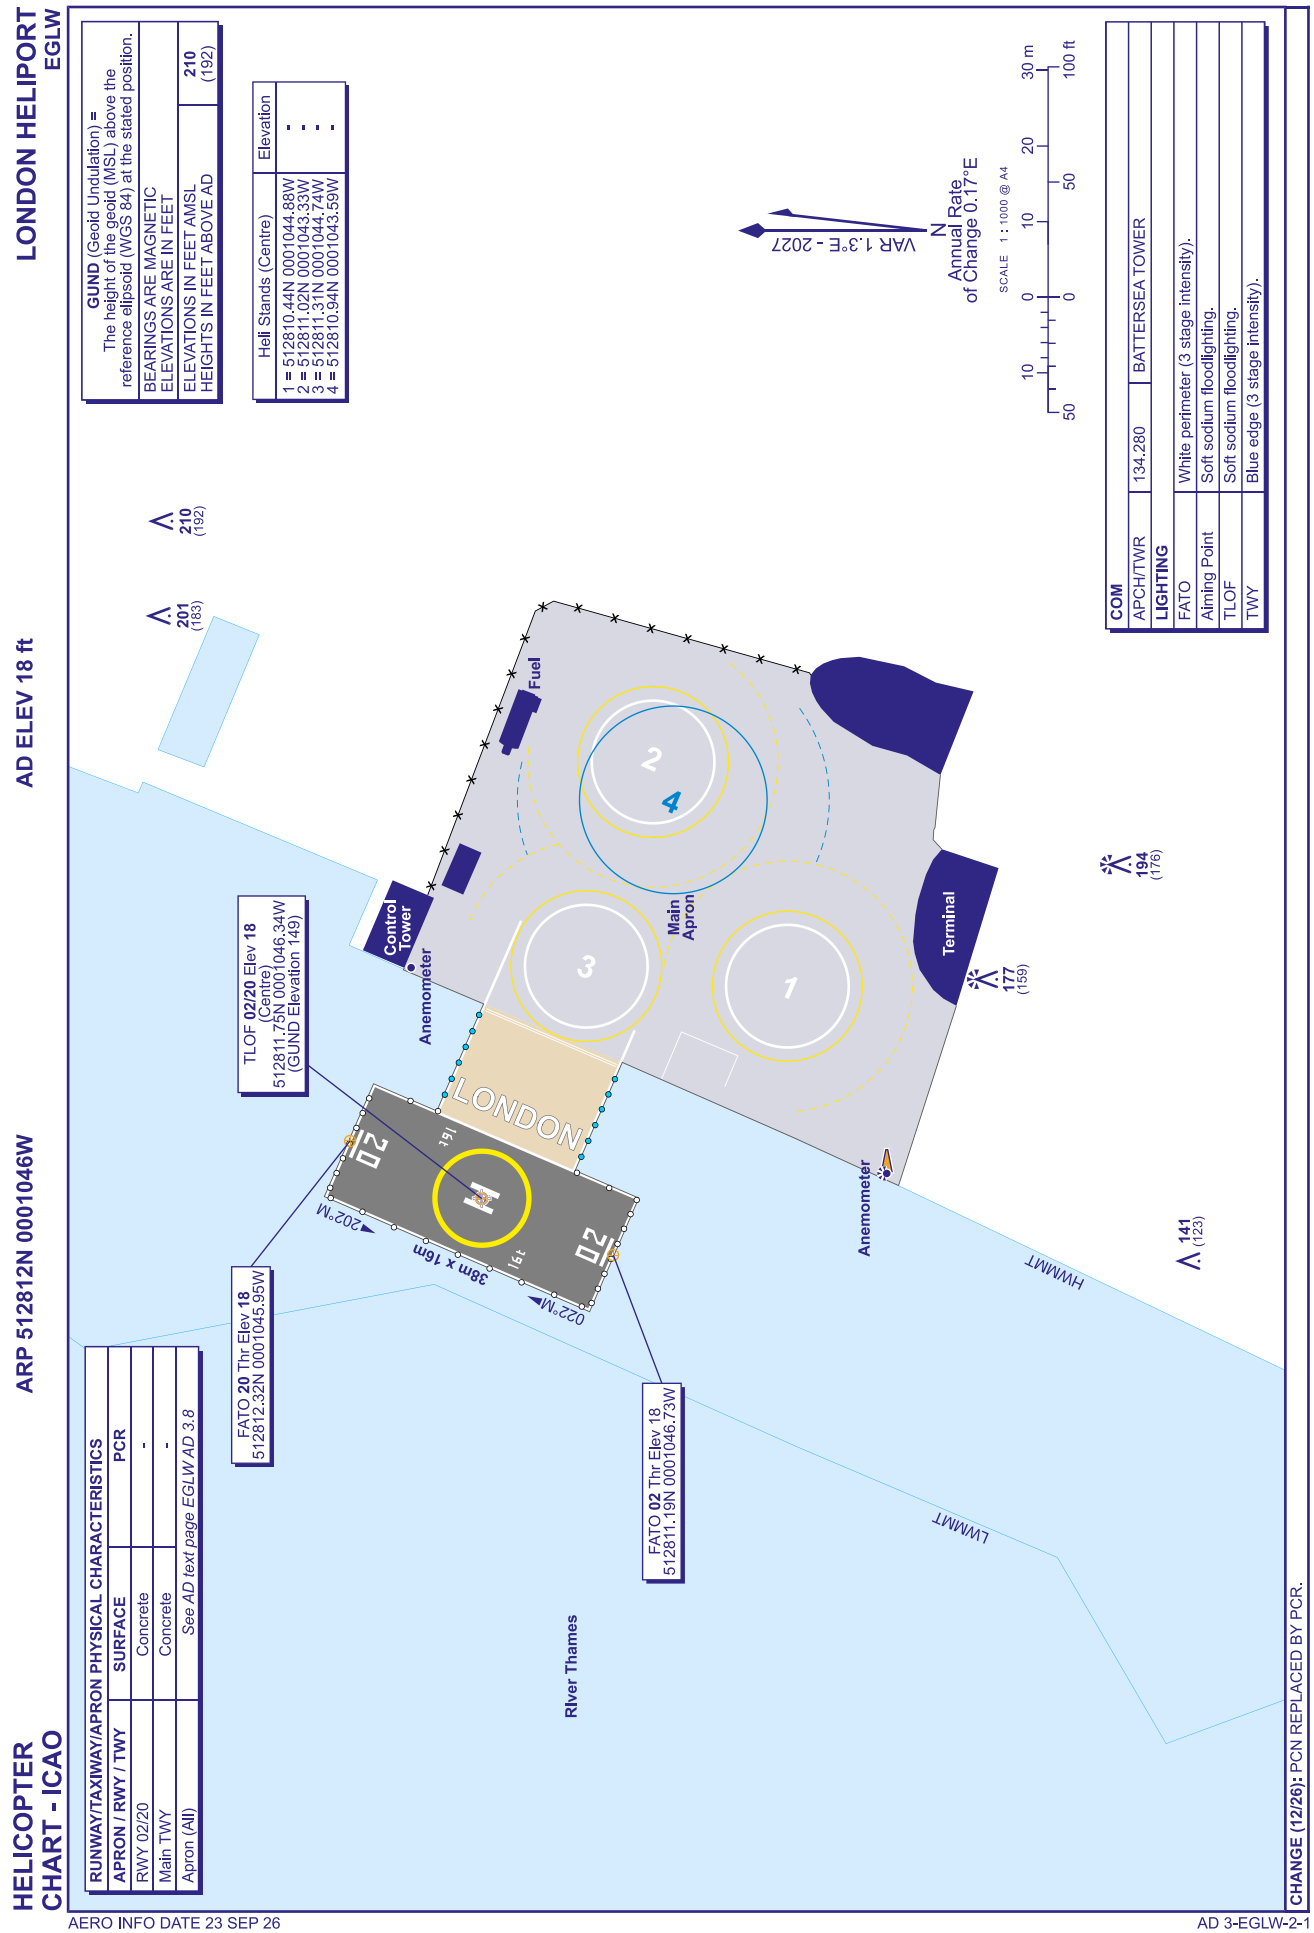
viii. Pilots must report leaving controlled airspace and must report leaving the Battersea Tower frequency before passing 10 NM from the heliport.

6 COMMUNICATIONS FAILURE

a) Inbound aircraft experiencing radio failure should hold on the north bank of the river and await light signals from the tower.

7 ATC PROCEDURES

a) ATC may instruct aircraft to fly to the north or south side of the river in order to be separated from traffic on the opposite side of the river. Aircraft may deviate from the centre of the river as far as required providing the requirements of SERA.3105 Minimum Heights and SERA.5005 Visual Flight Rules can be complied with. If unable or unwilling to accept this form of separation, advise ATC immediately.
b) Aircraft overflying the heliport must comply with the published route altitudes.



EGLW AD 3.22 ADDITIONAL INFORMATION

a) An Aerodrome Beacon is not provided.

EGHK AD 3.19 LOCAL HELIPORT REGULATIONS

1 GROUND MOVEMENT

a) Helicopters may not be ground taxied. Movements between the hangar, apron and helipads are to be carried out by towing.

2 HELIPORT OPERATIONS

a) Helicopters will primarily be operated on the Scheduled Service to/from the Isles of Scilly by Starspeed Ltd. Other flights may be carried out for maintenance, positioning or by emergency services helicopters on a strictly PPR basis. All visiting pilots are to obtain a verbal briefing (Telephone) from Penzance Heliport Operations 01736-780950 on the flight paths required to conform with the Heliport Local Authority Planning Conditions.

3 TRAINING

a) Company helicopter training flights may be carried out in addition to the Scheduled Service.

EGHK AD 3.20 NOISE ABATEMENT PROCEDURES

1 GENERAL

a) Pilots are to avoid overflight of all local built-up areas as far as possible and are only to approach the heliport from the south over Mount's Bay. Departures from Penzance Heliport should be routed over the sea, as soon as practicable after take-off.

EGHK AD 3.21 FLIGHT PROCEDURES

1 ARRIVING AND DEPARTING

a) Land's End Radio Mandatory Zone (RMZ). See EGHC AD 2.17 & AD 2.22.
b) Helicopters are to avoid Marazion Nature Reserve (2 NM to the East) and Penzance Town (2 NM to the West) before routing over the sea to approach Penzance Heliport. The village of Longrock and St Michael's Mount should not be overflown.
c) Outbound aircraft are to conform to departure flight paths briefed to visiting pilots by Penzance Heliport Operations. All departures are to be routed over the sea, as soon as practicable after take-off.

2 CIRCUIT PROCEDURES

a) Circuits are to be flown to the south of the Heliport only.

3 VFR AND SPECIAL VFR FLIGHTS

a) All flights are to be conducted under VFR.

EGDP AD 3.19 LOCAL HELIPORT REGULATIONS

1 GROUND MOVEMENT

a) Helicopters must hover taxi over the flood gate to and from the apron and FATO. Once on the apron, all helicopters should self-position and ground taxi to and from the allocated stand.
b) All helicopters requiring a refuel should taxi to and from the stand 1 under guidance from the marshaller.
c) Aircraft on the ground/hover in the helicopter dispersal area should give way to aircraft taxiing in. If sufficient separation between aircraft cannot be maintained, arriving aircraft should conduct circuits to the North and allow departing aircraft to clear the area.

2 HELIPORT OPERATIONS

a) Helicopters will primarily be operated by HeliOperations (HeliOps) delivering search and rescue (SAR) training. All visiting aircraft to Portland Heliport are PPR, call 01305-700001 or email bookings@helioperations.co.uk.

3 TRAINING

a) Search and rescue (SAR) training, military flying training and military operational training can be conducted by PPR. Civil flying training can be conducted by PPR.

EGDP AD 3.20 NOISE ABATEMENT PROCEDURES

1 GENERAL

a) All ground running should generally be undertaken on Stand 2.
b) The built-up area to the South/East of Portland Aerodrome should not be overflown below 1000 FT.
c) Minimise overland low flying within 10 NM of Portland Heliport.
d) Minimise unnecessary engine running particularly during unsociable hours.
e) Avoid unnecessary overflight of the Isle of Portland and any adjacent built up areas.
f) Avoid overflying the marina to the North and North West of the heliport.

EGDP AD 3.21 FLIGHT PROCEDURES

1 ARRIVING AND DEPARTING

a) Following approach to the TLOF, aircraft are then to hover taxi over the raised grass bank to the TDPC ‘H’ in the dispersal area, then to a parking spot or refuelling stand.
b) All ground taxi capable aircraft should land and take off at the ‘H’, and ground taxi to and from a stand or the Refuel Spot under guidance from the marshaller.

2 CIRCUIT PROCEDURES

a) 02 Left Hand - 1000 FT QNH;
20 Right Hand - 1000 FT QNH.

3 VFR AND SPECIAL VFR FLIGHTS

a) All flights are to be conducted under VFR.

EGDP AD 3.22 ADDITIONAL INFORMATION

1 GENERAL

a) Possible high masted vessels on the approach to H20.
b) Large vessels in the harbour on the approach to H20.
c) Possible paragliders 1-2 KM South-South East of the heliport.

EGHT AD 3.2 HELIPORT GEOGRAPHICAL AND ADMINISTRATIVE DATA

1	ARP coordinates and site at AD	Lat: 495644N Long: 0061953W
2	Direction and distance from city	2 NM north of Hugh Town, Isles of Scilly.
3	Elevation / Reference temperature / Mean Low Temperature	20 FT / 2 °C / -
4	Geoid undulation at AD ELEV PSN	176 FT
5	Magnetic Variation / Annual Change	0.60°W (2027) / 0.18°E
6	AD Administration Address Telephone E-mail address Web address	TRESCO HELIPORT Tresco, Isles of Scilly, TR24 0QQ. 01720-424109 (Tresco Heliport) heliportmanager@tresco.co.uk www.tresco.co.uk
7	Type of Traffic permitted (IFR/VFR)	VFR
8	Remarks	-

EGHT AD 3.3 OPERATIONAL HOURS

1	Heliport Operator	From 1 Apr to 31 Oct; Mon-Sat: 0830-1700 (0730-1600); Closed on Sun. From 1 Nov to 31 Mar; Mon-Fri: 0830-1030 and 1430-1600; Sat: 0830-1030; Closed on Sun.
2	Customs and Immigration	By arrangement of airfield operator.
3	Health and sanitation	-
4	AIS Briefing Office	-
5	ATS Reporting Office (ARO)	-
6	MET Briefing Office	As Heliport hours.
7	Air Traffic Service	AGCS only Channel ID 118.205
8	Fuelling	-
9	Handling	As Heliport hours.
10	Security	-
11	De-icing	-
12	Remarks	Aerodrome is PPR. Tel: 01720-424109.

EGHT AD 3.4 HANDLING SERVICES AND FACILITIES

1	Cargo handling facilities	-
2	Fuel and oil types	-
3	Fuelling facilities/capacity	-
4	De-icing facilities	-
5	Hangar space for visiting aircraft	Parking available.
6	Repair facilities for visiting aircraft	-
7	Remarks	Aircraft parking available. Overnight or during the day. No fuel available.

EGHT AD 3.5 PASSENGER FACILITIES

1	Hotels	-
2	Restaurants	Restaurants on the island.
3	Transportation	Transfers available to accommodation.
4	Medical facilities	-
5	Bank and Post Office	Tresco Stores.
6	Tourist Office	-

7	Remarks	Small private island facilities all close by.

EGHT AD 3.6 RESCUE AND FIRE FIGHTING SERVICES

1	AD category for fire fighting services	RFF Category H2 External rescue agencies available on request.
2	Rescue equipment	Water rescue facilities available for 08/26 during opening hours.
3	Capability for removal of disabled aircraft	-
4	Remarks	-

EGHT AD 3.7 SEASONAL AVAILABILITY - CLEARING

INTENTIONALLY BLANK

EGHT AD 3.8 APRONS, TAXIWAYS AND CHECK LOCATIONS/POSITIONS DATA

1	Apron/ helicopter stands surface and strength	APRON Surface: Grass. Compounded ground. NIL
2	Ground taxiway width, surface and designation	-
3	Air taxiway width and designation	Taxiway FATO 08/26: 45 M
4	Altimeter checkpoint location and elevation	-
5	VOR checkpoints	-
6	INS checkpoints	-
7	Remarks	No helicopter ground taxi available.

EGHT AD 3.9 MARKINGS AND MARKERS

1	Final approach and take-off markings	TLOF STAND 2: at westerly end of FATO.
2	Taxiway, air taxiway and air transit route markers	-
3	Remarks	Safety Area and FATO combined and marked with inlaid concrete markers. The landing TLOF STAND 2 is marked with L-shaped concrete markers at the westerly end of the FATO. No shutting down on this TLOF. Shutting down and short stay parking is on STAND 1 on the north side of the airfield. There are no runway designators or ‘H’s at either end of the FATO.
